GUIDE TO THE SQ18 YANOAMA FILE

[The name Yanoáma is an ethnolinguistic designation for a number of small groups of Indians living in southern Venezuela and northern Brazil, and does not refer to a nation or a people in the political sense. The Yanoáma include the Sanema (Guaharibo), Nabudub, Pubmatari, Taclaudub, Waica, Casapare (Shiriana), Karime, Samatari, Surara, and Pakidai. These subdivisions are not unified by socio-political authority but rather by a general and culture type, which in turn is integrated by a series of subcultures and cultural variants within the various subgroups. These groups occupy a coherent territory, speak more or less closely related languages and display essentially similar economic, sociological, and religious cultural forms. The Yanoáma are located in southern Venezuela and northern Brazil between 0° 30' - 5° North latitude and 62° - 65° 30' West longitude.

The Yanoáma language is basically an isolated linguistic stock, consisting of at least four languages and several dialects. Migliazza designates the four major languages of the Yanoáma family as: Yanomamɨ, spoken in the west-southwest; Yanomam in the east-southeast; Yanam in the northeast; and Sanɨma in the north (Migliazza, 1972, p. 34). According to the glottochronological analysis made by Layrisse et al, the Yanoáma linguistic stock ranges from 6-35 minimum centuries of internal separation. The two most clearly distinguishable families of the stock are: (1) Sanema, consisting of the Sanema, Nabudib, and Pubmatari, of 6-17 minimum centuries of internal divergencies, and (2) the Casapare, consisting of the Casapare, Carime (?), Waica, Samatari, Surara, and Pakidai, of 8-21 minimum centuries of internal divergencies (5: Layrisse et al, p. 80).

The Yanoáma are probably one of the largest, yet unacculturated aboriginal groups in South America, with a total population estimate of around 12,000 people distributed in over 200 villages. This would give an average of 60 people per village, yet as Migliazza points out in the central villages and those engaging in warfare, the population may reach as high as 200 in one village (Migliazza, 1972, p. 16). On the periphery of the Yanoáma area, the average per village is well below 50.

Subsistence is based on slash and burn agriculture with the predominant cultigen being a variety of plantains and bananas. Other crops grown are bitter and sweet manioc, taro, yams, and sweet potatoes. A form of arboriculture is also practiced, the tree grown being the peach palm whose fruit is of primary importance to the diet during certain times of the year. Hunting and collecting further supplement subsistence needs. Fishing is of minor importance to the economy.

The Yanoáma permanent settlements consisted of a circle of huts around a central plaza. The huts stand so close to one another that adjacent roofs overlap, giving the impression that a circular roof existed interrupted only by the diametrically opposed entrances to the settlement (Wilbert, 1972, p. 32). Each hut by itself was little more than a large windscreen on four poles, the front poles which are about twenty-one feet high slanting down in the rear to about three feet. The side facing the plaza is left open while the exterior wall is closed with poles wedged against the roof. The roof is made of a thick matting of palm leaves which are fastened to a framework of poles and lianas. The permanent villages are often surrounded by a palisade fence. The village is the basic socio-political unit of the Yanoáma and is composed of several

extended families with nuclear family households (5: Layrisse et al, p. 81). The founding nucleus of such a village consists of two intermarried pairs of brothers and (consanguineally with them unrelated) sisters and thier descendants. The two resulting lineages exchange their women, thus bringing about a web of affinal relationships. Every village has its own headman, and one pata, "big-old," was usually more influencial than the others. Migliazza claims that the position of chief or headman is not really inherited but was more dependent on having many living agnatic relatives and the ability to assert oneself among them (Migliazza, 1972, p. 415), yet there is some indication that at one time, at least, the office was inherited patrilineally from father to son, or from elder brother to younger brother. If there is no suitable successor to the office the old chief could choose a capable man outside of the dominant lineages. In addition to the regular village chief, during times of war, a man was often chosen with experience in combat to act as war chief. This latter office was not hereditary and became inactive when hostilities ceased. As additional lineage groups joined the village community and intermarried with members of the original lineages, political pressures and internal factionalism frequently led to the splitting apart of the village and the establishment of a completely new community.

Marriages are usually arranged by the male relatives of the girl, although there have been cases where the man would make his own choice of a bride and talk to her parents about the wedding arrangements. Brother-sister exchanges and cross-cousin marriages are the preferred pattern. Bride service is common among the Yanoáma. Residence is first with the girl's parents and later with the husband's family or wherever the husband chooses. There is no general marriage ceremony to all the Yanoáma. Polygyny is widespread.

All Yanoáma groups as well as their Carib neighbors have a kinship terminology of a bifurcate merging type (e.g., Ego calls his father's brother "father" and his mother's sister "mother"). A different term is used by Ego for his "uncles" and "aunts" of a different sex than that of his mother or father. In Ego's generation the terminology is of the Iroquois type in which parallel cousins are called "brothers" and "sisters" and thus differentiated from cross-cousins. Patrilineal descent and agnatic relationships are considered more important than matrilineal relatives, a fact not uncommon in the Iroquois kinship system (Migliazza, 1972, pp. 414-415).

Shamanism is well developed in the society with the shaman establishing contact with the spirits (hekira) through the use of hallucinogenic drugs. The chief function of the shaman is in the supernatural curing of the sick. All men can become shamans if they wish, requiring only some relatively simple but formal training under the tutelage of an older shaman; however, only a few men in each village actually choose to do so. The Yanoáma have a well developed cosmology and mythology with the primary cultural heroes Omam, his brother Yoao and their enemy Pore playing a major part in many of the tales and stories. A whole host of spirits and ghosts also play a part in their religious activities.

The SQ18 Yanoáma file consists of eleven sources, five in English (sources 5, 6, 9, 10, and 11), three are translations from the German (sources 1, 2, and 3), and three from the Spanish (sources 4, 7, and 8). Probably the most useful sources for a general background on the Yanoáma are 5: Layrisse et al, which contains a five page cultural summary on the Yanoáma as a whole, supplemented with the more detailed information presented in 10: Chagnon and 11:

Chagnon. The remaining sources in the file are related to specific Yanoáma subgroups. 1: Schuster, written by a professional anthropologist, is a sociological analysis of inter- and intra- community relationships among the Waica. Source 2: Becher, also written by a professional anthropologist, provides excellent ethnographic information on the material culture, religion, and political structure of the Surara and Pakidai subgroups, but is somewhat weak on social organization and kinship. 3: Rodrigues, written by a linguist, is a brief account of the historical and linguistic background of the Yanoáma language as spoken by the present day Surara and Pakidai. 4: Wilbert provides a good general background coverage on Sanema ethnography with additional data on other Yanoáma subgroups. Wilbert is a well known anthropologist with a specialized interest in South American ethnography. 5: Layrisse et al, prepared by a team of physicians and professional anthropologists, is basically a blood group study of the Waica Indians, with comparative data provided on other "Paleo/Meso-Indian peoples," especially the Warao and Yaruro. 6: Vinci, written by a traveler/explorer, is a popularized account of the author's travels among the Sanema subgroup of Yanoáma, as well as the Makiritare Indians (SS20) of southern Venezuela. Some general cultural information on both groups will be found here. 7 and 8: Barker, written by an American Protestant missionary, provide a short but precise ethnographic descriptions of the Waica, with special elaboration in 8: Barker on the warfare aspect. 9: Grelier, by a geographer, presents a popularized account of the author's trip to discover the source of the Orinoco River and his incidental observations on the various Indian groups with whom he came in contact during his expedition, here notably the Guaharibo (Sanema) and Waica, and the Makiritare (SS20). As noted previously, sources 10: Chagnon and 11: Chagnon provide a more general ethnography on the Yanoáma as a whole, with special emphasis in 10: Chagnon on warfare, social organization, and marriage alliances and in 11: Chagnon on warfare, interpersonal relations, and intercommunity relationships. All sources

except 3: Rodrigues, which was based entirely on secondary source material, were written from the primary field experiences of the authors. Sources 4: Wilbert and 10: Chagnon were further supplemented by the addition of documentary material to their primary data. All sources were based on data gathered in the period of 1950-1968.

The Yanoáma file is one of best available of any South American Indian group now a part of the HRAF file system, and well adapted to cross-cultural research. The file was processed between 1965-1972.]

/114/

121 I shall describe to you in the following some aspects of the social structure of the same Indian tribe whose conceptions about the soul Herr Dr. Zerries has just discussed. The title, "Sociology," is too presumptuous, insofar as today I intend to deal with only the larger social units and thus touch upon only a small sector of the sociological field. I shall be able to present to you only raw expedition-material; the comparative arrangement of these data in South American cultural history will be the work of the next few months.

101 131 The Waika /Waica/ inhabit the upper Orinoco river region in southern Venezuela; their area of habitation, however, is not limited by the Sierra Parima, in which the Orinoco rises and which forms the mountain border with Brazil, but rather extends into Brazilian soil far beyond this mountain chain, about to the middle of the northern tributaries of the Rio Negro and Rio Branco. [161] The Sierra Parima therefore is more the backbone of the living space of this Indian group, which, according to the best estimates, contains about fifty thousand persons and an area of about half 137 the size of West Germany. According to external appearances, [132] this region is counted as tropical rain forest; seasonal differences are only slight and are practically without influence on the life 101 and culture of the people. The critical cultural importance of the 199 forest lies in its isolating effect: between the habitation area of [137] the Waika and the first mixed settlement there extends an almost [487] uninhabited forest-belt several hundred kilometers wide, and since there is very little river traffic and as other means of transportation there are only onerously traversable Indian paths, the culture of the Waika has been able to remain almost completely pure. Only a [199] few material things from our world have as yet found their way to them: a few machetes and axes, a few matches and fishhooks, which an American mission working from 1947 to 1955 under very difficult conditions and we ourselves brought along; since the Waika do not maintain any contacts of their own downriver, however, the barely begun acculturation process does not go on /115/ by itself, but ebbs away the moment the visiting whites leave Waika country.

/115 cont./

101
(191)

Thus the geographic situation of the Waika and their extremely limited contact with civilization are depicted in a few words. Because the name is simple and well-known, I have so far spoken only of the "Waika," but now it is time to make a more precise distinction when first we turn to the question of tribal organization. On Venezuelan soil this people is divided into three large groups, all of whom, disregarding slight differences, speak the same language and have the same culture. The Shidishana /Shiriana/ live north of the Ocamo, a northern tributary of the upper Orinoco; to the north their territory is bordered by the Cariban Makiritare, with whom the Shidishana have in many ways entered into a close economic and social symbiosis. Adjacent to the Shidishana on the south are the Waika proper (the name means "killer"); they inhabit the region between Ocamo and Orinoco and with a few of their villages extend over to the southern Orinoco bank. The large and completely unexplored region south of the Orinoco to the Brazilian border and beyond, however, belongs, at least in its northern part, to the Shamatairi /Samatari/, the "tapir people," who are one of the most primitive groups of this people, stand strictly inimically opposed to any contact, and thus do not show even the slight traces of acculturation that the Waika do. As far as I can see, there is no reliable information available concerning the population groups east of the Sierra Parima, and unquestionably the picture for the Venezuelan area from whose northeastern part another group, named Okomatairi, has been reported will be improved later. The terms Waika and Shidishana (or Shiriana) used in the literature as a collective designation for these culturally similar virgin-forest groups are not very suitable, since they refer to subgroups; on the other hand, the name Guaharibo used by foreigners does not belong to the language of this people and is recognized only by the Shidishana. The only name that encompasses all the subgroups and is understood by the natives themselves as a general term is the word "Yanoama," which means "voice of the house" and contrasts with "nabe," by which all foreigners are meant indiscriminately -- all who do not speak

/115 cont./

101 the language of the Waika, Shidishana, or Shamatairi, therefore the neighboring Indians as well.

Thus the term "Yanoama" refers to the cultural and linguistic identity; it does not have the least political aspect. There is no tribe of the Yanoama, nor is there any tribe of the Waika, the Shidishana, or the Shamatairi. At most one can speak of the "people"; but one must bear in mind that there is no institution, no office, that is representative of this people. Also the cognizance of this term in the thinking of the natives /116/ remains general and therefore inevitably vague, parallel to the small amount of geographical knowledge, which is limited to what they themselves have traversed, that is, as a rule, to the circle of the nearest villages, which are about one to two days' journey away from one's own.

101 621 Geopolitical thought, which would find expression in a more extensive political organization, is unknown to the Yanoama; their conceptual world revolves around the village.

The village is the unit in which one thinks and after which one names himself: when questioned a Waika will never answer that he is a Waika or a Yanoama, but rather will give his village name, say, "Bolitaotedi," whereby "tedi" (village), like the Spanish "pueblo," refers less to the settlement and more to the

829 people who live in it. It seems obvious that one is a Waika, for the slight contact with civilization has not yet led in their thinking to distinguishing their own culture from that of foreigners; the foreigner has remained an individual guest with peculiar habits and has not yet become the representative of a large, strange

101 621 world. It is not obvious, however, to which village one belongs; village membership is the decisive political and sociological characteristic of the individual.

361 Externally the village is a clearing in the virgin forest, usually oval in ground plan, with a large diameter from 30 to 100 meters;

[162] the houses line the edge of this clearing. On the average a village is inhabited by about 100 persons. The villages of the Shamatairi south of the Orinoco, however, are much larger; according to our

Foreword

114
101 This monograph contains the results of a nine-month investigation which I conducted from October 1955 to June 1956 among two Indian tribes of northwest Brazil which are as yet unknown to science.

121 My journey and the analysis of its results were made possible through the generous support of the Deutschen Forschungsgemeinschaft /German Research Association/, for which I am deeply indebted to it.

114 I should like cordially to thank my esteemed teacher, Herr Prof. Dr. Franz Termer, for regarding this work, the completion of which he supported actively and in an advisory capacity, worthy of inclusion in the series of reports of the Hamburg Museum für Völkerkunde und Vorgeschichte /Museum for Ethnology and Prehistory/.

I was encouraged by Herr Prof. Darcy Ribeiro, head of the study division of the Serviço de Proteção aos Índios, to seek out these as yet uninvestigated tribes north of the middle Rio Negro. [122] Through his efforts I also obtained the approval of the Director and was given all possible assistance by this organization founded by Marshal Cândido Mariano da Silva Rondon, as well as a free flight with a military plane from Rio de Janeiro to Manaus. Hence I feel a sincere desire to express my gratitude to the Serviço de Proteção aos Índios, especially to Herr Prof. Darcy Ribeiro and the Brazilian Air Force.

122 I thank the University of São Paulo, above all the Dean, Herr Dr. Paulo Sawaya, and the Assistant Dean Herr Prof. Dr. Antonio Soares Amora, for granting me a stipend from June 1954 to September 1955, which made it possible for me to broaden my knowledge of Brazilian ethnology under such outstanding scholars as Herr Prof. Dr. Herbert Baldus and Herr Prof. Dr. Egon Schaden and to prepare myself thoroughly for the subsequent work in the field. To these two gentlemen I shall remain deeply indebted.

114 Valuable advice which was very useful to me on my expedition was given me by Herr Prof. Dr. med. Henrique da Rocha Lima (†).

it was possible to determine that the societies investigated belong to a relatively uniform culture group and even linguistically differ

Surára. Pakidái Shiriana Waica

/6 cont./

114 101 [127] [97]

from each other only slightly in dialectal deviations (see the appendix /see 3: Rodrigues, this file/) (21). How great their

21. Loukotka and Rivet already established the relationship of a few of these languages and grouped them under the general term "Širianá linguistic family," in which they include Širianá, Karimé, Waŕka, and Pusárakaú. (Loukotka, 1942, pp. 8/9; Rivet et Loukotka, 1952, p. 1140).

homogeneity is may be seen by the fact that the Surára and Pakidái call themselves Yanonámi and the Waiká and Xiriána, according to Zerries and Schuster, call themselves Yanoáma (22) (23).

22. Zerries, 1956a, p. 187.

23. Schuster, 1958a, pp. 115/16.

However, members of the Aramamesterí, Karauaterí, Puseheweterí, and even of the Xiriána, whom I met in the malokas of the Surára and Pakidái as wives, visitors, and captives, said that they were Yanonámi. Furthermore, the Surára chief Hewemão enumerated for me 42 more tribes between Catrimani and Rio Negro (24), friendly and hostile, pointing out that these

24. Becher, 1956.

must likewise be included.

In view of this and on the basis of the linguistic and cultural relationship, it would seem to be appropriate to adopt into South American ethnology Yanonámi or Yanoáma as a new designation for the linguistic and culture group made up of these small-sized and light-colored Indians of the northern Amazon. According to the investigations up to now, they occupy a relatively compact area which is bounded in the east and south by the Rio Branco and the Rio Negro, respectively, but in the north and west extends

Surára
Pakidái

/6 cont./

101 beyond the Uraricuera and the Parima range, respectively.
114 There can no longer be any doubt about the ethnic affiliation of this population. Koch-Grünberg was already of the opinion that in the case of the Xiriâna (Schirianá) and Waiká (Waíka) "it is not a matter of two different tribes, but merely of two divisions of one large nation" (25) (26). At the same place, however, the

25. Koch-Grünberg, 1922, p. 224.

26. Koch-Grünberg, 1923a, p. 290.

investigator expresses the conjecture, which was confirmed by the opinions of neighboring tribes, that the Waiká represent merely a subdivision of the Xiriâna, "with whom they live either peaceably or in bitter enmity" (25) (26) /see the footnotes above/. Their isolation from other tribes is, according to Ourique, "an example of the instinctive precaution of the race against its own deterioration and its downfall" (27).

27. Ourique, 1906, p. 24.

101 In this connection there is a significant hint by the Surára chief,
619 according to which there are two powerful tribes within the
[115] "Yanonámi nation" first the Xiriâna, who call themselves "Harateri," and secondly the Waiká, who, however, are constantly warring. All the smaller tribes are on the side of either one or the other, but at the same time are obliged to pay tribute
[438] and render service in war (28). The Surára and Pakidái, the
[114]

28. With regard to the Xiriâna, Koch-Grünberg already mentions this vassal relationship (Koch-Grünberg, 1922, p. 226), and Métraux also refers to it (Métraux, 1948, p. 861).

chief told me further, are allies of the Xiriâna and occasionally

/6 cont./
obtain by barter clay vessels, clay plates, bows, arrows, hammocks, baskets, belts, and upper-arm ornaments (29).

29. Pottery is not practiced at all by the Surára and Pakidái, and their self-made bows, arrows, hammocks, etc. are inferior in quality to those of the Xirifna.

/7/ IV. Historical Data

At the present time, in the winter months (rainy season), April-September, the Surára live at the Cachoeira dos Índios (Ill. 2 and 3), on the upper Rio Aracá, and the Pakidái in Taraquá, on a right branch of the middle Demini. The summer months (dry season), October-March, on the other hand, the two tribes spend together in a large, open maloka, which belongs to the Surára, in the virgin forest region between the Demini and Aracá rivers. This maloka lies 70 kilometers northeast of the Cachoeira dos Índios and about 100 kilometers south of the source region of the Orinoco.

Koch-Grünberg, on his map accompanying the work Vom Roroíma zum Orinoco /From the Roroíma to the Orinoco/, showed neither the Rio Demini nor the Rio Aracá and designates this region as "unknown territory." In his text he also says, "the entire large area between Rio Negro, Rio Branco and Uraricuéra is unexplored to this day" (30). Baldus likewise points out that in this area

30. Koch-Grünberg, 1923a, p. 287.

"surprises still await the seeker of unknown tribes" (31).

31. Baldus, 1956a, p. 294.

/8 cont./
however, they had withdrawn into regions remote from the river. Their last maloka on the Demini was taken over by a Waiká tribe in 1934. This is the place where today the Indian protection post "Ajuricaba" is located, on the right bank of the middle Demini, just below the Cachoeira Auatsinaua (40) (41). In 1939, the

40. Holdridge visited the Xiriána here in 1932. (Holdridge, 1933, p. 380.)

41. According to information which Nimuendajú obtained in Manaus in 1927 from a man named Domingos Campos, Aruak-speaking Indians on the Demini were supposed to have been called Xiriána (Nimuendajú, 1955, pp. 150/51). This brings up all kinds of questions which are yet to be solved. Thus, there could have been an Aruak tribe of this name, for the shards which I found on the Demini, as well as the name of this river, indicate that members of that linguistic group once lived here. It might also be possible, however, that Aruak groups, after their subjugation by the Xiriána, became assimilated with the latter. On the other hand, it is not impossible that individual Xiriána adopted the Aruak language, and finally there still remains open the surmise that the Indians mentioned by Domingos Campos are not identical with the actual Xiriána, but were merely called that by the caboclo population.

In the literature, the two tribal designations "Xiriána" (members of the Aruak linguistic family) and "Xirianá" (independent linguistic family) (Loukotka, 1942,

Surára
Pakidái
Shiriana
Waica

/8 cont./

114
174
101

41. (cont.)

pp. 8, 24, 52; Ribeiro, 1957, p. 99) have already become current. Nevertheless, I incline to the view that in the case of the Xiriána it is a matter of one and the same large, widely scattered Yanonámi tribe. The material and spiritual culture of the Xiriána with whom the Surára and Pakidái are allied (the latter and the Xiriána whom I met among them themselves regularly accent the first a) corresponds perfectly with the one that Koch-Grünberg calls "Schirianá." The latter points out in one work that "Schirianá" is their self-designation, while "Schirischána" is a name which their neighbors and mortal enemies, the "Maquiritáres," gave them (Koch-Grünberg, 1913, p. 454). It should also be mentioned that the designation "Shrirana," according to Vinci, is a Makuxí /Macusi/ word (Vinci, 1956, p. 107).

167 In 1939, the
648 Waiká, too, gave up this maloka and moved to the Rio Mapulau, a left tributary of the upper Demini. Here, at the beginning of the year 1956, at the time of my stay among the Surára, they were attacked by a Xiriána tribe and destroyed. Surára warriors told me that all the Waiká men were killed and the women and girls were taken captives.

101
114 As inhabitants of the Rio Aracá, Nimuendajú entered on the above-mentioned map of this region (see p. 16), with the date of 1874, the Bahuana, an Aruak tribe. With reference to this, the Surára chief remarked that this tribe also goes by the proper name of Pootarí and was an enemy of the Surára, Pakidái, Xiriána etc.; at the present time it lives in the source region of the Aracá

/134/

114 During his stay among the Surára Indians, Hans Becher was able to compile an extensive vocabulary of their language. This still needs linguistic revision and further checking. Even now, however, it makes it possible to establish perfectly clearly the relationship of this language to the languages of the Waika /Waica/, Širiana /Shiriana/, and Karimé. There is a very close correlation, [101] apparent at first glance, which corresponds to the cultural unity of these Indian groups, whom Becher has classified under the name Yanonámi /Yanoama/.

The first vocabulary of a language of this group was published by Koch-Grünberg in 1913 and -- considerably expanded -- in 1928, and comes from the Širiana (Širianá) of the Uraricuera (and its tributary the Uraricaparú) (1). In 1932 there appeared

1. Koch-Grünberg, 1913, p. 458; 1928, pp. 302-308.

a vocabulary of the Karimé Indians of the Catrimani River compiled by G. Salathé (2). Further material was then published by

2. Salathé, 1932, pp. 314-316.

A. Vinci, who added to his travel account a vocabulary of the Warema-Širiana (or -Waika, listed by him as Uarema, Guaica and Scirisciana) on the Merevari River (3). In 1954-55 O. Zerries

3. Vinci, 1956, pp. 354-357.

and M. Schuster collected as yet unpublished material among the Waika of the upper Orinoco, and in 1956 Becher presented his vocabulary from the Surára and a number of expressions from the Pakidái. This, to my knowledge, is all that is known about these languages at present.

114 As early as 1913 Koch-Grünberg found that Širiana was in-
197 dependent of the neighboring Karaiben /Carib/ languages and apparently isolated (4). The latter view was adopted in 1924 by

4. Koch-Grünberg, 1913, p. 455.

/11/

Introduction

101
131
[133] The native tribes that are discussed in the present report inhabit the northwest zone of the Escudo Guayanés, located in the southern part of the Republic of Venezuela. As the natural boundaries of this region, which we call "the Orinoco-Ventuari region," one may point out the rivers: the Orinoco in the north and west; the Ventuari in the south, and the Caura in the east. Geographically the zone is enclosed between 64°-68°W. and 4°-8° N. approximately. The northern part of it corresponds to the Distrito Cedeño of Bolivar state, while the southern part, as Departamento Atures, belongs to the Territorio Federal Amazonas.

133
101 Hydrographically speaking, the region includes five river basins which carry off its water and which at the same time set off the various areas of native distribution (1).

[128] 1. We do not include here the small native groups who recently arrived (Guahibo, Piapoco, Puinave, Curipaco). They live along the periphery of the region, except the Guahibo, who advanced a few years ago to the Manapiare river.

a) The basin of the Cuara, with the Mayoncon /Maioncon/, a subgroup of the Makiritare, the Yecuana, and with some Sanemá groups;
b) The basin of the Cuchivero, with the Panare Indians and some unknown groups on the headwaters;
c) The basin of the Suapure, which, with the exception of some Panare nuclei, does not at the present time have any native populations;
d) The basin of the Sipapo, with the Piaroa and Macó Indians;
e) The basin of the Ventuari, with the Yabarana Indians on the Manapiare River, the Yecuana (Decuana) subtribe of the Makiritare, and the Nabudub, a Sanemá subgroup (cf. hydrographic map /see p.12/).

Guahibo SC14
Yabarana SS22
Panare SS21
Sanema
Saliva SS15
Makiritare SS20

/11 cont./

All these basins, without exception, pour their great volumes of water into the Orinoco, which, like a gigantic arc, runs across the north of the Escudo de Guayana, thus enclosing all the native tribes studied here and marking the farthermost boundary and end of their primitive world (cf. ethnic map /see p. 5 /). /12/ /Map appears here./

/13/ It is interesting to point out that the extensive fluvial network of the Orinoco-Ventuari zone does not serve the majority of the tribes as a means of communication or as an outstanding source of food. The Panare of the basin of the Cuchivero do not travel by river, and on the Cuchivero we found only one dugout /bongo/, which was used solely for crossing the river. In general the curiara /dugout canoe/ seems to be a foreign element in Panare culture, introduced recently by the Creoles. Nor did the Yabarana of the basin of the Ventuari use the curiara, and they recently learned from their neighbors, the Makiritare, the art of making them. For the Sanemá the river represents an obstacle rather than a means of communication, and they use rafts in order to cross it. At the present time, only the groups who live in symbiosis with the Makiritare make curiaras, but there is not the slightest doubt that this industry was adopted recently. The Sanemá spend less time at fishing than do the Panare, Yabarana, and Guahibo, since the latter too are among those Indians oriented toward the land, with its roads, rather than toward the rivers and navigation. The only real voyagers of the Orinoco-Ventuari zone are the Piaroa and the Makiritare, and the fame of the latter exceeds that of the former.

Culturally, the Makiritare belong to a Neo-Indian level, as do their cousins of the same linguistic affiliation, the Panare and the Yabarana. It is interesting, however, to call attention to the fact that to speak of Caribe /Carib/ Indians is not the same eo ipso as speaking of voyaging Indians. There are Neo-Indians who are ignorant of the curiara and who developed agriculture, not in a Meso-Indian culture (of fishermen and voyagers), but basically on top of a Paleo-Indian culture (of hunters). Meso-Indian cultures, such as that of the Warao, for example, and possibly that of the Piaroa, represent a specialization of the Paleo-American who was

The Sanemá

101 The word Sanemá appears here as the designation for a subtribe of the Yanoama. The Sanemá were called Guaharibo and were sometimes confused also with the Shirishana /Shiriana/.

The terms Guaharibo and Shirishana (written with abusive orthographic freedom) lack proper sense when applied to the Sanemá, and they must not, as has heretofore happened, be applied to this tribe or to the peripheral bands, who accepted them as designations used by the Whites (Guaharibo) and by the Makiritare (Shirishana).

The name Guaharibo, like Macú and Tapuya, is a vague and collective designation which includes many primitive tribes and which, therefore, has little classificatory value and will not stand up to scientific and impartial criticism.

The term Shirishana, for its part, seems to us to be a nickname rather than a generic denomination, since it means "araguato monkey" and is used by the Caribe in a contemptuous tone when they refer to the Sanemá, whom they consider to be subhuman beings born from the dust of their shadows. The name also lends itself easily to confusion with the Crichaná of the Ianaperi River and of Caribe affiliation.

For the above-mentioned reasons we prefer the term Sanemá, which means "people," to that of Guaharibo, which is equivalent to "savage," or to Shirishana, "araguato monkey." This preference has more scientific aspects and more human respect.

[114] It would seem that the term Yanoama was introduced into ethnographic literature by Zerries (1956a, p. 187) and was accepted, quite rightly, by Schuster (1958, p. 115) and Becher (1960, p. 6) as a generic name for the Casapare, Sanemá, Waica, Samatari, Surara, and Pakidai.

128 101 In the present treatise we shall consider the Yanoama as a tribe, not so much in the politico-social sense, as in the linguistic-cultural sense, since the Yanoama, in general, represent a specific culture made up /178/ /map appears here/ /179/ of the various peculiar subcultures of the diverse subtribes which live in a coherent territory, which speak closely related languages, and possess essentially similar economic and sociological forms.

Map 7. Distribution of the Yanoama Indians (preliminary).

Bari SS 13 Sanema
Makiritare SS 20 Warao SS 18
Saliva SS 15

/179 cont./

Y 131 127 128 We have knowledge of the distribution of the Sanemá on the Ventuari, Erebato, and Caura from our own expedition's personnel, while we took the data on the Casapare from the excellent cartographic work of Montoya (1958), who visited the zone over a period of several months.

Y [101] /180/ The name Casapare is employed by the Sanemá to designate their neighbors to the east. Koch-Grünberg (1923) had already mentioned the group of the Upper Uraricaparâ, a tributary of the Uraricuera and the one that occupied the right shore of the Uraricuera River, facing the Marutani range, on the Motomotó River. The broken lines indicate, approximately, the territory occupied by each Yanoama subtribe. The location of the Makiritare of the Cunucunuma comes from the map published by Civrieux (1959), and that of the other settlements of that tribe was verified by the personnel of our expedition.

M 131 127

Y 131 161 According to this map, the territory inhabited at the present time by the Yanoama is located between 0° 30' – 5° 11 and 62° – 65° 30' W. If we grant that the total Yanoama population reaches the figure of 20,000 individuals spread out over an area of 150,000 square kilometers, we recognize as the density index of the population that of one person per 7.5 square kilometers. There are authors who, being overly generous, raise the Yanoama population to 30,000 and even 50,000 inhabitants, but this number seems exaggerated to us.

B S L 161 177 It is interesting to point out that the highest figures for the native population correspond to the primitive tribes of hunters and fishermen or to those who had an incipient or rudimentary agriculture, such as: the Barí (Motilones, Mapé), 2,000; the Piaroa, 4,000; and the Warao, 8,000.

They are also the tribes which have had least contact with the white man. There is an interesting and instructive relation between the demographic datum of a native population and the number of years that it has had contact with Whites: the higher the latter, the lower the former.

Sanema
Warao 5518
Saliva 5515
Bari 5513

/180 cont./

The Barí suffered greatly from the Yupa, the Piaroa and Warao from the Caribe, but these sufferings were minimal compared to the oppression to which other tribes were subjected by the Whites. The Yanoama have been attacked for hundreds of years by the Caribe, who surrounded their territory with a semicircle along the north; the Yanoama endured something similar from the Arawak, who surrounded them in a semicircle along the south. But all in all, the White has not been very successful so far in approaching this primitive population and his destructive influence has not affected their ancestral customs. The Caribe and Arawak have declined gradually in vigor and numbers; now we are witnesses of the triumph of the Yanoama over their neighbors of a more refined culture, for not only did they defend their territory, but were successful in spreading to the north and west.

The strongest and most efficaceous ally of the Yanoama has been the Cordillera de Parima, together with the dense tropical selva of the Territorio Amazonas. In the /181/ fateful period of persecution they have always found a safe refuge in the protecting selva. Nevertheless, as of relatively recent times, the different Yanoama subtribes are beginning to realize that the space beyond the conventional boundaries of their tribal territory is sparsely populated, almost deserted. The number of their traditional enemies has diminished considerably, and the invasions of their territory have had practically no consequences. In this manner they have gained almost 100 kilometers to the north of the Sierra de Pacarima, where the Casapare now live on the Upper Paragua, and the northern group of the Sanemá on the headwaters of the Ventuari, Erebato, and Caura rivers.

The center of distribution of the Casapare is located to the south of the Sierra Pacarima in the basin of the Rio Branco. We know this Yanoama subtribe only through a few sporadic superficial contacts, and the people, as well as their territory, remain practically unknown. For this reason we consider the name Casapare with which we designated all the Yanoama in the zone of study as strictly preliminary, and we would not be surprised if we had to change it in the future for a more exact and adequate name.

/181 cont./

101 name. We included the Casapare among the Yanoama on the basis of information from the Sanemá of the Erebato, who assured us that they speak a language similar to theirs.

101 127 The limited scientific data at our disposal and which refer to the Casapare all come from the northern group, and their interpretation is relatively difficult because of the fact that on the Uraricuera River the Waica and Sanemá zones of distribution come together with that of the Casapare, and the chroniclers were unable to distinguish with precision and clarity the representatives of the different subtribes.

101 The ethnic differentiation which appeared very early in the respective biographical sources was that of the Shirishana and Guaharibo (with their multiple orthographic variations). At the present time there is not the slightest doubt that we are dealing with Yanoama Indians, but we do not think that it is proper to identify the Guaharibo and Shirishana as a single group with two distinct names. It is our opinion, on the contrary, that each name designates a more or less distinct group of the Yanoama, and that "Shirishana" refers to the Casapare, and "Guaharibo" to the Sanemá. The Sanemá of the Territorio Amazonas of Venezuela have been known from the beginning by the name Guaharibo. The confusion of the two terms originates precisely in the northern zone under discussion, where the two subtribes live in close geographic proximity. Thus, we believe that among the Yanoama of the Paragua there are Sanemá in the west or on the headwaters of the Paragua itself, while the Casapare /182/ occupy the territory toward the east and are established principally along the length and on the banks of the Paramichi.

This close contact between the representatives of the two subtribes is recent, as we shall point out later on, and it is almost certain that today there is some genetic and cultural fusion between the two groups. To the south of the Sierra Pacarima they also have some relations, but more sporadically, since they occupy two distinct zones; the Casapare (Shirishana) on the Uraricuera to the north of Maraca Island; and the Sanemá (Guaharibo) and the Waica, the territory farther to the southwest.

[127]

/132 cont./

With regard to the Casapare of the Uraricuera River, we have the data supplied us by Koch-Grünberg (1923, pp. 284-319), and a comparison of his "Shirishana" vocabulary with the "Shirishana" vocabulary of Armellada and Matallana (1942, pp. 101-108) gives us the impression that both are very much alike, but differ greatly from the Sanemá family (cf. glotto-chronological sketch see p. 49 /). In spite of the fact that they now occupy adjacent geographic zones, we prefer to make a clear distinction in the literature between the "Shirishana" (Casapare) and "Guaharibo" (Sanemá), considering them as two different subtribes of the Yanoama tribe. According to their linguistic separation, they represent, in fact, the two extreme poles of maximum distance (18).

18. Note that this does not mean that we also continue with the old nomenclature, but rather that the name "Shirishana" of the literature corresponds to the Casapare subtribe, and the name "Guaharibo" to the Sanemá subtribe, of this work.

Y
648
P
M
648
361

[illegible] their center of distribution in Brazil, the Casapare harasse[illegible] their neighbors, the Pemón and the Makiritare, with continuo[illegible]raiding from the time that the latter arrived at the northern slope of the Serranía. It seems that the Taurepán (Pemón) were never able to establish a pueblo farther west than the eastern point of Maraca Island on the Uraricuera and that the Makiritare maintained their advanced posts at the cost of great losses and sacrifices, until finally they were forced to abandon them in the face of the constant threat and the imminent danger of losing their lives.

Y
M
648
361

The Makiritare began to lose ground at least some 120 years ago, when the Yanoama killed a number of Makiritare Indians (Schomburgk, 1841, pp. 437-8, 444), and it would seem that at the present time Tarakuñiña on the upper Yararejuri is the last Makiritare stronghold south of the Serranía.

P
197 /184 cont./ Casapare
799 Auake 555
161 Pemon 55 16
expansionists, and their number at present is quite small; they number 1,800 individuals and show a density of 1:16.5 square kilometers.

Y
177 The Mayoncon and Arecuna, along the north, do not make
648 an effective barrier to Yanoama expansion. Here, however they are liable to clash with the already advanced civilization of these regions where they will meet the Indian, the Negro, and the White with individual cultures irreducible by the Paleo-Indian culture of the Yanoama.

Y
101 Among the tribes which have been absorbed by the Yanoama
619 are the Kaliana, Auakí, etc., about whose identification there is some confusion in the literature.

Kaliana, however, is the name which the Casapare give to
104 the Sapé. The latter were identified as Kaliana by a native companion of Koch-Grünberg (1923, pp. 12-13; cf. idem, 1922, p. 227), while Armellada and Matallana (1942, p. 103) identify them with the name "Shirianá" (Casapare) as Karianapuik. In 1956 the Sapé (Kariana, Kaliana) were visited by Montoya, who classifies them as related to the "Shirishana" (1958, p. 168). "It is an isolated group," says Montoya, "which lives on the Antabarí River and upper Pao; in the zones of the upper Paragua and Pauré-Murán River.

A
241 /185/ "They devote themselves to agriculture, but produce
433 only as much as they consume or a little more for barter with the
439 Shirianna who are travelers and supply them with salt and other items which they lack.

A
501 "Some of them have learned to make curiaras in such a rudimentary manner as to make the Moñongón Indians, the masters of this art, smile. But they do make very fragile 'shells,' which allow them to travel to hunting and fishing zones, carrying
A light loads.

582 "They marry frequently with the Shirianna groups and even
A with the Arekuna. They appear to be destined to disappear as
101 a differentiated ethnic group or to be totally absorbed by the Shirianna, more numerous and nearer than the Arekuna" (Montoya, ibid.).

Auake 555

/185 cont./

101 [181] [114] As can be judged from these indications regarding the character of Sapé culture, this is a little-developed culture, and Montoya is right in differentiating them from the Caribe. But, judging from the Sapé vocabulary which accompanies the work of Armellada-Matallana and another by Koch-Grünberg (1928, pp. 308-317), it is not possible to identify the Sapé group as "related to the Shirianna."

101 114 [361] The Auaké, furthermore, are identical with the Arutani, who were visited by Armellada and Matallana during their expedition to the Paragua (1942, pp. 75, 86). They found them living in two rancherias; one near Maihia Falls on the Paragua River and across from the Momurán, a tributary of the same, on the right bank, with one house and 20 inhabitants. The comparison of the Auaké vocabulary of Koch-Grünberg (1928, pp. 308-313) with the Arutani vocabulary leaves no doubt but that the two are of the same tongue.

114 105 181 [362] [501] Both groups, the Sapé (Kaliana) as well as the Arutani (Auaké), seem to have a very poorly developed culture, probably like that of the Yanoama. Montoya describes Sapé culture with typically marginal traits, and Armellada and Matallana (1942, p. 75) say of the Arutani that "these Indians are the poorest that we have seen on the whole trip; they live in an absolutely miserable rancho and the little boats that they use are made of bejucos."

175 31 [101] [622] The Portuguese commission on boundaries (1787) mentions this tribe as Aoaquis, inhabitants of the sources of the Canamé, where they lived in large numbers under the command of three captains (Coudreau, 1887:2, p. 393). In 1838 Robert Schomburgk found some Oewaku on the middle Uraricuera; he describes them as a nomad tribe that lived on the headwaters of the Uraricapará and on the source of the Paragua. In 1882 the Auaké (Arutani) /186/ were visited for the first and last time in their own home by a Comisión de Límits, which found a small group on the upper Uraricapará. They had a large, round house, provided with a palisaded wall. The latter served them as protection against the attacks of their neighbors (Relatorio, 1884, p. 189; Grupe and Thode, 1890, p. 253). In 1911 Koch-Grünberg (1923, p. 12;

[342] [712]

Avake 555

/186 cont./

Y 114 797 162 indigenous groupings is interesting. In their report (1942, p. 87) they mention a total number of 296 Indians counted.

/187/ This result contrasts with the one obtained by the expedition of Montoya, and, in spite of his having traveled over much more territory than the Capuchin fathers, we must admit that Montoya found native populations in 1956 where the fathers saw none in 1940. This has its value in the first place inasmuch as it refers to Yanoama populations (Casapare, Sanemá), and it is significant for the reconstruction of the migratory history of the Yanoama. Armellada and Matallana (1942, p. 76) say that a rancheria near the mouth of the Pumpirí, a river which flows into the Paragua on the right bank, was "the only one which the Shiriana Indians have on the Venezuelan side in the Paragua basin." Twenty-six years later Montoya (1956) and his companions discovered Yanoama rancherias established from the Marí River to the headwaters of the Paragua. This indicates that the expansion of the Casapare and Sanemá is of very recent date in this zone of the Paragua and that it achieved its present volume only in the last decades. The marginal tribes, such as the Sapé and Arutani, have been pushed toward the north and are in the process of being absorbed by the Yanoama in the south and by the Caribe and the Whites in the north.

Y 162 167 114 Y [361] A [167] [648]

Referring to the Yanoama of the Paragua, Montoya distinguishes the Guaharibo, Guaika, and Shirianna. According to his excellent map, the Guaharibo and the Guaica live between the upper Caura and the headwaters of the Paragua itself and the river Okasiarí. It is possible that these are the Sanemá and Waica. The Shirianna occupy the Paragua River from the Marí River to the source of the Paramichí River, and these seem to represent the Casapare of our nomenclature. The region of the greatest penetration by the latter into Venezuelan territory seems to be via the Sharopae River (3° 50') from where the route to the Uraricuera River starts.

Y ● 101

According to Montoya (1958, pp. 173-174), the Guaharibo (Sanemá) are almost totally ignorant of agriculture and cross rivers by means of their characteristic bridges, which consist simply of two thick lianas, parallel and one above the other, the upper one serving as a handrail.

Y 491 241

/187 cont./

105 181 241 245 266

The Guaika (Waica) are considered by the above-mentioned author as "the natives with the most primitive and wild life of all those inhabiting the great region of the Venezuelan Guayana..." They have an incipient agriculture; they cultivate bananas and plantains as the principal basis of their diet, which they complement with the fruit of the pijiguao palm. They practice endocannibalism, consuming the bones of the cremated dead.

286 342 411 491 494

Their hammocks are knotted, their houses are triangular, and they use bows and arrows of various types, according to their uses. They keep the bones of many animals, travel by land, very rarely by water, and build bridges similar to the style of the Guaharibo (Sanemá).

/188/ Regarding the Shirianna (Casapare), Montoya says (1958) that "the real Shirianna live on the banks of river, building very stable settlements and devoting themselves to an agriculture already relatively advanced." They obtain curiaras from the Mayoncon, but have also learned to make their own, although in a rudimentary way. They use bows and arrows for hunting, but "above everything else, they are traders and travelers. They constantly travel into Brazil, leaving from the upper Paragua, using the route of the Shoropae River, Urarikuera and Parima, to Boavista." They differ from the other natives of the Paragua basin in that they are tall and strong, healthy, and well nourished.

361 241 484 439 411

142 146

114 ● 101

The last report on the Yanoama of the northeast was published by Gheerbrandt (1955, pp. 345-349), and in this report there appears for the first time the name Kaserapai, which must be an orthographic variation of the name Casapare which we use to designate a whole subtribe and not only a local group as the above-named author has done.

101 114 648

Navigating the Uraricuera in the year 1950, Gheerbrandt met and heard of various Yanoama groups with different names. Very near the Sierra Marutani he came upon the Guadema on the left bank of the river named. The Guadema were very much afraid of the Kaserapai, who had killed the majority of the Guadema and were in open conflict with Waikas and Waitschas on the Uraricuera. It is possible that this may be a reference to an encounter between Sanemá, Waica, and Casapare groups, but the extant data offer no certainty in this regard.

4: Wilbert--34 E-4,5 (1358) 1963 SQ18 Yanoama SQ18
Sanema
Makiritare SS 20

600 /186 cont./
M but the extant data offer no certainty in this regard. It is inter-
114 esting that Ghearbrandt (1955, p. 348) is of the opinion that the
167 Makiritare had left the Urariquera some twenty years previously.
Y The Guadema seem to be different from the Casapare,
• 101 according to what one can deduce from the above-mentioned book; probably it is a matter of a local Sanemá or Waica group.

The center of distribution of the Sanemá is the basin of the Padamo River, a tributary of the upper Orinoco. Their territory is bounded on the south by Waica territory, on the west by the Makiritare of the Cunucunuma, on the north by the Makiritare of the upper Ventuari, Erebato, and Caura, and on the east by the little known territory of the Casapare.

Y If we judge from the present situation of the distribution
101 of the Yanoama, it is quite probable that the first Yanoama
197 with whom the Whites had contact on their trips along the upper Orinoco were the Sanemá, who appear in historical sources as the Guaharibo. One finds the Guaharibo frequently mentioned together with the Waica, but it is interesting that from the very first reports authors made a distinction between Waica and Guaharibo

Y /189/ Caulin (1958, pp. 305-306), writing in 1775, places
175 the Guaribe on the Maraca and its tributaries. According to him,
101 they are white in color like the Spaniards and are the same "uaribas" already mentioned by the "Expedición de Solano." Humboldt also speaks of Guaicas and of Guaharibos, having met representatives of them in the Esmeralda Mission. Spruce (1908: 1, pp. 396-398), who met an old Guaharibo man on his trip on the Casiquiare, is the first one to leave us the fullest and most authentic information regarding the Yanoama of the upper Orinoco. According to this author, the Guaharibo call themselves Kudé-Kubui, but it is difficult today to decide whether these are Guaharibo or Waica. We have a like opinion regarding the Guaharibo of Chaffanjon (1889). It is possible that the Sanemá may have occupied zones farther toward the Casiquiare and the Cunucunuma, but the Arawak and Caribe of this zone occupied these places before the arrival of the Whites, and the boundaries were established by the tribes interested in them.

Y 174 101 /189 cont./

The expansion of the Sanemá to the north, that is, from the Padamo to the upper Ventuari, Erebato, and Caura, is relatively recent, but, to judge from the data given us by glottochronology, the separation of the various groups of the subtribe corresponds to 600-1,700 years. We established contact with three northern groups of the Sanemá: the Nabudub of the upper Ventuari, the Taclaudub of the upper Caura, and the Pubmatari of the Canaracuni. They apparently represent Sanemá groups which are quite well established, and the internal distance of this linguistic family is, in a way, surprising.

Y 101 184

The Sanemá of the Padamo and of the upper Orinoco are practically unknown to science, and it is expected that the cultural difference between them and their brothers who live north of 4° and in close contact with the Makiritare is relatively pronounced.

Y 101 648 167

The geographic separation of the Sanemá into a southern group and another northern one is recent and is due to the fact that in 1947 Captain Cardona had to make a landing field on the Canaracuni (personal communication), and, since there were no Indians in the zone to help him in his venture, he went to Brazil and brought the first Sanemá to this region of Venezuela.

Y 167

This date marks the beginning of the infiltration of the Yanoama element on a larger scale into the land of the Makiritare, their

Y M 643

neighbors on the northwest, with whom they have lived in deep enmity from remote times. While the Makiritare of the Cunucunuma still do not tolerate large groups of Yanoama in their territory, those of the Ventuari, Erebato, and Caura live in close contact

Y M [179]

with large groups of the Sanemá subtribe. This was the way in which Makiritare culture of the tropical selva type penetrated to that essentially /190/ preagricultural tribe composed of hunters

Y M 648

and gatherers with a very rudimentary culture. The Sanemá received extremely bad treatment at the hands of the Makiritare, comparable to that received by a slave at the hands of his master, for which reason toward the year 1950 the Sanemá revolted against

4 [411]

the Makiritare and declared a war without quarter against them. It was then that the different Makiritare subtribes united to repulse the Sanemá, whom they conquered in various encounters, thanks to their fire-arms.

Makiritare SS 20

M
Y
641 /190 cont./ scorn them, and, at first sight, they seemed to be unworried, but the knowledge that they no longer live alone in the land of their fathers, and the fact of having heard that four days prior to our arrival /191/ at the conuco an Indian who had sought refuge by climbing a tree was shot by a Sanemá arrow and fell M Y lifeless into the river, constantly tortured them.

582 A powerful stimulus which always encouraged the Makiritare
563 on their numerous trips was to get a wife among their neighbors
177 of the same tribe. Nowadays, despite the intense scorn which the
648 Makiritare profess toward the Yanoama, taking a wife from that
M [186] tribe is not considered an impossible or degrading thing; there are many Yanoama women who have married Makiritare men (cf. Grelier, 1955b, p. 10). This matrimonial interchange inevitably carries with it an assimilation of cultures between the two tribes, a process in which the Makiritare cultural pattern will
Y dominate that of the Yanoama and the Yanoama genes will
167 infiltrate the Makiritare gene pool. There is not the least doubt
563 but that the Sanemá, who were brought in for a short time, ar-
177 rived at the upper Ventuari and Caura where they took up resi-
648 dence to stay, and that the present fusion between the Caribe and the Yanoama ought not to be explained so much by the good will of the former as by the vitality of the latter.

Y
● 101 The Waica subtribe occupies the central part of the present Yanoama territory, that of the upper Orinoco and its tributaries above the mouth of the Ocamo, including also the southern bank of the river (Barker, 1953, p. 434). As we have already mentioned, they appear to live also in the general arc of the upper Rio Branco and its western tributaries, and Schuster (1958, p. 114) is very probably right when he says that the Sierra Parima does not bound the Waica zone, but that it extends to Brazilian territory.

Y
[77 We have already mentioned the first contacts which the
797 Whites had with the Waica, and, after a somewhat unfruitful effort by Hamilton Rice at the beginning of the present century, the Waica world went without contact with science until the New
Y Tribes Mission was able to start peaceful relations with the Waica
114 through the missionary James Paul Barker. Some ethnographic data were also published on this Yanoama subtribe by several

/191 cont./

114 members of the Franco-Venezuelan Expedition to the Upper Orinoco (1951) (cf. Grelier, 1955b; Anduze, 1958). Finally the Waica were studied between April of 1954 and August of 1955 by the German ethnologists Zerries and Schuster, who are preparing a monograph on this Yanoama subtribe.

•101 114 The southernmost groups of the Yanoama are known as Xamatari, Araraibo (Seitz, 1960), Surara and Pakidai (Becher, 1960). The latter presented a very extensive study based on the experiences that he had during the nine months (October 1955--June 1956) that he lived among them.

101 128 Because of the lack of comparative data, we have considered all these /192/ local groups as parts of a Samatari (people of the tapir) subtribe who represent a very autocthonous entity of the Yanoama. We would give warning, however, that this classification is subject to future changes, as is also the map of Yanoama distribution which we have just discussed.

126 192 The linguistic material which the author of the present work was able to assemble during his stay among the Sanemá consists of a vocabulary of the Nabudub, who live on the upper Ventuari, and of the Sanemá of the upper Caura. The former vocabulary contains 270 words, and the latter, 730 entries (Wilbert, 1961b).

128 192 174 197 In order to classify this material within the different Yanoama idioms, we compared the two vocabularies with others belonging to various Yanoama languages, and in this way we established, insofar as we were able, a basic vocabulary, calculating the minimum distances existing between them, according to the glottochronological method.

192 197 174 126 127 We have indicated that the Nabudub and Sanemá vocabularies were compiled by the author. The vocabulary of the Pubmatari (Sanemá of the Canaracuni) comes from Vinci (1956, pp. 351-357). This vocabulary has a total of 278 words, 73 of which correspond to the basic vocabulary. According to what the author says on pages 159 (1956) and 133 (1959), this is most probably a Pubmatari vocabulary.

/193 cont./

174 197 [192] 127] We were not able to obtain the vocabulary of the Karimé published by Salathé (1932, pp. 314-316). Dall'Igna Rodrigues (1960, pp. 134-138) places it between the Waica and the Casapare (Schiriana of Koch-Grünberg).

According to the results of the lexico-statistical calculation (cf. p. 47), it can be said that the idioms compared form a linguistic conglomerate whose internal divergences date from 6-35 minimal centuries (mc). By their temporal distribution they constitute two more or less distinct groups: a) a Sanemá family with Nabudub, Sanemá, and Pubmatari, with an internal divergence of 6-17 mc.; and b) a Casapare family with Samatari, Waica, and Casapare and with an internal divergence of 8-21 mc. The extreme languages are Nabudub (of the Sanemá) and Casapare. The distance of the Waica from the three Sanemá idioms corresponds to 17 mc., which is the same as the maximum internal distance of the Sanemá family, and the Nabudub have the same difficulty in understanding a Pubmatari or a Waica; they should, however, understand each other, although with some difficulty. The Waica has greater ties with the Samatari, with whom he can communicate orally without any great difficulty.

Other classifications of the Yanoama idioms were made by Rivet (1924, p. 678), Loukotka (1944, pp. 8-9), Mason (1950, p. 254), Rivet-Loukotka (1952, p. 1140), McQuown (1955), Swadesh (1959), and Dall'Igna Rodrigues (1960, pp. 136-137).

Koch-Grünberg (1913, pp. 455-458) had established by 1913 the independence of the Yanoama idiom (Shiriana) from the Caribe and added that the idiom apparently represented an isolated language. Rivet (1924, p. 678) and W. Schmidt (1926, p. 211) shared the opinion of Koch-Grünberg regarding the affiliation and independence of the "Shirishana" family. /194/ The classification of the "Shirishana Family" by Rivet-Loukotka (1952, p. 1140) includes the following idioms:

Shirishana Family

[101] a) Shirishana (or Guaharibo), who live dispersed in small groups in the interior, along the tributaries of the

/194 cont./

174 197 Uraricuera and on the southern slopes of the Sierra de Parima;

● 101 b) Karime (or Shauári), on the Catemany River in the same region;

c) Waika, who live on the upper Ocamo and Mocajahy, right tributaries of the upper Orinoco;

d) Pusárakáu, an unknown wild tribe which lives in the Sierra Parima.

174 197 As we mentioned above, we are inclined to differentiate between Shirishana (Casapare) and Guaharibo (Sanemá), which would seem to be linguistically justified by the distance of 23-35 mc between them. Rivet bases his opinion, it would seem, [127] on Koch-Grünberg's material (1928), which we have also used in our comparison. The Pusárakáu idiom (d), which also appears in Loukotka's classification (1944, pp. 8-9), is a completely unknown idiom and therefore does not figure in Mason's classification (1950, p. 254), which presented the following Shirishaná grouping:

SHIRISHANÁ

[101] A.--Waharibo (Guaharibo)

1. Shirianá

a) Waicá (Guaica, Uaica)

B.--Carimé (Karimé)

174 197 114 According to Mason, Shirianá and the less important Carimé are the principal idioms of the family. This observation is based upon Koch-Grünberg's material (1928, Shiriana), which was identified in our comparison as Casapare, and, as the greater separation of the Yanoama stock corresponds to that language, we must admit the value of Mason's opinion. Carimé does not figure in our classification.

Furthermore, Mason is of the opinion that the Waica idiom is, possibly, a dialect of Shirianá (Casapare), but, according to the glottochronological calculation, he does not seem to be on firm ground. The distance between the two idioms is 21 mc, which is much greater than a dialectal difference of 5-7 mc. Waica appears on the graph as closer to Sanemá (17-18mc). The opinion of /195/ many researchers that Shirianá (Casapare) and Waica are descended from the Guaharibo (Sanemá) seems to have some justification.

/199 cont./

128 attributed to the other subtribes also, but we do not believe it proper to make an indiscriminate generalization, particularly if we bear in mind that the subtribes seem to be carriers of different subcultures.

●101 The Sanemá live on the upper Ventuari, the Erebato, and the Caura. It is therefore a matter of the Sanemadub, Nabadub, and Pubmatari and their various local groups already mentioned in the introduction. We can, to begin with, divide these Sanemá into two groups: those who live in close association with the Makiritare, and those who, although living in the land of the Makiritare, have not been able to establish permanent relationships with them. For which reason it is difficult to record in a definitive and absolute fashion precise demographic data, and we view those which we publish here with certain reservations.

/200/

101 A. Sanemá of the upper Caura (Pubmatari)

162

Locality	No. Inhabitants	Observations
1. Canaracuni	300	In the border zone there are several nomadic bands with specific names, who accept the term "Sanemá" as a generic name of theirs. They frequently change their stopping places between Brazil and Venezuela.
2. Wanaña	200	
3. Yemekuni	300	
4. Caura source	100	
5. Nomadic bands	500

BLOOD GROUP ANTIGEN TESTS OF THE WAICA INDIANS OF VENEZUELA.[1]

MIGUEL LAYRISSE, ZULAY LAYRISSE, AND JOHANNES WILBERT

GENERAL ANTHROPOLOGICAL INFORMATION

128 INTRODUCTION: For the purpose of the present paper we would like to classify the Waica as a subtribe of the Yanoama tribe, the ethnic identification and the internal composition of which appears to be but little understood. Although the actual blood group study will be concerned with the Waica Indians most particularly, we shall, nevertheless, include as well some information on the Yanoama tribe in general. This, we trust, will not only serve to locate the specific Waica data within a wider frame of reference, but also to facilitate the comprehension of the theoretical considerations based thereon.

131 *Ethnic identification.* The Yanoama inhabit a very extensive area between 0°30'-5° N and 62°-65° W, which includes the headwaters of the Paragua, Caura, Ventuari, Padamo, Ocamo, Mavaca, and Orinoco rivers of Venezuela, as well as those of the Uraricuera, Catrimani, Dimini, and Araçá rivers of Brazil. The Sierra Parima crosses this heavily forested territory like a vertebral column, so to speak, and marks at the same time the frontier between the Venezuelan and the Brazilian parts of the Yanoama land (see map, Fig. 1).

101 The Yanoama are surrounded by Tropical Forest Indians with Neo-Indian culture types; Cariban tribes enclose them in a semi-circle to the northeast, while Arawakan peoples bound them in a semicircle to the southwest. Thus, the Yanoama seem to have been functioning as a buffer between the Caribs and the Arawak, successfully resisting any attempt of intrusion by such groups as the Soto (Makiritare), the Pemon, and others. In recent years, after their Carib neighbours had suffered a marked decline in numbers and in strength, the Yanoama ventured northward into the Ventuari, Caura, and Paragua drainage area, intruding into Carib territory for more than 100 km.

[648]

114 Although sporadic and rather casual information on the several Yanoama groups have been published by various authors since early Colonial time, it is only

122 1 We wish to thank Dr A. Berti and Ovidio Castellani (División de Malariología, Ministerio de Sanidad, Venezuela) and the Misión Salesiana of the Territorio Federal Amazonas for their collaboration in collecting the blood samples. FIG. 1. Preliminary map of Yanoama distribution. (Wilbert, 1961b).

since Koch-Grünberg's contact with two Yanoama groups, in 1911, that more substantial information on this interesting tribe has been collected and in parts been published.[2]

Emerging from these data are the names and descriptions of a number of distinguishable tribal units, e.g., Sanemá (Guaharibo, Shirishana), Casapare, Waica, Samatari, Surara, Pakidái, and others. It also has become quite obvious that the Yanoama subtribes are not unified by socio-political authority, but rather by a general and specific culture type, which in turn is integrated by a series of subcultures and culture variants, carried by the different subtribes and local groups respectively. The various local groups and subtribes occupy a coherent territory, they speak more or less closely related languages and display essentially similar economic, sociological, and religious forms.

Taken as a whole, the Yanoama were found to be a very numerous tribe and they belong, in fact, to the most numerous of all the autochtonous populations of lowland South America, but previously published figures of 30-50,000 individuals appear to represent very generous overestimations of the demographic strength of the Yanoama groups known so far.

Linguistic classification. Several authors have attempted a linguistic classification of the Yanoama although most of them did not have at their disposal the more recent material.[3] Taking advantage of this material, we have attempted a glottochronological analysis, the results of which allow us some interesting insight into the internal correlation of the Yanoama languages.[4]

According to this result, the several Yanoama languages, as known today, constitute the Yanoama linguistic stock of 6-35 mc of internal separation. The two more or less clearly distinguishable families of the stock are: *A. Sanemá:* (a) Sanemá, (b) Nabudíb, (c) Pubmatari, [6-17 mc of internal divergencies: Sanemá-Nabudíb = 6 mc, Sanemá-Pubmatari = 17 mc, Nabudíb-Pubmatari = 17 mc]; *B. Casapare:* (a) Casapare, (b) Carime (?), (c) Waica, (d) Samatari (Surara and Pakidái), [8-21 mc of internal divergencies, excepting Carime (for lack of vocabulary material): Casapare-Waica = 21 mc, Casapare-Samatari = 21 mc, Waica-Samatari = 8 mc].

Sanema

one gave a thought to these peaks that towered higher with every bend of the river. Then one afternoon, after a storm, they dropped out of sight, and we realized that we had entered a different region. Manuera pointed leftwards, to the mouth of a small river whose water was yellow.

'Pulipuli. Nuna,' he told us—Nuna being the Shirian and Makiritari pronunciation of 'Luna'. 'There is my home, the home of the Shirians.'

We swung into the mouth of the Luna and tied up under a tall clay bank among a few ill-made canoes—if you could call them canoes, for they looked more like rotten tree-trunks swept on to the little landing-beach in the course of some sudden flood.

Our arrival in the dirty waters of the Luna was a signal for swift and secret flight on the part of the population. Some Shirian youngsters had been hunting a capybara which the throb of our motor scared off. The boys, no less scared than the animal, ran to hide in the nearby huts, spreading the wondrous news that men had come with beards and an engine.

The Moon Valley people occupy a fair-sized wedge of territory in the forests between the Lower Canaracuni and the Caura. Their little huts are sorry imitations of the big Makiritari erections, and they have burned out big patches of forest for the sowing of manioc and bananas. All this is the work of the last twenty years. Not till then did the tribes of the Shirian borderland grow weary of their nomad life, their wars and their plundering expeditions, and decide to set up house and home. Pulipuli became a sort of agricultural centre for the groups living on the Upper Caura, or on the Merehuari and its tributary streams as far as the great mountain saddle between Uana-Coco, Canaua, and Uagna. These people here were therefore the most advanced of the Shirians, not only in a geographical sense but also in their culture. Their numbers were continually increasing because they had a magnetic attraction for neighbouring tribes who were still mere primitive forest hunters.

Manuera had married a Pulipuli girl and then joined her tribe. 'Let us build a fine house,' he had told her, 'and I'll come and live with you. I'll bring good manioc and banana roots. We'll plant a big patch, in the proper way we Makiritaris know, and there'll be no lack of food. You Shirians are for ever as hungry as beasts and I can't stomach the worms you eat.'

There was great puzzlement among the old Shirians—those whose hairless heads showed the marks of so many battles and so many robbing and plundering expeditions all through the valley and the Merehuari cordillera as far as the

6: Vinci T-5 (1950) 1959 SQ18 Yanoama SQ18
Sanema

'I am Uarema,' he declared to his Guayca kinsmen, who looked on him with hostile eyes because he was wearing trousers, 'Uarema, son of Measi. I was here as a boy. A long time I have been with "the rationals" [the civilized men] and I have grown to manhood. You are my people.'

His turning up in this fashion had a touch of the fabulous about it, and his kinsmen took him along without ill-treating him. When they found him to be a man of many accomplishments, and the old men remembered how he had disappeared during Uagna's time, after an encounter with the Samatari from the Aracosa lands, they kept him with them as their rightful chief, giving him unlimited freedom of action. As his obedient subjects they left it all to him.

Uarema had never taken to civilization. For him, it had lacked something. What it had lacked, we cannot guess: the civilization of the Lower Guiana rivers may be bounded by the cloth hammock and the bottle of rum, the loose woman and the pack of cards, but it cannot be ranked any lower than the barbarianism of the Guayca, eaters of worms and snakes. But now, after his experience of life with 'the rationals', neither could the young man endure the ceaseless warfare which engaged his own peoples. The broken heads he saw round the fire in the evenings, the howls of the medicine-men at their exorcisings—all this was anathema to him. He told his kinsfolk they had better put it all aside, and grow something. From the Soto they could obtain seeds and roots. Much manioc was needed, because without it one was always hungry. Sugar-cane was a pleasant thing to suck at any time, and the children loved it. Above all, there must be bananas, as far as eye could see—the forest must be transformed into a huge garden of fruits, there for the picking. Thus, with his head full of ideas which owed their origin to the years he had spent in civilization, Luis Antonio founded a new Guayca people. They were Guayca Indians no longer, but peasants—peasants who cared for the tilling of the soil and a sure supply of food. These Guayca called themselves after him, Uarema. They inhabited two big homesteads an hour distant from the Merevari river—a little above the mouth of the Canaracuni.

Now Luis Antonio wanted to stay with us and work, because he needed cloth for his people. We gave him what little we had been able to save from the greedy hands of Pancho's men, and he went off for a brief visit to his tribe, intending to return to Kirisochi in four days' time.

6: Vinci T-5 (1950) 1959 SQ18 Yanoama SQ18
Sanema

especially strong and intelligent, and keep him at his side, adopting him, as it were, as his successor. The little girls continue to live in the feminine world of their tribe. Shy and submissive, they take on the humblest tasks, fetching water, making the fire and helping in the preparation—highly problematical—of food.

Such definitions of customs have, however, only a relative value, like any attempt to estimate the Shirian way of life: for Shirians are to be found spread over wild territory of vast extent. Their customs are less well defined than one might suppose after reading certain tracts about primitive peoples—the Pacific islanders, for instance. These give the impression that with slight formal changes only, Western culture might have much to learn from the degree of social organization they have attained to. The Shirian tribes, cut off from one another as they are by physical barriers such as mountains and rivers, and moral barriers like the ceaseless state of war which exists between the various branches of this race of 'howling Indians', have developed their own customs in their own sporadic fashion. Sometimes they have been weakened by contact with foreigners, such as the Makiritari in the north-west and the Makushi in the east. More often they have been weakened by a lack of strong traditions, which do not spring easily from such an excessively low level of culture, where mere survival calls for an unending struggle against the tremendous power of the eternally hostile forest.

The most primitive races are those most affected by their geographical setting. Their environment conditions them. Only by adapting themselves continually to their surroundings, only by the long process of response to the determining factor of geography, can they create that growing racial identity which at last succeeds in reversing the process—that is, in conditioning the surroundings instead of being conditioned by them. But we are here touching on the larger question of the development of civilization generally.

Where the Shirians are concerned, we are still at the beginning of the beginning, when geography is the absolute determining factor. Here environment is the master of man—a creature inferior, qualitatively and quantitatively, to the region which it is his fate to inhabit.

The territory they occupy is immense. Divided though it may be by great cordilleras, which make it the breeding ground for various rivers rushing north, west and south, it possesses one marked characteristic throughout its whole extent: the sources and the headwaters of the rivers are contained in a sort of

6: Vinci T-5 (1950) 1959 SQ18 Yanoama SQ18
Sanema

island of unbroken forest, which is not crossed by any formidable water barrier. If this were the case, the Shirians, who are pre-eminently a land people, would be presented with an insurmountable obstacle.

North of the Brazilian frontier live the Shirians of the Canaracuni and the Merevari. These are divided into various clans, the most important being the Uana-Dildep, the Haruao, the Oskadeli, the Kopali, the Hana-Dildep, the Ukumatari, the Kona-Kona—they swarm like ants. Then there are the Guayca Shirians of Uarema, lately established on the Merevari, but originally from the Upper Uagna. Along the mountain watershed which extends, with frequent interruptions, from the Uagna to the centre of the highlands where the Uraricoera, the Ventuari and the Padamo rivers rise, one encounters the nomadic Samatari—the 'people of the pineapple'—a fierce and savage race of howling creatures that run in packs like animals.

The general term used by the Shirians to designate their most savage tribes is 'Guayca' (in their language, 'wild'). By the Guayca they sometimes mean the Samatari and sometimes the Ukumatari. On the Padamo and in the lowlands enclosed by the great mountains of Marahuaca and Duida—that is, to the south of the central ridge—they have spread right beyond the upper reaches of the Orinoco: though in these regions there are also many of the more peaceful Shirian peoples such as the Uaka on the Uesete, the Faricete, the Matacuni, the Kologli, the Haue, and the Ish'tich—the 'people of flowers and bananas'. The Guayca and the Samatari are also to be found east of the Padamo-Orinoco-Rio Parima watershed, in the wildest and least-known territory. Isolated groups, with a touch of the legendary about them, inhabit the fringe of this region: for instance, the Kasarape, credited by all Shirians with unparalleled ferocity and cruelty. The Kasarape inhabit the right bank of the Lower Uraricoera in Brazil, and no traveller appears to have visited them yet.

How numerous are the Shirians? No one can state a figure with any certainty, but it may be accepted that they run into many thousands, and taken together represent a block that outnumbers all other races and tribes inhabiting the Orinoco and Rio Branco basin.

I had asked Luis Antonio whether it would be possible for me to be present during the confinement of his kinswoman, presuming the happy event took place during our stay, but all I got for an answer was a doubtful 'I don't know'—the formula in which the Indian takes refuge when he does not know what to say. This did not quite deny the possibility, even if it did not encourage the

6: Vinci T-5 (1950) 1959 SQ18 Yanoama SQ18
Sanema

into the proper shape, which means without the logical synthesis which gives them their definitive value. As with his analytical copy of the face, so the Shirian analyses the world in his thoughts about it, but forms no judgment on it, because to form a judgment would necessitate a higher power of synthesis that he possesses.

We now discovered that the Indians had chosen two very fine names for us, by which we were henceforth known. Enrico's was Ilòh—howling monkey, on account of his red beard and its obvious resemblance to the alouata's tawny coat. Mine was Walé—wild boar: my hide was apparently somewhat similar to the peccary's. We had a good laugh over the names and were pleased to be known by them, because it meant that at any rate we had been accepted as men like themselves, our beards being so much superstructure; we were just Indians or '*Sanemá*', which means 'people', to use the word the Shirians apply to themselves, the equivalent of the Makiritari '*Soto*'.

The fact that I was accepted by the Samatari as one of themselves has

6: Vinci T-5 (1950) 1959 SQ18 Yanoama SQ18
Sanema

always filled me with pride. By setting about it in the right way we can always manage to make ourselves acceptable to our superiors, but no such effort will ensure the same result with people more lowly placed than we are: for this, the all-important thing is to possess a natural bent, a certain humility of spirit and a sympathetic understanding. One must possess the faculty of becoming, up to a certain point, 'primitive' oneself, adopting all the healthiest attributes of the primitive state, without at the same time losing one's own value as a civilized being: one must be primitive and something more—not just the 'something more' alone, which rather amounts to something less.

It often happens that scientific expeditions, or explorers of one sort or another, venture into regions inhabited by primitive men with the intention of studying them. They approach them with all the preconceived and presumptuous notions of men who have read up all there is on the subject, and every single human being who shows up on the river-bank becomes a savage and must be catalogued like a butterfly. Thus the Shirians in all their slightly different types and sub-divisions are all called 'Guaharibos'—a name which means nothing and which the Shirians themselves have never heard. These scientific explorers may indeed take measurements of their faces and calculate the number of red corpuscles in their blood: the Shirians remain Sanemà for all that—people living in their own forest land, fighting their battles for their own special reasons, but ready to become men just like any others—because with a completeness and a simplicity that surpasses our own, they are men already. But scientific records lump the Sanemà and the Soto together under the barbarian headings of Guaharibo and Magnungòn, both contemptuous epithets, and humanity learns nothing from these explorers with their solar topees, who have scarcely got back to civilization after spending a few months in the forest and learning all there is to be known about the savages before they start writing books about it. If these books could be read and understood by the primitive people they treat with, the authors would be rewarded with a volley of arrows.

VII

Living improved considerably and there was meat now in abundance: the banks of the Uraricoera were full of game. The best cuts were reserved for us,

This fantastic appellation sounded quite harmonious in the forest, even to Indian ears, and brought Dolfuss' followers out of their concealment, splashing through the water towards us.

[131] [101] Dolfuss belonged to the Shirians of the Uaka tribe. These are scattered over the territory bounded by the Matacuni, the Padamo and the tributary streams of the Upper Ventuari. They are similar in appearance to the Pulipuli people, though rather more savage. They were very timid, and full of references to the Guayca, who they said were very active in this area, particularly in the parts we had just come from.

With Dolfuss there was an old man who was always either squatting down or else propping himself up on one leg; and two dour, surly-looking boys, who kept well away from our guns with a gleam of terror in their eyes. The next morning brought a whole host, along with women and children too, and of course we had to let them all examine our beards and rub themselves against them, and investigate other more detailed peculiarities of our anatomy. By urging the whole crowd of them on with sweeping gestures, we managed to get on our way very quickly, and a few hours later arrived on the banks of the Ocamo, a smallish river but strangely resembling the Upper Merevari. From the last high point we had been able to make out some huge flat-topped massifs, blue in the haze of distance, which must certainly have belonged to the Duida-Marahuaca group. For a moment, we hoped to come out on a patch of savannah land where we should be able to dry the damp forest mould out of ourselves and our belongings. But the Shirians told us there was no savannah in these parts.

[361] [501] [342] [162] [165] The Uaka huts were on the side of a hill, a hundred yards from the right bank of the river, which we crossed by means of a length of rotten wood, shaped like a canoe. There were three buildings, each with the single-span sloping roof, very humble affairs, so low-pitched that inside them one risked getting a beam in one's eye at any moment. There were about fifty of these people, and among them we noticed many who had reached a considerable age, which is unusual. There must have been some aspect of the Ocamo region which favoured longevity in the inhabitants. There was an 'ape-man' too—an old, solitary fellow, almost dumb, who came up to us with gurgles of amazement, not daring to touch us. However, he took one of the axes when we gave it to him and with the aid of some of the youngsters started making us a cabin.

Life with the Shirians was made extremely difficult by their petulant ways

/433 cont./

121 Messrs. Eugene Higdem, Byron Reihart, and Joe Jenkins, and the late Flora Troxel.

124 The information concerning the area of Brazil inhabited by the Guaika /Waica/ has been gathered from oral reports made to me by several men who said that they had worked upstream /434/ on the rivers of Brazil, within or near Guaika Territory. This information, although fragmentary and not absolutely certain, has helped us nevertheless to form a more complete picture of the Guaika tribe as a whole.

Orientation

101
131 The Guaika /Waica/ tribe inhabits the region of the Upper Orinoco and its tributaries above the outlet of the Ocamo River, including also the south bank of the Ocamo itself. In addition, the Guaika tribe extends into the territory of Brazil, occupying the headwaters of several tributaries of the Branco and Negro rivers (see the map /see p. 6 /).

The tribe located to the north, the Guajaribo /Guaharibo/, inhabits the north bank of the Ocamo River, the valley of the Padamo River, and the headwaters of the Caura River, and is also found in Brazil on the headwaters of the Uraricoera River, a tributary of the Branco River. The Guajaribo come downriver frequently as far as La Esmeralda, and on occasion even come as far as the mouth of the Cunucunuma River. It has been reported that they have been seen as far to the east as the Paragua River in the state of Bolívar (see map).

197 The Guaika and Guajaribo Indians speak the same language, but there are several observable dialectical differences which make it possible to distinguish immediately by their speech whether they belong to the one group or to the other. I make this observation on the basis of my studies of the Guaika language spoken in El Platanal and its comparison with samples of the Guajaribo dialect collected by Flora Troxel and by me in La Esmeralda and Ioeitedi.

[121]
[122]

/434 cont./

197 Nevertheless, what distinguishes the Guajaribo as a
101 separate group from the Guaika, even more than the small differences in language, are certain differences in their habits and material culture.

101 The Guajaribo share a goodly portion of their habitation
197 zone with the Maquiritare /Makiritare/ Indians, who live to the north. As a result of this, it appears that they have adopted
[248] many things from Maquiritare culture; for example, they culti-
[352] vate yuca more than the /435/ Guaika do. Their cotton ham-
[342] mocks and those of the Guaika seem to be a simplified version
[484] of the ones which the Maquiritare make. They also build some few ranchos with double-sloped roofs. And, like the Maquiritare, they travel much farther than the Guaika.

191 A certain number of the Guajaribo are bilingual, and they
192 speak Maquiritare in their commercial relations. They have also adopted a certain number of Spanish words through the Maquiritare and through their outside contacts, which have been more numerous than the contacts which the Guaika of the Orinoco have had with outsiders.

101 The title "Guajaribo" seems to be a name given to this tribe by outsiders and adopted by them for commercial reasons. The Maquiritare call the Guajaribo "Shidishana" or "Shiriana." These names, Shidishana and Shiríana, are the ones which the Guajaribo themselves employ when they talk among themselves or when they talk with the Guaika and the Maquiritare.

Maps

126 I have not been able to find a map of the exact territory inhabited by the Guaika /Waica/ and Guajaribo /Guaharibo/
[114] tribes. For example, on most of the maps the Ocamo River is shown running almost parallel to the Padamo River, when in reality it runs almost parallel to the Orinoco River. I have corrected some of these errors, but my maps are still only approximations.

126 On the map of the local area of El Platanal, I have tried
628 to show the friendly and hostile relations between the settlements, as well as the approximate location of the Guaika

they have imposed their mark in the names of the rivers, the word-endings -ari, -uni, -eni, meaning river or water. The ending -ari, often altered to -are, is ubiquitous west and north-west of the Orinoco as far as the foothills of the Andes—evidence of the former extent of the Arawak race. Most of the boatmen we recruited

MAP SHOWING DISTRIBUTION OF INDIAN TRIBES IN THE AREA OF THE UPPER ORINOCO

in the Orinoco basin and on the Amazonas slopes were Arawaks. As a result of countless voyages up and down the great rivers and as a consequence of many an invasion they are, anthropologically, a very mixed lot, even showing traces of Negro blood.

Caribs

Caribs were the late-comers to the territory. They include the Arekuna, the Yauarana, the Mapayo, the Yekuana and the Bekuana.

[i.e. The Arawaks -- Analyst]

Saliva SS 15

the upper reaches of the Caura and Caroni rivers; and on the tributaries of the upper reaches of the rivers Negro and Branco in Brazil.

In his classification based on families of language, Koch-Grünberg includes these scattered groups under the heading "Detached Groups", a term he uses for all linguistic groups that do not belong to either of the main families, though he acknowledges their anthropological and linguistic kinship. The fact that they inhabit the most distant and least accessible regions, that they are dispersed over so wide an area, and that they are subdivided into clans which frequently number no more than a dozen individuals, strongly suggests that these people are a "residual population" that has doubtless been thrust farther and farther back by successive waves of invasion.

The four or five thousand Piaroas and Guaharibos who inhabit the territory of the Middle Orinoco, between Puerto Ayacucho and San Fernando de Atabapo, are also classified as "Detached" by Koch-Grünberg. Anthropologically it would seem that these two peoples are comparatively remote from each other. As we have no information as to the time of their emergence and settlement in their present zone of habitation, we may perhaps assume that all of these groups constitute, or did once constitute, the original stratum of population, without necessarily coming from the same stem.

Three small clans, tiny pockets of people geographically isolated from each other which cannot as yet be related to any of the big families already mentioned, also appear on Koch-Grünberg's ethnological map. These are the Makus. They occur on the River Auari, where they occupy no more than a single hut; on the Ventuari, where they number about eighty; and on the Iñirida, where they are known as Puinabes. It has been suggested that these last could conceivably be the descendants of the Guaypunabis whose chief, Ceseru, joined with Solano in founding San Fernando de Atabapo and Santa Bárbara.

Thus the classification of the Indian peoples of the

9:Grolier K-5 (1951) 1957 SQ18 Yanoama SQ 18
Guaharibo

101 Guiano-Amazonas district of Venezuela, is neither so simple nor clear-cut as it at first appears. None of the Indians of the Guianian highlands are natural settlers. The more primitive groups, who live entirely from cropping the forest, fishing and hunting, are compelled to lead wandering lives; and those who practise agriculture and live in villages are ever ready for [167] a change of scene. These things, allied to an ingrained migratory instinct, lead them to keep moving about the country throughout their lives.

More Guaharibos from the Padamo

123 On the afternoon of May 25th another party of Guaharibos arrived at Esmeralda. I was approaching the jetty in one of the boats when I heard Francisco shouting from the other bank. It was nothing new to hear Francisco's bellowing; whenever he had killed a tapir that was too heavy for him to carry alone, or when the day's bag was too big to be loaded on his minute *curiara*, he would give tongue in this manner. I turned back to join him and as I did so he pointed with a paddle to an Indian craft which till then had been hidden from me by the bank-side vegetation. I steered towards it, standing up in the boat and making gestures of welcome and friendship. For an answer two men stood up timidly in their [501] boat as I went over to them and circled round them. Their craft, which rocked buoyantly in my wash, was built of a single strip of bark. It was similar to the one the children had left behind them, but bigger and contained thirteen people. Then I led them back to the landing-stage.

The official reception of these people we left to Butrón, who had a wonderful gift for this sort of thing. He quickly had some machetes brought out as gift-offerings. Of the boat's crew nine were young men in their teens, two of whom had their faces blackened with charcoal. Among them was Mopare, the eldest of our first visitors. Two children of about six and two young women tried to efface themselves against the bottom [291] of the boat. The youths wore some cotton material round their middles which was secured back and front by a belt of string. The women wore a sort of fringed apron no more than a few inches across.

9:Grelier K-5 (1951) 1957 SQ18 Yanoama SQ 18

Orinoco to the Guaharibo Rapids. On this the river's course is given in great detail, showing not only the major tributaries but a great many minor ones as well, though there is no indication of their size. From first-hand experience it was clear to us that the contribution of some of the lesser tributaries was anything but negligible. There are, for instance, the Iguapo, which joins the Orinoco from the right ten miles above Esmeralda after itself being joined by a river its own size, and another river, unnamed as far as I know, which has its mouth midway between the Padamo and the Ocamo. And entering from the other bank come the Lipe and the Icipe, of which the latter is eighty yards wide at the confluence. Of these four only the Iguapo has been explored and that by Diez de la Fuente.

Above the Mavaca the Orinoco's mean width is less than two hundred yards. Its general direction of flow is east to west with a slight northern tendency and surprisingly, since it nowhere else does so in its thousand miles journey from Mavaca to the sea, it twists and turns pronouncedly.

Since we had left Esmeralda the only birds we had seen were single specimens of black ibis, large kingfishers and droves of white egrets. The egrets would sit craning their necks in the trees and, as we approached, would fly up only to settle down a little farther away. It was as though no human being had ever disturbed their forests. Once or twice we saw a pair of otters diving from a rock or dead tree stump and once we shot at an anaconda which was placidly coiled round a tree. We watched as it slowly unwound and disappeared into the murky water.

That evening we took one of the *curiaras* up a small tributary and fished, but the spate was too strong. Instead of fish we gathered some forest cocoa whose pulp is a refreshing drink when newly made.

The First Waïkas

The Padamo and Ocamo rivers are inhabited by Guaharibos. Above the Ocamo, the inhabitants of the Orinoco's banks call themselves Waïkas. They closely resemble the Guaharibos we had met at Esmeralda but are, perhaps, a little more primitive. Some had had previous contact with Butrón's wood-cutters.

CHAPTER I

YĘNOMAMÖ CULTURE AND EARLIER ANTHROPOLOGICAL WORK[1]

[101]

A. Yęnomamö Culture

The Yęnomamö are discussed in the literature under such tribal designations as Guaica, Waika, Guaharibo, Makù, Schiriana, Xiriana, Kirischana, Shidishana, Shamatari, Sanema, and Yanoama. Most of the terms are derogatory names applied to the Yęnomamö by their neighbors and characterize the people as being monkey-like or as savages.[2]

[114] In the upper Orinoco and the Mavaca basin where I conducted my field work, the Indians referred to themselves as Yęnomamö, which at once defines their mode of life, language, origin, and includes all people who share this mode of life, language and origin. All non-Yęnomamö are collectively

---

[114] [1]As there are very few reliable English sources describing Yęnomamö social organization and culture, I give a brief description of them here. The best source in English to date is Zerries' 1955 publication, but it deals only with particular traits of Yęnomamö culture.

[128] [2]The word Yęnomamö is nasalized on every syllable,
[94] but for ease of typing this manuscript, I have not indicated all
the nasalization. The vowel /-ę-/ is written /-ë-/. I have writ-
[104] ten the /- ə -/ as "-ë-" and have indicated nasalization
by /-,-/; whenever a Yęnomamö word has one nasalized syllable,
all syllables in that word are nasalized.

• 101 called nabä--"stranger" or "foreigners." Nabä have degenerated from an original Yąnomamö stock and are regarded, therefore, with some contempt by the Yąnomamö, an attitude that is further manifested in the language; Yąnomamö in linguistic usage requires an honorific pronoun whereas nabä takes the common pronouns.

[128] I adopt the term Yąnomamö to refer to the entire group whose geographical distribution is shown in Map A,[1] using the term in a linguistic-cultural sense to define the tribe. Others have adopted the same usage with minor differences in spelling.

Several of the above-mentioned terms, Sanema, Waika, and Shamatari deserve further discussion, as they are used either as self-designations or in reference to local groups of Yąnomamö occupying specific geographical areas.

The term Sanema (Wilbert, 1963) is used in the upper Caura River as a self-designation. In this dialect the [194] initial phone /y/ has been replaced throughout the language by /s/, Sanema thus being a local pronunciation of Yąnomamö.[2]

The term Shamatari is used by all the Yąnomamö Indians on the upper Orinoco River to refer to the congeries of villages that occupy the large area south of the Orinoco River and adjacent portions of Brazil. Zerries (1964:19)

---

[1] See next page.

[115] [2] Ernesto Migliazza, personal communication. According to Migliazza, the word Sanema is pronounced /Sanöma/.

[TEXT CONTINUED ON PAGE 29]

Zerries (1964:19) has included the groups I studied in the Shamatari classification on the basis of information taken from Mahekodotedi informants. The members of these groups, however, deny the Shamatari identity and distinguish themselves from their southern neighbors, some of whom visit them regularly and are married into their villages.

The Shamatari,[1] according to my Bisaasi-tedi informants, take their name from one of the headmen, Kayabawä ("big tree"), who lived north of the Orinoco River in a village then called Shihowä-tedi. Kayabawä was an unusually corpulent man and bore a second name, Shamatari, derived from their word (Shama) for the tapir, a large ungulate found throughout tropical South America. Shamatari, when Shihowä-tedi split, led his faction south of the Orinoco River and settled in the headwaters of the river known to the Yąnomamö as the Shukumöna-u (see above), where his village became known as Mokayëaba-tedi. Other villages, related to Shiowä-tedi, moved into the Shukumöna River and Mavaca River basins after Shamatari's village was established, ultimately spreading as far southwest as the Cauabury headwaters in Brazil. The Shamatari expansion into this area took place around the turn of the century, according to my reconstruction of Shamatari history (see below). This is also supported by meagre

---

[1] There is another "Shamatari" group in the tributaries of the Upper Parima River of Brazil; these are not to be confused with the Shamatari under discussion here, although both groups are Yąnomamö. See Vinci, 1959, for an impressionistic account of his brief contact with the Parima Shamatari.

This is also supported by meagre historical evidence bearing on the aboriginal inhabitants of this area. Several distinguished Europeans explored portions of the area under consideration and all of them were familiar with the existence of the Yąnomamö in the Orinoco headwaters. None of them, however, reported that Yąnomamö Indians were living in the Mavaca Basin. Alexander Humboldt, who ascended the Casiquiare Canal in 1800, discussed the area of the Mavaca headwaters as one frequently used by Indians of the 'Portugueze Missions' as the route between the Cauabury headwaters to Esmeralda (on the Orinoco River) by way of the Mavaca River. The aromatic seeds of the puchery laurel were seasonally gathered near Esmeralda and sold in Brazil (Humboldt, 1281, Vol. 5, pt. 1, pp. 308-9).

So well known was this route that Robert Schomburgk intended to follow it in 1839 to reach the Rio Negro from Esmeralda, hoping to avoid the 200 miles that the Casiquiare route would have added to his journey. He was dissuaded from doing so by the residents of Esmeralda, who, knowing both the route and the seasonal variations in the river, assured him that the trip would be impossible at that time of the year (Schomburgk, 1840 :244).

Richard Spruce ascended the Paciba River, a branch of the Casiquiare Canal that has its source near the Mavaca River, in 1854 and found the upper reaches of the river inhabited by several Aruak-speaking tribes (1908:425, 427).

The first evidence that the Yąnomamö had penetrated

? [i.e. Shamatari expansion south of the Orinoco R. - Analyst]

101
175 The first evidence that [31] the Yąnomamö had penetrated the Mavaca Basin comes from a brief comment in Rice's account (1921) of his exploration of the Upper Orinoco. His guide, a Baré Indian, told him that the 'Guahariboa' had killed his brother ". . . near the sources of the Umauaca."[1] There is no historical evidence that the Yąnomamö occupied the Mavaca basin any earlier than this date (ca. 1915-20), save for scattered reports of unidentified 'wild tribes' alleged to dwell in these regions. My own data support this.

By 1925 the Yąnomamö were reported to be raiding settlements along the upper Cauabury River and soon were raiding the north bank of the Rio Negro itself. The Brazilian (648) settlers eventually abandoned this area because of the raids (Seitz, 1963:19, 20, 21; Zerries, 1964:14).

The historical evidence suggests, then, that the Yąnomamö have entered this large area only recently. This is supported by the accounts given to me by the Yąnomamö, who further describe the occupants of the area as Shamatari, a usage based in part on the historical interconnectedness of the villages that spread into the area, and in part on geographical considerations. Yąnomamö villages unrelated to the original group led by Kayabawë (Shamatari) have entered this area, and their northern neighbors refer to them as Shamatari, even though these villages are not historically related to Kayabawë's and their members deny being Shamatari.

---

[1] Ibid., p. 341.

• 101 The term Waika or Guaica is used in much the same way as the term Shamatari, i.e., in reference to a geographical bloc of villages that have a common history. I have no knowledge concerning the origin of the term except its etymological derivation from the verb waikaŏ: "to kill something that is already wounded," "to finish off an animal that is dying."[1]

The term Waika, or variants of it (Guaica, Uaica), has been in the literature the longest, appearing in Caulin's 1779 work. Zerries has adopted its usage, along with the term Schiriana, to refer to the entire Yąnomamŏ group; ironically, members of the village in which he conducted his field work, Mahekodo-tedi, denied to me that they were Waika, explaining that the Waika lived further up the Orinoco River and inland.

Insofar as designations more precise than Yąnomamŏ are required, the Indians themselves simply use their village names. The terms Shamatari and Waika do not refer to political entities, and the boundaries of the geographical zones including so-called Waika or Shamatari villages are difficult to fix. Only the members of those villages that are related historically to Kayabawë's group are properly designated as Shamatari. All of the Indians of this large area, however, regard themselves as Yąnomamŏ, no matter what others call them, and I adopt this term to refer to the entire group.

000 Numerically, the Yąnomamŏ are one of the largest

[114]

[1]Zerries, 1964:3, gives the same derivation for the term.

131 Numerically, the Yąnomamö[33] are one of the largest
161 unacculturated tribes in South America, having a total population that approaches 10,000 in both Venezuela and Brazil. Most Yąnomamö live in Venezuela, occupying the area drained by the upper Orinoco, Mavaca, Manaviche, Ocamo, Padamo and Ventuari Rivers in the state of Amazonas, and the headwaters
101 of the Caura and Paragua rivers of Estado Bolivar. In several
197 drainages (Paragua, Caura, Ventuari and Padamo) the Yąnomamö
439 are in contact with other tribes speaking Carib languages (Makiritare and Arekuna or Taulipang), from whom the Yąnomamö have traditionally obtained steel tools in trade and from whom a number of culture traits have been borrowed. Zerries has painstakingly analyzed these traits in his 1964 work.

114 161 No systematic census has been made of the entire Yąnomamö language family, although James P. Barker was commissioned by the Venezuelan Government to compile a census of the Yąnomamö occupying the Amazonas territory of that country. By both actual head-count and estimates of village size for groups that topography prevented him from visiting, Barker presently estimates the Venezuelan Amazonas Yąnomamö population to be well over 7,000.[1]

161 162 #621 The population in Amazonas is distributed in some 80 to 100 villages, averaging between 60 and 100 people per village.[2] Villages occasionally contain as few as 40 people

---

[115] [1]Personal communication. See Zerries (1964:5) for a discussion of Yąnomamö population size. He concludes that the Yąnomamö are ". . . the largest yet unacculturated aboriginal group in tropical South America." (Ibid. My translation.)

[128] [2]The relationship to warfare tactics and village size is discussed in detail in Chapter 4.

593 684 the enraged husband struck his wife in the face with a burning log, severely burning her mouth. Burning is a common punishment, and many women bear immense scars from wounds inflicted by enraged husbands. Just before I left the field [578] a fight developed in Patanowä-tedi between a man and his wife's lover. The lover was killed in the fight and the woman's husband punished her by cutting off her ears with a [165] machete. Some women have been killed by enraged husbands, but in most of these cases, the deaths resulted from wounds that were not intended to be fatal.

607 613 *621 *628 [593] Despite the fact that the tie between spouses is weak, marriages create strong ties between a man and his sister's husband. This tie is of great significance in the social organization of the Yąnomamö, as it is stable, well defined, non-ambiguous and politically important. The brother-in-law (shoriwä) tie is the key link in alliances between local descent groups, both within and between villages.

607 601 The term shoriwä (brother-in-law, MoBrSo, FaSiSo, friend) is used constantly by Yąnomamö men when they address any new male acquaintance. Shoriwä implies a set of obligations and duties between the speakers. One can depend on his shoriwä for material goods and gifts, and a request for such items from a shoriwä is not easily denied: shoriwä is, in addition to goods-giver, wife-giver. The Yąnomamö use this [997] [609] [101] term for foreigners as well; they use it so frequently that the Salesian Missionaries who have recently contacted a few

607 601 799 [609] [601] groups of Yąnomamö have begun referring to the entire tribe as "Los Shori." The Yąnomamö address the missionaries with this term hoping to maximize their chances of obtaining desirable manufactured goods such as machetes and axes.

607 52 601 Men who are not related by blood constantly remind each other of obligations when they use this kinship term. A brother-in-law deserves respect, fair treatment, and gratitude. As the term is reciprocal, a conversation between two shoriwë is punctuated frequently by these constant reminders that each owes the other goods, services and respect by virtue of the fact that they stand in wife-giver/wife-receiver relationship to each other. Such conversations, usually about material goods or women, strike the outsider as something of verbal contests to determine which of the two speakers is more of a shoriwë than the other, i.e., who owes the other more goods, services, gratitude and generosity. One who has actually given a sister to the other's group has an advantage, in a trading sense, as he can more legitimately claim goods from the wife receiver.

*628 574 609 601 583 When men visit the village of an ally to beg, trade or participate in feasts, they call all non-related men of that village 'brother-in-law,' emphasizing the fact that they stand in wife-giver relationship to them, and deserve, therefore, the generosity of the hosts.

*628 527 574 583 581 Alliances between villages involve, in addition to military aid, mutual feasting and trading. It must be remembered that alliances, no matter how many marriage ex-

151

[Namowei-tedi Group]

The headman of Wareta-tedi, Shamaiyowä, and some of his kinsmen went to visit their allies on the latter's invitation, but Husirawä's group treacherously killed Shamaiyowä and two of his followers. Not wanting to participate in the raiding against their old allies, the Namowei-tedi established a new garden and moved away from the Wareta-tedi. A number of individuals in the present populations of Patanowä-tedi and Bisaasi-tedi trace descent back to the headman of Wareta-tedi, as the latter had demanded women in return for his protection. In ca. 1910 the Namowei-tedi moved to their new garden at Namowei.

Area 3: Namowei-tedi

This area is quite mountanous and the group took its name from one of the ranges, Namowei-kähkö--"sharpness." They lived here long enough to make three different gardens (Makei, Shodemi, and Amatakö), but ultimately were forced to abandon the area because of renewed raiding from their old enemies, the Boreta-tedi. Having no friends to the north and several old enemies to the east, the Namowei-tedi moved west and established their garden at Hahoyaoba-täka in ca. 1920.

Area 4: Hahoyaoba-tedi

The old allies of the Namowei-tedi, the Wareta-tedi, were forced to abandon their site and move west. They settled in the area immediately south of the Namowei-tedi, splitting into two villages (Hasaböwä-tedi and Ashadowä-tedi), and continued to remain on good terms with the Namowei-tedi.

10:Chagnon E-4.5 (1964-1966) 1987 SQ18 Yanoama SQ18

628 583 Bisaasi-tedi are the dominant partners in the bride-exchange network with their Shamatari allies, a dominance that is reflected in the disproportionate number of women they have managed to coerce out of their allies.

361 621 114 While I conducted my field work the Bisaasi-tedi lived in two villages on opposite banks of the Mavaca River. The group on the east bank was beginning to split by the time I left the field, and the split took place a few months later,[1] one of the factions moving to the north bank of the Orinoco River, but still within view of the other group.

B. The History of the Paruritawë-tedi

174 621 The Shamatari came into being as an identifiable group shortly before 1900. The Shamatari identity, as I have shown above (p. 28 ff.), is a function of the historical connections between the villages that split off from Shihowë-tedi's parental group, as well as geographical considerations.

My informants consistently spoke of two 'true' Shamatari men: Kayabawë (Shamatari) and Matakuwë. The villages of these two men have a common origin, but I was unable to get data on the nature of the events that led to the separation of these two groups. This event took place long before the life-span of my oldest informants, and none of them knew any details of the splitting. By 1875, however, 195 101 361 there were two distinct Shamatari groups north of the Orinoco headwaters, one of which bore the name Shihowë-tedi. Kayabawë

[1] Personal communication, James P. Barker.

(Shamatari) lived in this village and, when the village split, led his faction into the Shukumöna-u basin, becoming known as the Mokayäaba-tedi. This move took place about 1900.

The second village also moved to the south side of the Orinoco, but remained on that river. They settled near a mountain called Aramamisi-käkö, and named their village after the mountain. My historical data on the Shamatari village movements is sparce up to this point.

Between 1900 and 1950 the Mavaca and Shukumöna drainages were populated by the descendents of these two 'original' Shamatari groups, and the process of village splitting that led to the occupation of this large area continues at the present time.

Although there are two Shamatari groups (Kayabawä's and Matakuwä's), I outline the details of the movements of Matakuwä's group, mentioning Kayabawä's only in so far as it relates to the history of Paruritawä-tedi. Militarily, Kayabawä's group plays a prominent role in the movements of Matakuwä's followers up to 1920, illustrating once again that cognate villages enter into hostile relationships with each other after they separate. Thus, this section deals with the historical movements of the group that ultimately gave rise to Paruritawä-tedi; as this group also gave rise to a number of other villages, I shall have to briefly sketch the movements of these villages after their separation from the main group.

It will be immediately apparent that the Shamatari

[Paruritawä-tedi Group]

Area 4: Kayurewë

174 175 +628 726 861 The Aramamisi-tedi continued to raid Matakuwë's group at Kayurewë, so this site was abandoned in about 1940. Matakuwë's group had gotten into a war with the Namowei-tedi by 1940 over the death of Ruwahiwë, who was killed while he visited the Namowei-tedi at Patanowë-tëka. Ruwahiwë was Matakuwë's eldest son. After this incident, the Namowei-tedi actively raided Matakuwë's group at Kayurewë, and abducted a large number of women from them. Being raided by two villages, Matakuwë moved back to Konabuma, where his group had previously lived, because the peach palms of that garden were still producing.

Area 5: Konabuma

174 +621 361 (622) (101) About 5 years after this site was reoccupied by Matakuwë's group, the group split into two villages. One of them continued to live at Konabuma, and was led by Matakuwë's son, Sibarariwë. The other group moved to a branch of the Shukumöna-u River and took the name Paruritawë-tedi, led by Weiamamowë. The split at Konabuma was caused by an internal feud over a woman. A club fight temporarily settled the dispute, but after the groups separated, they began raiding each other.

(578) (721)

174 36 +628 722 175 Sibarariwë's group remained at Konabuma for a short time after the Paruritawë-tedi separated from them, but raids from the Namowei-tedi, the Armamisi-tedi and the Paruritawë-tedi themselves forced Sibarariwë's group to abandon Konabuma

likelihood that marriage practices will depart from the rules governing ideal marriage behavior, then we would expect a reduction in warfare to produce a reduction of this gap. A decrease in warfare should obviate the need for military alliances validated by exchanges of women; under such conditions marriage practice should conform more closely to preferential rules.

The Yąnomamö who live on the Upper Uraricoera and Uraricaá rivers of northern Brazil differ markedly in a number of traits from the Venezuelan Yąnomamö of the Mavaca basin considered in this thesis. A major point of difference is that among the former warfare is much less common than it is among the Yąnomamö described in the preceding chapters. It is likely that this reduction in warfare is partly due to more frequent contact of the Brazilian Yąnomamö with Carib-speaking Indian tribes (Makiritare and Arekuna) and, since 1958, with Christian missions. There appears to be a cline in the decreasing intensity of warfare from southwest, the area in which I conducted my field work, to northeast, the area from which these new data are drawn (see Map D, next page). Yąnomamö from the Upper Padamo River, an area about on the mid-point of this cline, told me that fighting with clubs was very rare in their villages. Migliazza[1] asserts that raiding between villages on the Uraricoera River occurs only every four or five years and is usually provoked by

[1]Personal communication.

[TEXT CONTINUED ON PAGE 195]

MAP D

The Location of Uraricaá and Mavaca Yąnomamö

accusations of sorcery or by the desire to abduct women.

Another major difference between the Uraricaá and the Mavaca Yąnomamö is the manner in which they treat extra-marital liaisons. On the Uraricaá, liaisons are tacitly permitted and fighting rarely develops between a man and his wife's lover. Should fighting occur, it is generally caused by some incident unrelated to the affair itself. In short, men permit their wives to have extra-marital affairs, provided the women are discreet.

Of major analytical significance is the fact that the Uraricaá Yąnomamö closely adhere to their rules of ambilateral cross-cousin marriage.[1] This stems from the fact that political alliances between villages there never involve the transfer of women from one group to the other. The Yąnomamö of the Uraricaá are endogamous within each congeries of villages having a common history. It would seem, therefore, that the absence of intensive warfare permits marriage practice to follow marriage rules.

The Uraricaá settlement pattern and village organization differ considerably from those found among the Yąnomamö of the Mavaca basin. What I have called a small village of 40 people among the latter segments, on the Uraricaá, into clusters of extended family units separated from each other by as much as half a mile (Migliazza, 1964). The village in which Migliazza lived, for example, comprised 80 persons

[1] Migliazza was not able to give me statistical data on actual marriage practices. I intend to collect this kind of information in January-February 1967 when I visit the Uraricaá area.

1

Doing Fieldwork among the Yąnomamö

101 131 161 162 361 101 197 THE YĄNOMAMÖ[1] INDIANS live in southern Venezuela and the adjacent portions of northern Brazil (see frontispiece map, p. iv). Some 125 widely scattered villages have populations ranging from 40 to 250 inhabitants, with 75 to 80 people the most usual number. In total numbers their population probably approaches 10,000 people, but this is merely a guess. Many of the villages have not yet been contacted by outsiders, and nobody knows for sure exactly how many uncontacted villages there are, or how many people live in them. By comparison to African or Melanesian tribes, the Yąnomamö population is small. Still, they are one of the largest unacculturated tribes left in all of South America.

721 793 181 But they have a significance apart from tribal size and cultural purity: the Yąnomamö are still actively conducting warfare. It is in the nature of man to fight, according to one of their myths, because the blood of "Moon" spilled on this layer of the cosmos, causing men to become fierce. I describe the Yąnomamö as "the fierce people" because that is the most accurate single phrase that describes them. That is how they conceive themselves to be, and that is how they would like others to think of them.

114 122 123 I spent nineteen months with the Yąnomamö,[2] during which time I acquired some proficiency in their language and, up to a point, submerged myself in their culture and _____ way of life.

[194]

[1]The word Yąnomamö is nasalized through its entire length, indicated by the diacritical mark [ą]. When this mark appears on a word, the entire word is nasalized. The terminal vowel [-ö] represents a sound that does not occur in the English language. It corresponds to the phone [ö] of linguistic orthography. In normal conversation, Yąnomamö is pronounced like "Yah-no-mama," except that it is nasalized. Finally, the words having the [-ä] vowel are pronounced as that vowel with the "ah" sound of "duck." Thus, the name Kąoläwä would be pronounced "cow-ha-wah," again nasalized.

[2]I spent a total of twenty-three months in South America of which nineteen were spent among the Yąnomamö on three separate field trips. The first trip, November 1964 through February 1966, was to Venezuela. During this time I spent thirteen months in direct contact with the Yąnomamö, using my periodic trips back to Caracas to visit my family and to collate the genealogical data I had collected up to that point. On my second trip, January through March 1967, I spent two months among Brazilian Yąnomamö and one more month with the Venezuelan Yąnomamö. Finally, I returned to Venezuela for three more months among the Yąnomamö, January through April 1968.

nant, while other plants allegedly cure the same evils. Kaobawä's followers do not cultivate many of these malevolent magical plants; they claim, however, that the "Waikas"[8] use them extensively and blow harmful charms at their enemies through hollow tubes. The failure of Kaobawä's group to use magical plants in this fashion is cited as a distinguishing feature that sets it aside from other groups of Yanomamö.

101
114

[8]The Yanomamö are sometimes referred to in the literature by such designations as Shiriana, Xiriana, Guaharibo, and Waika. The first three terms are foreign words meaning "howler monkey" and have been applied to the Yanomamö by their northern neighbors, the Carib-speaking Makiritare Indians. A good deal of the early information came from the quite unreliable accounts travelers obtained from the Makiritare. The term "*Waika*," however, from the verb *waikai*, is a Yanomamö word meaning "to kill an animal (or man) that is already dying from a wound." Zerries (1964) used the term "*Waika*" in much the same sense that I am using the term "Yanomamö." *Waika*, however, is very ambiguous and imprecise. For example, members of village "A" will assert that members of village "B" are "Waikas." If you ask members of village "B" if they are Waikas, however, they will deny it and say they are Yanomamö, adding that the members of village "C" are Waikas. When you question members of village "C," you will get the same answer: The Waikas live in the next village, only Yanomamö live here. Nevertheless, the term does have currency in the villages near the headwaters of the Orinoco River. One of my informants claimed that the blood of "Moon" (see the third section of this chapter) changed into Waikas, but they became extinct because they were so fierce. He also asserted that the Waikas were Yanomamö.

361 578 The group then crossed the Orinoco for the third time and settled, sometime around 1925 or 1930, at Patanowä. By this time their numbers had increased to such a level that internal feuds were frequent. As the result of many fights, the group split into two villages in about 1940, and eventually entered into hostilities. The part of the village [101] that remained behind took the name Patanowä-teri and has remained to the present at that site. Kąobawä's group fled to Shihota, but was driven from there to Kreiböwei by the Patanowä-teri. They occupied this site in 1950–1951, when they were massacred during a 361 feast by the members of two Shamatari villages to their south. This led them to take 726 temporary refuge in the village of Mahekodo-teri on the Orinoco River, as they had 721 not had time to make a new garden. Their site at Kobou was established while they 628 lived with the Mahekodo-teri. It was only a vantage point from which they could estab- [841] lish gardens in more suitable areas, areas that were too far removed from Mahekodo-teri to permit the establishment of the gardens in a single move. Thus, Kobou was abandoned after only a few years' occupation there.

361 Kąobawä's group split in the process of abandoning the Kobou garden in 1954, 621 a part of them taking the name Monou-teri. The Monou-teri still live at the site they [721] established in 1954, but they were in the process of abandoning it in 1966 because of [722] renewed raids from the Patanowä-teri. Kąobawä's group moved to the Orinoco again, [101] to the site called Barauwä. By 1939 foreigners had finally reached this area, so Kąobawä and his followers moved down the Orinoco to the mouth of the Mavaca River to estab- [648] lish contact there with a government malaria post. They hoped to obtain steel tools from the family of foreigners at the post. They split into two factions after settling, half of them moving to the opposite bank of the Mavaca River. Thus, Bisaasi-teri has an up- [101] stream and a downstream settlement, and the members of these two groups refer to themselves as the Upper and Lower Bisaasi-teri, respectively, Bisaasi being the name of a grass commonly found around gardens.

361 Similarly, the Shamatari villages, indicated as circles in Fig. 2-8, have a settlement 621 pattern characterized by internal village disputes leading to fissioning, gardens being 578 abandoned because of warfare, and a general movement to the south and west away 722 from the Orinoco headwaters. The history of the Shamatari villages is a little more 184 complicated than the history of Kąobawä's group, since village fissioning began much earlier in their moves and produced many more villages. This was probably due to the fact that their original location had more inhabitants. The history of the villages marked as hexagons on the map, Fig. 2-8, is nearly identical in its over-all pattern to the above two groups of villages.

361 Kąobawä's group and the two Shamatari villages of Mǫmariböwei-teri and Reya- [134] boböwei-teri (see Fig. 2-8) have, together, made some sixteen major moves during the [648] past seventy-five years (Chagnon 1966, Chap. V). Only one of them was stimulated by [722] poor soil conditions; one additional move was the result of the coming of foreigners. The [578] remaining fourteen major moves resulted from either raids emanating from hostile neighbors, or internal village feuds that led to bloodshed and caused a split in the local group.[9] This should suffice to demonstrate that the political and military relationships between

[TEXT CONTINUED ON PAGE 44]

[9]This figure does not include the moves that took place while I lived with the Yąnomamö. See Chapter 5 for a discussion of these.

obtain by barter clay vessels, clay plates, bows, arrows, hammocks, baskets, belts, and upper-arm ornaments (29).

29. Pottery is not practiced at all by the Surára and Pakidái, and their self-made bows, arrows, hammocks, etc. are inferior in quality to those of the Xirifna.

/7/

IV. Historical Data

At the present time, in the winter months (rainy season), April-September, the Surára live at the Cachoeira dos Índios (Ill. 2 and 3), on the upper Rio Aracá, and the Pakidái in Taraquá, on a right branch of the middle Demini. The summer months (dry season), October-March, on the other hand, the two tribes spend together in a large, open maloka, which belongs to the Surára, in the virgin forest region between the Demini and Aracá rivers. This maloka lies 70 kilometers northeast of the Cachoeira dos Índios and about 100 kilometers south of the source region of the Orinoco.

Koch-Grünberg, on his map accompanying the work Vom Roroíma zum Orinoco /From the Roroíma to the Orinoco/, showed neither the Rio Demini nor the Rio Aracá and designates this region as "unknown territory." In his text he also says, "the entire large area between Rio Negro, Rio Branco and Uraricuéra is unexplored to this day" (30). Baldus likewise points out that in this area

30. Koch-Grünberg, 1923a, p. 287.

"surprises still await the seeker of unknown tribes" (31).

31. Baldus, 1956a, p. 294.

/7 cont./

Demini and Aracá were first introduced into the literature by João Barbosa Rodrigues, although he did not write Demini, but rather Demeune (32), and the Rio Aracá was called Uaraca by him (33).

32. On maps of that period one likewise finds the entry Demeney.

33. Rodrigues, 1885, pp. 136, 148.

With regard to the name Demini, it may be assumed that the ending "ini," according to the linguistic studies of Koch-Grünberg (34a), is derived from the Aruak /Arawak/ word "eni" =

34a. Koch-Grünberg, 1923a, p. 15.

river, water. This assumption is confirmed by many very old finds of shards which I discovered on the entirely unpopulated terra firma on the riverine lakes of the Demini. They are yellowish gray shards, which are decorated with spiral lines, meanders, and other plaiting designs and resemble the earthenware vessels which Koch-Grünberg described for the Aruak tribes (34b).

34b. Koch-Grünberg,1910a, pp. 227/28 and Ills. 152-155.

The fact that I found only shards is undoubtedly linked with the custom of the Aruak described by Koch-Grünberg, according to which all the clay vessels that belonged to a deceased person must be broken to pieces, for otherwise the spirit of the dead would punish the greed of the relatives (35).

35. Koch-Grünberg, 1910a, p. 151.

This would also confirm the surmise of Koch-Grünberg that at one time Aruak tribes coming from the west and southwest penetrated into the region between Rio Branco and Orinoco, which was

It did not take us a great deal of time to organize the expedition. The question of food supplies didn't arise. We had given the little we had left to Jean. We were going among the Samatari like Samatari ourselves. The forest land of Uagna and the Rio Branco was waiting for us with its tapirs and its deer, serenely at pasture in the rich water-grass; with its ripened fruits falling from the trees into streams of dark water; with its birds whose crops were full of that fruit, and its fish which no barbasco had threatened for decades now, ever since the Guayca migrated to the north; with its fat grubs forming white silken cocoons in the trees. In the sharpness of our longing for the uncharted scene and for peoples still unknown, we saw ourselves already, in our imagination, plunging into the hidden depths of the forest, and the forest, in its turn, taking us to its bosom like a mother, boundlessly wise, providing for all our needs.

Hashimo arrived the next day and so far as we could judge from the preparations he had made and the quantity of arrows he was carrying, he had decided to come with us. So began the palavers between the four of us—Enrico and I on one side, Uaremu and Hashimo on the other. We went into everything. Hashimo had lived as a boy in the region we wanted to explore; he knew the Samatari and at times he claimed to be on friendly terms with them, so that it was he more than anyone who knew the problems we might have to face. From the Samatari 'gate', which we had already seen on the Uagna, our path lay over exactly thirty-two hills. The Indian made the same gesture as he would have used to greet us and numbered them off with his hand, his eyes closed and the whole scene passing in front of his mind's eye. Thirty-two—not one less—and some so high that the speaker groaned with exhaustion as he enumerated them, as if he were trying to push some great stone over the top. After these hills, which would mean a six days' march from the landing, one reached the River Aracosa. After descending that, there was the Parima (the Shirian name for the Upper Uraricoera), as far as a big falls. Then more *pilishi* and *nawishi* —daily stages and night stops—and landmarks on the way, until the traveller came to the Samatari. [103]

Considering that this people ranged like monkeys over a region which extended for hundreds of miles, we could not understand how he could be so definite about their present whereabouts—especially since he hadn't seen the place himself for many years. But the Indian mind is capable of subtleties beyond our imagining.

/435 cont./

126 628 rancherías. For anyone who might be preparing to travel or work in Guaika territory, these relations can be as important as the geographical location of the settlements. If a group of Guaika should be engaged to carry out certain tasks, they might be inclined to work well in certain areas, but doubtless would refuse to enter areas inhabited by their enemies.

126 /436/ On the map of the whole area inhabited by the Guaika and Guajaribo, I have tried to show the approximate limits of the two tribes. The areas which are shaded on the said map correspond to the zones where we have had contact with these [114] tribes on several occasions. The settlements whose names appear underlined, that is to say, El Platanal and Ioeitedi, are native rancherías where we have lived and worked for long periods of time. These settlements continue to be our principal bases of operation.

● 103 The native names of the principal rivers are as follows:

Orinoco River	Majekodo-ko
Cunucunuma River	Ami-ko
Padamo River	Jaiyama-ko
Metacuni River	Wakawaka-ko
Ocamo River	Kia-ko
Mavaca River	Wachewa-ko
Manavichi River	Mata-ko

The native name of the Raudal de Guajaribos /Guaharibo Torrent/ is Kalebakbola.

I have not been able to discover even one name for the hill of Guaiaribo, but the most important peaks, starting below and going up the river, are: Wanidi-mak, Yabinao-mak, Kacholaoa-mak, and Wadubaoa-mak.

Geography

361 A few Guaika /Waica/ settlements are located along the principal rivers and are accessible by means of small boats or canoes with outboard motors. Nevertheless, most of the Guaika settlements are inland and can only be reached after one or more days of travel.

Population -- 1953

361 It is known that there are about 23 Guaika /Waica/ settlements between the Orinoco and the Ocamo rivers and in the region of the Brazilian frontier to the north of the Orinoco River.

/438/ It is known that there are at least 28 other Guaika settlements to the south of the Orinoco River.

• 103 162 The approximate population of the Guaika settlements with which we have had the most contact is as follows:

Majekodotedi (Platanal).	100	Kacholaotedi	100
Bichaasatedi	100	Boleitaotedi	100
Lajalaowatedi	100	Patanaotedi	120
Yabitaotedi	75	Chibardiatedi	60

361 At least eight Guajaribo settlements are known to exist in the region of the Ocamo and Lower Padamo rivers. It is known that there are others on the Upper Padamo, a few others on the Ventuari River, and still others on the Upper Caura (also called the Merevari River).

103 162 [114] The approximate population of the Guajaribo settlements with which we have had the most contact is as follows:

Iceitedi	60
Wakawakatedi	100
Kwaisitedi	100

No2 The population of El Platanal can be divided by age and sex approximately as follows:

	Men	Women	Total
Great-grandparents	0	1	1
Grandparents	6	6	12
Parents	8	15	23
Newlyweds (childless)	5	6	11
Unmarried adolescents and children	33	21	54
	52	49	101

/479/

736 Orphans in general are cared for by relatives, but when they do not have any, they are normally adopted. I have never known of any who was left in helplessness.

The Community

621 [62] The population of a seat or settlement varies between 60 and perhaps 120, but most of the settlements have around 100 inhabitants. Smaller groups are afraid to live apart, and there- [578] fore they join together to protect themselves. Larger groups soon split up, owing to internal frictions.

[622] Within the settlement there is generally one or two more influential individuals, who not only direct their own families, but several others. When these groups grow sufficiently, they split up and form their own settlements. These groups are found united in a single settlement out of fear.

621 622 578 The largest and most influential group gives orders in the settlement. The result of this is that any struggle for command will not necessarily be a test of strength between two men, but may easily turn into a struggle between the partisans of each of them. The maximum gravity reached by these contests is generally the "macana fight."

626 Public opinion is a powerful force, and even the men of greater influence have to yield on many occasions to the will of the public.

• 103 Each settlement usually has two names, the one of the present locality and the name of one of the localities previously occupied.

Sickness and Magic

752 753 Some accidents are attributed to carelessness, but many accidents and all sicknesses are attributed to supernatural causes or spirits.

10:Chagnon B-4.5 (1964-1966) 1967 SQ18 Yanoama SQ18

Zerries (1964:19) has included the groups I studied in the Shamatari classification on the basis of information taken from Mahakodotedi informants. The members of these groups, however, deny the Shamatari identity and distinguish themselves from their southern neighbors, some of whom visit them regularly and are married into their villages.

The Shamatari,[1] according to my Bisaasi-tedi informants, take their name from one of the headmen, Kayabawë ("big tree"), who lived north of the Orinoco River in a village then called Shihowë-tedi. Kayabawë was an unusually corpulent man and bore a second name, Shamatari, derived from their word (Shama) for the tapir, a large ungulate found throughout tropical South America. Shamatari, when Shihowë-tedi split, led his faction south of the Orinoco River and settled in the headwaters of the river known to the Yanomamë as the Shukunöna-u (see above), where his village became known as Mokayëaba-tedi. Other villages, related to Shihowë-tedi, moved into the Shukunöna River and Mavaca River basins after Shamatari's village was established, ultimately spreading as far southwest as the Causbury headwaters in Brazil. The Shamatari expansion into this area took place around the turn of the century, according to my reconstruction of Shamatari history (see below). This is also supported by meagre

---

[1] There is another "Shamatari" group in the tributaries of the Upper Parima River of Brazil; these are not to be confused with the Shamatari under discussion here, although both groups are Yanomamë. See Vinci, 1959, for an impressionistic account of his brief contact with the Parima Shamatari.

CHAPTER V

THE HISTORY OF FIVE YĄNOMAMÖ VILLAGES

I shall briefly outline in this chapter the history of the movements of Bisaasi-tedi, Monou-tedi, Patanowë-tedi, MŲmaribŏwei-tedi and Reyabobŏwei-tedi, including those movements during the fifteen-month period (November 1964 through February 1966) covered by my field work. The historical data I collected on village movements enable me to discuss the village histories from about 1875 to the present.

The first three of the above-mentioned groups lived together at one time and the present residents of these villages are closely related. The last site they occupied as one village was called Mamowei-tedi, and for sake of simplicity I adopt this name in the discussion of their movements up to that point in time. Similarly, the last two villages of the five mentioned above have a common history, being called Pararitawë-tedi immediately prior to their splitting in 1960.

I wish to make several points in the discussion that follows. The histories indicate (1) that villages move only when forced to do so by raids from other villages; (2) that villages are structurally unstable and tend to split into factions because of internal disputes; (3) that the newly-established cognate villages frequently enter into hostilities with each other; and (4) that it is necessary to know the

Table 5: History of Namowei-tedi, Summarized.

Site	Dates of Occupation	Reason for Abandoning Site	If Village Split, Cause of Split	Relationships Between Cognates
Konata	1875-1900	Raids from Obotawë-tedi, Boreta-tedi, Bokpoiwë-urihi-tedi and Aramata-tedi	None	---
Wareta	1900-1910	Raids from Shihowë- and Nusirawë-urihi-tedi	None	---

151

[Namowei-tedi Group]

The headman of Wareta-tedi, Shamaiyowë, and some of his kinsmen went to visit their allies on the latter's invitation, but Musirawë's group treacherously killed Shamaiyowë and two of his followers. Not wanting to participate in the raiding against their old allies, the Namowei-tedi established a new garden and moved away from the Wareta-tedi. A number of individuals in the present populations of Patanowë-tedi and Bisasasi-tedi trace descent back to the headman of Wareta-tedi, as the latter had demanded women in return for his protection. In ca. 1910 the Namowei-tedi moved to their new garden at Namowei.

Area 3: Namowei-tedi

This area is quite mountanous and the group took its name from one of the ranges, Namowei-kËkë--"sharpness." They lived here long enough to make three different gardens (Nakei, Shodemi, and Amatakë), but ultimately were forced to abandon the area because of renewed raiding from their old enemies, the Boreta-tedi. Having no friends to the north and several old enemies to the east, the Namowei-tedi moved west and established their garden at Hahoyaoba-tëka in ca. 1920.

Area 4: Hahoyaoba-tedi

The old allies of the Namowei-tedi, the Wareta-tedi, were forced to abandon their site and move west. They settled in the area immediately south of the Namowei-tedi, splitting into two villages (Hasaböwë-tedi and Ashadowë-tedi), and continued to remain on good terms with the Namowei-tedi.

174 men for the Kreibŏwei-tedi women distracted the Shamatari,
175 and a large number of Kreibŏwei-tedi managed to escape.
729 These fled to a mountain called WadubadidiobakĪkŏ where
[729] they had previously started clearing a new garden, Kobou-tĪka.
• [103] Here, the Kreibŏwei-tedi removed the arrow-points from the
[241] wounded and regained their health. They returned to Kreibŏwei-
[752] tĪka, as their new garden had not yet begun producing. Shortly
• [628] after the treacherous feast the Kreibŏwei-tedi were visited
by Shinanokawĭ, the headman of Mahekodo-tedi, and one of his
followers, Shiroba-tedi. The two men had heard of the
Kreibŏwei-tedi's unfortunate circumstances and visited them
to extend an invitation to join Mahekodo-tedi while they made
a new garden.

Area 8: Mahekodo-tedi

174 Before they left for Mahekodo-tedi the Kreibŏwei-tedi
175 undertook a revenge raid against Riakowĭ's group. They
721 killed two men and then retreated to Mahekodo-tedi, collect-
• 628 ing their women and children at Kreibŏwei-tĪka as they pro-
361 ceeded from Riakowĭ's village to Mahekodo-tedi. This was
early in 1951.

174 For the remaining months of 1951 the Kreibŏwei-tedi
175 worked on their garden at Kobou, returning to Mahekodo-tedi
361 at approximately 3-week intervals to rest and obtain more
241 plantains; these latter were carried to Kobou to sustain the
• 621 Kreibŏwei-tedi while they worked on their garden. Before
Kobou-tĪka was producing, however, the Kreibŏwei-tedi decided

[Namowei-tedi Group]

Area 9: Kobou-tika

124 125 228 241 361 722 [103]

9 The Kreibŏwei-tedi parted with their protectors as soon as this garden began producing. They lived at this site only long enough to complete their two new gardens at Monou and Barawë, moving into the latter when they, in turn, began producing. "Kobou" in Yanomamö means "let it go at that," or, in more vernacular terms, "to hell with that garden." Kobou was abandoned shortly after it was made, having served as a temporary base for the Kreibŏwei-tedi while they completed their split. It would not have been necessary to complete the splitting of the village by making two new gardens had there been no war with the Shamatari. But, as one faction of the group made their garden elsewhere, the others were reluctant to remain at Kobou and bear the brunt of the revenge raids from the Shamatari. Thus, they too made a new garden. Again, it would not have been necessary to make Kobou-tika had Mahekodo-tedi been a dependable ally. But as the Kreibŏwei-tedi suspected that their erstwhile protectors were plotting against them, they followed that course of action most expedient at the time. As they had already started Kobou, it was simply more practicable to complete that garden and move out of Mahekodo-tedi as soon as possible, rather than begin making two gardens and delay their move until these gardens began producing.

124 125 228

Areas 10 and 11: Monou-tedi and Barawë-tedi

After separating into two groups the Kreibŏwei-tedi

(Shamatari) lived in this village and, when the village split, led his faction into the Shukunčna-u basin, becoming known as the Nakayišbe-tedi. This move took place about 1900.

The second village also moved to the south side of the Orinoco, but remained on that river. They settled near a mountain called Aramamisi-kïkë, and named their village after the mountain. My historical data on the Shamatari village movements is sparse up to this point.

Between 1900 and 1950 the Mavaca and Shukunčna drainages were populated by the descendents of these two 'original' Shamatari groups, and the process of village splitting that led to the occupation of this large area continues at the present time.

Although there are two Shamatari groups (Kayabawë's and Matakuwë's), I outline the details of the movements of Matakuwë's group, mentioning Kayabawë's only in so far as it relates to the history of Paruritawë-tedi. Militarily, Kayabawë's group plays a prominent role in the movements of Matakuwë's followers up to 1920, illustrating once again that cognate villages enter into hostile relationships with each other after they separate. Thus, this section deals with the historical movements of the group that ultimately gave rise to Paruritawë-tedi; as this group also gave rise to a number of other villages, I shall have to briefly sketch the movements of these villages after their separation from the main group.

It will be immediately apparent that the Shamatari

[Pururitawë-tedi Group]

Area 1: Arasanisi-kËkë

Matakuwë's group settled here after abandoning their site north of the Orinoco because of wars with Kayabawë's group. The village at Arasanisi-kËkë, according to my informants (who could not possibly have remembered it from childhood), was immense. As the populations of the present villages of Yeisi-tedi, Nakialyoaba-tedi, Arasanisi-tedi, Konabuma-tedi,[1] Iwahikoroba-tedi, Akawaiyoba-tedi, MËwËracoba-tedi, Karawatari-urihi-tedi, Warabawë-tedi, Koherosahi-tedi, MËwaribËwei-tedi, and Kayabobëwei-tedi trace their origins to this single village, we must conclude that the village was indeed large in 1900.

A large segment of the population broke away from the main group and moved to the Mahuawë-u River, splitting into two groups after reaching that area. Their separation from the Arasanisi-kËkë population developed out of a feud over a woman within the village, and the feud escalated to mutual raiding after the separation was completed. The splinter group entered into friendly relationships with the Namowei-tedi and were their allies until about 1935, when a war between them broke out. The present villages of Konabuma-tedi, Yeisi-tedi, Nakialyoaba-tedi, and Akawaiyoba-tedi are derived from the original faction that separated from Matakuwë's group. The first three of these groups presently live in the Shakunëna-u basin, while the last one lives in the area abandoned by the

[1] There were two distinct Shamatari villages that had the name Konabuma-tedi.

others. Matakowë's group was being raided by Kayabowë's followers and by the splinter group that separated from Aramamisi-këkë. These raids forced Matakowë and his followers to abandon Aramamisi-këkë and settle at Shirakobëwei. This move took place about 1900, perhaps a few years later.

Area 2: Shirakobëwei

Matakowë's followers established several sites in this area, as they were harried by the raids from Kayabowë's followers. An internal village feud developed between the factions led respectively by Karehewë and Orakawë. During the fighting a young man from Karehewë's group was killed with a spear, and Karehewë moved to the Mavaca basin. Karehewë's followers raided the group at Shirakobëwei, and the latter reciprocated, forcing Karehewë to move further north. Karehewë's son, Riakowë, became headman of this village and played host to the 1950 treacherous feast in which the Kreibëwei-tedi lost a large number of men. This village is presently called Iwahikoroba-tedi, and is led by Riakowë's son, Bërëbëwë. In 1965 rumors reached the Bisaasi-tedi that Iwahikoroba-tedi had split into two factions, both moving down the Mavaca River. In September 1965 I attempted unsuccessfully to make the first contact with this group, but my guides forced me to turn back when we began seeing signs (bridges and trails) made by Bërëbëwë's group. They feared Bërëbëwë would kill us.

Another faction, led by Waiyabowë, split off from

conuco--cultivated areas
curiara--the native canoe
guayucos--loincloths
hamacas--hammocks
hɨwɨ̃awán--the priest
hɨnpɨrɨ̃b--a soul who goes to live in the house of Omao as hɨ̃kula-d̃ib
hɨ̃kula--an immortal and spiritual vital principle in plants and animals, different than the soul

648 agencies, so to speak, in the primeval forest. It is also one of the duties of the personnel, however, to lay out plantations for their own living, where they grow manioc, maize, sweet potatoes, bananas, mamão /papaya/, beans, tobacco, sugar cane, etc. In addition, they hunt and fish.

Since living conditions are more favorable on the Aracá and the work of the piaçabeiros (palm-fiber gatherers) is more remunerative than that of the rubber gatherers, the population here is four times as large as on the Demini. The region of the Indians begins at the Cachoeira dos Indios (Ills. 2 and 3). There is not as yet, however, any Indian protection post on the Rio Aracá.

/5/

114 III. The Ethnic Affiliation of the Surára and Pakidái

As early as the beginning of the previous century important investigators, among them Alexander von Humboldt, Robert Schomburgk, Jean Chaffanjon, and Theodor Koch-Grünberg, undertook ethnographic and in part linguistic studies in the northern and western part of the area between Rio Branco, Uraricuera, Serra Parima, and Rio Negro among a few groups of the Xiriána /Shiriana/ (5b) and Waiká /Waica/, which were broadened and

[104] 5b. X is pronounced like sch /in German/.

deepened by Otto Zerries and Meinhard Schuster in 1954/55, especially with regard to the Waiká (6a) (Waika) in the catchment

[194] 6a. When the Surára and Pakidái pronounce the tribal name of the Waiká, their worst enemies, they always accent the final a.

[197] area of the upper Orinoco (6b). Their work was supported by North

114
197 (for him Shirianá, Shirianán), but disregards the unknown Pusarakaú (10). His attempt at a classification of this family, in

10. Mason, 1950, p. 254.

which he subordinates the Waika (Waicá) to the Siriana (Shirianá) /135/ and contrasts the two, put together as Waharibo (Guaharibo), Karimé (Carimé) (11), remains questionable (cf. p. ?). It has

11. Ibid.

been taken over and expanded by N. A. McQuown, however, whereby he again introduces the unknown Pusarakaú and adds a questionable, likewise linguistically unknown Guaharibo (12).

12. McQuown, 1955.

114
100 Since in McQuown's work the classification is not clear, I am
197 giving it here in the form of a table, in which I am retaining the not always fortunate orthography of McQuown:

Z. 15. CHIRIANAN.

a. Guahariban. Ven. Br.

α. Chiriana (861). N2-4° W61-64°30' Br.

β. Uaica (860). N1°30'-2° W62-4°, N3°30' W63°39', N4° W62°† Br.; N2-3° W64°, N3° W65° Ven.

γ. ? Guaharibo (495). N3° W65° Ven. Br.

b. Carime (845). N4° W64° Br.

c. Pusaracau (844). N3° W64° Br.

"Ven." means Venezuela, "Br." Brazil; the numbers in parentheses after the names of languages refer to McQuown's place-maps; the other data are the geographical co-ordinates of the places where the languages are spoken or (if followed by †) were spoken (in this connection it should be noted that Karimé erroneously appears on the north bank of the Uraricuera instead of on the Catrimani, considerably to the south of it [approximately N1°30' W62°30']).

/135 cont./

114 197 however, Čiriana and Čapakura are still to be regarded as two independent linguistic groups.

128 197 In the following, only a small selection of Surára words are offered, along with the corresponding words of Waika (according to Schuster) (16), Karimé (according to Salathé, 1932),

(122)

16. My sincerest thanks are due Herr Dr. Meinhard Schuster, Frankfurt, for the willingness with which he put at my disposal an excerpt of the Waika linguistic material that he is working on.

Širianá (according to Koch-Grünberg, 1928), and Warema (according to Vinci, 1956), in order to illustrate the close relationship that exists between these languages. The chief criterion for the selection was the availability of documented forms in the five languages; moreover, care was also taken to draw on words of a "non-cultural" nature for the most part, that is, /136/ those that are not so frequently taken over by neighboring languages and thus -- if agreeing morphologically and in meaning -- represent stronger proof of the genetic relationship of the languages compared. Becher's linguistic notes were made chiefly with Surára informants; for the designations of body parts, however, there were also additional forms (marked by P) which a Pakidái informant gave him.

104 194 The transcription of the five lists has been standardized; that of Karimé has also been simplified somewhat by the fact that two h and š sounds not adequately described by Salathé have been reproduced simply as h and š. With respect to the transcription, the following should be noted: ë = middle, back (or central), unrounded vowel; ï = high, back (or central), unrounded vowel; ã, etc. = nasal vowel; ɛ = open e; š = unvoiced, alveopalatal fricative; x = unvoiced, palatal fricative; ? = glottal stop; : = length for the previous sound.

CHAPTER I

YĘNOMAMÖ CULTURE AND EARLIER ANTHROPOLOGICAL WORK[1]

101 ### A. Yąnomamö Culture

The Yąnomamö are discussed in the literature under such tribal designations as Guaica, Waika, Guaharibo, Makú, Sohiriana, Xiriana, Kirischana, Shidishana, Shamatari, Sanema, and Yanoama. Most of the terms are derogatory names applied to the Yąnomamö by their neighbors and characterize the people as being monkey-like or as savages.[2]

[104] In the upper Orinoco and the Mavaca basin where I conducted my field work, the Indians referred to themselves as Yąnomamö, which at once defines their mode of life, language, origin, and includes all people who share this mode of life, language and origin. All non-Yąnomamö are collectively

---

[1] As there are very few reliable English sources describing Yąnomamö social organization and culture, I give a brief description of them here. The best source in English to date is Zerries' 1955 publication, but it deals only with particular traits of Yąnomamö culture.

[127] [94] [104] [2] The word Yąnomamö is nasalized on every syllable, but for ease of typing this manuscript, I have not indicated all the nasalization. The vowel /-ə-/ is written /-ë-/. I have written the /- ə -/ as "-ë-" and have indicated nasalization by /-,-/; whenever a Yąnomamö word has one nasalized syllable, all syllables in that word are nasalized.

amoamo--dancing and singing of Yanoama men at feasts
basho--a large monkey. very desirable as food
broke--empty or void
buhli--one kind of human soul: will: self
date--a thick. sweet soup made from boiled plantains
ebene--a hallucinogenic drug
hashimo--a type of grouse hunted
hearoya--"husband"; the group from which a woman gets a husband
hekura--demons used by the shaman
henicmou--the week-long hunting trip of the men
hikari thka--a garden or jungle that has the potential for becoming a garden
humbou--state of emotional disequilibrium
mashi--exogamous patrilineal lineages; species. group; cluster of similar things
no borehoe--buhli after death
nomohoni--treachery
noreshi--a sort of spirit or portion of the soul. and in addition an animal that lives in the jungle and corresponds to this soul.
no uhudi (or hore)--the portion of the soul released after cremation
roo--"squatting"; menstruation
shabono--permanent house made out of wood material

104

shabori--shaman
shobariwaka--hell
shoriwae--brother-in-law
suaboeya--"wife"; group from which a man takes his wife
waiteri--fierce one
yai--spirits
yobõmou--girl's first menses

Fig. 3–1. Ideal Yąnomamö marriage pattern.

Fig. 3–1 can be presumed to represent the organization of a particular village over five generations, starting in the year 1888. Let us assume that the village originated in that year when individuals x_1 (and his sister, not numbered) and y_1 (and his sister) broke away from a larger village and established their own garden at some new location. Thus, in the year 1888, the village was comprised of two groups of kinsmen, X and Y. These two kinship groups are called lineages, the distinctive features of which I will discuss later.

In generation I, x_1 married the sister of y_1 and, in exchange, gave his own sister to y_1 as wife. This marriage practice is called *brother-sister* exchange and characterizes Yąnomamö marriage behavior. A man is under considerable obligation to *reciprocate* a woman to the kinship group from which he has taken one. In Fig. 3–1, x_3 married y_1's sister and reciprocated the exchange by giving his own sister to y_1. Because of this obligation of reciprocity, kinship groups become interdependent socially and form pairs of woman-exchanging kin groups. These paired kinship groups are discussed below in the context of village fissioning.

In generation II of Fig. 3–1, the village still contains only two groups of intermarrying kinsmen. These are the children of the individuals who founded the village. The reciprocal exchanges of women between the two groups of kinsmen (lineages X and Y) continue in the second generation, x_2 getting his wife from lineage Y and vice versa. Like their fathers, x_2 and y_2 exchanged sisters. It will be noted at this point that x_2 has married his mother's brother's daughter, who is simultaneously his father's sister's daughter.[1] This is a logical consequence of the fact that there are only *two* lineages in

[1] This is called bilateral cross-cousin marriage. See glossary for definitions. Hereafter the following abbreviations will be used, following Murdock, 1949: Mo—mother; Fa—father; Br—brother; Si—sister; So—son; and Da—daughter. Thus, "mother's brother's daughter" is simply MoBrDa.

11: Chagnon E-5 (1964-1968) 1968 SQ18 Yanoama SQ18

Glossary

AFFINES: Relatives by marriage. These can also include blood relatives when, for example, a man marries his mother's brother's daughter. The word "cognate" is used to describe those blood relatives who are related by marriage. Cognates also include kinsmen who have a common ancestor. 104

AGNATES: Persons who trace their relationships to each other through males. This is distinct from cognatic kinship, where the relationship may be traced through either males or females.

BANANA, WILD: A distant relative to the common banana, but producing a fruit pod that is very different from the banana. The pod contains seeds that taste like maize. It is the only American member of the Musaceae family. Plantains and bananas now cultivated by the Yąnomamö were probably introduced to the Americas after Columbus.

BIFURCATING MERGING: A term used to describe the widespread type of kinship system in which an individual's paternal relatives are distinguished (bifurcated) from maternal relatives in the terminology. Furthermore, a single term is used in reference to, for example, father and father's brother; that is, they are merged terminologically into the same kinship category. The Yąnomamö have the most commonly found variant of this type, the Iroquois system. *See* Iroquois kinship terms.

BILATERAL CROSS-COUSINS: In practical terms, an individual's mother's brother's children *together with* his father's sister's children. Unilateral cross-cousins are mother's brother's children *or* father's sister's children, but not both. These two terms are frequently ued in discussions of types of marriage rules found in primitive societies. Mother's brother's daughter is a *uni*lateral cross-cousin; properly speaking, she is a *matri*lateral cross-cousin. In Yąnomamö (Iroquois) kinship this person is simultaneously father's sister's daughter. Some societies have rules forbidding marriage with the latter type of cousin, that is, they have a *uni*lateral cross-cousin marriage rule. *See* Cross-cousins.

COGNATES: Individuals who are related to each other through either males or females. *See* Affines, Agnates.

CORPORATION: A group of people sharing some estate, having definite rights with respect to each other and to the estate, and able to demonstrate their membership to that group by citing a recognized rule concerning recruitment.

CROSS-COUSINS: The children of a man and his sister are cross-cousins to each other. The children of a man and his brother are *parallel* cousins to each other. Similarly, the children of a woman and her sister are parallel cousins.

11: Chagnon E-5 (1964-1968) 1968 SQ18 Yanoama SQ18

• 104 DEMOGRAPHY: The study of populations with the intention of gathering certain kinds of vital statistics, such as birth rate, death rate, and family size.

DEMONSTRATED KINSHIP: Tracing relationships to kinsmen by citing the putative biological links. *See* Lineage.

IROQUOIS KINSHIP TERMS: Classifying both kinds of cross-cousins (matrilateral and patrilateral) into the same kinship category and distinguishing them from brothers and sisters and parallel cousins. In most Iroquois systems the parallel cousins are called by the same terms that are used for brothers and sisters.

LEVIRATE: A rule enjoining a man to marry the widow of his dead brother.

LINEAGE: A kinship group comprised of people who trace relationships to each other through either males or females, but not both. If the relationship is traced through males, as among the Yąnomamö, the group so defined is a *patri*lineage. The distinctive feature of the lineage is that the relationships are demonstrated by citing genealogical links. In a clan, relationships are merely *stipulated* by citing the fact that the two individuals in question belong to the same named kinship group. In short, a clan is a *named lineage* the members of which do not remember or do not care how they are related to each other biologically. *See* Demonstrated kinship.

LOCAL DESCENT GROUP: Among the Yąnomamö, a group of people who are related to each other patrilineally, who live in the same village, and one of whose major functions is to arrange marriages for the younger members of the group. It is usually the older males of the group who arrange the marriages.

MACHETE: A broad-bladed, long knife commonly used throughout South America for cutting brush. The closest English equivalent is the cutlass.

MATRILATERAL: Tracing relationships on the mother's side.

PATRILATERAL: Tracing relationships on the father's side.

PLANTAIN: A member of the banana family. The fruit looks like the common banana, but is considerably larger. When ripe, the fruit resembles the common banana in taste, but differs in that its texture is crude and stringy. Plantains are usually eaten cooked. Green plantains resemble raw potatoes in taste, even after cooking. Plantains appear to have been introduced to the Americas after the arrival of Europeans, but they spread with such rapidity that many early travelers described them as being native crops. (*See* References, Reynolds, 1927.)

SIBLINGS: One's brothers and sisters.

SORORAL POLYGYNY: A type of marriage in which a man marries two or more women who are related to each other as sisters.

TEKNONYMY: The practice of addressing an individual by the name of one of his children rather than by his own personal name. A kinship term is used in combination with the child's name, such as *father* of so-and-so.

105

105 CULTURAL SUMMARY--synopsis of the whole culture (as a background for specific information); references to summaries in other works. See also:

Cultural history . . . . . 17 Ethos 181

/121 cont./

166 Therefore two types of nomadism are superimposed on each
221 other in the migratory movements of the Waika: the nomadism
241 of the very active hunting for wild food, which is represented today
as a radial movement from an agricultural central-point, stamps
182 the annual cycle, whereas the agricultural village-move, which follows the fields cleared by burning, occurs in a cycle of a few years and has a greater spatial range than the wild-food forays. To express it in a different manner: a wild-food nomadism more restricted spatially and temporally fills out the periods of the more extended agricultural migrations. Even at the ends of these periods, when both cycles overlap, they are felt by the Waika to be quite different matters and not mutually substitutable: after they have worked for a time in the new, scarcely begun planting, and the external reasons for a forest sojourn (such as change of living place and more favorable possibilities for gathering and hunting) are assuredly present, they still move off once more in the traditional manner to another place in the forest -- the laying out of a new plantation, even with the great similarity of external circumstances, is basically different from the forest life of hunting for wild food and in no way a substitute for it.

162 The short sojourns in the forest are, as was said, usually
621 made by the whole village, whereas with the laying out of new
182 plantings the group of families comes into the foreground as the
174 working unit. One might conclude from this fact that the formation and the sociological importance of the groups of families is connected with the introduction of agriculture. I should like to make the opposite conclusion, however, that merely the old wild-food settlement-unit has maintained itself in these groups of families in the present larger agricultural village-society. The relationship of the groups of families to hunting for wild food is clear from the fact that the gift-exchange carried on by the groups of families is quite predominantly an exchange of meat, to which a few roasted bananas are added, and can only take place after a hunt.

● 105 Thus the sociological findings regarding the larger social
621 units of the Yanoama reflect the picture of the other cultural
182

/121 cont./

105
621
182

realms of this people: /122/ elements related to hunting for wild food, such as the group of families connected by kinship in various ways, for which, in accordance with its structure, one could probably use "roving horde" or similar terms, have held their ground and actively maintained themselves against those forms connected with agriculture and sedentariness, in our case the permanent village society. The Waika are now just at the point where the high economic preponderence of cultivated plants is beginning to make corresponding changes in the noneconomic cultural spheres.

/187 cont./

105 181 241 245 266

The Guaika (Waica) are considered by the above-mentioned author as "the natives with the most primitive and wild life of all those inhabiting the great region of the Venezuelan Guayana..." They have an incipient agriculture; they cultivate bananas and plantains as the principal basis of their diet, which they complement with the fruit of the pijiguao palm. They practice endocannibalism, consuming the bones of the cremated dead.

286 342 411 491 514

Their hammocks are knotted, their houses are triangular, and they use bows and arrows of various types, according to their uses. They keep the bones of many animals, travel by land, very rarely by water, and build bridges similar to the style of the Guaharibo (Sanemá).

/188/ Regarding the Shirianna (Casapare), Montoya says (1958) that "the real Shirianna live on the banks of river, building very stable settlements and devoting themselves to an agriculture already relatively advanced." They obtain curiaras from the Mayoncon, but have also learned to make their own, although in a rudimentary way. They use bows and arrows for hunting, but "above everything else, they are traders and travelers. They constantly travel into Brazil, leaving from the upper Paragua, using the route of the Shoropae River, Urarikuera and Parima, to Boavista. They differ from the other natives of the Paragua basin in that they are tall and strong, healthy, and well nourished.

361 241 484 439 411

142 146

114 101

The last report on the Yanoama of the northeast was published by Gheerbrandt (1955, pp. 345-349), and in this report there appears for the first time the name Kaserapai, which must be an orthographic variation of the name Casapare which we use to designate a whole subtribe and not only a local group as the above-named author has done.

101 114 648

Navigating the Uraricuera in the year 1950, Gheerbrandt met and heard of various Yanoama groups with different names. Very near the Sierra Marutani he came upon the Guadema on the left bank of the river named. The Guadema were very much afraid of the Kaserapai, who had killed the majority of the Guadema and were in open conflict with Waikas and Waitschas on the Uraricuera. It is possible that this may be a reference to an encounter between Sanemá, Waica, and Casapare groups, but the extant data offer no certainty in this regard.

/201 cont./

342 The two windscreens had two posts stuck superficially into the ground at a distance of two meters apart. Contiguous to the post there was a smaller stake tied to it with a bejuco. The roof of this screen was covered with interlaced branches and roofed with platanillo leaves and supported with a slight inclination against two posts. The roof projects from the posts some 40 centimeters and touches the ground at its lower edge. In these houses the Sanemá hang their hammocks of bejuco or majagua. In some ranchos we found vestiges of fire. [352]

177 342 The houses of Makiritare type (rectangular or oblong) are small-scale imitations and have only one room. The roofs, made of palm leaves, are of two rectangular slopes and are raised on four or six posts. The edges of the roof are straight or rounded. The walls consist of bark or juxtaposed sticks. They have an average dimension of four meters long by two meters wide and approximately three high. Each house has one or two quite narrow doors. Within the house (of the Makiritare type) the greatest disorder reigns: from the roof and from the walls hang baskets, gourds, weapons, leather bags, tobacco, palm fruit, hammocks /chinchorros/ of bejuco, majagua, and cotton. On the floor there are hearths, firewood, cooking utensils, guapas with spindle and cotton, yuca graters, dogs, and children, all in confusion without order or arrangement. It is clear that they are not used to living under a roof, and the house is a place for storing things rather than a habitation. 353 [179]

● 105 422 484 The technology of the Sanemá is very little-developed, and precisely for this reason one can classify the Sanemá (and the Yanoama in general) as representatives of the most backward peoples of America and of the whole world. It would seem that the ideal of these seminomadic Indians is: omnia mea mecum porto -- everything that is mine I carry with me! and, apart from their weapons, a few implements, and a basket, it is unusual for them to carry anything else on their travels. They do not even transport their hammocks /202/ of bejuco or majagua from one camp to another, but rather make new ones each time they need them. [352]

St Layrisse et al. D, E-5 (ca. 1960)1962 SQ18 Yanoama SQ18
Waica

since Koch-Grünberg's contact with two Yanoama groups, in 1911, that more substantial information on this interesting tribe has been collected and in parts been published.[2]

Emerging from these data are the names and descriptions of a number of distinguishable tribal units, e.g., Sanemá (Guaharibo, Shirishana), Casapare, Waica, Samatari, Surara, Pakidái, and others. It also has become quite obvious that the Yanoama subtribes are not unified by socio-political authority, but rather by a general and specific culture type, which in turn is integrated by a series of subcultures and culture variants, carried by the different subtribes and local groups respectively. The various local groups and subtribes occupy a coherent territory, they speak more or less closely related languages and display essentially similar economic, sociological, and religious forms.

Taken as a whole, the Yanoama were found to be a very numerous tribe and they belong, in fact, to the most numerous of all the autochtonous populations of lowland South America, but previously published figures of 30-50,000 individuals appear to represent very generous overestimations of the demographic strength of the Yanoama groups known so far.

Linguistic classification. Several authors have attempted a linguistic classification of the Yanoama although most of them did not have at their disposal the more recent material.[3] Taking advantage of this material, we have attempted a glottochronological analysis, the results of which allow us some interesting insight into the internal correlation of the Yanoama languages.[4]

According to this result, the several Yanoama languages, as known today, constitute the Yanoama linguistic stock of 6-35 mc of internal separation. The two more or less clearly distinguishable families of the stock are: *A. Sanemá:* (a) Sanemá, (b) Nabudîb, (c) Pubenatari, [6-17 mc of internal divergencies: Sanemá-Nabudîb = 6 mc, Sanemá-Pubenatari = 17 mc, Nabudîb-Pubenatari = 17 mc]; *B. Casapare:* (a) Casapare, (b) Carime (?), (c) Waica, (d) Samatari (Surara and Pakidái), [8-21 mc of internal divergencies, excepting Carime (for lack of vocabulary material): Casapare-Waica = 21 mc, Casapare-Samatari = 21 mc, Waica-Samatari = 8 mc].

2 Surara-Pakidái, by Becher, 1960; Waica, by Becher, 1953; Schuster, 1958; Zerries, 1955, 1956, 1958a, 1958b, 1959, 1960; Sanemá, by Vinci, 1939; Wilbert, 1961a, 1961b.

3 Rivet, 1924, p. 678; Loukotka, 1944, pp. 8-9; Mason, 1950, p. 254; Rivet and Loukotka, 1952, p. 1140; McQuown, 1955, p. 525; Greenberg, 1956; Swadesh, 1959, p. 20; Dall' Igna Rodrigues, 1960, pp. 136-137.

4 We are indebted to Drs H. Becher and O. Zerries for having us have a basic vocabulary of Surara-Pakidái and Waica respectively. Complete information on source material has been presented by Wilbert, 1961a.

St Layrisse et al. D. E-8 (ca. 1960)1962 SQ18 Yanoama SQ18
Waica

In 1913, Koch-Grünberg[5] had observed that Yanoaman was different from Cariban and that it apparently represented an isolated language. While this opinion was shared by the majority of authors who subsequently referred to the language, two American linguists have recently broken with this tradition by forwarding suggestions of possible affiliations. Greenberg[6] classified "Shirianá" as a distinct group belonging to the "*Chibchan proper*," subfamily of the "*Macro-Chibchan*" family, and Swadesh[7] established a "*Macro-Siriana*" with an internal separation of 30 mc, including Chapacura (27 mc), and Sirioana (21 mc). He later suggested (personal communication) that Waraoan should also be reckoned in "*Macro-Siriana*," which would increase the internal divergence of this microphylum to that of 72 mc. Since the latter suggestion is of major interest to the distribution of the Diego antigen, we shall return to the discussion of the same after having presented the material on the Waica blood groups.

Cultural aspects. The Yanoama are a semi-nomadic forest people who rely for their subsistence chiefly on hunting, gathering, and arboriculture. Fishing is of a very subordinate importance and only peripheral groups, such as the northern Sanemá, have adopted agriculture from neighboring tribes. Although arboriculture is of vital importance among most of the Yanoama subtribes (plantains [*Musa paradisiaca normalis*], and pupunha [*Guilielma gasipaes*]), there can be little doubt that the basic economic and cultural pattern of the Yanoama has remained essentially on a Paleo-Indian culture level of the early hunting peoples of South America.

Yanoama technology is very little developed. The Waica produce thick-walled conical cooking pots, and Yanoama women make large twined carrying baskets. Cordage, belts, and one type of hammock are made of planted cotton, but weaving and metal work of any kind is unknown. Recently, several Yanoama groups have learned how to make dugout canoes, but their crafts and paddles still lack the perfection of the same artifacts among their masters (e.g. Caribs). Very long bows and arrows are the main weapons of these Indians, but stick-clubs may antedate the former.[8]

The local groups of the Yanoama are composed of bands of several extended families with nuclear family households. Residence rules have, as yet, not clearly been established, but judging from the Sanemá of the Erebato and from the

8 Only the Waica were reported to make pottery, and the planting of cotton is very recent.

St Layrisse et al. D, E-6 (ca. 1960)1962 SQ18 Yanoama SQ18
Waica

Waica,[9] there seems to be a strong tendency towards bilocality. Although bilocal extended families are relatively rare,[10] their existence among the semi-nomadic Yanoama could very well be possible, since there do not exist any decisive economic factors which could strongly favor unilocal residence. Among the Sanemá of the Caura (incipient agriculturists) we have observed initial matrilocal with subsequent patrilocal residence and a rather formal initiation of common residence of the spouses. Polygyny is permitted and young girls are frequently married to men even before their first menstruation. The kinship system is of the Hawaiian type.

Local groups follow the suggestions of a headman in peacetime and receive orders from a war chief in wartime. There appear to exist at least two and possibly three different religious-medical practitioners among some of the subtribes, who (*hāwiawan*) represent their community at the court of a deified Culture Hero, who (*subli*) regulate the groups' relationship to a host of animal and plant spirits, and who (*kāilala*) cure physical ailments of mainly non-supernatural origin.[11] The *subli* (shaboliwa) seems to be the most important practitioner of the Waica, among whom the *hāwiawan* has not been observed.

Physical appearance. Two authors have recently reported on the occurrence of a great phenotypical variation among the Sanemá (Samatari)[12] and among the Waica.[13] They mention four different types with more or less specific physical features:

a. A minority pygmoid type with a general stature of less than 130 cm, light skin, fine-cut faces with a gay expression, small hands and small feet.
b. Relatively tall type, dark skinned, robust, stout, and with a wild facial expression.
c. Type of medium stature, round-headed, with a feminine expression, small nose, small mouth, and yellowish clay-colored skin. Some individuals have wavy hair and brown instead of black eyes.
d. "Mongoloid" and "semi-Tartaric" type with almond-shaped eyes, frowning expression, protruding forehead and pointed chin, thin beard, slim, and of medium stature.

We shall return to this observation in a later chapter.

Summary

Tables 5 and 6 broadly summarize the movements of the five villages. As the details of the text indicate, considerably more village movement goes on than can be included in tables of this sort. The micro-movements, however, merely express in greater detail what is immediately apparent from an examination of Tables 5 and 6: the Yanomamö abandon their gardens and move to new locations because of raids from other groups. In only one instance was the movement of a village stimulated by economic considerations: site 4 was abandoned by the Namowei-tedi because of poor soil. Another exception was the abandoning of Barawä (site 10) by the Bisaasi-tedi in 1959. They moved to the mouth of the Mavaca River to gain access to steel tools, marking the beginning of their sustained contact with foreigners.

The tables also show that there were ten village splits relevant to explaining the origins of the five villages considered in this chapter. Five of these splits were due to feuds over women. In four of the cases the factions that were involved immediately entered into hostilities with each other. The recent split within Patanowä-tedi, discussed in the text (pp. 188-89), again over a woman, is not included in Table 5, as the refugee group did not form a new village of their own. Three village splits in Tables 5 and 6 developed out of minor feuds, usually over women, brought about by large village size. In one case, the factions ultimately entered into hostilities with each other, whereas in two cases the factions still remain on friendly terms.

000 the factions still remain on friendly terms.

*621 *628 578 726 105 Material presented in the discussion above--details of the movements of factions that are not relevant to the origin of the five villages considered here--also support the contention that villages split over internal feuds. That villages are structurally unstable is evidenced by the sheer number of village splits and the fact that the related factions enter into hostilities with each other after separating. Data I collected on village movements for other Yanomamö groups support the conclusions I reach here.

*621 *628 602 582 583 105 [613] One can see that the process of village splitting leads to the formation of independent villages that comprise closely-related kinsmen. Intuitively, one can also see that marriages "between" such villages, i.e., between spouses that each claim to be of different villages, do not necessarily represent political alliances between those villages, for in many cases the marriages were contracted between the local lineages involved before they separated. This is not to say that all the cases of this sort can be dismissed in this fashion. Some marriages between ambilateral cross-cousins are in fact properly interpreted as marriage alliances between villages, for occasionally related villages enter into alliances with each other. In these cases, the marriages between them come about for essentially the same reasons that the exogamic marriages between unrelated groups occur. In short, the existence of the marriage rule alone does not account for alliances between related groups that enter into politico-military pacts.

11: Chagnon E-5 (1964-1968) 1968 SQ18 Yanoama SQ18

guishing feature that sets it aside from other groups of Yąnomamö. Many wild plants are also said to have magical properties.

CONCLUSION The Yąnomamö have adapted to their jungle environment with a very simple technology. Exploiting both the naturally occurring foods and domesticated crops is relatively easy with this technology, and the resources of both the jungle and the garden provide the people with the two basic necessities of life: food and shelter. Although the resources are extremely varied and numerous, the diet is largely dominated by one food item: plantains. Techniques of manufacturing are so simple and direct that each individual can produce any item he needs from the resources immediately around him. The material aspect of the culture is decidedly rudimentary by comparison with other tropical forest tribes; the Yąnomamö appear to deliberately limit their possessions to an amount that can be easily transported in case the group is obliged to abandon its site on short notice.

Adaptation to the Sociopolitical Environment

The adaptation of the Yąnomamö to their environment can be only partially expressed in terms of how they make a living in the tropical forest with specific kinds of tools, plants, and techniques, for the forest is only one aspect of the external world to which they must adjust. Their adaptation also takes place in a social and political environment. This likewise affects the way in which the Yąnomamö are distributed over the land, how their villages are moved from one location to another, and the kinds of relationships each village has with its neighbors. In short, the Yąnomamö must relate themselves to each other as well as to nature.

ALLIANCES AND VILLAGE SIZE I spoke of the considerations that must be met when a new garden site is selected. However, the area within which the new site is selected is determined almost exclusively by political factors. A Yąnomamö group would remain indefinitely in the area it settled were it not for the threat of raids from warring neighbors. To be sure, the group would move its garden little by little each year, but the general area would be abandoned only if the people were driven out by stronger groups around them. Again, dissident factions of the village might leave the area if a particularly serious fight developed within the group, but because a garden is necessary for the group to survive as a group, the Yąnomamö abandon them only when faced with disaster. To establish a new garden at a great distance from the old one, a Herculean effort is required just to transport the necessary plantain cuttings and seed, not to mention carrying provisions for eating while the work of clearing the garden and planting the crops progresses. Then, since a new garden produces sporadically for the first year, the people are frequently faced with food shortage. They are, therefore, reluctant to sacrifice the predictability of subsistence at the established garden for insecurity, periods of hunger, and hard work at some distant location.

Instead, they develop political alliances with neighboring villages, thereby adjusting to their social environment. The nature of these alliances is discussed in detail in Chapter 4, but at this point I will make some general statements about the relationships between villages to show why, on the one hand, the social environment calls forth the alliances, and why on the other hand, when alliances fail, a group must abandon its area.

11: Chagnon E-5 (1964-1968) 1968 SQ18 Yanomama SQ18

SHAMANS The nature of the relationship between man and spirit is largely one of hostility. The shamans, by and large, spend most of their time casting charms on enemies and enjoining their own personal demons to prevent harm from befalling the local people. Magic and curing are intimately bound up in shamanism, the practitioner devoting his efforts alternatively to causing and curing sickness.

The demons that the shamans contact are *hekura*, very tiny humanoid beings that dwell on rocks and mountains. Particularly successful shamans can control these demons to such an extent that the *hekura* will come and live inside the chest of the shaman. Each shaman solicits the aid of numerous *hekura* and attempts to lure them into his body.

Men who want to become shamans (*shabori*) go through a simple rite of fasting and chastity. They sit before their houses, use only a few trails, eat very little, and spend most of their time in a contemplative stupor brought about by hunger and drugs. After several days of this, the initiate has entered the world of the *shabori*, and can practice his skill. Each village has as many *shabori* as there are men who wish to enter this status: probably half of the men in each village are shamans.

Rerebawä told me that he was going to become a *shabori*, as he enjoyed taking the drugs and making contact with the spirit world. He decided to do this because his wife is still nursing their youngest child so that he cannot have sexual relationships with her anyway; the obligatory chastity associated with becoming a shaman will not be as difficult now as it would be when his wife weans the child. No *hekura* will dwell in the chest of a novice *shabori* who continues to have sexual relationships. After the practitioner has captured the *hekura* and they become acquainted with him, they will stay in his chest after he resumes his sexual activities.

Contact with the *hekura* is achieved by taking drugs. Particularly adept *shabori* can contact their *hekura* with only a pinch of drug, which they inhale directly from their fingers. Most of them, however, take a large dose of the drug by means of the hollow blowing tube. The *shabori* then prances back and forth in front of his house and chants to the demons he attempts to control, enjoining them to descend on enemies and cause them sickness (see Fig. 2-9). If he is curing someone, he chants before the house of the patient, rubs him, massages him, and draws the evil spirit causing the sickness to some extremity, such as an arm or leg. Then he sucks or pulls the spirit out and carries it away from the sick person, either vomiting it out or throwing it away, depending on how he extracted it originally. The Yanomamö do not employ medicines made from plants or animals. Consequently, they rely exclusively on the cures that the *shabori* effect, fighting supernatural ills with supernatural medicine.

One of the surprises of my field experience was that I had to spend a great deal of time curing the sick, and my medicines were always in demand. The sick people, however, always took their illnesses to the *shabori* after I had treated them—one cannot be too careful.

CONCLUSION In summary, the Yanomamö have effected an adaptation to their three environments. This is not to say that other means and techniques could not do the job equally well; but the peculiar combination of technology, social organization, and cosmology found among the Yanomamö distinguishes them as a group from all other tribes. Although their technology is primitive, it permits them to exploit their jungle habitat sufficiently well to provide them with the wherewithal of physical comfort. The nature of their economy—slash-and-burn agriculture—coupled with the fact that they

11: Chagnon E-5 (1964-1968) 1968 SQ18 Yanoama SQ18

have chronic warfare, results in a distinctive settlement pattern and system of alliances that permits groups of people to exploit a given area over a relatively long period of time. Finally, the Yąnomamö explain the nature of man's ferocity and origin in myth and legend, articulating themselves intellectually with the observable, real world.

Thus, each individual Yąnomamö enters the world with the physical, social, and ideological traditions at his disposal that will permit him to confront and adjust to the jungle, his neighbors, and the demons that cause sickness. The cosmos is ordered and orderly, in *fonda* as it is on earth.

/As an ethnographical account, this study goes into exact details on material culture, religious activities, and political structure. Social organization, in particular kinship, finds only limited discussion. The author provides the native terms for most culture elements under description. When discussing individual culture elements he points out their distribution in other parts of South America, and gives his own as well as other anthropologists' theories on the origin and migration of the particular element. During his stay in the field the author learned the language of these two Yanoama tribes. He held a most sympathetic attitude toward the Indians and was fully accepted by them.

8 maps (1 unnumbered); 26 illustrations.

HRAF Copy. /HRAF MS: pp. 1-115/.

Translated from the Spanish for the Human Relations Area Files by Sydney Muirden.

[This source encompasses only the introduction and one chapter (the Sanema) of the author's major work dealing with the Indians of the Orinoco-Ventuari region of southern Venezuela. The introductory portion deals primarily with the geography of the region and the location and basic identification of the various tribes inhabiting the area, specifically (in addition to the Sanema), the Makiritare-SS20, the Saliva--SS15, the Guahibo-SC14, the Yabarana-SS22, the Panare-SS21, the Puinave-SC18, the Barauna-SQ27, the Achagua-SC5 and the Venezuelan Indians-SS4. Data pertinent to the above ethnic groups have been given appropriate sub-heads in the text. The chapter on the Sanema (which incidentally covers other sub-tribes of the Yanoama in addition to the Sanema proper, as well as other OWC tribal groups), presents a general coverage of information on such aspects as: intertribal relationships; early European accounts of contacts with the Sanema; locality of settlements and population statistics of the Sanema on the upper Caura (Pubmatari), the upper Erebato (Sanemadub), and the upper Ventuari (Nabudub); house types; technology; clothing and body painting; a linguistic study of the language

4: Wilbert, Johannes.

based on glottochronological analysis of the vocabularies of the various Yanoama sub-tribes; genetic relationship of the Diego gene in the population in terms of linguistic affinity; food gathering and agriculture; domestic animals; the family, marriage customs and residential patterns; community structure; religion and the religious hierarchy (shaman, priest and magician); political organization (i.e. the chief); puberty; death customs; and mythology.

The author frequently uses native terms in the text which in many cases he fails to define, thus the source would benefit greatly if there had been a glossary. A brief glossary prepared by the analyst appears in category 104. The bibliography and table of contents will be found only in the foreign text, pp. 247-263 and p. 265 respectively.]

HRAF copy.

[Although this source is basically a blood group study of the Waica Indians, the first five pages contain a cultural summary of the Yanoama which should serve as an excellent background for the understanding of the people as a whole. After a discussion of the results of the blood group antigen tests with the Waica, the authors compare their results with the frequency of similarly occurring antigens among other marginal ("Paleo/Meso-Indian") people, primarily the Warao and the Yaruro. On the basis of their genetic analysis in conjunction with other linguistic and cultural evidence, the authors present the hypothesis(based on sampling of the Waica and Warao data) that "...the establishment of the genetic identity of two tribes with respect to the Diego blood gene has led us to assume that Paleo-American Man in Venezuela, although phenotypically different, is homogeneous for the Diego gene. Probably, in response to a changing environment, he developed two different culture types still traceable among his modern descendants.]

HRAF Copy.

[Among the Yąnomamö Indians social relationships between members of a group as well as with persons outside the group are marked by highly aggressive behavior. Villages split frequently due to conflicts between residents. Warfare is most frequent and fierce between villages which have developed from such a split. The most frequent cause for intra- and intervillage conflicts is the shortage of females, created by female infanticide and polygyny. Abduction of women is a main goal of warfare. Alliances between villages are dictated by the warfare situation, and are very unstable. The militarily weaker village has to cede women to the stronger one as price for the protection granted. Apparently this situation of extreme aggression does not apply to all Yanoama groups, but primarily to the ones in the Mavaca Basin of Venezuela. Among the groups of the Uraricaa river area in Northern Brazil warfare is by far less frequent.]

[This monograph on the Yanoama is based on a two year stay in the field; the research being conducted in the native language.

The Yanoama in the tropical forest between the Rio Negro and the Orinoco, live on the cultivation of various food plants, of which plantains are of major importance. Yanoama society is marked by a chronic state of warfare, which determines not only intervillage relationships, but also relations between individuals of the same community, and even of the same family. Interpersonal as well as inter- and intracommunity relations are marked by constant distrust and display of fierceness to prove superiority.

This book also contains a very interesting description of the author's personal experience as field worker.]

1 map.

Yale: S14 305 50.

[In this article, Zerries divides these two groups into four physical types: a pygmy type, not over 130 cm. tall, light skin, fine features, with very small hands and feet; a relatively larger type with a darker skin tone; a medium large type with round heads, very small nose and mouth, some having wavy hair and brown instead of black eyes; and a Mongoloid "half-Tartar" type with almond-shaped eyes and sharp chin. He gives some data as to their distribution and adduces some historical causes for these various body types.]

YV 127 128

/19 cont./

In the present report we use most of the extant data, and their compilation, ordering, and selection, together with our own personal contribution, constitute the study which we present here on the Indians of this part of Venezuela.

YV 114 128 ● [113]

For our purpose we followed the footsteps of the great Venezuelan ethnologist, Lisandro Alvarado, who, with the publication of his book, Datos Etnográficos de Venezuela /Ethnographic Data of Venezuela/, took a firm step toward the great task of compiling /20/ all the objective material written over the course of many decades regarding the native tribes of this part of the world (2).

YV [113]

2. Obras completas de Lisandro Alvarado /Complete Works of Lisandro Alvarado/, Vol. 4 (Ministerio de Educación, Dirección de Cultura y Bellas Artes). Caracas, 1956.

YV 128

Our report lacks uniformity with regard to the character and volume of material on the various tribes to which we refer, but this fact reflects precisely our present sporadic knowledge concerning the tribes, which, in the last phase of their autochthonous life, urgently invite the competent ethnologist to leave testimony of a human conglomerate of our ancient American continent. /Maps 5 and 6 appear here. Pages 21-176 are not included in the translation./

St Layrisse et al. D, E-6 (ca. 1960)1962 SQ18 Yanomama SQ18
Waica

We would best interpret our general culture historic problem in the sense of suggesting that there exists a high probability for the two different populations and culture types to represent simply variants of basically the same people and the same culture type. Archaeologists[30] have proved that the Meso-Indian culture type dates back to 4150 ± 80 BP (Manicuare), so that the *Warao* Meso-Indian culture type could actually date back to the time of their splitting off from the *Yanomama* who, for their part, continued to live in the Paleo-Indian tradition, and which, in turn, may date back to its most original form in Venezuela to 16,000 ± 300 BP and more.

In our particular case, then, the establishment of the genetic identity of two tribes with respect to the Diego blood gene has led us to assume that Paleo-American Man in Venezuela, although phenotypically different, is homogeneous for the Diego gene. Probably, in response to a changing environment, he developed two different culture types still traceable among his modern descendants. A detailed analysis of the contents of both cultures would greatly substantiate this hypothesis, but in the limited frame of the present paper we shall have to refrain from doing so.

In closing this discussion, we would like to underline the preliminary character of our hypothesis. The culture content of the Waica and of the Warao has not been fully described as yet; the linguistic affiliation of the two tribes remains to be confirmed by profound linguistic analysis; and genetically we have little more to go by than the behavior of mainly one gene. Nevertheless, taken together this kind of threefold evidence, in spite of all the existing limitations, appears to be much stronger than the single evidence available for any one of them, and it would be highly desirable to test similar cases along the lines described above.

Film

An ethnographic film with synchronous sound in color will be available for classroom use late in 1968. It will illustrate Yąnomamö trading and feasting practices as described in Chapter 4. The movie was filmed by Timothy Asch, Director of the Center for Ethnographic Film Studies of the Department of Anthropology, Brandeis University, and Napoleon A. Chagnon, in conjunction with the Program in Ethnographic Films (P.I.E.F.) of Harvard University.

In addition, 8 mm film loops depicting various aspects of Yąnomamö behavior are currently available through the Ealing Corporation of Cambridge, Massachusetts.

Foreword

114 101 This monograph contains the results of a nine-month investigation which I conducted from October 1955 to June 1956 among two Indian tribes of northwest Brazil which are as yet unknown to science.

121 My journey and the analysis of its results were made possible through the generous support of the Deutschen Forschungsgemeinschaft /German Research Association/, for which I am deeply indebted to it.

114 I should like cordially to thank my esteemed teacher, Herr Prof. Dr. Franz Termer, for regarding this work, the completion of which he supported actively and in an advisory capacity, worthy of inclusion in the series of reports of the Hamburg Museum für Völkerkunde und Vorgeschichte /Museum for Ethnology and Prehistory/.

I was encouraged by Herr Prof. Darcy Ribeiro, head of the study division of the Serviço de Proteção aos Índios, to seek out these as yet uninvestigated tribes north of the middle Rio Negro. [122] Through his efforts I also obtained the approval of the Director and was given all possible assistance by this organization founded by Marshal Cândido Mariano da Silva Rondon, as well as a free flight with a military plane from Rio de Janeiro to Manaus. Hence I feel a sincere desire to express my gratitude to the Serviço de Proteção aos Índios, especially to Herr Prof. Darcy Ribeiro and the Brazilian Air Force.

122 I thank the University of São Paulo, above all the Dean, Herr Dr. Paulo Sawaya, and the Assistant Dean Herr Prof. Dr. Antonio Soares Amora, for granting me a stipend from June 1954 to September 1955, which made it possible for me to broaden my knowledge of Brazilian ethnology under such outstanding scholars as Herr Prof. Dr. Herbert Baldus and Herr Prof. Dr. Egon Schaden and to prepare myself thoroughly for the subsequent work in the field. To these two gentlemen I shall remain deeply indebted.

114 Valuable advice which was very useful to me on my expedition was given me by Herr Prof. Dr. med. Henrique da Rocha Lima (†).

/V cont./
114 as well as by Herr Prof. Dr. José Antonio Benton, Herr Prof. Dr. Wilhelm Saake, S.V.D., Herr Harald Schultz and Frau Wilma, all of São Paulo.

I found helpful assistance in Manaus on the part of Herr Alipio Edmundo Lage, the head of the I. Inspetoria Regional do Serviço de Proteção aos Índios, as well as in the small German colony there on the part of the families of Prof. Dr. Harald Sioli, Kurt Polack, and Gerhard Lindenberg.

122 With profound gratitude I mention my kind friends, the
123 Surára and Pakidái Indians, who were so hospitable to me and indefatigably helpful in my work; they are primarily the ones who deserve credit for the successful outcome of the undertaking.
[115] Above all the Surára chief Hewemão and his brothers Kurikayawõ and Inxinemá, my little interpreter Jibeauwõ (see p. 258), and the Pakidái chief Karenauõ and the war chief Porẽhiwõ deserve special mention here.

I also owe much to my faithful servant, the Tukano /Tucano/ Indian Mateus Dias, a member of the Indian protection post Ajuricaba on the middle Rio Demini. He was an indispensable helper to me in all emergencies during these nine months.

/VI/ I am likewise very much indebted, however, to the Brazilian country people on the Rio Negro and on the Demini and Aracá rivers, as well as to the personnel of the Indian protection post Ajuricaba on the middle Demini and the mission station of the Salesians in Barcelos. No matter where I went, I was shown such hospitality as is scarcely imaginable. Mention should be made here above all of the Spanish planter, Manuel Antonio Gómez, of the Rio Aracá, and the German nun, Klara Jakob, of the Salesian mission in Barcelos, who devotedly nursed me during my attacks of malaria. Equal thanks are due the physicians and sisters in the Hospital de Isolamento "Emílio Ribas" in São Paulo, where, after my return, I was treated without charge for two months and cured of a serious liver infection.

114 I thank Herr Dr. Koch and Herr Müller of the Bayer branch
122 in Rio de Janeiro for the medicines they donated. This made it possible for me to help many sick Indians and caboclos and to alleviate my own sufferings.

648 agencies, so to speak, in the primeval forest. It is also one of the duties of the personnel, however, to lay out plantations for their own living, where they grow manioc, maize, sweet potatoes, bananas, mamão /papaya/, beans, tobacco, sugar cane, etc. In addition, they hunt and fish.

Since living conditions are more favorable on the Aracá and the work of the piaçabeiros (palm-fiber gatherers) is more remunerative than that of the rubber gatherers, the population here is four times as large as on the Demini. The region of the Indians begins at the Cachoeira dos Indios (Ills. 2 and 3). There is not as yet, however, any Indian protection post on the Rio Aracá.

/5/

• 114 III. The Ethnic Affiliation of the Surára and Pakidái

As early as the beginning of the previous century important investigators, among them Alexander von Humboldt, Robert Schomburgk, Jean Chaffanjon, and Theodor Koch-Grünberg, undertook ethnographic and in part linguistic studies in the northern and western part of the area between Rio Branco, Uraricuera, Serra Parima, and Rio Negro among a few groups of the Xiriâna /Shiriana/ (5b) and Waiká /Waica/, which were broadened and

[104] 5b. X is pronounced like sch /in German/.

deepened by Otto Zerries and Meinhard Schuster in 1954/55, especially with regard to the Waiká (6a) (Waika) in the catchment

[194] 6a. When the Surára and Pakidái pronounce the tribal name of the Waiká, their worst enemies, they always accent the final a.

[197] area of the upper Orinoco (6b). Their work was supported by North

6b. Zerries, 1956a.

American missionaries who have been in touch with the

Surára
Pakidái

Waica

/5 cont./

114
[199] aforementioned Indians for several years and used this opportunity to carry on their own ethnological investigations (7a, b). More-

7a. Barker, 1953.

7b. Finney, 1957.

over one should mention the Italian, Alfonso Vinci, who lived in southern Venezuela in 1953-1955 and there met Xiriâna and Waikâ groups (8).

8. Vinci, 1956.

On the subject of contacts with natives in the interior of that vast area between Rio Branco and Serra Parima, which Coudreau regarded as virtually unpeopled (9), that is, according to his view,

9. Coudreau, H.A., 1887, p. 255.

only west of the Rio Branco, between the lower Mucajaí and the lower Catrimani, did there live a few Indian groups "mal connus et redoutés" known as evil and feared/ (10), Georges Salathé

10. Coudreau, H. A., 1887, p. 247 and Map V.

and Donald Holdridge alone have reported as yet (11). The

114
648

11. The area between Rio Branco, Rio Uraricuera, Serra Parima, and Rio Negro, as well as the region east of the Rio Branco, have for a long time been regarded as dangerous because, as Alexander von Humboldt and Robert Schomburgk have already reported, several of the tribes living there are supposed to have a very

/5 cont./

114
648

11. (cont.)
hostile attitude toward the whites as well as toward neighboring Indians. Since the rubber gatherers, palm-fiber gatherers, etc. on the Demini, Aracá, and the other rivers usually do not advance beyond the middle course, to say nothing of visiting the regions away from the rivers, the Indians only rarely feel disturbed in their territory. The incidents mentioned below, however, which have taken place there within the last 30 years, confirm that hostility on the part of a *few tribes continues* and may at any time lead to new acts of violence:
1928: Surára Indians, in an attack on a settlement of palm-fiber gatherers on the Rio Aracá, abducted two white women and a girl.
1942: Jaú Indians shot at the Brazilian-Venezuelan border commission on the upper Demini and forced it to turn back; two members of the commission were seriously wounded by arrow shots.
1945: Five American officers were killed by arrow shots by the Aimirí Indians on the Rio Jauaperi. They had gone up the river in a motor boat in order to take motion pictures of Indians there. The Brazilian guide, who was the only one to escape, later said that the Indians disliked the whirring of the camera and had several times urged the Americans to go back.
1946: The Aimirí Indians attacked the Indian protection post on the Rio Jauaperi and killed ten men of the personnel.

[127]

[197]

from each other only slightly in dialectal deviations (see the appendix /see 3: Rodrigues, this file/) (21). How great their

21. Loukotka and Rivet already established the relationship of a few of these languages and grouped them under the general term "Širianá linguistic family," in which they include Širianá, Karimé, Waika, and Pusárakaj. (Loukotka, 1942, pp. 8/9; Rivet et Loukotka, 1952, p. 1140).

homogeneity is may be seen by the fact that the Surára and Pakidái call themselves Yanonámi and the Waiká and Xiriána, according to Zerries and Schuster, call themselves Yanoáma (22) (23).

22. Zerries, 1956a, p. 187.

23. Schuster, 1958a, pp. 115/16.

However, members of the Aramamesterí, Karauaterí, Puseheweterí, and even of the Xiriána, whom I met in the malokas of the Surára and Pakidái as wives, visitors, and captives, said that they were Yanonámi. Furthermore, the Surára chief Hewemão enumerated for me 42 more tribes between Catrimani and Rio Negro (24), friendly and hostile, pointing out that these

24. Becher, 1956.

must likewise be included.

In view of this and on the basis of the linguistic and cultural relationship, it would seem to be appropriate to adopt into South American ethnology Yanonámi or Yanoáma as a new designation for the linguistic and culture group made up of these small-sized and light-colored Indians of the northern Amazon. According to the investigations up to now, they occupy a relatively compact area which is bounded in the east and south by the Rio Branco and the Rio Negro, respectively, but in the north and west extends

/6 cont./

101 beyond the Uraricuera and the Parima range, respectively.
●114 There can no longer be any doubt about the ethnic affiliation of this population. Koch-Grünberg was already of the opinion that in the case of the Xiriâna (Schirianá) and Waikâ (Waika) "it is not a matter of two different tribes, but merely of two divisions of one large nation" (25) (26). At the same place, however, the

25. Koch-Grünberg, 1922, p. 224.

26. Koch-Grünberg, 1923a, p. 290.

investigator expresses the conjecture, which was confirmed by the opinions of neighboring tribes, that the Waikâ represent merely a subdivision of the Xiriâna, "with whom they live either peaceably or in bitter enmity" (25) (26) /see the footnotes above/. Their isolation from other tribes is, according to Ourique, "an example of the instinctive precaution of the race against its own deterioration and its downfall" (27).

27. Ourique, 1906, p. 24.

101 In this connection there is a significant hint by the Surâra chief,
619 according to which there are two powerful tribes within the
[115] "Yanonâmi nation" first the Xiriâna, who call themselves "Haraterî," and secondly the Waikâ, who, however, are constantly warring. All the smaller tribes are on the side of either one or the other, but at the same time are obliged to pay tribute
[438] and render service in war (28). The Surâra and Pakidâi, the
[114]

28. With regard to the Xiriâna, Koch-Grünberg already mentions this vassal relationship (Koch-Grünberg, 1922, p. 226), and Métraux also refers to it (Métraux, 1948, p. 861).

chief told me further, are allies of the Xiriâna and occasionally

362

29. Pottery is not practiced at all by the Surára and Pakidái, and their self-made bows, arrows, hammocks, etc. are inferior in quality to those of the Xirianá.

/7/

IV. Historical Data

At the present time, in the winter months (rainy season), April-September, the Surára live at the Cachoeira dos Índios (Ill. 2 and 3), on the upper Rio Aracá, and the Pakidái in Taraquá, on a right branch of the middle Demini. The summer months (dry season), October-March, on the other hand, the two tribes spend together in a large, open maloka, which belongs to the Surára, in the virgin forest region between the Demini and Aracá rivers. This maloka lies 70 kilometers northeast of the Cachoeira dos Índios and about 100 kilometers south of the source region of the Orinoco.

114
103

Koch-Grünberg, on his map accompanying the work Vom Roroíma zum Orinoco /From the Roroíma to the Orinoco/, showed neither the Rio Demini nor the Rio Aracá and designates this region as "unknown territory." In his text he also says, "the entire large area between Rio Negro, Rio Branco and Uraricuéra is unexplored to this day" (30). Baldus likewise points out that in this area

30. Koch-Grünberg, 1923a, p. 287.

"surprises still await the seeker of unknown tribes" (31).

31. Baldus, 1956a, p. 294.

/7 cont./

•114 103 Demini and Aracá were first introduced into the literature by João Barbosa Rodrigues, although he did not write Demini, but rather Demeune (32), and the Rio Aracá was called Uaraca by him (33).

32. On maps of that period one likewise finds the entry Demeney.

33. Rodrigues, 1885, pp. 136, 148.

174 184 [103] With regard to the name Demini, it may be assumed that the ending "ini," according to the linguistic studies of Koch-Grünberg (34a), is derived from the Aruak /Arawak/ word "eni" =

34a. Koch-Grünberg, 1923a, p. 15.

[172] [323] river, water. This assumption is confirmed by many very old finds of shards which I discovered on the entirely unpopulated terra firma on the riverine lakes of the Demini. They are yellowish gray shards, which are decorated with spiral lines, meanders, and other plaiting designs and resemble the earthenware vessels which Koch-Grünberg described for the Aruak tribes (34b).

34b. Koch-Grünberg,1910a, pp. 227/28 and Ills. 152-155.

The fact that I found only shards is undoubtedly linked with the custom of the Aruak described by Koch-Grünberg, according to which all the clay vessels that belonged to a deceased person must be broken to pieces, for otherwise the spirit of the dead would punish the greed of the relatives (35).

35. Koch-Grünberg, 1910a, p. 151.

This would also confirm the surmise of Koch-Grünberg that at one time Aruak tribes coming from the west and southwest penetrated into the region between Rio Branco and Orinoco, which was

/7 cont./

114 inhabited by an old population living in a wholly primitive state.
174 The Aruak were said to have been subjugated later by the Karaiben /Carib/, who, in turn, met powerful resistance on the part of the warlike Xiriâna and Waikâ (36). Elsewhere the same

36. Koch-Grünberg, 1923a, pp. 15/16.

investigator writes: "On the Merewari and upper Orinoco Karaiben live together with Arowaken, whereas the upper Uraricuéra and the Parima Range are entirely in the hands of the allophylian Schirianâ and Waika" (37). I, too, met neither Karaiben nor

37. Koch-Grünberg, 1922, p. 233.

Aruak tribes in the Demini-Aracâ region.

114 On a tribal map of that region drawn by Nimbendajú (38),
131
174

38. This map is in the possession of the scientific division of the Serviço de Proteção aos Índios in Rio de Janeiro.

Xiriâna are given as the inhabitants of the Rio Demini, along with the date 1874. Rodrigues also reports that at the end of the nineteenth century members of this tribe lived both along the banks of that stream and along its tributaries, the Cuieiras and Mamimêu; from there they extended their roving expeditions as far as the Catrimani (39).

39. Rodrigues, 1885, p. 136.

173 /8/ Today only one civilized Xiriâna family is living on the
115 lower Demini as planters, but it no longer has any connection
[131] at all with its original, living fellow-tribesmen. This family, whose members speak Portuguese exclusively, told me that the region of the Demini has been the land of the Xiriâna from olden times. On account of frequent attacks on the part of the Waikâ,

/8 cont./

however, they had withdrawn into regions remote from the river. Their last maloka on the Demini was taken over by a Waikâ tribe in 1934. This is the place where today the Indian protection post "Ajuricaba" is located, on the right bank of the middle Demini, just below the Cachoeira Anatuinama (40) (41). In 1939, the

40. Holdridge visited the Xiriâna here in 1932. (Holdridge, 1933, p. 380.)

41. According to information which Nimuendajú obtained in Manaus in 1927 from a man named Domingos Campos, Aruak-speaking Indians on the Demini were supposed to have been called Xiriâna (Nimuendajú, 1955, pp. 150/51). This brings up all kinds of questions which are yet to be solved. Thus, there could have been an Aruak tribe of this name, for the shards which I found on the Demini, as well as the name of this river, indicate that members of that linguistic group once lived here. It might also be possible, however, that Aruak groups, after their subjugation by the Xiriâna, became assimilated with the latter. On the other hand, it is not impossible that individual Xiriâna adopted the Aruak language, and finally there still remains open the surmise that the Indians mentioned by Domingos Campos are not identical with the actual Xiriâna, but were merely called that by the caboclo population.

In the literature, the two tribal designations "Xiriâna" (members of the Aruak linguistic family) and "Xirianâ" (independent linguistic family) (Loukotka, 1942,

114
174
101

41. (cont.)

pp. 8, 24, 52; Ribeiro, 1957, p. 99) have already become current. Nevertheless, I incline to the view that in the case of the Xiriána it is a matter of one and the same large, widely scattered Yanonámi tribe. The material and spiritual culture of the Xiriána with whom the Surára and Pakidái are allied (the latter and the Xiriána whom I met among them themselves regularly accent the first a) corresponds perfectly with the one that Koch-Grünberg calls "Schirianá." The latter points out in one work that "Schirianá" is their self-designation, while "Schirischána" is a name which their neighbors and mortal enemies, the "Maquiritáres," gave them (Koch-Grünberg, 1913, p. 454). It should also be mentioned that the designation "Shrirana," according to Vinci, is a Makuxí /Macusi/ word (Vinci, 1956, p. 107).

167 In 1939, the
648 Waiká, too, gave up this maloka and moved to the Rio Mapulau, a left tributary of the upper Demini. Here, at the beginning of the year 1956, at the time of my stay among the Surára, they were attacked by a Xiriána tribe and destroyed. Surára warriors told me that all the Waiká men were killed and the women and girls were taken captives.

101
114 As inhabitants of the Rio Aracá, Nimuendajú entered on the above-mentioned map of this region (see p. 16), with the date of 1874, the Bahuana, an Aruak tribe. With reference to this, the Surára chief remarked that this tribe also goes by the proper name of Pootarí and was an enemy of the Surára, Pakidái, Xiriána, etc.; at the present time it lives in the source region of the Aracá.

6

/9 cont./

114 This shows that nothing has changed since 1948, when Métraux,
178 following the accounts of Koch-Grünberg and other investigators
181 traveling through this region, quite justifiably wrote: "The
648 Shirianá are very warlike people who succeeded in dominating several weaker tribes" /cited in English/ (42).

42. Métraux, 1948, p. 861.

141 V. Physical Characteristics

With regard to physical characteristics, the Surára and Pakidái are identical. Their height is below average, for the men are only 1.50-1.60 meters tall and the women 1.40-1.50 meters.
142 Both sexes have soft but muscular body forms, yet frequently a protruding abdomen and often relatively thin legs. Since they
[291] always go barefoot, their feet have retained the ability to serve as prehensile organs for climbing tree trunks, and their toes are not squeezed together as much as in the case of civilized persons who wear shoes all the time. The considerable gap between the great toe and the second toe is striking (Ill. 14) (43). The color

43. Crevaux has already pointed this out in connection with the Oyampí Indians in French Guiana: "The great toe, very much set apart, always turns inward, while the third, fourth, and fifth are turned outward" /translated from the French/ (Crevaux, 1880, p. 76 and ill., left).

of their skin is very light, almost white. The forehead of the dolicocephalic head is often flat. Their broad noses with the nostrils directed slightly upward are noteworthy; the root of the nose, on the other hand, is narrow. The Mongoloid strain is clearly evident in the prominent cheekbones and the slanting, dark-brown, almost black-looking eyes. Between the slightly

Surára, Pakidái, Waica, Shiriana

/9 cont./

142 pouting lips of a mouth that is never too large, there are always two gleaming rows of sound teeth. Their beautiful, always straight hair is a very dark brown. They all have a thick head of hair, but lose it in old age. No bald spot appears, however; the hair then simply looks as though it had been cut very short all over the head. Individual men have a thin growth of beard on [302] either side of the lips and on the chin; occasionally they pluck out the beard hair. The rest of their body hair is limited to the pubic region. Women pluck out their pubic hair, as well as their eyebrows and lashes. Young girls usually have well-formed, hemispherical, firm breasts, which, however, become slack and pendulous after the first child, although at that time the women have often not even reached the age of 18 or 19 years old.

• 114 142 These observations parallel the descriptions which Alexander von Humboldt gives of the Waiká (Guaicas) and Guaharibo. He also describes them as tribes "with whitish skin color and very small stature." He adds, however, "the shortness of the Guaicas and the whiteness of the Guaharibos, /10/ whom P. Caulín calls [141] Guaharibos blancos, are equally exaggerated" (44). The Guaicas

44. A. von Humboldt, 1860, IV, pp. 113 ff.

measured by Alexander von Humboldt were "on the average four feet seven inches to four feet eight inches (according to the old French measurement)" (44) /see footnote above/, in other words, about 1.52-1.55 meters. Koch-Grünberg gives the same body height for the Waiká (Waíka) whom he met in Motomotó on the Uraricuera and whom he likewise describes as very light-skinned (45). In

45. Koch-Grünberg, 1923a, p. 293.

[141] another place Koch-Grünberg writes: "The Schirianá and Waíka of Motomotó were small people, on the average about 1.52 meters tall. In no case did the height exceed 1.55 meters... Older people had distended abdomens and thin legs... These people, who were by nature ugly almost throughout, were even more

Surára
Pakidái
Waica
Shiriana

/10 cont./

114 repellent because of the lack of any kind of body care" (46).
142

46. Koch-Grünberg, 1923a, p. 304.

Chaffanjon expressed himself in a similar manner, but even more disapprovingly, with regard to the Guaharibos: "Small and puny, thin limbs, a stomach enormously distended, hair long and dirty, a bestial countenance make them look repulsive.
[291] They are absolutely naked; two men have a long and scraggly
[411] beard; their complexion is lighter than that of all the Indians whom I have thus far mentioned; their only weapon is a stick"
114 /translated from the French/ (47). Finally, it should be men-
141

47. Chaffanjon, 1889, pp. 308-311.

tioned that, of approximately 40 adult Waiká, Zerries established an average figure of 151.5 centimeters for men and 142 centimeters for women (48a).

48a. Zerries, 1956a, p. 186.

114 Comparisons show that the Surára and Pakidái have the same
142 physical characteristics as the Guaharibo, Xiriána, and Waiká (48b).

48b. Only recently there appeared a work by the same author, "Beiträge zur Anthropologie der Waika- und Schiriana-Indianer im Grenzgebiet zwischen Venezuela und Brasilien /Contributions to the Anthropology of the Waica and Schiriana Indians in the Border Region Between Venezuela and Brazil/," which is supplemented by excellent illustrative material (Zerries, 1959, pp. 31-41).

It is therefore astonishing that Chaffanjon and Koch-Grünberg describe the Indians that they studied as so strikingly ugly. It

/10 cont./
114 142 is true, the related Surára and Pakidái, as well as the Waiká in the catchment area of the upper Orinoco, embody a type that is strange to us (see Ills. 9-24 /see pp. 270-274/ and ills. in Zerries, 1959), but certainly not one that is repulsive to that extent.

342

VI. Technology and Material Culture

1. House Forms

The Surára and Pakidái are familiar with four different house-forms. The simplest and probably the earliest form, which at present, however, is used only as overnight quarters by one family during the expeditions in the virgin forest, is similar to a wind-screen /Windschirm/ (Ill. 4). It is built in the following way: In front, one or two supports, 2-2.50 meters long, are set into the ground at intervals as long as a hammock; about three meters behind these there are two weaker supports, 1-1.50 meters long, at somewhat longer intervals. The upper ends are joined together with poles; cipó-titca (a type of liana) serves as lashing material. The poles are also frequently tied to trees standing a short distance apart, instead of the rear supports. Over this 12 to 15 thinner poles are placed crosswise, and on top of these four to six are placed lengthwise. This results in a more or less steep frame-
[824] work which has the shape of a lean-to roof (Ill. 4). Palm leaves are laid on this so that the hut gives secure protection against the rain; even the most severe tropical thunderstorms cannot
[352] harm the Indians sleeping under it. The hammocks are fastened
[354] in the form of a triangle around the fire burning in the center; In the case of larger families, two hammocks often hang one above the other.

361 /11/ If the entire tribe is on the march, the huts of the individual families are always placed in a circle around the chief's hut standing in the center, after the virgin forest has been hastily cleared to a certain extent beforehand. The space between the huts is five to eight meters.

/11 cont./

342 ●114 [184] Exactly the same construction is shown by Salathé for the Karimé (49), Zerries for the Waiká (50), and Koch-Grünberg for

49. Salathé, 1931/32, pp. 298-300 and Fig. 1 and 2.

50. Zerries, 1956a, p. 184.

the Xiriána (Schirianá) on the upper Uraricapará; the latter, however, calls the lean-to type of hut a storm-shelter /Wetterschirm/ (51). This name is not suitable, however, for a

51. Koch-Grünberg, 1923a, p. 300 and Pl. 43 b and c.

genuine storm-shelter, also called windscreen, touches the ground on one side. In the method of construction described and likewise in Koch-Grünberg's drawings, however, the roof rests on supports everywhere. The circular arrangement of the huts is also mentioned in Koch-Grünberg. In this connection the scholar expresses 361 114 the opinion that this is only a temporary camp (52), which I am

52. Koch-Grünberg, 1923a, p. 300 and Plate 43 a.

now able to confirm with respect to the Surára and Pakidái. On the other hand, Koch-Grünberg, Salathé, and Zerries say nothing about a hut standing in the center. Among the Surára and Pakidái, however, this is never absent. The reason for it, these Indians [622] told me, was to protect the chief sleeping in it from hostile attacks. Moreover, two warriors must always guard the camp at night.

361 Along the routes of travel of the Surára and Pakidái in the area between the Demini and Aracá rivers, one finds many such abandoned camps. They are never occupied a second time as overnight quarters, however, although the construction is often

/15 cont./

342 large posts. On each of the two narrow sides of the three tall middle posts, 11 thin sticks are attached, organ-fashion, between the supported horizontal poles and form the two gable faces.

[824] Here, too, cipó-titica is used exclusively as the lashing material. To the right on the front broad-side and to the left on the rear one there is a small entrance only one meter high and one meter wide. After the framework is completed (Ill. 8), the panos (rectangular mats made out of the leaves of the ubim palm) are again laid over one another on the roof, like shingles, and fastened to the rafters. It is the same technique as has already been described in the construction of the large, open maloka. The upper part of the two gable sides is left open so that light may penetrate into the interior of the house and the smoke be carried off. The walls, too, are completely covered with panos, and in front of the entrances palm-leaf mats that can be drawn back are hung by means of lianas. Inside the house, the center part is left free for holding festivals and dances, while the families, in the same way as in the open maloka, live comparatively close to the wall, one

[622] family beside the other. For the chief and his family a particularly large space is reserved on the side toward the river.

342 171 114 The astonishing fact in this form of house is that the ground plan is circular whereas the roof is gable-shaped. Ordinarily for houses with a circular ground-plan, the conical roof is characteristic, as Olga Coudreau (54) and Koch-Grünberg (55) have shown

54. Olga Courdreau, 1903, p. 121.

55. Koch-Grünberg, 1923a, p. 18 and Pl. 2 (1a, 1b, 2a, 2b).

for Karaiben /Carib/ tribes. In this case, one or at most two center posts are used. Koch-Grünberg also mentions, to be sure, a construction with three and writes: "If the two center posts are set farther apart or if, instead of two center posts, three or more are used, /16/ the ridge is lengthened and the circular ground-plan gradually becomes an elliptical one" (56).

56. Koch-Grünberg, 1923a, p. 22 and Pl. 2 (4).

/16 cont./

342 In the building method described by me, however, the
174 circular ground-plan is retained, in spite of the three center posts.
177 According to Koch-Grünberg, the gable roofs and huts with elliptical
ground-plan and others of a square shape owe "their origin obvi-
[114] ously to European influence" (57). On this point I am in com-

57. Koch-Grünberg, 1923a, p. 22.

plete agreement with the above-mentioned investigator and therefore believe that this maloka built by the Surára, which they modeled after the community house of the Xiriána, actually developed from the Karaiben conical-roofed hut, while the roof represents a borrowing from the civilized world (palm-straw huts of the caboclos). This is also indicated by the construction of the chief's hut within the periphery of the large, open maloka,
[184] which likewise has a gable roof (see p. 29). It is noteworthy, however, that the maloka of the Surára has a height of ten meters, while the round huts mentioned by Koch-Grünberg show
342 a height between 4.20-5.57 meters (58). My question as to why
825

58. Koch-Grünberg, 1923a, p. 21.

the Surára in the sierra occupy an open maloka and on the Cachoeira dos Índios on the upper Aracá a closed one was answered to the effect that in the higher, cooler region between Demini and Aracá there are practically no mosquitoes, whereas there are relatively many along the riverbank of the Aracá. This explanation is very plausible, for in the closed community-houses of the Indians there are no gnats. They avoid the semidarkness and the smoke of the constantly burning fire.

2. Bridges

501 Boats are not used by the Surára and Pakidái. When, on
484 their narrow forest paths which are scarcely discernible to our
491 eyes, they come to brooks, they simply wade across. In the case of wider brooks which are greatly swollen during the rainy

Surára
Pakidái

/16 cont./

484 season, or in case their banks are steep, a tree trunk is simply
491 laid across as a footbridge. To cross small rivers, for example, the Rio Deminisinho, a left tributary of the upper Aracá which empties into it one kilometer beyond the Cachoeira dos Índios, the Surára even use a regular bridge. The Rio Deminisinho is 38 meters wide at the place where it is crossed, and on either side
499 there are steep banks eight meters high. The bridge, which was built here during the summer, when the riverbed was relatively shallow, consists of 12 crossed tree-trunks 12-14 meters long, which were rammed into the riverbed. Over the places where they crossed, two thinner trunks were laid next to each other and fastened with liana lashings. At the projecting ends of the supporting posts, lianas form a sort of railing. Since they hang very loosely, however, they can scarcely offer a grip. To secure the bridge, both ends have been additionally anchored to thick trees by means of lianas. Because of this, the construction looks like a hanging bridge at first glance. Since it is one meter higher than the banks, however, small rung-ladders 60 centimeters wide are attached at either side and fastened with liana lashings.

484 While I always had to fight with great difficulty to keep my
491 balance in crossing this and other tree-trunk bridges, the Indians,
[481] men, women, and children, always strode across effortlessly, even when they were carrying a great deal of baggage. This may be connected with the fact that they hardly place their feet outward at all, so that one might almost believe them parallel (Ill. 17) (59).

•[114]
[141]

59. There are similar accounts by Crevaux with regard to the Oiana /Oyana/ (Rukuien /Rucuyen/, Roucouyennes). The investigator sought the reasons for this and believed he found them in the pelvis. The white women, too, he said, more than the men, walk with their feet placed inward, because their pelvis is wider. On account of the foot position, he concludes that the Indians also have a wider pelvis (Crevaux, 1875, p. 255).

411 barter. For smoothing, they use the inner edge of the eye-tooth
412 from the lower jaw of a wild pig and the rough leaves of the
322 curatella (Cecropia peltata), which gives the bow a beautiful,
237 shiny appearance.
824 The bowstring -- penahitábe --, which consists of three
411 strands of curauá (Bromeliaceae) fiber strings twisted to the right,
283 is fastened to the bow ends with a simple knot. If one wants to tighten up the bow, the string must be twisted more, which makes it shorter.

411 The bow described may be immediately classified as one of
191 the typical bow-forms of Guiana, which Métraux characterizes as
● 114 follows: "Guiana bows were generally convex on the belly while the back or outer surface was concave or flat" /cited in English/ (66).

66. Métraux, 1949, p. 232.

According to Meyer's classification, on account of its semi-circular cross-section, it would /18/ belong to the North Brazilian bow-type; on the basis of the material, however, to the Peru group, because it is not the reddish-brown, smooth leguminous wood, but that of the pupunha palm (67). P. Schmidt also

67. Meyer, no date, p. 31.

devotes a rather long section to this "reverse form of the flat bow" and already lists the following tribes north of the Amazonas where it occurs: "Kanamare on the Rio Jurua, Trio, Ojana, Makusi, Wapisiana, Uaupe, Porokoto, Passe (child's bow), Siriana on the Rio /Fig. 2 appears here./ /19/ Uraricapara,
411 Motomoto" (68). On the basis of the descriptions and illustra-
184

/19 cont./

411 184 ●114 [173] almost identical with that of the Surára and Pakidái, except for the fact that the former is set off at the ends. This confirms the statements made by the Indians investigated by me who said that they obtained bows of this kind and the knowledge of how to make them themselves from the Xiriána. In reply to my question as to why their bows were not set off at the end, I was told that the Xiriána demand this deviation. In the Hamburg Museum für Völkerkunde und Vorgeschichte /Museum for Ethnology and Prehistory/, there are two Xiriána bows which were collected by Koch-Grünberg (12.25:29, 12.25:31). They are relatively small specimens, however, for they are only 1.92 and 1.82 meters high, respectively. A bow which came from the Xamatári of the Rio Maiá, a left tributary of the Rio Cauaboris, and which is also in the Hamburg Museum für Völkerkunde und Vorgeschichte (Boeldecke Collection, 56.15:4) and is two meters high, has exactly the same shape as the Surára and Pakidái one, that is, without the offset ends. .This is not surprising, for, according to the statement of the Surára chief Hewemão, the Xamatári are likewise satellites of the Xiriána (see p. 12). Finally, it should be mentioned that the same bow-form has also been documented for the Waiká in Venezuela (70).

70. Schuster, 1958b, p. 17.

411 249 824 The arrows -- xerêka --, whose total length comes to between 2-2.12 meters (shaft length 1.89-1.94 meters; weight, 60-90 grams) (71) (72), are made out of arrow cane -- xerekaîbe --

[114]

71. These measurements confirm Weule's statement when he says that the arrow must correspond in length, shape, and weight to the bow, in order to guarantee a certain accuracy of aim (Weule, 1899, p. 6).

72. Pertinent comparisons with other South American tribes are to be found in the chart by Ranke (Ranke, 1903, p. 347).

411 which the Surára and Pakidái plant in the vicinity of their malokas
[249 on the upper Aracá and the middle Demini, respectively. All five
[824 of the arrow types used by them have the same feathering --
[237 jaromahîk --, which consists of two halves of the black wing feathers of the mutum (Crax sp.) -- pararí. They are placed against the cane in such a way that they alternately show the upper and the
[283 lower side of the feather. At several places on the hand end they are held by two threads of the tight winding of Bromelia fibers -- pemakasiurakama. Inside this winding, which is supposed to strengthen the weak cane against the pressure of the bowstring, there is stuck on the end of the cane in addition a small wooden peg fastened with resin, which has a notch in its thickened outer part, which is set on the bowstring. This is supposed to prevent the cane from splitting when the arrow flies off. The upper end of the feather shaft is wound with a second, narrower winding, in which, between the two halves of the arrow feathers, two additional small black mutum feathers are frequently stuck as ornaments (Fig. 2f).

411 The feathering described belongs to the Guiana type of
184 feathering, according to the classification by Meyer (73). Koch-
• 114

73. Meyer, no date, p. 9.

Grünberg (74) confirms it for the Xiriána, and it can also be recog-

411 feathering, and, according to Salathé, it is also to be found
184 among the Karimé (76).
114

76. Salathé, 1931/32, p. 300 and Figs. 3 and 4.

411 There is an astonishingly wide range of variation for the arrow points, of which the following five different types occur among the Surára and Pakidái:

1. Kantaná -- It is a wide, lancet-shaped bamboo point, 25-28 centimeters long, both /20/ ends of which come to a point; the [531] width in the center is 3-4 centimeters. The upper side is rounded off, and the lower one, occasionally somewhat hollowed out, is [283] sometimes painted with black dots. It is inserted in the slightly split arrow shaft and tightly wound with Bromelia fibers (Fig. 2a). Since the arrows with this large point have particularly great penetrating power, they are used chiefly for the hunting of tapirs and jaguars; moreover, they are used for warlike encounters. Every Surára and Pakidái man always carries two or three such reserve points in his quiver.

411 Salathé found similar points among the Karimé (77) and
184
114

77. Salathé, 1931/32, pp. 299/300 and Fig. 3b.

Vinci among the Xamatári (78). Moreover, they are confirmed

78. Vinci, 1956, pp. 145 and 146, Fig. b.

for the latter Indians by a specimen in the Hamburg Museum für Völkerkunde und Vorgeschichte. (Alfred Boeldecke Collection, 56.15:5. Length, 23 centimeters; width in the center, three [531] centimeters. On the lower hollowed-out side, this point is painted with a black, serpentine line.)

Shiriana
Surára
Pakidái

/20 cont./

411 184 ● 114 [283]

The lancet-shaped bamboo points of the Xiriâna investigated by Koch-Grünberg, on the other hand, have a somewhat different shape. Here the two ends do not come to a point, as among the Surára, Pakidái, Karimé, and Xamatári, but rather one end is thickened, hollowed out, and, wound with Bromelia fibers, is set on a wooden shaft inserted in the arrow cane (79). Three such

79. Koch-Grünberg 1923a, p. 312 and Pl. 47 (5, 8).

Xiriana arrow points of the Koch-Grünberg Collection in the Hamburg Museum für Völkerkunde und Vorgeschichte have, moreover, the respectable length of 34 centimeters (12.25:37) and 35 centimeters (12.25:34-35).

Inasmuch as the Surára and Pakidái, according to their own statements, borrowed their lancet-shaped bamboo points from the Xiriâna, the ensuing alteration process is quite significant, since, indeed, the point is no longer mounted on a wooden shaft, but is inserted directly into the arrow cane.

Furthermore, lancet-shaped bamboo points have been confirmed for the Waiká by Zerries (80) and Schuster (81), but it is

80. Zerries, 1956b, p. 151.

81. Schuster, 1958b, p. 17.

not clear from their texts whether this is the same type as that of the Surára, Pakidái, etc. or that of the Xiriâna.

411 171

How greatly the lengths and attachment possibilities of such bamboo points vary among South American Indians is very clearly shown by the comprehensive investigations of Meyer (82) and

82. Meyer, no date, pp. 18, 19, 25, 27, 30, 36, 37, 47, 48, 49, and Plates I, 11, 13; II, 16; III, 14; IV, 8, 15.

Surára
Pakidái

/20 cont./

Métraux (83).

83. Métraux, 1949, pp. 236/37 and Fig. 64.

2. Rahaká -- This is a narrower lancet-shaped bamboo point which is inserted in the arrow cane wound with Bromelia fibers in the same way as the kantaná (Fig. 2b). The individual points are 20-22 centimeters long and 1.5 - 2 centimeters wide in the middle. Wild pigs, water hogs (capybara), deer, pacas, and cutias (see p. 4) are killed with them. It is noteworthy that such narrow bamboo points have hitherto not been mentioned in the literature.

3. Kantarím -- Point with barb, made from a twin-pointed piece of bone from the cuatá (Ateles paniscus L.). This is lashed, by means of a winding of Bromelia fibers additionally coated with pitch, parallel to the upper end of a wooden shaft inserted in the arrow cane (Fig. 2c). With this arrow tip, which is very widespread in South America, the Surára and Pakidái shoot birds and fish.

According to the classification by Métraux, it belongs to the second principal type of arrow points occurring in the tropical forest region of South America (84). Meyer mentions that it is

84. Métraux, 1949, p. 237.

used in Guiana, but also in western Brazil and among the Karajá /Caraja/ (85). Within the Yanoámi group, they have furthermore

85. Meyer, no date, p. 18.

been documented for the Xiriána (86), Karimé (87), Xamatári (88),

86. Koch-Grünberg, 1923a, p. 312 and Pl. 47 (7).

411 and Waiká (89) (90). In the Hamburg Museum für Völkerkunde
114
184

89. Zerries, 1956b, p. 151.

90. Schuster, 1958b, p. 17.

und Vorgeschichte, there are, /21/ moreover, three Xiriâna arrows with this point (Koch-Grünberg Collection, 12.25:39-41) and an arrow from the Xamatâri (Boeldecke Collection, 56.15:6).

411 4. Ranaká -- Forked wooden point of a bird arrow; length, 12-15
[824] centimeters. The material is furnished by a tree -- paioórimá -- which shows countless such forkings. The lower part of the stem is pointed and is set in the arrow cane wound with Bromelia fibers (Fig. 2e). Thus far there is a parallel for this arrow point only among the Waiká (91a).

91a. Barker, 1953, p. 464.

5. Unamú -- Wooden arrow-point with a coating of poison. A thin, pointed rod of the hard wood of the pupunha palm, 22-24 centimeters long, is coated with arrow poison, giving it a black appearance. The rear end is inserted in the arrow cane wound with
[824] Bromelia fibers (Fig. 2d). Such poisoned arrows are used exclusively for hunting monkeys, since these animals living in the tall trees are otherwise difficult to kill. According to the statements of Surára and Pakidái informants, they never shoot poisoned arrows at human beings.

411 Other Yanonámi tribes who likewise use poisoned arrows are
184 the Xiriâna (91b), Karimé (92), and Waiká (93) (94). Moreover,

91b. Koch-Grünberg, 1923, p. 312.

92. Salathé, 1931/32, p. 301 and Fig. 5a.

94. Schuster, 1958b, p. 17.

/21 cont./

411 184 there is a Xamatári poisoned arrow in the possession of the Hamburg Museum für Völkerkunde und Vorgeschichte (Boeldecke Collection, 56. 15:7).

411 171 114 [139] Métraux writes with reference to the poisoned arrows: "Poisoned arrows were not so widely used by the Indians as is commonly assumed from the exaggerated accounts of the Spanish conquistadors. Curare, which is the most deadly poison known to the Indians, is prepared by relatively few tribes though it is traded throughout wide regions" /cited in English/ (95). Among

95. Métraux, 1949, p. 242.

Karaiben /Carib/ tribes in Guiana, poisoned arrows which are shot with a bow are not very often encountered, for they are documented only for the Makuxí /Macusi/ by Richard Schomburgk (96) and for

96. Richard Schomburgk, 1847, p. 428.

411 171 the Trio by de Goeje (97). It should be mentioned in this connec-

97. de Goeje, 1906, p. 15; Pl. V, Figs. 10-12; Pl. XI, Fig. 22.

tion, however, that many Karaiben, for example, the Arekuná-Taulipang /Arecuna/, shoot small poisoned arrows with a blowgun; this weapon is unknown to the Surára and Pakidái.

278 Arrow poisons:

[192] [184] According to what my Surára informants reported to me, they use three kinds of poison of different strengths, all of which, however, they designate by the general name -- mamokõrimaunãpe. This name is almost the same as the one which the Waiká, according to Zerries, use for arrow poison -- mamokondi (98).

98. Zerries, 1956b, p. 151.

Surára
Pakidái
Shiriana

/21 cont./

278 The strongest poison is said to be obtained from the milk of a tree which, in the language of the Surára, is called -- patemá. [824] This tree was not pointed out to me; I was told that it only grows in a very distant region. To prepare an allegedly weaker poison the milk of the -- tototo -- (Strychnos toxifera) is used.

[415] As soon as it is obtained, the particular type of milk is boiled in a clay vessel. This makes it turn black, and subsequently [413] it is painted on the arrow points by means of a wooden stick which is wrapped with cotton. Special bags -- kanabó --, which are made [415] out of the leaves of the açaí palm (Euterpe oleracea Mart.) and [824] sewed with lianas, are used for storing them. There is never anything left of the poison itself.

278 I was also told that of the tribes allied with the Xiriána only 438 the Surára were entrusted with the preparation of these two types of poison. All the Indians who were friendly with them, even the Xiriána, thus obtained their poisoned arrows from them by barter. The Surára chief Hewemão, however, emphasized that the detested Waiká also knew how to prepare arrow poisons, which they used above all to shoot at human beings. The latter statement is confirmed by Zerries (99). [114]

99. Zerries, 1956b, p. 151.

278 /22/ The third type of arrow poison is the weakest. It is made out of snuff powder -- epená -- (see pp.190/193, which is mixed with water and boiled. This method is also supposed to be familiar to the Pakidái and Xiriána.

Unfortunately, I could not take part in the preparation of the poisons, for, with the exception of the chief /Fig. 3 appears here/ and his brother, only a few older men are familiar with them and they are kept strictly secret even from all the other members of the tribe. The meager information about them is limited to oral statements.

Surára
Pakidái

/22 cont./

411
[482]

In the forest the Surára and Pakidái as a rule carry their bows and arrows longwise with one or both hands above their heads, but occasionally also on the right or left shoulder.

In shooting, the bow is held in a horizontal position with the left hand. The arrow lies to the left of the bow, between thumb and index finger. The man holds the end of the arrow between the index finger and middle finger of the right hand and simultaneously stretches the bowstring with the second joints of these fingers (Fig. 3); occasionally he also adds the second joint of the ring finger, if the shot is to be reinforced. This is a form which, following Morse, is designated as the "Mediterranean release" /cited in English/. This practice has been documented also for Eskimo tribes and Siberian peoples (100), but never for

411
171
114

100. Morse, 1885, pp. 12-15 and Figs. 8 and 9.

South American Indians. Concerning the tribes on the Aiarý, Koch-Grünberg says that here the men hold the end of the arrow with thumb and index finger of the /23/ right hand, while they simply press the other three fingers against the palm of the hand (101).

101. Koch-Grünberg, 1909, p. 104 and Ill. 58.

The Yurakare /Yuracare/, too, hold the arrow with the thumb and index finger of the right hand, and they use the remaining three fingers for stretching the bow (102). These latter forms seem to be

102. von Holten, 1877, p. 111.

the most customary in South America, but unfortunately this cannot be definitely established because the information concerning this is too meager. Friederici has already justifiably complained: "With reference to the manner of grasping and stretching the bow and aiming and shooting the arrow, reports are unfortunately very scarce;

Surára
Pakidái

/23 cont./

411 the few that are available are not the type from which rules could
171 be deduced" (103). If the arrow is to be shot upward, the left arm
● 114

103. Friederici, 1907, p. 329.

is stretched out and the bowstring is pulled up to the right eye with the right hand (Ill. 13). I did not meet any left-handed archers. Koch-Grünberg mentions one and remarks that he was assured there were many of them (104). Among the Mosquito

104. Koch-Grünberg, 1923a, p. 73.

Indians in Central America left-handedness seems even to be quite pronounced, for Sapper shows their typical handling of the bow and arrow in the photograph of a Mosquito boy shooting left-handed (105).

105. Sapper, 1903, p. 54.

411 The best shooting performances, which I tested with men and boys, were between 40-50 meters for the former, who shot straight through an empty gasoline can with the large, mounted, lancet-shaped arrow-point, and between 8-10 meters for the latter. Yet even at a distance of 100 meters, most of the men hit the target; the penetrating power, however, was considerably diminished. These figures agree very closely with the statements compiled from the literature by Friederici (106). Several warriors

106. Friederici, 1907, p. 326.

were also able to shoot indirectly, which is shown by the following experiment which I carried out with Hewemão, the chief of the Surára, his younger brother Kurikajawõ, the Surára man Brakaiwõ, and the warrior chief of the Pakidái, Porẽhiwõ. I placed three white leaves of standard size on the ground, one behind the other, at a distance of 30, 28, and 26 meters from the

Surára
Pakidái

/23 cont./

411 individual archers. The aforementioned men then shot three arrows into the air successively (one with a large lancet-shaped point, one with a small lancet-shaped point, and one with a bone point), and each one hit the leaf, usually even the center of it. This Indian [114] ability to hit targets even with an indirect shot has already been pointed out by Friederici and substantiated in the sources (107).

107. Friederici, 1907, p. 329.

I also observed, however, that not all the men were equally good archers, although from childhood on, of course, they are constantly handling bow and arrow. My servant Mateus and I each carried a shotgun, 20 caliber, with us, and the use of our guns aroused the interest of only a few men. The aforementioned three Surára and the Pakidái, however, as well as several other warriors, after a very short time, knew how to handle them just as well as bow and arrow.

[114] Koch-Grünberg came to similar conclusions on his journeys, for he writes: "This is not to say that every Indian is an accomplished hunter. Among these people, too, talents and inclinations are unevenly distributed..." (108).

108. Koch-Grünberg, 1923a, p. 59.

[422] It should be mentioned further that bows and arrows repre-
[196] sent the most valuable private property of every man, and they
[155] also play a large part in all magical and religious practices (cures of the sick, festivals, dances, etc.). Furthermore, the weapons
[439] are favorite trade items and gifts of honor which the Surára and
[431] Pakidái occasionally receive from the Xiriána or give the latter during visits (see pp. 13, 159/160). A young man who wants to
[584] marry a girl must also first make a bow and five different arrows for his future father-in-law. /24/ If a warrior dies, his weapons
[764] are burned with him, so that he may use them on his journey to the moon and on the moon itself (see p.150).

411 Before the Surára and Pakidái adopted the large reverse flat
173 bow from the Xiriána, I was told, their forefathers were acquainted with only the branch-bow.

Surára Pakidái

411 482 /24 cont./ lancet-shaped bamboo points, is worn on a neck cord by every hunter and warrior, who has it hang down on his back so that it does not interfere with the stretching of the bow.

411 184 /25/ Quivers of the same form and carried in the same way are also found among the Waikâ, as may be seen from a photograph by Zerries (116). Moreover, the Hamburg Museum für Völkerkunde und Vorgeschichte owns such a quiver, though without decoration, from the Xamatâri (Boelsche Collection, 56.15:3a).

372 4. Fire-making Apparatus

Tied by means of a string of cotton or curauâ (bromelia fiber) to every Surára and Pakidái quiver at the top and bottom is the fire-drilling apparatus -- borôrohfi -- which consists of a lancet-shaped hearth -- panâibequehfi -- and two drilling sticks -- ihirupehfi (Fig. 5). Both parts are made from the soft wood of the [824] [184] wild cacao tree -- porôroâ -- exactly as among the Waikâ (117).

117. Schuster, 1955b, p. 17.

372 114 Koch-Grünberg documents such a fire-drilling apparatus for the Xirianâ (118), but without mentioning the material. On the basis

118. Koch-Grünberg, 1923a, p. 311.

of a specimen which he brought back for the Hamburg Museum für Völkerkunde und Vorgeschichte (Koch-Grünberg Collection, 12.25:124), however, one may state that it is likewise made of the wood of the wild cacao tree. He says nothing at all about [411] quivers and thus does not seem to have found any. Nor did I find elsewhere in the literature any parallels for the very practical combination of quiver and fire-making apparatus (119). Nevertheless,

392 411 184 114 119. That it is well-known among the Xamatâri, however, is proved by two objects from that tribe in the Hamburg Museum

Surára Pakidái

/25 cont./

372
411
184
114

119.(cont.) für Volkerkund und Vorgeschichte (Boeldecke Collection 56.15 3a and b), and presumably the fire-making apparatus is likewise fastened to the quiver among the Waiká. Definite statements about this by Zerries and Schuster have not yet been made.

Fig. 5. Bamboo quiver with fire-drill apparatus tied on.

372 Nevertheless,
[484] it is perfectly obvious; for if the Surára and Pakidái men on war and hunting expeditions are unable to return to the maloka in the evening, they are able to kindle a fire along the way in three to four minutes. To do this a man in a squatting position holds the hearth on the ground with one foot and drills with the palms of his
[412] hands (Ill. 31). The holes of the hearth are previously bored with
[237] a knife made of the sharp tooth of the cutia (Dasyprocta aguti L.)
(See P. 116) and are /26/ connected with a small groove at the side.

Surára
Pakidái

372 /25 cont./
(see p.116) and are /26/ connected with a small groove at the side. The hole is enlarged by the drilling. There is loosened a fine dust which slowly starts to smoke and glow and, by way of the groove, falls on tinder previously placed next to it (dry grass, leaves, or dry splinters of bamboo), which quickly catches fire. Cautiously the man blows upon it, and a short time later a flame leaps up. This requires a great deal of practice and skill, however; often he
[171] has blisters on his hands after drilling. This is the most widely distributed method of producing fire in South America (120). In their malokas

120. Nordenskiöld, 1924, pp. 118-125 and Map 13.

the Surára and Pakidái preserve the fire.

283

5. Twining and Spinning

[824] For making thread and cord the leaf fibers of a Bromeliaceae, curauá (121), and cotton are used, the latter, however, only in more recent times.

[114] [171] 121. Koch-Grünberg also verifies the use of this material for the northwestern Brazilian tribes (Koch-Grünberg, 1910, p. 210).

[462] While to this day the curauá fibers are worked, mostly by men and only occasionally by women, with the right hand against the right thigh in the direction of the knee, to produce thread twisted to the right (122), a spindle is used to make cotton thread,

[171] 122. Threads which are not spun with the spindle are twisted to the right among most of the South American tribes. There are exceptions, however, for among a few nations of northwestern South America threads twisted to the left are more prevalent, and

283 /26 cont./
171 Up to now there has been only one parallel to this, namely
184 a Quechua spindle (124). The spindle of the Karimé, on the
114

124. Frödin and Nordenskiöld, 1918, pp. 26/27.

basis of the drawing in Salathé's article, seems to resemble those of the Surára and Pakidái (125). Unfortunately, Salathé does

125. Salathé, 1931/32, p. 305, Fig. 14.

not indicate whether the whorl is held in position by a wrapping put on below it or perhaps by means of resin or wax, as is the case, for example, for the spindles of the Chama and Pauserna (126).

126. Frödin and Nordenskiöld, 1918, pp. 26/27.

283 This already exhausts the comparisons with regard to the securing of the whorl by means of a wrapping, wood, or wax, so that no conclusions about origin and distribution can as yet be drawn about it.

283 During the time I lived with the Surára and Pakidái, I
123 found that many women preferred to use the lids of my empty powder-boxes and skin-cream jars as whorls, /27/ and they preferred to spin the surgical cotton which I carried with me rather than their cultivated cotton, because, they said, the threads spun from it were stronger and more durable.

283 Spinning is done in the following way: The woman sits on a thin tree trunk with the lower part of her legs bent back. The cotton that is to be worked hangs over her left shoulder and from there the thread is fed out with the fingers of the left hand. She first rolls the spindle, on the barb of which she has fastened the thread, in a horizontal position with the palm of her right hand on her slightly sloping right thigh, moving her hand rapidly from the knee upwards. This gives the thread a

/27 cont./

283 left twist. Then she lets the spindle fall to a vertical position between her legs and rotate on the ground.

[191] This method belongs to Variation I of the Bakaïri spinning (127), which is extraordinarily characteristic for the

127. Frödin and Nordenskiöld, 1918, pp. 34 and 46.

Guiana tribes and which is described in a similar manner by Koch-Grünberg (128), Frödin-Nordenskiöld (129), Im Thurn (130),

128. Koch-Grünberg, 1923a, p. 86.

129. Frödin and Nordenskiöld, 1918, pp. 52 and 56.

130. Im Thurn, 1883, p. 282.

and Roth (131).

131. Roth, 1929, p. 23 and Pl. I and II.

283 436 437 The spun threads are wound into round balls, which in this form are used as tribute payment to the Xirišana (see pp. 159/160) and also represent popular trade items, exactly as in the case of the Arekuná-Taulipang and their neighbors (132).

132. Koch-Grünberg, 1923a, p. 86.

283 174 The cotton, the spindle, and the technique of spinning it to the left presumably reached the Surára and Pakidái from Karaiben /Carib/ tribes by way of the Xirišana. The fact that cotton and spindle represent imports becomes clear in particular from the technique of the left twist, since in the case of the original material, the curauá fibers, the threads are always twisted to the right. Im Thurn already points out that in Guiana

[191] [114]

283 /27 cont./
191 it is chiefly the Karaiben who spin thread out of cotton, and he
194 believes that they also brought along cotton and the spindle
114 when they immigrated into Guiana (133). The latter assumption

133. Im Thurn, 1883, p. 287.

has, however, not yet been proved, for on the upper Rio Negro Koch-Grünberg met Karaiben tribes who were acquainted with neither cotton nor the spindle. To an inquiry by Frödin and Nordenskiöld about this, he replied in a letter as follows: "It is an absolute mystery to me why the Indians on the upper Rio Negro do not plant cotton for spinning and have no spindles. It would be important to investigate how far this absence of spindles extends down the Rio Negro and into its tributaries, which, to be sure, from the Curicuriary downward, are almost completely unknown ethnographically" (134).

134. Frödin and Nordenskiöld, 1918, p. 21, footnote 1.

283 Within the Yanonámi group, cotton and spinning are known,
184 in addition to the Xiriána, Surára, and Pakidái, also to the
194 Pusheweteri, Aramamesteri, and Karauateri, members of
114 whom I met in the malokas of the Surára and Pakidái, and also to the Karimé (135) and the Waikâ, who, according to Schuster,

135. Salathé, 1931/32, p. 305 and Fig. 14.

presumably became acquainted with cotton through the Karaiben Makiritare (136).

136. Schuster, 1958b, p. 16.

/28 cont./

291
[171]
[482]

137. (cont.)
(Baldus, 1945, pp. 87/88), because there is the very likely danger that it might tear.

291 I am herewith able to
• 114 confirm an opinion which Ehrenreich already holds with regard
[171] to the covered glans penis among the Xingú Indians (138), which,

138. Ehrenreich, 1890, p. 86.

however, is shared neither by Karl von den Steinen (139) nor by

139. Karl von den Steinen, 1894, p. 195.

Koch-Grünberg (140). According to the opinion of these two

140. Koch-Grünberg, 1910b, p. 89.

scholars, and also of Nordenskiöld (141) and Krickeberg (142),

141. Nordenskiöld, 1922, p. 94.

142. Krickeberg, 1922, p. 251.

the tying up of the penis is supposed to protect the glans from penetrating insects, thorns, etc. This assumption, as far as the Surára and Pakidái are concerned, is at most of secondary importance, for the uncovered female vagina is, of course, equally threatened by penetrating insects. But magical conceptions, too, with which Karsten (143) tries to explain the tying up of the

143. Karsten, 1926, pp. 151/52.

penis, are not applicable in the case of the Indians investigated by me. Hence, the second conjecture expressed by Karl von den Steinen, in which he connects this custom directly with the sex life and points out that it might have the same purpose as

/28 cont./

291 circumcision, is more suggestive. "Not that the opening is
●114 enlarged; it is a matter of a gymnastic treatment of phimosis rather than an operative one. Do they not stretch the skin which the others cut? Do they not make room inside, where the others make it toward the outside? This may be doubted least of all for the clamping of the preputium by means of the hip cord, which, as has already been mentioned, seems to be the oldest form, for the hip cord has been retained everywhere. The skin was roughly pulled forward with the cuff. Among young men it often looked sore and scraped. The European has the shoemaker put shoes that are too tight upon the last, but in the interior of Brazil, where only finished, imported goods are bought, a man of social standing thinks nothing of appearing in patent leather shoes which he has widened by a couple of vigorous slashes. His knife is to the shoemaker's last what the circumcising splinter or thorn is to the hip cord"(144).

144. Karl von den Steinen, 1894, p. 199.

Besides the verified feeling of modesty, this assumption may
[833] quite possibly be a second reason. One would then have a parallel, as it were, to the girls who are deflowered with the finger by the mother after the first year of life; it is expressly stated that this is done to facilitate sexual intercourse later on (see p. 135).

291 Among other Yanonámi tribes, too, the hip cord of plant
184 fibers or cotton is used by both sexes, /29/ and the men likewise tie up the penis with it. I was able to verify this among members of the Xirišána, Puseheweteri, and Aramamesteri who, as wives or visitors, were staying in the malokas of the Surára and Pakidái. The captive Karauateri girl, Nikeromá, also always wore a hip cord and told me that this was characteristic for her tribe and that the men likewise stuck the member under it. Similarly, Zerries (145) and Hübner (146) point out that the

145. Zerries, 1956a, p. 184.

146. Hübner, 1907, p. 231 and Fig. 12.

/35 cont./

291 On the basis of my field work, however, I have reached different conclusions with respect to the Surára, Pakidái, Puseheweteri, Aramamesteri, Xiriána, and Karauateri. Protection of the genital organs is completely eliminated for the women of these tribes, and for the men it is at most of secondary, if not tertiary importance. The thin hip-cord gives them, in fact, the same outward security that the article of clothing gives the civilized person. Though nothing is covered by it, except the glans penis, the absence of it immediately arouses a feeling of modesty in them, which, however, differs from that which has been instilled in us in that it has nothing to do with their nakedness. Clothing, shirts and trousers which I brought along as gifts, was donned by them, to be sure, as a joke, in somewhat the way we might dress up for a carnival, but they were glad when they could take it off again. Yet these Indians never showed the least shyness or embarrassment before me in their unclothed state, and when I had won their friendship and convinced them of the harmlessness of my photographic equipment, men, women, and children let themselves be photographed in relaxed and natural poses.

291 123

292 In contrast to the important hip-cord, the belts of the Surára and Pakidái are expressly ornamental objects. Since they are worn not only for festivals, however, but also on all ceremonial occasions, magical motives may likewise play a part. At the same time, they are a distinguishing mark for specific tribes and age classes. They differ from all the other belts of South American Indians, as do the men's belts of the Waiká (186) (187), in that they are open in front

186. Zerries, 1955b, colored picture on jacket and photograph on p. 663, lower left.

187. Zerries, 1954b, Pl. VI, top.

[114] and positively accentuate the pubic parts. Thus, they seem to represent striking evidence for the view of Brosse (188) and

188. Grosse, 1894, p. 96.

/35 cont./

292 Westermarck (189), who regard the belts as a sexual stimulus,
114

189. Westermarcj, 1901, pp. 195/96, 211.

by means of which the eyes are supposed to be drawn to the pubic parts. For the Surára and Pakidái, however, /36/ this hypothesis does not apply, in spite of their open belts, for the naked body does not provide any sensual stimulation for them, but rather solely the sexual act. According to Krause, among the Karajá /Caraja/ the feeling of modesty of the girls is supposed to have led to the development of the types of belts. As evidence for this, he gives the following observation: "Women never removed or changed their bands in our presence, and small girls from whom I bought belts went behind the nearest mat wall in order to put on a new one there before they brought
291 123 me the worn belt" (190). My experiences among the Surára

190. Krause, 1911, pp. 208/09.

and Pakidái were the same with respect to the hip cords, among men as well as among women and children, but they always untied their belts without shyness and gave them to me in exchange
292 184 for trade goods. This was also true of the Puseheweterf women, which shows that their little fringed aprons do not represent, say, a pubic covering, but merely ornamentation. Moreover, they also tie on their belts only for festive occasions.

291 171 The situation with respect to the children's belt made of the skin of the maracajá is unique. It should be noted, however, that in Guiana, one of the chief South American areas of distribution of the skin belt (191) (192), specimens made of jaguar skin have

191. Becher, 1951, I, p. 82; II, plate and Map No. 4.

192. Becher, 1955, p. 72.

301 /36 cont./ Even the younger women, however, have
856 the idea that by occasionally wearing it they can preserve their
[824] busts, especially if the cord was made of the original material,
292 curauá fibers. On the other hand, the chest cord and the string bundle, which is worn only during festivals and on the occasion of ceremonial acts, are regarded as ornamental objects and insignia of two age classes.

301 The women of the Xiriána, Puseheweterí, Aramamesterí,
184 and Karauaterí whom I met in the malokas of the Surára and Pakidái also wore such cords and string bundles, to be sure, but
[114] said that they were not used in their tribes. This also explains why Koch-Grünberg did not mention such articles when he
301 described the dress of the Xiriána (Schirianá). Among the Arekuná-
171 Taulipang, on the other hand, he saw as festival ornaments for women and men long chains /37/ /Fig. 13 appears here/ of white beads and brown seeds, which they had slung crosswise in many windings over the chest and back (196) (197). Aside from

196. Koch-Grünberg, 1923a, p. 37.

197. Koch-Grünberg, 1923b, Plates 15, 45, 62, 91, 92, 93, 98, 99, 100, 102, and 107.

the additional ornamental material used, these chains differ from the cords and string bundles described above in the way they are worn, for they reach much farther down.

301 One thus gains the impression that in the case of the chest
179 cord of curauá fibers used by the Surára and Pakidái women it is a very primitive object from which the string bundle was developed after the introduction of cotton. This, in turn, could have been borrowed by Karaiben tribes, perhaps during war contacts, and
[191] transformed by them into a long ornamental chain. The former is, to be sure, also slung crosswise, but the original meaning, the enhancement of the breast form, was lost, which may also be deduced from the fact that among the Arekuná-Taulipang even men tie such an ornamental chain around themselves.

302 /39 cont./
593 husband beats his wife for reasons of jealousy, he may likewise choose only this marked part of the head. As a further, but
302 probably secondary reason, I was told that the short haircut and
825 the tonsure made it easier to control the plague of lice. People with long hair, they thought, were certainly unable to escape head lice.

302 The tonsure is also mentioned in religion and mythology.
538 Poré, the lord of the moon, is imagined as an old man with a long white beard and a tonsure painted red (see p. 197).

302 As among many other South American tribes, the tonsure
191 is also a /40/ characteristic feature of all small-sized light-
184 skinned Indians between the Rio Negro and the upper Orinoco, for the members of both sexes of the Xiriâna, Pusheweteri, Aramamesteri, and Karauateri whom I met also wore it (206).

302
191
●114 206. The Brazilian country people designate all Indians with tonsures as Coroados = crowned. Baldus and Willems, however, quite rightly demand that the use of this name be avoided in Brazilian ethnology: "Coroado- Várias tribus de indios no Brasil, por exemplo, os Botocudos, Kaingang, Purí, Bororo, receberam do povo o nome de Coroados, devido ao modo de cortar o cabelo, se bem que êsse modo não fosse igual entre todas elas. Causou êste têrmo grande confusão na etnografia brasileira, razão pela qual deve ser abandonada" /Coroado -- Various tribes of Indians in Brazil, for example, the Botocudo, Caingang, Puri, Bororo, are given the name of Coroado by people, owing to the manner of cutting the hair, even though this style is not the same among all of them. This term has caused great confusion in Brazilian ethnography, and for this reason it should be abandoned/ (Baldus and Willems, 1939, p. 67).

/42 cont./

304 824 386 412 377 The former use the juice of the genipap fruit as coloring matter, the latter the ashes of burned honey bees (229) /see footnote p. 90/. The original instrument everywhere for the puncturing of the dots was a palm thorn. Koch-Grünberg, however, also saw the use of pointed fragments of glass among the above-mentioned Karaiben (230).

230. Koch-Grünberg, 1923a, p. 45.

304 174 171 ●114 A decision about whether the tattooings in the mouth region developed independently among the aforementioned Yanonámi, Karaiben, and Aruak tribes or whether they were brought about by reciprocal or outside influences cannot be reached as yet, although Koch-Grünberg saw a young Xiriána woman who had the fishhook and dot tattooing of the Arekuná-Taulipang painted on her face (231). This may have been an exception, however,

231. Koch-Grünberg, 1923a, p. 305.

for, strangely enough, he did not find any further tattooing among the Xiriána.

179 The designs of the Surára and Pakidái also seem to be more primitive than the basic motifs of the Karaiben and Aruaken in the form of fishhooks, which clearly point to borrowings from civilization. Moreover, the fact that among the Karaiben tribes of Guiana individual men and boys are tattooed in the region of the mouth leads one to conclude that there has been a leveling of this custom. For probably there, too, it was formerly reserved for only the women, just as it is today among the Surára and Pakidái.

In conclusion, reference is to be made to P. Schmidt and Nordenskiöld, from whom there are already available brief, summary studies about puncture-tattooing in South America. The first-named author differentiates two groups, which are reserved for men and women or only for women, respectively, and regards a western origin as probable (232). /43/ On the other

/43 cont./

232. P. Schmidt, 1913, pp. 1083/84.

304 174 171 114 hand, Nordenskiöld represents the view that puncture-tattooing "could rather easily have been discovered in various places." His map of distribution shows a concentration of this custom in the northern and central parts of South America (233). A com-

233. Nordenskiöld, 1918, pp. 128-130 and Map 19.

prehensive study on the tattooing of South American Indians would definitely produce worthwhile and informative results.

301 h) Painting

The body painting which is applied on ceremonial occasions, war expeditions, and occasionally also hunting expeditions is [531] very simple and artless. Either it consists of constantly recurring motifs, such as serpentine lines, circles and dots (234), which

234. The implements are also painted with these motifs.

are applied sometimes singly, sometimes mixed, or the entire body is rubbed with red or black coloring matter.

[824] [386] For the red coloring matter, there is urucú -- narú --, a paste which is prepared from the red berries of Bixa orellana. Blue color is furnished by the seeds of the genipap fruit (Genipa brasiliensis) -- narabú --, whereas for black coloring matter the soot scraped off cooking pots is used, usually mixed with a little genipap.

[413] The serpentine lines, circles, and dots are applied with the fingers or a wooden stick, and for diffused coloring a little ball of cotton is used.

Surára
Pakidái

/44 cont./

301 171 South American tribal units developed their abilities and passed on their traditions over the centuries from generation to generation.

301 184 For the Yanomámi the simple upper-arm ornament represents a further external distinction, for Xirišna, Pusebeweteri, and Aramamesteri men whom I met wore it in the same manner.

● 114 With regard to the Xirišna, my observations correspond with a statement by Koch-Grünberg: "The men," he says, "wrap around the upper arms long, red-dyed cotton strings, on the ends of which hang bird skins (Pl. 46, 2 and 2a). When they go to war, they stick bunches of tail feathers of the red arara in front under the arm bindings, so that they project above the /45/ shoulders" (239).

239. Koch-Grünberg, 1923a, p. 305.

For the Waiká this upper-arm ornament is documented by photographs by Zerries (240) (241).

240. Zerries, 1955b, frontispiece.

241. Zerries, 1954b, Pl. VI, top.

301 239 171 As for ear and lip ornaments, parallels are found among the Makuxi and Arekuná-Taulipang, but here the white down-feathers of the king vulture or of the large hocco (mutum) are used (242).

242. Koch-Grünberg, 1923a, p. 28.

301 436 (822) D) Bead ornaments

European glass beads, especially small ones, are to this day the favorite trade items among the Surára and Pakidái. They value most of all white, blue, and red beads (243), and

243. In this respect the Surára and Pakidái are like many other South American tribes (Menzel, 1957, p. 23 and Pl. 3).

/45 cont./

301 in most cases, a silver triangle, a large glass bead, or a fruit pit is fastened at the bottom.

301 439 When I came to the Surára and Pakidái, a few bead chains were already in use. According to their statements, they had obtained the glass beads from the Indian protection post Ajuricaba on the Rio Demini, from rubber and palm-fiber gatherers, and from the Xiriána. The latter had presumably acquired this foreign commodity from Karaiben tribes who, for their part, had received it from the whites. This shows that the barter of glass beads is still carried on vigorously among the Indians themselves (245).

• [114]

245. It was already observed by v. Martius that glass beads were traded over wide areas (von Martius, 1867, I, pp. 702 ff.), and Krause also points out that they are greatly prized as trade items (Krause, 1911, p. 279).

7. Hammocks

352 [824] The Surára and Pakidái have three different kinds of hammocks. The hammock of embira (tree bast, Malvaceae sp.) -- yâritanacîk -- whose length is between 1.80-1.90 meters, may probably be regarded as the oldest and most primitive form (Ill. 26). It has no weft and consists only of ten to 14 embira strips [284] 1-2 centimeters wide. These are bent over at the ends and tied together by means of two ropes 1.30-1.40 meters long, which at the same time serve for suspension (Fig. 18a and b). Both ropes are very strong and durable, for they have been plaited in the form of a braid out of three one-centimeter-wide /46/ /Fig. 18 appears [462] here/ strands of embira. The manufacture of this hammock is [824] extraordinarily simple and is done only by men. From the embira [284] tree they remove 10-15 bast strips two meters long and 1-2 centimeters wide, which they tie together in the manner described above, after they have first plaited two ropes. To cut the tree [412] bast they use the little cutia-tooth knife (see p. 113). Since the yâritanacîk is extraordinarily light, the men like to use it on their

284

Fig. 18a-b
Detail of the end fastening on a hammock of embira, as well as loop and knot diagram.

352 roving, hunting, and war expeditions as a travel hammock.
[482] Rolled up, it then hangs on their backs, held by a thin neck-cord
of cotton or curauá (Bromelia fiber). For sleeping they usually
[513] lie curled up in it; it takes practice and skill, however, not to
fall out.

352 Similar hammocks are also used by the Waiká, and there,
184 according to Zerries, they are supposed to fulfill certain functions
[114] in the ritual system (246) (247), whereas Schuster says that they

246. Zerries, 1955a, p. 87.

247. Zerries, 1956a, p. 184.

are made only in an emergency (248). The tree-bast hammocks

248. Schuster, 1958b, p. 16.

of the Xirianá are more highly developed, for they have a weft of cotton threads and plant fibers. Ruth Haebler describes two specimens in the ethnological museums in Berlin (VA 61119) and Leipzig (8736) (249).

249. Haebler, 1919, p. 12.

Surára
Pakidái

/46 cont./

352
191

Even highly civilized peoples, however, for example, the Ipurina, an Aruak /Arawak/ tribe that at present is still living on the Acre, Seruini, and Ituxí rivers in the Brazilian state of Amazonas (250), formerly used these hammocks without weft, as

250. Darcy Ribeiro, 1957, p. 75.

is confirmed by a specimen in the Berlin ethnological museum (VB 3758) (251). There were also some, however, that were bound

251. Haebler, 1919, p. 12.

[114] by means of one or two rather long cross-strips. With respect to their purpose and manufacture, my observations among the Surára and Pakidái are almost identical with Ehrenreich's statements concerning the Ipurina. Thus, the investigator named writes: "The extremely primitive, but serviceable hammocks which the Ipurina use in an emergency on journeys, hunting expeditions, etc. clearly show how this useful implement may have been invented.

"Four or five strips of bast (embira) two meters long and 3-4 centimeters wide are simply loosened from the tree and gathered together at the ends, and sometimes bound together by one or two shorter cross-strips. In any case, lying in it requires no little skill and practice" (252).

252. Ehrenreich, 1891, p. 63.

The Berlin Museum für Völkerkunde, however, owns one hammock that is still more primitive. It comes from the Nahukuá (Nahuqua), a Karaiben /Carib/ tribe of the Xingú source region, and consists only of a bundle of grass, which, tied together at top and bottom, served as a sleeping arrangement for children (VB 2624) (253).

253. Haebler, 1919, p. 12.

252 /51 cont./
184
285 The tube-press -- pokunho -- has only recently gained entry
[192] among the Surára and Pakidái. Among the former I discovered only three specimens, among the latter five, all of which /52/ /Fig. 22 appears here/ were made of bast strips of the curauá plant
[438] (Ananas sativus Sch.) and were relatively small (length, 1.10-1.20 meters; diameter, 3-4 centimeters). They were in the possession of a few families who had obtained them by barter
[192] from the Xiriána. Heretofore the manioc pulp has been pressed out with the hand by means of small, square plaitings -- yorohí -- (290).

290. The name is practically identical with the one for the small basket with handle -- yorohikes -- and the plaiting technique is the same throughout.

[178] Even today this method is more common than the one with the tube-press, but the latter is gradually beginning to come in.
[426] Families who do not as yet own a tube-press sometimes borrow one, for up to now it has been made neither by the Surára nor the
● 114 Pakidái. The above reference to the fact that the tube-press is
252 supposed to represent an import article from the Xiriána is
174 significant, however. That is, when Koch-Grünberg stayed with
285 a Xiriána group in Motomotó, he did not find any there, but only small basket-winnowers, in which the manioc pulp was squeezed
[177] with the hand (291). Hence it is to be assumed that these Indians,

291. Koch-Grünberg, 1923a, p. 308.

too, have not known the tube-press for very long; presumably they took it over from the Karaiben. /Fig. 23 appears here./

/52 cont./

854 287 [824] [413] [412] 854 [171] [184] [114]

9. Band for Carrying Children

The band for carrying children -- okomakuſ -- is made from the bast of an embira tree (Daphnopsis brasiliensis Mart.). For this purpose thin trunks are cut down by the men. Then the women remove the bark and /53/ with a bast beater -- xamotimſ -- (a piece of wood 30-40 centimeters long, from the embira tree) beat on the trunk for 1-2 hours. Through this the bast -- uarimaxſke -- becomes loosened, soft, and pliable, so that finally it can be easily peeled off the trunk -- pekehſ -- (Fig. 23a-c). Then the two ends are slipped into each other and sewed double with a thread of Bromelia fibers or cotton. The holes are pierced beforehand with the little cutia-tooth knife (see p.117), and then the thread can be drawn through without effort.

The carrying-band is always slung over the right shoulder so that the right hand remains free for work, and it ends at the level of the left hip (Ill. 15), which gives the sitting child additional support if the mother puts its legs around her body.

This carrying method is very widespread in South America and is also employed by tribes that do not use the carrying-band (292). Among the Xiriſna Koch-Grünberg does not seem to

292. See, for example, Koch-Grünberg 1923a, Pl. 45.

have seen such carrying-bands, for he says nothing about them.

10. Receptacles

415 824 [192]

As receptacles, the fruits of the Bignoniaceae (Crescentia cujete Lin.) and Cucurbitaceae (Cucurbita lagenaria Lin. and Cucurbita idolatrica Lacerda = jamaru), which offer a variety of shapes (ball shape, bottle shape, cucumber shape, and others), are used principally.

These vessels in general are called -- horotokſ --, except for those of the jamaru fruit (Fig. 24), which are called -- nhapotoſma.

/55 cont./

The Surára acquire these articles by way of barter through their occasional contacts with the piaçabeiros (palm-fiber gatherers) on the Rio Araçá, while they are given to the Pakidái as gifts by the personnel of the Indian protection post Ajuricaba on the middle Demini. To my question as to whether their ancestors had once used stone axes (I could not discover any), I was always given affirmative replies. They also have a special name for the ax -- hanhokomã. The blade alone is named synonymously, whereas the shaft is called -- hanhokomãhitohĩ. Most probably the stone axes were acquired by barter, as is the case, according to Schuster, for the Waikás (310). Which tribe furnished this

310. Schuster, 1958b, p. 17.

import article could no longer be determined, but this time the Xirianá seem to be excluded as the intermediaries. Koch-Grünberg writes: "They (the Xirianá) in former times apparently had no axes at all to cut down the forest. At any rate, they did not know what to do with a stone ax that I showed them" (311a).

311a. Koch-Grünberg, 1923a, p. 307.

12. Equipment for Climbing

To climb up tall palms with a smooth trunk, such as the açaí (Euterpe oleracea Mart.), bacaba (Oenocarpus distichus or Oenocarpus /56/ bacaba Mart.), bucu (Manicaria saccifera Gaertn.), buriti (Mauritia vinifera Mart.), inaja (Maximiliana regia Mart.), paxiuba (Iriartea exorrhiza Mart.), tucuma palm (Astrocaryum sp.), and others, the Surára and Pakidái use the climbing ring -- horoboromã --, which consists of a split liana (cipó-titica) rolled up several times. The ends of the liana are wound around the ring several times and tied with a knot (Fig. 27). /Fig. 27 appears here./

Surára
Pakidái

/57 cont./

VII. Social Organization

1. General

619

In the case of the Surára and the Pakidái, these are sovereign tribes, who, however, live together in connubium. The same extends to the friendly Xiriána /Shiriana/, Pusheweterf, Aramamesterf, etc.

648 161 [842] [164] [165] [726]

Although the Indians investigated by me have very little contact with palm-fiber gatherers or the personnel of the Indian protection post Ajuricaba on the Demini, their population is steadily decreasing for the following reasons: birth control; high infant mortality as a result of the lack of hygiene; diseases, chiefly measles epidemics (312), but also chicken pox and grippe;

> 312. In 1952/53, for example, a measles epidemic spread like a wave from the lower Amazonas as far as the Brazilian-Colombian border area and brought death to many Indians. [115] (Statement by Herr Alipio Edmundo Lage, Inspector of la. Inspetoria do Serviço de Proteção aos Índios, Manaus).

and frequent wars (313).

> 313. On the occasion of an attack on a hostile maloka, an attempt is made to kill all the men, young men, and boys, insofar as possible, while the women and girls are taken along as captives.

2. Names

551 162 [160]

The exact number of Surára at the time of my stay among them amounted to only 64 (314) and consisted of the following:

• [114]

> 314. In the first reports of my investigations I erroneously gave the number as 42 (Becher, 1957a, p. 118; Becher, 1958, p. 157).

Surára
Pakidai

/63 cont./

854 593 It is simply touching to see how lovingly and solicitously every mother treats her child. But the love of the father is no less great. He openly acknowledges the child and clearly shows his feelings of pride and fatherliness (318), though he is otherwise

[114] [191]

318. In contrast to this, Alexander von Humboldt, with reference to the Indians on the Orinoco, writes that fathers do not have any affection for their children (A. von Humboldt, 1860, III, p. 155).

very reserved in his expressions of feeling. When he comes wearily into the communal house after a strenuous hunting expedition or from his field work, he never forgets to devote himself first of all to his little child for a while. He either takes it on his arm and goes walking with it, or he lays it beside him in the hammock. Even during migrations of the tribe he sometimes [858] carries the child for hours. Moreover, he loves a daughter just as much as a son.

854 304 During the first year of life the ear lobes and the lower lips of boys and girls are pierced by the mother with a sharp palm thorn, and, in addition, the girls are given perforations in the corners of the mouth. To prevent the wounds from healing, small wooden rods are stuck in temporarily and moved back and forth 304 frequently.

854 833 When a little girl has completed the first year of life, she is deflowered by the mother with her finger. This procedure is done in preparation for sexual intercourse later on.

114 191 854 833 304 Similar procedures were observed by von Feldner among the Machacarí /Mashacali/ Indians, and he describes them as follows: "Nulla inter illas invenitur virgo, quia mater inde a tenera aetate filiae maxima cum cura omnem vaginae constrictionem ingredimentumque amovere studet hoc quidem modo: manui dextrae imponitur folium arboris in infundibuli formam redactum, et dum index, in partes genitales immissus huc et illuc movetur, per infundibulum aqua tepida immittitur" (319). In this connection

319. von Feldner, 1828, II, p. 149, footnote.

114 171 854 833 304

/63 cont./
Ploss and Bartels have already observed: "These manipulations probably serve not so much the purpose of cleanliness as preparation for the later sexual functions" (320).

320. Ploss and Bartels, 1927, p. 376.

171 304 854

A custom which is said to prevail in Paraguay should be mentioned in this connection. When a girl is born there, the midwife inserts her finger into the vagina and says: This is a woman (321). Unfortunately, there is no account of the origin

321. Written communication from Montegazza to Ploss (Ploss, 1912, p. 219).

of this custom. It is possible that it was taken over from Indians, because in Paraguay the Indian population is, of course, numerically the largest.

Among most South American tribes for whom there is evidence of an artificial destruction of the hymen, however, chiefly those of the Tukano /Tucano/ and Pano linguistic families, but also some of the Aruaken /Arawak/ and Tupi, it is done for ritualistic purposes at the onset of puberty (322).

322. Fuchs, 1956, pp. 79-81.

Among the Totonaken /Totonac/ in Mexico it is one of the duties of two priests to destroy with their fingers the hymen of female babies 28-29 days after birth. At the same time they ordered the mothers to repeat the defloration six years later with their fingers (323). Strebel regards this procedure as a castigation rite,

323. Krickeberg, 1918-1922, p. 47.

corresponding to the circumcision of male infants, which was also carried out by the priests. "Even the child was to pay its tribute to the gods, /64/ and the fact that the sexual parts were chosen for

Surára
Pakidái

/64 cont./ If the child's nose is not clean, the mother carefully takes it between her teeth, presses its contents into her mouth, and spits them out. The women found it most unhygienic that I blew my nose into a handkerchief and carried it with me.

The little Surára and Pakidái learn to walk and talk at the same age as the children of civilization, and they are aided by their parents, siblings, and relatives. The pleasure of the relatives is great and they are overjoyed when the child is able to stand and walk and babble its first words, nápe=mother and hápe=father.

e) Name-giving

After the completion of the third year, a new, important period of life begins. The nursing period is ended, and the child, which hitherto belonged to the flesh and blood of the mother (325b), has become an independent human being.

325b. This idea is very unusual for South American Indians. It should be remembered, however, that among most of the tribes the so-called couvade, the men's childbed, is practiced. Karl von den Steinen, who has examined the psychological basis of this custom, says that in this case the child, whether it be a boy or girl, is "the little father," so to speak, a part of the father, that is, a bit of his body. (K. von den Steinen, 1894, pp. 334 ff.) "The activity of the mother in this connection is compared to that of the soil, which receives the seed." (von Spix and von Martius, 1831, p. 1338.)

has become an independent human being. Now it is also given a name, which is taken from the animal or vegetable kingdom. The name is given to the father, when he offers his prayers in snuff-powder intoxication, by the gigantic animal and plant spirits living on

/64 cont./

553 976 [782] high mountain ridges -- hekurá --, who represent the intermediaries to Poré and Perimbó, the joint Supreme Being of these Indians (see pp.197/199). The particular animal or plant whose name a child bears is regarded as a sort of "spiritus familiaris" [779] throughout its life. This is linked to the idea that the fate of the child has now become identical in essence with them; that is to say, good fortune, but also the suffering and dying of animals and plants are transferred to the like-named human beings.

553 • 114 191 The use of animal names corresponds to the nagualistic ideas and customs which Eduard Seler mentions in his monograph /65/ on Michuacan /Michoacán/ (326), while plant names are

326. Seler, 1908, pp. 104/05.

also included under the same aspect by the Surára and Pakidái. The name "nagual," according to Seler, is derived from the Aztec word naualli = disguise (327). In place of nagualism, however, the

327. Seler, 1904, pp. 75/76.

technical term "tonalism" may also be used (Aztec tonalli = someone's destiny, fate, soul, spirit...) (328).

328. Haekel, 1958, p. 45.

553 302 [412] [824] On the day of the name-giving the children are given a tonsure such as is worn by all adults of both sexes. It is shaved off with the sharpened side of a split piece of reed (taquara -- Guadua sp.). Simultaneously they are attired for the first time in 553 291 the hip cord of cotton or plant fibers, which they may then never remove up to the end of their lives, not even while bathing or during sleep. The cord must, of course, be renewed occasionally, but this is done in all secrecy. At the time of the donning of the hip cord by little boys, the penis is tied up, with the preputium held fast under [834] the cord by means of a loop (Ill. 22). From now on the penis must no longer hang down, for this would be an offense against good [292] form. On festive occasions a belt of cotton is also tied around children (See pp. 64ff.).

Surára
Pakidái
Shiriana

619 /75 cont./
651 already waiting for him. After such a visit, the Surára and Pakidái
576 are thoroughly stripped, but at least the constraint under which
574 they were put during these hours has been removed, and one soon hears them laughing and joking again (346).

[114]

346. For traveling investigators who come into contact with tribes of this region it is also very important to make sure, in offering presents and trade articles, that valuable objects are held back at first, because the chief always takes his share last. A visitor who is not familiar with this mentality and stands empty-handed at the end would incur the enmity of the chief and thus of the entire tribe from the outset.

7. Making a Living

433
178
241 a) General

At present the Surára and Pakidái are in a state of transition from an exploitative to a productive economy. The traditional means of acquiring food, hunting and gathering, still played a dominant role among these Indians at the time of my visit, but I could see that most of the members of the tribe, especially the men, already manifested a great interest in agriculture, which had been introduced a generation or two before. The chiefs in particular proved to be shining models, for they set a good example in all the work in the roça (forest clearing) (347). According to their

[622]
000

[174]

347. The myth about the origin of the banana (see p. 249) clearly shows that the Surára and Pakidái were formerly only hunters and gatherers.

Surára

222 carrying baskets. -- Of the fruits of the wild cacao tree (Theobroma sp.) -- boroš --, which has many branches and whose foliage is dense and dark, only the sweet pith of the husks is sucked out, while the beans, which played such an important part among the high-culture peoples of Central America, are carelessly thrown away (363). -- The apple-like fruit of the lucuma tree

[184] [192] [114]

363. Zerries reports the same thing of the Waikš, and here the names are "loa" or "boholoa" (Zerries, 1956b, p. 150; Zerries, 1958c, p. 177).

(Lucuma macrocarpa Hub.) -- kumatš -- is valued for its sweetish, gelatinous pulp that surrounds the pit; the /79/ outer meat of the fruit and the shell, on the other hand, has a very bitter, unpleasant taste. -- The fruit of the wild pineapple, which only reaches the size of a medium-sized apple, is also eaten with relish.

The pods of the pacova sororoca, a Musaceae species (Ravenala guianensis Benth.) -- mokohš -- (364), gathered espe-

364. The pacova-sororoca is often erroneously called "wild banana" because its large leaves, which resemble those of the banana trees.

cially frequently, contribute more to the everyday food. -- When there is an occasional food shortage during the rainy season, the flat brown fruits of the pot tree (Lecythis longifolia), which are called uapš by the Surára and kurupš by the Pakidái, are appreciated to this day (365).

365. The Waikš have the name "wabu" for them (Zerries, 1956b, p. 149; Zerries, 1958c, p. 177); Barker, 1953, p. 443).

Besides these most important vegetable products that are gathered, there are also a great many animal ones. To be named here above all is the honey of several species of small bees (366)

[36]

366. There are said to be more than 20 different varieties of them.

Surára
Pakidái

/80 cont./

241
166
361 It is worth mentioning that at present in the course of one year the Surára as well as the Pakidái regularly carry on their field work in two places that are far apart. During the rainy season, April-September, the Surára, as is well known, live at the Cachoeira dos Indios on the upper Aracá and the Pakidái on a right tributary of the middle Demini, where they also own fields. On the other hand, they spend the summer season together in the large, open Surára maloka (between the Demini and Aracá rivers), around which was laid out a roça which was large enough to be divided among the Surára and Pakidái families. Thus, both tribes always have the benefit of abundant harvests at their permanent dwelling sites. In addition, there are the bananas and pupunha fruits of the abandoned fields, to which the entire tribe travels at the time of this harvest, or gathering expeditions are undertaken to bring in chestnuts, inga, and other kinds of wild fruits.

241
423 Since, however, on account of the seminomadic way of life of these Indians, one forest clearing or another is left untended for shorter or longer periods, there is the danger that in the meantime members of hostile tribes will break in and take possession of the produce there. Provision is made for this, however. Before the tribe leaves one of its clearings, a few men commissioned by the chief stick several wooden arrow points and thorns of the pupunha palm, coated with poison, into the ground and put leaves over them. Hostile Indians with plunder in view therefore risk the danger of running these into their legs (370).

[291] 370. All Indians of this region go barefoot.

[184] As I was told, this custom is resorted to by all Yanomámi tribes, and for this reason no Indian would ever think of setting foot on the deserted clearing of another tribe (371).

• [114] 371. This hint may be of the greatest importance for research travelers who want to work in this region.

Surára
Pakidái

245
[481]

/81 cont./

with a specially constructed apparatus (see p. 120), bears very narrow, pinnate leaves that are curly at the tips and are always gently swaying in the wind. They stand around the community house like sentinels and seem to be perpetually nodding benevolently and reassuringly to the inhabitants of the large, open maloka (Ill. 6). Their fruits -- maraxá -- (377),

377. The name among the Waiká is very similar -- "lasha" (Zerries, 1956b, p. 149).

50-80 of which form a cluster, are noteworthy. They can be harvested only once a year, between September-April, but each palm has at least three, and sometimes four clusters, that is to say, approximately 200-300 fruits. At first they look yellow, but after ripening they take on a bright red color. In contrast to other palm fruits, they are characterized by especially abundant meat.

137
245
●114

As to the question of whether or not the pupunha fruit has seeds, there are various opinions. Zerries did not find any seedless ones (378). On the other hand, I saw fruits with

378. Zerries, 1956b, p. 149.

seeds and without. This observation is confirmed by statements by Sauer, who writes: "In many cases it has lost the capacity to produce fertile seeds..." /cited in English/ (379).

379. Sauer, 1950 p. 525.

And even Alexander von Humboldt (380) and Vinci (381)

380. Alexander von Humboldt, 1860, III, p. 281.

381. Vinci, 1956 pp. 370-375.

245
139
•114
[040
184]

/81 cont./
mention such seedless fruits (382).

382. Zerries, moreover, thinks it is possible that among the Waikás the pupunha fruit was the predecessor of the mealy banana (Zerries, 1956b, p. 148).

244 The cultivation of tubers, which is always done separately from the banana plantings, has hitherto been practiced on only a very modest scale. It includes the cultivation of taioba or taro (Colocasia antiquorum and Xanthosoma violaceum Schott.) -- ohĩná -- (383), cará or yams (Dioscorea

383. Among the Waikás the corresponding name is "ohina" (Zerries, 1956b p. 153).

sp.) -- cabiromá -- sweet manioc, known in Brazil as macaxeira aipim or mandioca doce (Manihot palmata Muell. Arg.) -- mihitarima -- bitter manioc (Manihot utilissima Pohl) -- kuamirimakõse --, and sweet potatoes (Ipomoea batatas Lam.) -- hikarí -- (384). Worth mentioning

249
243

384. The Waikás call the sweet potato "higali" (Zerries, 1956b, p. 153).

also are the sugar cane plantings (sugar cane (Saccharum officinale) -- bukũ -- (385)) and the absence of maize (386).

385. The Waikás have the same word for sugar cane (Zerries, 1956b, p. 153).

[184]

386. Zerries, to be sure, found evidence of its cultivation by the Waikás. But, he adds, maize "is little more than a rare delicacy" (Zerries, 1956b, p. 153).

Surára
Pakidái

/83 cont./

252
262

394. (cont.)
nourishment during their first and second menstruation (see p. 142), and it represents the most important item of food for pregnant women, and for several months after confinement. Among the Tapirapé, on the other hand, where the banana also represents a basic part of the diet, parents must refrain from eating this fruit after a birth. "They believe that the child would die if they disregarded this rule" /cited in English/ (Baldus, 1956b, p. 601).

[191]

252 raw. -- The mealy, nourishing fruits of the pupunha palm are primarily boiled. Then the soup is allowed to cool and a refreshing drink is obtained in this way. Before festivals all the [415] women pour it into a large, wooden trough, which is found in every maloka, so that there will be enough on hand. By means of steaming or roasting, a solid food is also prepared from them (395). --

• [114] [137]

395. Alexander von Humboldt, by the way designates the pupunha or pihiguao palm as "Pfirsich-palme" /peach palm/ and praises the delicious taste of its fruit (Alexander von Humboldt, 1860, III, pp. 281 f., 300; IV, p. 145). I cannot agree with the great scholar in this, for to me it tasted like slightly bitter potatoes. Zerries, by the way, is of the same opinion (Zerries, 1956b, p. 148).

Taioba, carí, sweet potatoes, and sweet manioc are steamed in a pot or roasted in hot ashes without being previously washed or
252 peeled. -- Bitter manioc is scraped by the women with the
412 lancet-shaped bamboo knife (see p. 118) and then grated on a rough slab of granite, for they do not have grating boards (396) (397).

[177] [123]

396. My servant Mateus, however, made them

Surára
Pakidái
Shiriana

/83 cont./

252
412
[177]
[123]
[192]

396. (cont.)
a few graters out of the sides of our empty gasoline cans by boring numerous holes in them with a nail. They were very happy over these and maintained that it was considerably more agreeable to grate on them. They also immediately had a name for this grater -- kabaricinamõ.

252
184
412

397. The Xiriâna, too, grate the manioc roots on rough slabs of granite (Koch-Grünberg, 1923a, p. 308).

252 The grated pulp is then pressed out by hand with the help of small, square strips of plaiting (see p. 112), which are rolled up (398).

398. The poison is removed from the manioc pulp in the same way among the Xiriâna (Koch-Grünberg, 1923a, p. 308).

Among the Surâra I found three tube presses and among the Pakidâi five, which they had obtained from the Xiriâna (see p. 112). With the flour the women bake, on large, flat granite stones under which a fire is kindled, manioc flat-cakes, which are consumed with pleasure. This food, which appeared among them only a comparatively short time ago, seems to become
293 more and more popular. The preparation of kaschirí is unknown (399).

• [114]
[177]

399. Since, however, my servant, a pure-blooded Tukano /Tucano/ Indian, felt a great desire for a slight alcoholic intoxication at the sight of the manioc flat-cakes, he taught the Surâra how to make kaschirí. At first they tried this unknown drink very critically. But after the first swallow their eyes shone, and they slapped Mateus on the shoulder enthusiastically and assured him again and again how good it tasted to them.

/84 cont./

272 are kneaded and pulverized in calabashes filled with water. This produces a grayish-brown, greasy juice which, after the fleshy husks have been fished out and thrown away, reminds one of cacao in appearance and flavor and is extremely filling. This drink tasted even better to me when I added a little sugar. [123] [263] The Indians who tasted this, however, were not enthusiastic about the addition, since they like sugar just as little as salt. I was unable to please either children or adults with my bonbons. The fruit of the bacu buriti, curauá, piaçaba, and ubim palms (see p. 166) is made into beverages in the same way, while that of the inaja palm is cooked beforehand. The juice obtained from this tastes quite insipid, to be sure, but likewise has a high food value.

One should also mention that a drink is prepared from the gathered honey by mixing it with water. I never saw it eaten, [114] [84] [197] as has been confirmed for the Waiká (407) and various /85/ other

407. Zerries, 1956b, p. 150.

tribes of Guiana (408) (409).

408. Koch-Grünberg, 1923a, p. 55.

409. Richard Schomburgk, 1848, II, p. 169.

271 184 As the above account shows, the Surára and Pakidái do not lack variety with regard to beverages, so that only in the rarest instances need they resort to plain water, as is the case, according to Zerries' accounts, among the Waiká (410). As among

273 184

410. Zerries, 1958c, p. 177.

the latter (411), however, alcoholic beverages are completely

411. Zerries, 1958c, p. 177.

unknown to the Surára and Pakidái too.

2: Becher--186 E75 (1955-1956) 1960 SQ18 Yanoama SQ18

Surára
Pakidái

/86 cont./

231 Dogs are never killed; they are allowed to live until they
[262] die of old age. When I asked whether dog meat was ever eaten
in former times, men and women, with horrified faces, answered
in the negative. Yet this custom is supposed to have prevailed
[273] at one time among various tribes of Guiana (414). There do not

414. Alexander von Humboldt, 1860, IV, p. 189.

seem to be any myths about dogs.

123 I should also like to mention that during my months-long,
23 extremely friendly stay with the Surára and Pakidái, and in
[114] spite of great efforts, in which the Indians helped me, I never
23 succeeded in winning the affection of their dogs. It meant a
[114] good deal that in time I was tolerated by them. I can agree
perfectly with Friederici when he writes: "The Indian dog has
always hated the white man, and, conversely, the dog of the
European, the Indian. The odors given off by the races are so
different that even a human nose can usually tell the difference,
how much more a dog. If a white man walked through an Indian
camp he usually had a whole pack of growling and teeth-baring
dogs behind him" (415). But I also found that the opposite was

415. Friederici, 1899, p. 365.

true. The dogs kept at the Indian protection post Ajuricaba on
the middle Demini, mongrels of the most diverse breeds, but
among them also former Indian dogs, behaved, in their hatred, as
though they were mad when Pakidái families came to visit (416).

[171]

416. Baldus, on the occasion of his Chaco expedition, also observed that Indian dogs, once they are in the hands of whites, become the bitterest enemies of their former masters (Baldus, 1931, p. 18).

Surára
Pakidái

/88 cont./

296 and Pakidái I was unable to learn anything with reference to this, although there, too, the consumption of tobacco is uncommonly
[249] great. They plant plenty of tobacco in all the forest clearings, however, and if it were entirely harvested in the fields where they were living at the time, the men fetch it from other distant rocas or in emergencies they obtain it from friendly tribes by barter.

[184] [114] Koch-Grünberg reports that the Xirifna and Waikâ hordes visited by him chew the tobacco (430). From his description, how-

430. Koch-Grünberg, 1923a, p. 311.

ever, it is to be seen that actually a sucking of the tobacco is
296 also involved. The Arekunâ on the Roroima probably also did the
191 same thing, although Richard Schomburgk (431) and Appun (432)
114

431. Richard Schomburgk, 1848, II, p. 239.

agree in speaking of "tobacco chewing." It is noteworthy that Koch-Grünberg (433) did not observe this form of tobacco enjoyment

433. Koch-Grünberg, 1923a, p. 57.

among any other tribe in the Roroima region, for on the occasion of his visits the men smoked the tobacco as cigarettes or in short English pipes which were imported from British Guiana; he never saw women smoke.

123 If I offered the Surára and Pakidái cigarettes, they first
296 always removed the paper and enjoyed the tobacco in the same way as their cultivated tobacco. Yet they were not very enthusiastic about it, for in their opinion the cigarette tobacco was much too weak. In time, however, men and children became accustomed to smoking (434), but not the women.

434. As a result of this, our supply of cigarettes rapidly dwindled, and my

Survey Panikí

/89 cont./

Among the Waikâ, this taking of snuff is done in the same way (438). The Tuparí (439) and numerous other tribes of western

438. Zerries, 1955b, p. 665.

439. Caspar, 1953, pp. 151 ff.

South America (440) also indulge in this custom, though the com-

440. Gillin, 1948, p. 855.

[115]

Fig. 28a. Bamboo tube for storing snuff-powder.

Fig. 28b. Bamboo snuff-tube.

position of the powder, except for the paricá or Piptadenia seeds, seems to differ from tribe to tribe. Cooper, moreover, in a com- [114] parative study of the taking of Piptadenia snuff, comes to the conclusion that this is a "western trait" /cited in English/ (441).

441. Cooper, 1949, pp. 536-538 and Map 10.

Surára. Pakidái Waica

/92 cont./
and children, bear names of plants or animals (see pp. 138/139). This results in a symbiosis which at the same time furnishes proof of the alter-ego motif to be found here. If a person who has passed the third year of life dies, an animal or plant of the species whose name he bore must likewise be killed or its death be brought about. This is done so that, for the long journey to the moon, the soul of the deceased has a companion who leads the way and facilitates for it entrance into the paradisiac realm of the dead (see also p. 149).

/93/ If the chiefs, who, of course, are at the same time medicine men, or other male members of the tribe wish to make contact with the nature spirits, either in connection with curing the sick, before or after hunting expeditions, on the occasion of prayers of thanksgiving for a successful harvest, etc., they have another man blow narcotic powder into the nose with a bamboo tube and immediately afterwards fall into a state of intoxication in which they feel themselves to be giants among giants (see p. 193). Thus, it is understandable that in a snuff-powder intoxication they identify themselves with the heiuri and use a very similar sounding word -- teiuri -- for any magical performance.

If one compares the beliefs of the Surára and Pakidái with those of the related Waikâ /Waica/, who were studied by Otto Zerries, Meinhard Schuster, and the American Missionary James Paul Barker (448) (449a) (449b), one finds that they are largely

448. Zerries, 1958a.

449a. Zerries, 1958b.

449b. Barker, 1953.

in accord in their basic features.

All the tribes mentioned believe in a Supreme Being, Puré or "Omama," respectively, and ascribe to it the creation of the earth and all living creatures. To be sure, there are certain differences, which may, however, be traced back to external influences. Thus, Puré is brought into relationship with the moon --

Surára
Pakidái
Waica

776
184
821

/98 cont./ Thus, Peré is brought into relationship with the moon-Perimbó -- and with the latter forms an inseparable unity (450),

[114]
[171]

450. This conception, which seems rather strange and in which Josef Haekel therefore thinks he sees a contradiction (Haekel, 1959, p. 40), is, however, also confirmed for the Uitoto /Witoto/, for Preuss writes about it, among other things: "We thus have here the rare instance in which, through a combination of the god of the earth and a moon demon, a single deity has arisen, a sort of monotheism, alongside of which there are only very insignificant demons" (Preuss, 1922, p. 176). And elsewhere he states: "The fact that moon and Supreme Being here coincide may therefore have come about later, but not necessarily. Today we have them as an inseparable unity" (Preuss, 1922, p. 184).

whereas "Omawa," together with a helper, "Yoawa," lives in the western sky, where they too produce rain, in that they pour the water out of the two celestial rivers (451). In contrast to this

451. Zerries, 1958b, p. 280.

among the Surára and Pakidái it is believed that Peré shakes the rain-tree of the moon (see p. 199).

821
184
773

Great significance is also attached to the moon by the Waiká, and, significantly enough, also in connection with the creation of human beings. This may be seen from their legend of primitive times (452), which, except for minor deviations,

452. Zerries, 1958b, p. 280.

corresponds to the one which the Surára chief Hewemão told me

171

"The suggested parallels," Haekel goes on to say, "between Yanoama and Carib call attention, in any case, to a series of problems for which we are still far from a solution today. The probability of historical relationships can undoubtedly not be overlooked. But who were the 'givers,' who the 'receivers'? It is obvious that the Surara-Pakidai and Waika lie within the sphere of influence of Cariban tribes, but in my opinion there is no justification for thinking merely of influences from the Carib in connection with the similarities coming to light. One should also take into consideration the fact that Yanoama and Carib participated jointly in an older substratum" (472). On

472. Haekel, 1959, p. 43.

this point I agree with Haekel completely. I also share certain reservations that he has with regard to the avowed western orientation of the Waikâ or the Yanonámi culture (473), which

473. Haekel, 1959, pp. 43/44.

Zerries represents (474). True, there is much in favor of it,

474. Zerries, 1955a, p. 81.

among other things a definite form of endocannibalism and the ritual taking of a narcotic snuffpowder. Further proof might be seen in the fact that among the Ipurina on the Rio Purús the

Surara Pakidai

/94 cont./

moon -- "pati" -- is venerated as Supreme Being and "father," who causes the fruits to grow (475). In this case, however,

475. Ehrenreich, 1891, p. 72.

Ehrenreich believes that there has been Christian influence. Among the Sáliva in southern and eastern Colombia /95/ one also finds certain features in the religion and mythology which are reminiscent of those of the Yanomámi and Karaiben, and the Supreme Being worshiped by them is called "Puru" (476), a

476. H. v. Walde-Waldegg, 1936, pp. 40 ff.

name which sounds very similar to Poré and "Purá." Haekel further points out that the religion of the Sáliva shows marked agreement with the neighboring Aruak Achagua (477), which

477. Haekel, 1959, pp. 45/46.

was described by Hernandez de Alba (478). Moreover, it should

478. Hernandez de Alba, 1948, pp. 410 ff.

be mentioned that the Guahibo Indians on the Venzuelan banks of the Orinoco, according to Zerries, have taken over their deity, Purnaminali, from the Achagua or Sáliva (479).

479. Zerries, 1956c, p. 232.

But in the eastern regions of Guiana there are also significant parallels with respect to the religious and mythological conceptions of the Yanomámi mentioned. Reference has already been made to the Kachuyana and their Supreme Being, Purá (see p. 205). They are even more strongly pronounced among the Warrau /Warao/. In their moon myth about "Aboré" and "Wowtáh" the moon has the character of a culture hero (480).

480. Brett, 1880, p. 76.

2: Becher--208 E-5 (1955-1956) 1960 SQ18 Yanoama SQ18
Surára
Pakidái
Waiká

/95 cont./

796 exactly as among the Surára and Pakidái; moreover, the corre-
191 spondence between the names Aboré and Poré is especially great. The supplying of cultural possessions is also attributed to the deities in each case. In the Warrau myth it is even said that Aboré fled before Wowáh into the land of the whites, from whence he provided his fellow tribesmen with import articles (481).

481. Brett, 1880, pp. 84 ff.

794 The idea that there are gigantic prototypes of each animal
191 and plant species also exists among other South American tribes. Zerries has already worked out the connections for this and has cited several investigators who confirmed identical or similar views for various Indian peoples, among them Arawak, Mura, tribes of the Chaco, Karaiben in Guiana (Arekuná-Taulipang /Arecuna/, Cavina and Tumupasa Indians of northeastern Bolivia, Cáyapa in Ecuador, and Yaruro in Venezuela (482).

482. Zerries, 1951, pp. 149/50.

794 The conception of the Yaruro in particular shows corre-
191 sponding parallels, according to Petrullo's description (483).
●114

483. Petrullo, 1939, p. 237.

For the Karaiben tribe Arekuná, Koch-Grünberg, to be sure, does not find any evidence of gigantic plant spirits, but their idea of the animal spirits is very similar; here they are called "podole" = father (484).

484. Koch-Grünberg, 1923a, p. 187.

793 If one then compares the myths which deal with happen-
184 ings on the already created earth, one is struck by the fact that among the Waiká the transformations of human beings into land animals cover a wide range (485). The same is true among the

485. Zerries, 1958b, p. 283.

Surára
Pakidái

/102 cont./

755 I was allowed to take part as a spectator in all the cures,
[123] and each rekurí was a new, great experience for me. I was
755 amazed at the devotion, passion, and fervor with which the
757 chief and his helpers interceded with all their physical and
622 psychic powers to ward off the sicknesses of their fellow-tribesmen (504). This explains why the Surára and Pakidái

[123]

> 504. The same care was bestowed upon me, the stranger. If I had an attack of malaria, the chief and his helpers likewise danced around me, and they sang in chorus while Hewemão stroked my body, massaged it, and sucked at it. He was of the opinion that the Waikâ had poisoned my blood because I lived in friendship with the Surára and had brought them so many beautiful gifts.

have such boundless confidence in their chiefs and are absolutely convinced of their magic powers. It is doubtless due to this unshakable faith that so many of the sick can be cured (505).

> 505. I never saw the chiefs demand a fee for their cures. The members of the tribe show their appreciation, however, by continuously offering their chiefs larger or smaller gifts (see p. 130).

[431]

755 In this context I should like to cite the following very re-
756 vealing description by Herbert Baldus: "The witch doctors were
● 114 simply called imposters by early travelers, and even today all whites who are incapable of understanding the mentality of the Indian are of the same opinion. One forgets that, as a result of the suggestibility of the primitive, the magic practices not only essentially help the sick person and rid his relatives of their fears, but also weave such a spell around the practitioner himself that it is impossible to decide to what extent he is acting in good

2: Becher--224 E-5 (1955-1956) 1960 SQ18 Yanoama SQ18
Surára Pakidái

/102 cont./
755 faith and to what extent he is faking" (506). The fact that
756
•114

506. Baldus, 1931, p. 142.

even in modern medicine great importance is now attributed to the suggestive influence of the physician on his patients is shown in the following statements by Hans Grimm: "If we emphasize that the suggestive influence of the physician's personality on the patient is often of decisive influence (Jores), if we use hypnosis, the so-called 'autogenous training,' etc., we are, in our own way, returning to what was already playing a role in shamanistic techniques" (507).

507. Grimm, 1958/59, p. 357.

769 3. Religious Festivals

Every year, toward the end of the dry season, March-April, the Surára and Pakidái jointly celebrate the festival in memory of the dead -- patapánomãn -- (508). It always takes
[192]

508. This contains the word for corpse, the male or female dead person -- anomãn.

place in the large, open Surára maloka Jaracá (see pp. 25 ff.). Occasionally a few families of friendly tribes (Xirifna, Pusheweteri, Aramamesteri, etc.) also take part. The
[114] patapánomãn festival, which I witnessed in all its phases, /103/ was held during the period from the fourth to the sixth of
769 April, 1956. But even before that there were great preparations
251 for this purpose. The men set out on a joint hunting expedition in order to kill as many tapirs as possible, the meat of which was then roasted on roasting racks over an even fire, not too hot, until it was black and bone-hard, so that it could be kept for a

Surára. Pakidái. Waiká

/107 cont./

769 526 [622] [624] [147] in his place. The wife then managed the head of the exhausted one, so that he would quickly be ready to resume. The chiefs and war chiefs in particular distinguished themselves in this type of sport. They also fought the longest, some of them with five, six, and more opponents; they had positively unbelievable strength and endurance.

These combats, in which one man always symbolically represented the good spirit, that is, a hekurá, and the other, who had smeared himself with soot, the evil spirit, a nonexí (see pp. 213 ff., 225 ff.), lasted almost two hours. After [262] that the men were completely exhausted and refreshed themselves with a new, joint meal of tapir meat and manioc flat-[276] cakes. Afterwards, however, many of the participants suffered from severe headaches brought on by the snuff-powder in connection with the inhuman physical exertion, so that many wives were obliged to manage their husbands' heads.

769 In the evening there was another half-hour procession in the maloka courtyard, when all the little jamaru vessels in which remains of bone ashes were stored were carried along. This retention of a certain amount of ashes is very important, so that the next festival in memory of the dead can be held, even though no member of the tribe /108/ dies up to that time. It could not take place without any bone ashes of deceased Surára or Pakidái.

769 ● 114 184 If one compares this annual festival with that of the Waiká, which was described by Zerries in great detail (515), one finds

515. Zerries, 1955b, pp. 662-665.

extensive analogies in the most important phases. Zerries believes that among the Waiká it was originally a harvest festival to which other rites of various kinds were added (516).

516. Zerries, 1955b, p. 662.

For the Surára and Pakidái, on the other hand, it can definitely be said that here there are no features reminiscent of a harvest festival.

2: Becher--235 . E-5 (1955-1956) 1960 SQ18 Yanoama SQ18
Surára, Pakidái Waica

/108 cont./

769 182 184 789 526 [946]

festival. It is decidedly a festival in memory of the dead, which characterized by the ceremonial drinking of the bone ashes of deceased members of the tribe. At the same time, defensive magic against the nonexf is connected with it, for they, of course, are the ones who transmit sickness and thereby frequently cause death. As in all the magic cures for healing the sick, where the symbolic struggles between the "bekurf" and one or more "nonexf" are always enacted (see pp. 212 ff.), this factor is naturally also in evidence in all parts of the festival, in the dances, in the mixing of bone ashes, when the medicine man pulls down-feathers of the gavião-real out of the hair of the warriors and adds these, and in the duels performed in a sitting position. The latter are also documented for the Waikí in the same way, but Zerries writes that neither for him nor for the American missionaries was it possible to find out anything definite about the meaning of this ceremony (517). Presumably,

517. Zerries, 1955b, p. 665.

however, it is the same symbolic struggle between a good and an evil spirit as among the Surára and Pakidái. As yet nothing has been reported about this from other Indian tribes. My informants, however, told me that the Xirixána, Pusebeweterf, and Aramamesterf engage in these combats on the occasion of their festivals in memory of the dead. Hence it seems to be a very special characteristic of the Yanomámi, which in former times may have been even more widespread. Herr Dr. Gerdt Kutscher, in connection with a lecture I gave in Berlin, called my attention to the fact that the position taken by the two men during this is reminiscent of the painting on a clay bowl from the Río Ulúa, Honduras (518). According to Zerries, Barker,

114 769 526

518. This is in the Berlin Museum für Völkerkunde (No. IVa Ca 22381) and was reproduced in an article by Walter Lehmann (Lehmann, 1910, p. 737, Ill. 9).

Surára
Pakidái
waica

/108 cont./ According to Zerries, Barker,
114 and Dupouy, there is also a similar combat among the Waikâ,
769 in which the partners alternately beat each other on the chest
52 with clenched fists (519a, b, c). I did not observe this among
184

519a. Zerries, 1955b, p. 665.

519b. Barker, 1953, p. 447.

519c. Dupouy, 1953, p. 495.

114 the Surára and Pakidái. Similarly unknown there is the custom,
769 also reported by Zerries, that the men, when they run about in
276 the snuff-powder intoxication, hit each other on the back with the
palm of the hand (520). The author named regards this as a

520. Zerries 1955b, p. 665.

769 fertility rite. There seems to be involved here, however, out-
187 side influences of agricultural tribes, which is indicated also by
179 the ceremonial gathering of pupunha fruits (521).

521. Zerries, 1955b, p. 665.

769 It is further noteworthy that among the Waikâ women and
184 girls actively participate in the festival in that they take part in
52 some dances and even drink some of the banana soup mixed with
[266] bone ashes (522). In contrast to this, the female members of

522. Zerries, 1955b, pp. 662 ff.

the tribe act only as spectators among the Surára and Pakidái.

769 The endocannibalism should be regarded as a very signifi-
184 cant similar trait. It is documented for the Waikâ by Cruxent (523a)
266
114

523a. Cruxent, 1953a, pp. 149/50.

Surára Pakidái Waiká

/108 cont./

and Zerries in several articles (523b) (524) (525). Moreover,

523b. Zerries, 1955a, p. 80.

524. Zerries, 1955b, pp. 664/65.

525. Zerries, 1956a, p. 185.

769 266 171

Moreover,

/109/ the latter author, on the basis of contributions to the first five volumes of the Handbook of South American Indians, drew up a distribution map for the occurrence of endocannibalism, which was supplemented by numerous examples (526). Accord-

526. Zerries, 1955a, pp. 80/81.

ing to this, endocannibalism occurs in South American primarily in the western parts of the continent and among the marginal and submarginal tribes of the Tropical zone. This custom is particularly frequent among the Pano and Tukano /Tucano/. In most cases, besides the pulverized bones, which are mixed with chicha (for example, Pano and Tukano), water (for example, Tapuya), or a mash of Pará chestnuts (Moré Indians), the flesh is also eaten. The practice of the Surára, Pakidái, and Waiká, on the other hand, who consume only the cremated, pulverized bones, is very rarely found. The corresponding custom of the Sáliba, Guayupe, and Saé in Colombia is the most similar one. But in eastern Guiana, too, endocannibalism is widespread, for example, among the Karaiben /Carib/ Parukotó (527) and

527. Frikel, 1957, pp. 520 and 545.

among the Arapium, a Tupi tribe in the vicinity of Santarem (528).

528. Zerries, 1955a, p. 81.

Moreover, it is reported of the Kalina, Palikur, and Arawak that they consume cremated bones of the dead (529). Of the latter

529. de Goeje, 1948, p. 11.

2: Becher--238 E-5 (1955-1956) 1960 SQ18 Yanoama SQ18
Suppl
Pamphlet

/109 cont./

Raleigh also writes that they pound the bones to powder and consume them mixed with a beverage (530) (531), and the same has

530. Raleigh, 1848, p. 55.

531. Waitz, 1862, p. 388.

been attested to for the Maxubí (532).

532. von Martius, 1867, I, p. 404 A.

According to Whiffen, there is no endocannibalism at all in South America, for, according to his view, only vengeance against hostile tribes can be regarded as a motive for anthropophagy. "From all this," he continues, "it follows that intratribal cannibalism would be a criminal outrage by the tribe on itself, and therefore it could never occur that a member of the tribe was eaten, ... This disposes of any such thing as the eating of dead relatives as a sign of respect. These and similar statements are due to misapprehension /sic/ of facts by the writer, or a too hasty judgement on the part of the explorer" /cited in English/ (533). In conjunction with these devious

533. Whiffen, 1915, pp. 120/21.

statements by Whiffen with their completely unjustified criticism, I should like to cite a contribution concerning endocannibalism drawn up by Herbert Baldus and Emilio Willems (534):

534. This appeared in the eminently important, but long out of print, Dicionário de Etnologia e Sociologia /Dictionary of Ethnology and Sociology/, which came out shortly before World War II and is therefore, unfortunately, not available in most European libraries.

/The long passage in Portuguese which follows on pp. 109-110 in the original source is omitted in the translation; see the foreign text/ /110/ (535a).

535a. Baldus e Willems, 1939, pp. 40/41.

Most recently there appeared the commendable study by Boglár, "Ein endokannibalischer Ritus in Südamerika /An Endocannibalistic Rite in South America/," in which the author presents the material of several competent sources (535b). I

535b. Boglár, 1958, pp. 67-85.

cannot, however, agree with his interpretations in connection with them. The consumption of the bone powder of the deceased is by no means always to be associated with agricultural tribes, for, as my informants among the Surára and Pakidái explained to me, their forebears, who were pure hunters and gatherers, already practiced this custom. Also the author's view that the showing of respect, the magical transmission of good qualities, etc., can be regarded merely as secondary motives of the endocannibalistic rite (535c), do not apply to the

535c. Boglár, 1958, p. 83.

Surára and Pakidái; here they are decidedly primary. Among them the future life of the dead is assured by cremation, for with the ascending smoke the soul of the dead reaches the moon (see p. 151).

It should further be mentioned that endocannibalism is documented also for Central America, Mexico, and in one case in North America, but Beals regards it as a typical element of the South American Indians (536).

536. Beals, 1932, pp. 123/24.

Sutéra
Pakidá!

/110 cont./

224 If the hunter accompanied by his wife has slain small game or a bird, the wife carries the hunting booty into the community /111/ house. If the man was alone, he brings the animal only to the entrance of his dwelling. It is taken inside by his wife or by another man. The same is true for big game, for example, a tapir, from which a few pieces of meat are first taken along; the rest is fetched later by friendly fellow tribesmen. Thus, the hunter may always carry his booty to the entrance of the maloka, but he may never go inside with it. He must also leave the evisceration of the animal to other men. Subsequently he may roast the meat, to be sure, but after it has been prepared, he is forbidden to eat the first morsel. When (782) he has finished his meal, he is obliged to pray anew by way of the heiuri to Poré and Perimbó, for the latter demand that one thank them for the hunting booty. If the hunter observes all these rules, the united Supreme Being and the heiuri will always be well-disposed toward him and will always provide for a successful outcome of the hunt.

224 Among many other tribes of South America there are the
191 same or similar conceptions of hunting magic. I can here refer
114 to Zerries, who has gathered together the pertinent source material and made a comparative study of it (537) (538). This

537. Zerries, 1951.

538. Zerries, 1954a.

shows that urucú is almost always used for the red coloring before the hunt. Métraux, however, mentions that the ancient Mocovi in the Gran Chaco smeared the snouts of their dogs with jaguar blood (539). From this Zerries draws the justifiable

539. Métraux, 1944, p. 283.

conclusion that urucú is a substitute for blood (540), which

540. Zerries, 1954a, p. 22.

/111 cont./
Métraux also documents for the Chiriguano (541).

541. Métraux, 1931, p. 154, footnote 1.

It should also be pointed out that the hunting rule so strictly observed by the Surára and Pakidái men, which says that a hunter may never carry his game into the maloka himself, can probably be traced back to Karaiben /Carib/ influences. In this connection Zerries speaks of propitiatory rites relating to the killed animal (542). According to his investigations, the

542. Zerries, 1954a, p. 359.

northern region of South America emerges as the nuclear area, where they are found primarily among Karaiben tribes of the Venezuelan coast and its hinterland (543). The author cites

543. Zerries, 1954a, pp. 136/37, 359/66.

Roth (544) and Crévaux (545) as the most important sources, as

544. Roth, 1915, p. 294.

782 with threads of Bromelia fibers. Such threads are also drawn
(824) crisscross over the sticks, and on them are glued down-feathers
(239) of the gavião-real (Thrasaetus harpyia L.). The structure --
alwanobé --, which women and girls are not permitted to see,
gives the effect of a man's head, in the hair of which are glued
down-feathers of the gavião-real. By order of the chief, several
warriors take this calabash into the forest and set it down in a
particular spot.

6. Birds as Transmitters of Messages

825
202

On May 21, 1956, in his maloka on the Cachoeira dos
Índios on the upper Rio Aracá, a Surára man, Honohomá, was
engaged in a loud monologue which started about 4:00 in the
morning and lasted until about 6:00; during this he was lying in
(114) his hammock. As to the meaning of this apparent monologue,
my little interpreter Jibeauwõ afterwards gave me the following
explanation: When Honohomá woke up, he heard the singing
of the little bird kaukaumã, a japim (Cacicus cela L.), in which
at the time, however, the soul of Porõhiwõ, the war chief of the
Pakidái, was to be found. The latter was living with his tribe
in the /113/ maloka on the middle Demini. The soul in the
little bird said that the Pakidái, after the festival in memory of the
dead, had arrived safely at their communal house. At the same
time it reported the course of the journey in detail, the hunting
successes, and the planting of new banana trees and pupunha
palms. Whenever the little bird interrupted its song for a time,
Honohomá would tell it about how the Surára were getting along.

According to the belief of the two tribes, the little japim
is a transmitter of messages, who reports illness and death, as
well as military encounters with hostile tribes.

Surára
Pakidái

/117 cont./

XI. Reasoning Abilities

153 Among the Surára and Pakidái the memory is especially keen, both with respect to the myths and songs, religion, and tribal history, as well as with respect to the flora and fauna and the peculiarities of a landscape (561). Their imitative

117

561. In this connection I should like to refer to a remark by Baldus: "By and large as far as the Indian's memory is concerned, he retains only what is useful on the phenominal level accessible to him. He will note each peculiarity of a landscape which he crosses, for that is necessary in order to find the way again and to be able to describe it to his companions. The much lauded 'sense of orientation' of the Indian is nothing but memory" (Baldus, 1931, p. 118).

123 153 Their imitative talent is also noteworthy. For example, upon my arrival, writing and drawing seemed new and mysterious to the Indians. When I handed them my fountain pen and pencils and asked them to draw something, neither the children nor men and women managed to produce anything but the customary serpentine lines, circles, and dots which they otherwise draw with urucú on their bodies, faces, and utilitarian objects. But as soon as I drew trees, houses, and animals for them, they were able to copy these figures after a few attempts. They proved indefatigable in this, and once they had started, they did not want to stop at all. Nor was it long before they /118/ were able to copy letters and finally entire words (562) (563).

153 191

562. Baldus reports the same thing about the Indian tribes in the northeastern Chaco: "Once one has taught the Indians

564. (cont.)
Manoel Antonio Gómez, who succeeded in saving his life. The chief was said to have been very angry at first over the arbitrary action of the grandmother, but then, when he saw that the little one had recovered, he calmed down.

123 Most men, after but a short time, had no difficulty handling
153 our two guns; a few were soon even operating the outboard
[179] motor, and the Surára chief Hewemão, who showed great interest in my camera, took very acceptable pictures with it.
153 The reasoning power seems to be somewhat more strongly developed among the men than among the women (565).

• [114]
[191]

565. This conclusion agrees with an observation by Baldus among the Tumerehã, and the scholar adds a remark which could also be applied to the Surára and Pakidái: "The differences in the talents of the sexes are perhaps the result of their way of life and division of labor. Thus, among the Tumerehã, the man's way of acquiring food has probably developed his acuteness, for he does not merely gather fruits, like the woman, but also goes hunting..." (Baldus, 1931, p. 119).

802 /119/ XII. Counting and Conception of Time

The Surára and Pakidái count only to three:

1 -- mahón

2 -- porokabõ

3 -- prukatabõ.

• 114 During his stay among the Surára Indians, Hans Becher was able to compile an extensive vocabulary of their language. This still needs linguistic revision and further checking. Even now, however, it makes it possible to establish perfectly clearly the relationship of this language to the languages of the Waika /Waica/, Širiana /Shiriana/, and Karimé. There is a very close correlation, [101] apparent at first glance, which corresponds to the cultural unity of these Indian groups, whom Becher has classified under the name Yanomámi /Yanoama/.

The first vocabulary of a language of this group was published by Koch-Grünberg in 1913 and -- considerably expanded -- in 1928, and comes from the Širiana (Širianá) of the Uraricuera (and its tributary the Uraricaparú) (1). In 1932 there appeared

1. Koch-Grünberg, 1913, p. 458; 1928, pp. 302-306.

a vocabulary of the Karimé Indians of the Catrimani River compiled by G. Salathé (2). Further material was then published by

2. Salathé, 1932, pp. 314-316.

A. Vinci, who added to his travel account a vocabulary of the Warema-Širiana (or -Waika, listed by him as Uarema, Guaica and Sciriciana) on the Merevari River (3). In 1954-55 O. Zerries

3. Vinci, 1956, pp. 364-367.

and M. Schuster collected as yet unpublished material among the Waika of the upper Orinoco, and in 1956 Becher presented his vocabulary from the Surára and a number of expressions from the Pakidái. This, to my knowledge, is all that is known about these languages at present.

114 197 As early as 1913 Koch-Grünberg found that Širiana was independent of the neighboring Karaiben /Carib/ languages and apparently isolated (4). The latter view was adopted in 1924 by

4. Koch-Grünberg, 1913, p. 455.

/134 cont./

114 197 Rivet, who at that time set up in his classification of the American languages a Širianá linguistic family which included the Širiana and Waika (5). W. Schmidt, who was familiar with the larger

5. Rivet 1924, p. 678.

Širiana vocabulary of Koch-Grünberg, still unpublished at that time, was of the same opinion and wrote in 1926 that the language of the Širiana (Schiriana) "forms an isolated group along with those of the nearby Waika" (6). C. Loukotka, who took over the

6. Schmidt, 1926, p. 221.

revision and further working out of the classification from Rivet, retains the Širianá linguistic family, but adds to it Karimé, which has meanwhile become known, and Pusarakaú, which is merely mentioned, but is unknown linguistically (7). Waika was also still

7. Loukotka, 1944, pp. 8-9.

undocumented at that time, but its inclusion in the family resulted from the assertion by Koch-Grünberg that "the language of the very light-colored Waika is very closely related to the Schirianá" (8).

8. Koch-Grünberg, 1913, p. 455.

This assertion is now fully confirmed by the Waika notes of Zerries and Schuster. Up to the present time, however, the Pusarakaú has remained unconfirmed. The last version of the classification by Rivet and Loukotka, which appeared in 1952, introduces no change in the Širiana family (9).

9. Rivet and Loukotka, 1952, p. 1140.

J. A. Mason, in his comprehensive revision of the classification of South American languages undertaken for the Handbook of South American Indians, acknowledges the Širiana linguistic family

/134 cont./
114 197 (for him Shiriană, Shirianán), but disregards the unknown Pusarakaú (10). His attempt at a classification of this family, in

10. Mason, 1950, p. 254.

which he subordinates the Waika (Waicâ) to the Širiana (Shiriană) /135/ and contrasts the two, put together as Waharibo (Guaharibo), Karimé (Carimé) (11), remains questionable (cf. p. 7). It has

11. Ibid.

been taken over and expanded by N. A. McQuown, however, whereby he again introduces the unknown Pusarakaú and adds a questionable, likewise linguistically unknown Guaharibo (12).

12. McQuown, 1955.

114 104 197 Since in McQuown's work the classification is not clear, I am giving it here in the form of a table, in which I am retaining the not always fortunate orthography of McQuown:

Z. 15. CHIRIANAN.

a. Guahariban. Ven. Br.
α. Chiriana (861). N2-4° W61-64°30' Br.
β. Uaica (860). N1°30'-2° W62-4°, N3° 30' W63°30', N4° W62°† Br.; N2-3° W64°, N3° W65° Ven.
γ? Guaharibo (495). N3° W65° Ven. Br.
b. Carime (845). N4° W64° Br.
c. Pusaracau (844). N3° W64°? Br.

"Ven." means Venezuela, "Br." Brazil; the numbers in parentheses after the names of languages refer to McQuown's place-maps; the other data are the geographical co-ordinates of the places where the languages are spoken or (if followed by †) were spoken (in this connection it should be noted that Karimé erroneously appears on the north bank of the Uraricuera instead of on the Catrimani, considerably to the south of it [approximately N1°30' W62°30']).

/135 cont./

114
197

Rivet, Schmidt, Loukotka, Mason, and McQuown all agree in regarding the Širiana family as a more or less closed group for which it has not been possible to determine any closer relationship with other American linguistic families. On the other hand, Swadesh, in his most recent contribution to the classification of American languages, sets up a "Makro-Širiana" group (for him macro-siriana), which includes, besides the Širiana family (for him sirisana), also the Čapakura family (chapakura) (13). This

13. Swadesh 1959, p. 20.

quite unexpected linkage, if it could be proved, would certainly raise very interesting and important questions for linguistics and ethnology, for the Čapakura family is found in the Guaporé basin, where it extends approximately between the tenth and sixteenth degrees south latitude over an axis formed by the 63rd degree west longitude. I therefore pursued the possibility of such a relationship and compared the languages of the Širiana family with those of the Čapakura. Although in the process nine Čapakura languages were considered (14), a lexical relationship between the two

14. Čapakura, Kitemoka, Napeka, Pawumwa, Iten, Moré, Kumaná, Wanyam, and Kabiší.

linguistic families could not be established. Since Swadesh has not yet published any material as evidence for the relationship suggested by him (15), his results cannot yet be evaluated in a

15. Swadesh is preparing to publish this evidence soon under the title "Materiales para un diccionario comparativo de las lenguas amerindias /Material for a Comparative Dictionary of Amerindian Languages/"; cf. Swadesh, 1959, pp. 8-9.

case such as the present one. On the basis of my own investigation,

/135 cont./
114 however, Čiriana and Čapakura are still to be regarded as two
197 independent linguistic groups.

128 In the following, only a small selection of Surára words
197 are offered, along with the corresponding words of Waika (according to Schuster) (16), Karimé (according to Salathé, 1932),

(122)

16. My sincerest thanks are due Herr Dr. Meinhard Schuster, Frankfurt, for the willingness with which he put at my disposal an excerpt of the Waika linguistic material that he is working on.

Širianá (according to Koch-Grünberg, 1928), and Warema (according to Vinci, 1956), in order to illustrate the close relationship that exists between these languages. The chief criterion for the selection was the availability of documented forms in the five languages; moreover, care was also taken to draw on words of a "non-cultural" nature for the most part, that is, /136/ those that are not so frequently taken over by neighboring languages and thus -- if agreeing morphologically and in meaning -- represent stronger proof of the genetic relationship of the languages compared. Becher's linguistic notes were made chiefly with Surára
114 informants; for the designations of body parts, however, there were also additional forms (marked by P) which a Pakidái informant gave him.

104 The transcription of the five lists has been standardized;
194 that of Karimé has also been simplified somewhat by the fact that two h and š sounds not adequately described by Salathé have been reproduced simply as h and š. With respect to the transcription, the following should be noted: ë = middle, back (or central), unrounded vowel; ï = high, back (or central), unrounded vowel; ã, etc. = nasal vowel; ɛ = open e; š = unvoiced, alveopalatal fricative; x = unvoiced, palatal fricative; ? = glottal stop; : = length for the previous sound.

128

The languages have been arranged in such a way that those which seem to be nearest to the Surára lexically follow it directly, and those which differ from it the most come last. This gradation of similarity with respect to the Surára is given here, however, only on the basis of impressionistic findings, which, furthermore, rest only on an examination of language samples containing the above 40 words. It is therefore not a reliable basis for a linguistic classification of the entire group, though one may see in it an indication of the relationships of the individual languages to each other. In any case, support for the classifications of Mason and McQuown (pp. 1-3) cannot be drawn from it. /The bibliography on pp. 137-138 of the original source is omitted in the translation; see the foreign text./

M /13 cont./
101 searching primarily for a new source of food and not so much for a better means of communication. The typical Venezuelan Caribe, at least at the present time, is a man who loves land (Pemón, Cariña, Panare, Yabarana, Yupa), and the Makiritare, river men, represent an exception among them.

I & Y/Ya M According to the relative importance which the river has among the different tribes, nuclei of them are found along the
361 principal aquatic arteries, such as those of the Makiritare, or at a distance from them, on the tributaries and headwaters, as among the Panare, Yabarana, Guahibo, and Sanemá. This circumstance is of the utmost importance for the study of these Indians. The
Y/Ya farther away they live from the river, the more difficult it is to
[128] make contact and to live with them. Thus the Panare are even less known than are the Makiritare and the Piaroa, and we are presenting in the present report the first relatively ample information on the Sanemá and Yabarana. /14/ /Map appears here./

D Y
● 114 /15/ The three weeks which we spent among the Panare were very laborious, and the time among the Sanemá was very hard physically.

Y/122 In spite of these difficulties, which in comparison with those of a voyage at the beginning of the century are insignificant, the zone is open for any type of communication. One can
P go by airplane to Caicara, Puerto Ayacucho, San Juan de
122 Manapiare, and Cucurí (between the Tenqua and Oso Falls). Thus, for a special study of the Panare one can go from Caracas to Caicara
S on a flight of a few hours and then continue by jeep and arrive
122 on the same day at the first bohio of the Panare. In order to
Ya study the Piaroa, one goes by airplane as far as Puerto Ayacucho
122 and then on by foot or by curiara. The Yabarana can be visited in the dry season, going by regular flight to Puerto Ayacucho and from there to San Juan de Manapiare by a flight lasting 30 minutes
Y in a small plane. One reaches the houses of the Yabarana on
M the same say, and in two days more the "Monteros," the most
122 autochthonous of this tribe. In order to reach Makiritare territory and the Sanemá of the upper Ventuari, one goes by airplane to Puerto Ayacucho on a regular flight and then on to Cacurí on a flight lasting 50 minutes more or less in a small plane. In

[Text continues on p. 6]

V /19 cont./
137 traveler, they usually indicate an obstacle, even in dry seasons.
[133] The hygrophilous selvas, constantly green (tropical rain forest), are made up of trees from 20-50 meters in height, intertwined with lianas and epiphytes. The trunks on occasion measure over two meters in diameter, and once in a while they have tabular roots. Among the characteristic species are found: Anacardium rhinocarpus, Terminalia amazonica, Philodendron bipinnatum, Sterculia apetala, Basiloxylon brasiliensis, Astronium graveolens, Brosinum spec., Pouteria spec., Guarea spec., Carapa guianensis, Mora excelsa, Bertholletia excelsa, Hevea benthamiana, and Ochroma lagopus.

In the Venezuelan region of Guayana it is difficult to make a distinction between the zones of hygrophilous selvas and the deciduous mesophilous forests. In Venezuela the deciduous mesophilous forests occupy the most extensive part of all the forest zones. Owing to the dry season, this type of forest has a smaller number of species than the hygrophilous selvas. The trees attain a height between 20-40 meters, and lianas are less abundant than in the hygrophilous forests. Among the important species in the deciduous forests of our region are found: Cedrela mexicana (cedar), Swietenia macrophylla (mahogany), Anacardium rhinocarpus (mijao) Mombacopsis sepium (saquisaqui), Spondias mombin (jobo), Samanea saman (saman) and Tabebuia pentaphylla (apamate) (Hueck, 1960).

V
114 As we have already indicated in the preface /untranslated/,
127 the present book is the result of a report on two trips and of a bibliographical study of the extant data on the zone visited (cf. map: Route of the expedition /see p. 3 /). Although it is true that no monographic work has yet been written for any of the tribes of the Orinoco-Ventuari region, it is also true that the great number of articles which have been published on the Indians of that zone is surprising. The material is primarily descriptive, but since they often describe for us aspects of native life which have now disappeared or changed, the general material of these authors is of great value and interest.

/19 cont./

In the present report we use most of the extant data, and their compilation, ordering, and selection, together with our own personal contribution, constitute the study which we present here on the Indians of this part of Venezuela.

For our purpose we followed the footsteps of the great Venezuelan ethnologist, Lisandro Alvarado, who, with the publication of his book, Datos Etnográficos de Venezuela /Ethnographic Data of Venezuela/, took a firm step toward the great task of compiling /20/ all the objective material written over the course of many decades regarding the native tribes of this part of the world (2).

2. Obras completas de Lisandro Alvarado /Complete Works of Lisandro Alvarado/, Vol. 4 (Ministerio de Educación, Dirección de Cultura y Bellas Artes). Caracas, 1956.

Our report lacks uniformity with regard to the character and volume of material on the various tribes to which we refer, but this fact reflects precisely our present sporadic knowledge concerning the tribes, which, in the last phase of their autochthonous life, urgently invite the competent ethnologist to leave testimony of a human conglomerate of our ancient American continent. /Maps 5 and 6 appear here. Pages 21-176 are not included in the translation./

/177/

The Sanemá

101 The word Sanemá appears here as the designation for a subtribe of the Yanoama. The Sanemá were called Guaharibo and were sometimes confused also with the Shirishana /Shiriana/.

The terms Guaharibo and Shirishana (written with abusive orthographic freedom) lack proper sense when applied to the Sanemá, and they must not, as has heretofore happened, be applied to this tribe or to the peripheral bands, who accepted them as designations used by the Whites (Guaharibo) and by the Makiritare (Shirishana).

The name Guaharibo, like Macú and Tapuya, is a vague and collective designation which includes many primitive tribes and which, therefore, has little classificatory value and will not stand up to scientific and impartial criticism.

The term Shirishana, for its part, seems to us to be a nickname rather than a generic denomination, since it means "araguato monkey" and is used by the Caribe in a contemptuous tone when they refer to the Sanemá, whom they consider to be subhuman beings born from the dust of their shadows. The name also lends itself easily to confusion with the Crichaná of the Ianaperi River and of Caribe affiliation.

For the above-mentioned reasons we prefer the term Sanemá which means "people," to that of Guaharibo, which is equivalent to "savage," or to Shirishana, "araguato monkey." This preference has more scientific aspects and more human respect.

●[114] It would seem that the term Yanoama was introduced into ethnographic literature by Zerries (1956a, p. 187) and was accepted quite rightly, by Schuster (1958, p. 115) and Becher (1960, p. 6) as a generic name for the Casapare, Sanemá, Waica, Samatari, Surara, and Pakidai.

128 101 In the present treatise we shall consider the Yanoama as a tribe, not so much in the politico-social sense, as in the linguistic-cultural sense, since the Yanoama, in general, represent a specific culture made up /178/ /map appears here/ /179/ of the various peculiar subcultures of the diverse subtribes which live in a coherent territory, which speak closely related languages, and possess essentially similar economic and sociological forms.

/182 cont./
the last Makiritare stronghold south of the Serranía. The Yanoama, however, by their own strength, were able to contain the advance of the Caribe in the northeastern part of their territory.

The massacre of the Indians to which we have made reference above was pointed out by Schomburgk (1841), who visited this land around 1839, /183/ and his data constitute the first report regarding the Yanoama of the north. Schomburgk had crossed the Sierra Pacarima when, on the way to the sources of the Orinoco, he found the Makiritare in the grip of great panic. The Yanoama, possibly a group of Waica, had killed a number of Makiritare who had been on their way to the Yanoama rancherías in order to establish commercial relations with them. A short time after that horrible massacre, the same Yanoama attacked a Makiritare rancheria with the intent of exterminating all its inhabitants. This event marked the date of the withdrawal of all the Makiritare south of this zone. Even the Caribe companions who were with Schomburgk accompanied them on their flight, abandoning him with his baggage a short distance from the sources of the Orinoco. It is easy to understand Schomburgk's emotional state, bordering on desperation, on finding himself so close to his goal without being able to reach it.

On the upper Uraricuera, in the region of the Sierra Marutani, Schomburgk came upon a comuco /cultivated area/ of the "Kirishanas," whom he described as nomad Indians who depended primarily on hunting, fishing, and the gathering of wild fruits for their basic sustenance; some, however, cultivated small plantings of bitter yuca and peppers (Schomburgk, 1841, p. 417). Seventy-two years after this first report, Koch-Grünberg, in December of 1911, once again established brief communication with the Yanoama of this zone, and his information constituted, until a few years ago, the most important material on the Yanoama in general. Koch-Grünberg met representatives of two distinct groups. The first group (Casapare), which he found at the Purumamé Falls, lived at that time on the upper Uraricaparâ, although it had only recently arrived in that region from the Uraricuera, above the island of Maraca. That was the place where they took by surprise all the Indians whom they robbed and killed.

/183 cont./

At the other end of the island of Maraca the territory of the Taurepan (Pemón) begins, and it is interesting to note that about the year 1911 the Casapare, under the command of one captain Kuranaí, had established peaceful contacts with the neighboring Caribe for the purpose of acquiring by barter European utensils, which they valued very highly. The custom of cultivating small plantings, which were noted by Schomburgk, Koch-Grünberg, and Gheerbrandt (1955, p. 345), must also be of Caribe origin.

Koch-Grünberg (1928, pp. 302-308) was able to publish the first vocabulary of a Yanoama language, and, as the same author points out, some words of Caribe origin can be distinguished in this idiom of the Uraricapará River, /184/ but almost all of them refer to utensils and cultivated plants of Caribe or European origin.

The other group (Waica?) was visited by Koch-Grünberg four weeks after his first encounter with Yanoama people, with whom he lived in a rancheria on the Motomotó across from the Sierra Marutani. This group had relations with the Makú of the Auarí River, from whom they adopted certain cultural elements, such as agriculture. We do not have a vocabulary from this group, but, according to information given to Koch-Grünberg by his native companions, they speak the same Yanoama idiom with slight dialectal differences.

The expansion of the Casapare toward the north is of recent date, since their sworn enemies, the inhabitants of the Paragua, as well as the Pemón to the northeast, ceased their reprisals and allowed the unhindered advance of the Yanoama nomads. It seems that at the same time the Sanemá of the southwest and the Casapare began to invade the zone. At the present time, the Yanoama dominate as far as the Marí River, a left tributary of the Paragua (5° 10'). The Pemón to the east of the Paragua have vacated the space between this river and the Caroní. Their nuclei are to be found on the Gran Sabana, in the southeastern part of Venezuela. Under the joint influence of civilization and the mission they have lost their characteristics as Caribe

Auake 555

A /186 cont./
131 cf. idem, 1922, p. 226) was visited on the Urumamy Falls by
175 a small group of Auaké (Arutani), who pointed out to the ex-
A plorer that their land was on the source of the Paragua, where
[167] they had a communal house. But even by that time the Auaké
A (Arutani) had left their southern haunts to the Casapare and had
Y migrated to the north. But a large number merged with the
[619] Casapare, and it is very likely that the Arutani of the upper
Paragua represent the last vestiges of the Auaké.

A It is useful to stress the fact that both tribes, the Sapé and
101 the Arutani, belong among the primitive groups of South
174 America, and that their idioms constitute independent languages.
648 They have very probably served as buffers between the Caribe
[199] and the Yanoama, and while the former pushed them from the
Paragua to the south, the latter absorbed them or displaced them
C toward the north. The Caribe have had the same function in
648 more recent times, when they were destroyed between the frontiers
of white civilization and that of the Yanoama, and today only
a few vestiges of these tribes remain.

A Regarding the idioms of the Sapé (Kaliana) and Arutani
197 (Auaké), it is interesting to point out that Loukotka (1935) found
194 Chibcha vestiges in the Auaké and the Kaliana. If we consider
that the Yanoama are related to the Warao and that both have
a relatively low cultural level, it is possible to believe in a sub-
stratum of marginal tribes with a Chibcha linguistic affiliation,
to which the present Warao, Sapé, Arutani, and Yanoama tribes
may possibly belong. We shall go into this interesting topic in
the section which describes some of the linguistic aspects of the
Yanoama /see pp. 38 ff./.

Y The most recent information that we have regarding the
● 114 Casapare was submitted by the previously mentioned Capuchin
fathers, Armellada and Matallana (1942), by Gheerbrandt (1955),
and by Montoya (1958).

Y The expedition of the Capuchin fathers was undertaken in
114 1940 with the intention of completing a missionary report on
797 the river and its native population. They went out in search of
162 men, and their conclusion that the Paraguá, apart from being
a dangerous river and difficult to navigate, did not have large

Avake 555

/186 cont./ indigenous groupings is interesting. In their report (1942, p. 87) they mention a total number of 296 Indians counted.

/187/ This result contrasts with the one obtained by the expedition of Montoya, and, in spite of his having traveled over much more territory than the Capuchin fathers, we must admit that Montoya found native populations in 1956 where the fathers saw none in 1940. This has its value in the first place inasmuch as it refers to Yanoama populations (Casapare, Sanemá), and it is significant for the reconstruction of the migratory history of the Yanoama. Armellada and Matallana (1942, p. 76) say that a rancheria near the mouth of the Pumpirí, a river which flows into the Paragua on the right bank, was "the only one which the Shiriana Indians have on the Venezuelan side in the Paragua basin." Twenty-six years later Montoya (1956) and his companions discovered Yanoama rancherias established from the Marí River to the headwaters of the Paragua. This indicates that the expansion of the Casapare and Sanemá is of very recent date in this zone of the Paragua and that it achieved its present volume only in the last decades. The marginal tribes, such as the Sapé and Arutani, have been pushed toward the north and are in the process of being absorbed by the Yanoama in the south and by the Caribe and the Whites in the north.

Referring to the Yanoama of the Paragua, Montoya distinguishes the Guaharibo, Guaika, and Shirianna. According to his excellent map, the Guaharibo and the Guaica live between the upper Caura and the headwaters of the Paragua itself and the river Okasiarí. It is possible that these are the Sanemá and Waica. The Shirianna occupy the Paragua River from the Marí River to the source of the Paramichí River, and these seem to represent the Casapare of our nomenclature. The region of the greatest penetration by the latter into Venezuelan territory seems to be via the Sharopae River (3° 50') from where the route to the Uraricuera River starts.

According to Montoya (1958, pp. 173-174), the Guaharibo (Sanemá) are almost totally ignorant of agriculture and cross rivers by means of their characteristic bridges, which consist simply of two thick lianas, parallel and one above the other, the upper one serving as a handrail.

/187 cont./

105 The Guaika (Waica) are considered by the above-mentioned author as "the natives with the most primitive and wild life of all those inhabiting the great region of the Venezuelan Guayana..." They have an incipient agriculture; they cultivate bananas and plantains as the principal basis of their diet, which they complement with the fruit of the pijiguao palm. They practice endocannibalism, consuming the bones of the cremated dead.

Their hammocks are knotted, their houses are triangular, and they use bows and arrows of various types, according to their uses. They keep the bones of many animals, travel by land, very rarely by water, and build bridges similar to the style of the Guahariho (Sanemá).

/188/ Regarding the Shirianna (Casapare), Montoya says (1958) that "the real Shirianna live on the banks of river, building very stable settlements and devoting themselves to an agriculture already relatively advanced.". They obtain curiaras from the Mayongon, but have also learned to make their own, although in a rudimentary way. They use bows and arrows for hunting, but "above everything else, they are traders and travelers. They constantly travel into Brazil, leaving from the upper Paragua, using the route of the Shoropae River, Ararikuera and Parima, to Boavista." They differ from the other natives of the Paragua basin in that they are tall and strong, healthy, and well nourished.

114 101 The last report on the Yanoama of the northeast was published by Gheerbrandt (1955, pp. 345-349), and in this report there appears for the first time the name Kaserapai, which must be an orthographic variation of the name Casapare which we use to designate a whole subtribe and not only a local group as the above-named author has done.

101 114 648 Navigating the Uraricuera in the year 1950, Gheerbrandt met and heard of various Yanoama groups with different names. Very near the Sierra Marutani he came upon the Guadema on the left bank of the river named. The Guadema were very much afraid of the Kaserapai, who had killed the majority of the Guadema and were in open conflict with Waikas and Waitschas on the Uraricuera. It is possible that this may be a reference to an encounter between Sanemá, Waica, and Casapare groups, but the extant data offer no certainty in this regard.

Makiritare SS 20

M
Y
648 /190 cont./ scorn them, and, at first sight, they seemed to be unworried, but the knowledge that they no longer live alone in the land of their fathers, and the fact of having heard that four days prior to our arrival /191/ at the conuco an Indian who had sought refuge by climbing a tree was shot by a Sanemá arrow and fell lifeless into the river, constantly tortured them.

M
Y

M
[186] A powerful stimulus which always encouraged the Makiritare on their numerous trips was to get a wife among their neighbors of the same tribe. Nowadays, despite the intense scorn which the Makiritare profess toward the Yanoama, taking a wife from that tribe is not considered an impossible or degrading thing; there are many Yanoama women who have married Makiritare men (cf. Grelier, 1955b, p. 10). This matrimonial interchange inevitably carries with it an assimilation of cultures between the two tribes, a process in which the Makiritare cultural pattern will dominate that of the Yanoama and the Yanoama genes will infiltrate the Makiritare gene pool. There is not the least doubt but that the Sanemá, who were brought in for a short time, arrived at the upper Ventuari and Caura where they took up residence to stay, and that the present fusion between the Caribe and the Yanoama ought not to be explained so much by the good will of the former as by the vitality of the latter.

Y

177
648

Y
101 The Waica subtribe occupies the central part of the present Yanoama territory, that of the upper Orinoco and its tributaries above the mouth of the Ocamo, including also the southern bank of the river (Barker, 1953, p. 434). As we have already mentioned, they appear to live also in the general arc of the upper Rio Branco and its western tributaries, and Schuster (1958, p. 114) is very probably right when he says that the Sierra Parima does not bound the Waica zone, but that it extends to Brazilian territory.

Y
177
797 We have already mentioned the first contacts which the Whites had with the Waica, and, after a somewhat unfruitful effort by Hamilton Rice at the beginning of the present century, the Waica world went without contact with science until the New Tribes Mission was able to start peaceful relations with the Waica through the missionary James Paul Barker. Some ethnographic data were also published on this Yanoama subtribe by several

Y
● 114

/191 cont./

114 members of the Franco-Venezuelan Expedition to the Upper Orinoco (1951) (cf. Grelier, 1955b; Anduze, 1958). Finally the Waica were studied between April of 1954 and August of 1955 by the German ethnologists Zerries and Schuster, who are preparing a monograph on this Yanoama subtribe.

101 114 The southernmost groups of the Yanoama are known as Xamatari, Araraibo (Seitz, 1960), Surara and Pakidai (Becher, 1960). The latter presented a very extensive study based on the experiences that he had during the nine months (October 1955--June 1956) that he lived among them.

101 128 Because of the lack of comparative data, we have considered all these /192/ local groups as parts of a Samatari (people of the tapir) subtribe who represent a very autocthonous entity of the Yanoama. We would give warning, however, that this classification is subject to future changes, as is also the map of Yanoama distribution which we have just discussed.

126 192 The linguistic material which the author of the present work was able to assemble during his stay among the Sanemá consists of a vocabulary of the Nabudub, who live on the upper Ventuari, and of the Sanemá of the upper Caura. The former vocabulary contains 270 words, and the latter, 730 entries (Wilbert, 1961b).

128 192 174 197 In order to classify this material within the different Yanoama idioms, we compared the two vocabularies with others belonging to various Yanoama languages, and in this way we established, insofar as we were able, a basic vocabulary, calculating the minimum distances existing between them, according to the glottochronological method.

192 197 174 126 127 We have indicated that the Nabudub and Sanemá vocabularies were compiled by the author. The vocabulary of the Pubmatari (Sanemá of the Canaracuni) comes from Vinci (1956, pp. 351-357). This vocabulary has a total of 278 words, 73 of which correspond to the basic vocabulary. According to what the author says on pages 159 (1956) and 133 (1959), this is most probably a Pubmatari vocabulary.

/194 cont./

174 197 101 Uraricuera and on the southern slopes of the Sierra de Parima;

b) Karime (or Shaufri), on the Catemany River in the same region;

c) Waika, who live on the upper Ocamo and Mocajahy, right tributaries of the upper Orinoco;

d) Pusirakidu, an unknown wild tribe which lives in the Sierra Parima.

174 197 [127] As we mentioned above, we are inclined to differentiate between Shirishana (Casapare) and Guaharibo (Sanemá), which would seem to be linguistically justified by the distance of 23-35 mc between them. Rivet bases his opinion, it would seem, on Koch-Grünberg's material (1928), which we have also used in our comparison. The Pusirakidu idiom (d), which also appears in Loukotka's classification (1944, pp. 8-9), is a completely unknown idiom and therefore does not figure in Mason's classification (1950, p. 254), which presented the following Shirishaná grouping:

SHIRISHANÁ

[101] A.--Waharibo (Guaharibo)

1. Shirianá

a) Waicá (Guaica, Uaica)

B.--Carimé (Karimé)

174 197 114 According to Mason, Shirianá and the less important Carimé are the principal idioms of the family. This observation is based upon Koch-Grünberg's material (1928, Shiriana), which was identified in our comparison as Casapare, and, as the greater separation of the Yanoama stock corresponds to that language, we must admit the value of Mason's opinion. Carimé does not figure in our classification.

Furthermore, Mason is of the opinion that the Waica idiom is, possibly, a dialect of Shirianá (Casapare), but, according to the glottochronological calculation, he does not seem to be on firm ground. The distance between the two idioms is 21 mc, which is much greater than a dialectal difference of 5-7 mc. Waica appears on the graph as closer to Sanemá (17-18mc). The opinion of /195/ many researchers that Shirianá (Casapare) and Waica are descended from the Guaharibo (Sanemá) seems to have some justification.

/195 cont./

174
197
● 114

McQuown (1955) classified the "Chirianan" family in the following way:

a) Guahariban with Chirianaa, Uaica and ? Guaharibo; b) Carime; c) Punaracau.

A more recent classification of the Yanoama family was made by Dall'Igna Rodrigues (1960, pp. 136-137). By their internal distances the author just mentioned brought together the various Yanoama idioms in the following manner: Surara and Pakidai (Samatari), Waika, Karimé, Shirianá (Casapare), Warema (Sanemá, Pubmatari) (19).

19. The names in parenthesis were added by the present author.

Dall'Igna Rodrigues arrived at this result on the basis of a comparison of 40 words of the idioms mentioned and explains that the idioms of his list were arranged according to the relative distance between each one of them with respect to Surara and Pakidai. He also emphasizes the provisional nature of his result, somewhat different from those presented by Mason and McQuown.

It is interesting, however, to observe that the classification of Dall'Igna Rodrigues coincides in its details with ours. On adding the lexico-statistical data, the classification would read as follows:
Surará-Pakidai (Samatari) 8 mc > Waica; 21mc > Shirishaná (Casapare); 21-25 mc > Warema (Sanemá).

Two American linguists, Greenberg and Swadesh, recently broke with the tradition established by Rivet, W. Schmidt, Loukotka, Mason, and McQuown, according to which the Yanoama had no close affiliation with any other South American linguistic family.

Greenberg (1956) classifies the Shirianá as a distinct group in the "Chibchan proper" subfamily of the "Macro Chibchan" family. The Tunebo also belong to the same category.

Swadesh (1959, p. 20) established a Macro-Siriana, with an internal separation of 50 mc, including Chapacura (27 mc) and

/195 cont./

114 174 197 Sirisana (21 mc). According to what Dr. Swadesh said to me personally, he also planned to include the Warao in Macro-Siriana, which would magnify the internal divergence of the group to 72 mc of a microphylum. I took some interest in this suggestion by Swadesh and tried to compare Warao with Yanoama, particularly with the more extensive vocabulary which I collected among the Sanemá.

I made two comparisons: a) that of the basic vocabularies, and b) that of all the possible pairs between the Sanemá vocabulary and the Warao /196/ dictionary by Barral (1957). The results of these comparisons can be expressed in the following manner: More than 20% of all the pairs compared seem to be related, a sufficiently high percentage to stimulate a more thorough linguistic study. The result of the preliminary glottochronological calculation gave a separation between the two idioms of 45 mc corresponding to 26% of common retentions.

I have the impression that that mathematical result tends to diminish and not to become greater as one goes further into his study. We also observed certain relationships between the Yanoama and the Ye /Ge/ of Brazil. But these are of a different nature and more distant than the cases considered between the Warao and Sanemá.

As we have already mentioned, there are certain indications that the Tunebo, Warao, Yanoama, and Ye idioms seem to have a common root in Chibcha and are linguistically more closely related among themselves than with the majority of South American idioms.

143

At the beginning of the year 1961 I had an opportunity, together with Dr. Layrisse, to visit the Waica of the upper Orinoco, where we went with the intention of taking blood samples of that group. We obtained 140 individual samples, which, in all probability, are representative for the Yanoama in general. We shall now report an interesting genetic discovery.

Y
143

The Waica showed a complete absence of the gene Diego (Di^a). As we reported before (Layrisse, Wilbert, 1960), the antigen Diego is an exclusively Mongoloid genetic marker, but, in spite of the fact that it occurs solely in populations called "Mongoloid," it does not appear in all of them. There are Diego-positive Mongoloids and Diego-negative Mongoloids. Gradual differences of frequency between one Mongoloid population and another have also been observed. Up to the present the scale of frequency varies between 0 and 50%.

4c
8
[143]

The Waica are one of the Diego-negative Mongoloid populations, and the tribes of South America in the same category are: the Tuñebo, Barí (Motilones Bravos), and Warao. Other groups with very low incidence could be included in this category also, since the low frequency they showed for the gene can be better explained by the crossing of a population originally negative with another one highly positive. A representative of the latter group is the tribe of the Yaruro.

Y
CI
143
197

During the six years of research on the Diego gene we made an observation which we consider to be of importance, which is: the various frequency groups of the Diego antigen correspond to different linguistic affinities. The most carefully studied case is that of the Caribe. We examined more than ten tribes and subtribes and they all show an average of 28% of the Di^a gene. In this case the Caribe linguistic affinity is indicatory for a positive incidence of the Di^a gene. It is understood, of course, that there is no causal relationship between these two facts and that its observation is not to be interpreted in the sense that we are trying to make a chromosome responsible for a given cultural trait. The two factors are essentially different, but their parallel appearance is an interesting fact.

262 /207 cont./
223
825 it answers that it is an enemy is he to kill it. In the majority of cases it turns out to be an enemy, and the hunter kills it with a double aim: to have meat and to cause an enemy to disappear. The hunter carries the eagle home, and his wife prepares it for [514] food. Those who eat the meat must not defecate on the ground, [785] but only in the water. The hunter himself must not eat any of this meat and fasts for two months. The eagle "weighs heavily" on his chest, and only when it has "gone upwards" does the hunter get better and begin to feel well again. From now on those who have eaten of the meat may live without taking the above-mentioned precautions (22).

22. See the section which deals with "war" /see p. 57 /.

825 It might be said that for every Sanemá rancheria there exists a rancheria of eagles and of hanekasá. This belief has characteristics of the idea of the alter ego, and the Sanemá apply kinship terms to these animals when they speak to them. The same occurs with regard to jaguars and other animals which they mentioned to us vaguely.

226 Fishing plays a very secondary role in the Sanemá economy. [433] They fish with barbasco, with bow and arrow, but we have not seen special arrows for this purpose. In recent times they have adopted fishhooks, which they now use quite frequently.

222 /208/ Of secondary importance, coming after hunting, is the gathering of various kinds of small animals, insects, wild fruit, [527] and also honey and eggs. The shoots of palms represent an important part of the diet, but above all the fruit of the pijiguao palm (Guilielma sp.), the harvest of which, during the first three months of the year, marks the time of festivities and other social [114] activities. We were not able to gather much information from the Sanemá regarding this matter, but Barker (1953, pp. 447-48), Zerries (1955b), and Becher (1960) refer to this festive occasion in greater detail, according to their observation of it among the Waica, Pakidai, and Surara (cf. Vinci, 1959, pp. 111-118).

Sanemá raft.

/223 cont./

776 The Great Jaguar has certain relations with Omao, the
793 deified hero of the Sanemá, since his name, "Omao-kóhe," indicates such a relationship, and it is possible perhaps to speak of a vocation for the office of priest, since the Sanemá Supreme Being admits him, after his encounter with the Great Jaguar, into the court of Omao.

793 According to South American ethnology, it is surprising
171 to find a "specialist" in a nomadic preagricultural society, but, as we shall state below, this is the second time that we have found a similar case in Venezuela; the other one was that of the Warao wiʃiráto.

793 The Sanema priest is a member of the court of Omao, not
776 only because the Great Jaguar changed him into a bat, but also
778 because Omao gave him a hikuladɛ which is invisible, although it has a spherical shape like a ball, and the larger the hikuladɛ, the more powerful the priest.

The hikuladɛ of the priest, the informant explained, is like a globe which the hɛwĩawán keeps in his chest. We shall also see later that the other religious practitioner of the Sanema has a hikuladɛ too, but one which is essentially different. We
793 have the impression that the hikuladɛ of the priest contains "the
778 souls" of the ancestors who were destined by Omao to live there
775 and help the priest. Since the data obtained are, in our opinion,
793 insufficient, we do not want to hazard peremptory statements,
778 but it seems certain that the Sanemá priest also cures the sick,
755 particularly those who are suffering from fever. Our informant
[114] explained to us that the ancestors (hikula-dĩb), the people of the
[775] hikuladɛ of the priest, are the ones who cure the fever when the priest brings the hikuladɛ out of his chest and deposits it for a time on the body of the patient.

Sometimes the desired effect is not attained, and that indicates that the soul of the /224/ victim has already abandoned the
793 body and does not want to return. The hʃkula therefore constitute
778 a sort of supernatural "little pueblo" /pueblecito/ within the
628 Sanemá community in which the priest lives and do not wish to have any communication with the kʃkula-dib /sic/ of the neighboring pueblo. The priests from nearby pueblos do not visit each

BLOOD GROUP ANTIGEN TESTS OF THE WAICA INDIANS OF VENEZUELA.[1]

MIGUEL LAYRISSE, ZULAY LAYRISSE, AND JOHANNES WILBERT

GENERAL ANTHROPOLOGICAL INFORMATION

128 INTRODUCTION: For the purpose of the present paper we would like to classify the Waica as a subtribe of the Yanoama tribe, the ethnic identification and the internal composition of which appears to be but little understood. Although the actual blood group study will be concerned with the Waica Indians most particularly, we shall, nevertheless, include as well some information on the Yanoama tribe in general. This, we trust, will not only serve to locate the specific Waica data within a wider frame of reference, but also to facilitate the comprehension of the theoretical considerations based thereon.

131 *Ethnic identification.* The Yanoama inhabit a very extensive area between 0°30'-5° N and 62°-65° W, which includes the headwaters of the Paragua, Caura, Ventuari, Padamo, Ocamo, Mavaca, and Orinoco rivers of Venezuela, as well as those of the Uraricuera, Catrimani, Dimini, and Aratá rivers of Brazil. The Sierra Parima crosses this heavily forested territory like a vertebral column, so to speak, and marks at the same time the frontier between the Venezuelan and the Brazilian parts of the Yanoama land (see map, Fig. 1).

101 The Yanoama are surrounded by Tropical Forest Indians with Neo-Indian culture types; Cariban tribes enclose them in a semi-circle to the northeast, while Arawakan peoples bound them in a semicircle to the southwest. Thus, the Yanoama seem to have been functioning as a buffer between the Caribs and the Arawak, successfully resisting any attempt of intrusion by such groups as the Soto (Makiritare), the Pemon, and others. In recent years, after their Carib neighbours had suffered a marked decline in numbers and in strength, the Yanoama ventured northward into the Ventuari, Caura, and Paragua drainage area, intruding into Carib territory for more than 100 km.

114 Although sporadic and rather casual information on the several Yanoama groups have been published by various authors since early Colonial time, it is only

122 1 We wish to thank Dr A. Berti and Ovidio Castellani (División de Malariología, Ministerio de Sanidad, Venezuela) and the Misión Salesiana of the Territorio Federal Amazonas for their collaboration in collecting the blood samples. We are also indebted to Esperanza García for her technical assistance. We are greatly indebted to J. P. O'Riordan (The National Blood Transfusion Association, Dublin), M. Shapiro (The South African Blood Transfusion Service, Johannesburg), R. E. Rosenfeld (The Mount Sinai Hospital, New York), and Albin Moores (The Minneapolis Memorial Blood Bank, Minnesota) for supplying us with critical anti-sera.

St Layrisse et al. D,E-5 (ca. 1960)1962 SQ18 Yanoama SQ18
Waica

since Koch-Grünberg's contact with two Yanoama groups, in 1911, that more substantial information on this interesting tribe has been collected and in parts been published.[2]

Emerging from these data are the names and descriptions of a number of distinguishable tribal units, e.g., Sanemá (Guaharibo, Shirishana), Casapare, Waica, Samatari, Surara, Pakidái, and others. It also has become quite obvious that the Yanoama subtribes are not unified by socio-political authority, but rather by a general and specific culture type, which in turn is integrated by a series of subcultures and culture variants, carried by the different subtribes and local groups respectively. The various local groups and subtribes occupy a coherent territory, they speak more or less closely related languages and display essentially similar economic, sociological, and religious forms.

Taken as a whole, the Yanoama were found to be a very numerous tribe and they belong, in fact, to the most numerous of all the autochtonous populations of lowland South America, but previously published figures of 30-50,000 individuals appear to represent very generous overestimations of the demographic strength of the Yanoama groups known so far.

Linguistic classification. Several authors have attempted a linguistic classification of the Yanoama although most of them did not have at their disposal the more recent material.[3] Taking advantage of this material, we have attempted a glottochronological analysis, the results of which allow us some interesting insight into the internal correlation of the Yanoama languages.[4]

According to this result, the several Yanoama languages, as known today, constitute the Yanoama linguistic stock of 6-35 mc of internal separation. The two more or less clearly distinguishable families of the stock are: *A. Sanemá:* (a) Sanemá, (b) Nabudíb, (c) Pubmatari, [6-17 mc of internal divergencies: Sanemá-Nabudíb = 6 mc, Sanemá-Pubmatari = 17 mc, Nabudíb-Pubmatari = 17 mc]; *B. Casapare:* (a) Casapare, (b) Carime (?), (c) Waica, (d) Samatari (Surara and Pakidái), [8-21 mc of internal divergencies, excepting Carime (for lack of vocabulary material): Casapare-Waica = 21 mc, Casapare-Samatari = 21 mc, Waica-Samatari = 8 mc].

2 Surara-Pakidái, by Becher, 1960; Waica, by Baker, 1953; Schuster, 1958; Zerries, 1955, 1956, 1958a, 1958b, 1959, 1960; Sanemá, by Vinci, 1959; Wilbert, 1961a, 1961b.

3 Rivet, 1924, p. 678; Loukotka, 1944, pp. 8-9; Mason, 1950, p. 254; Rivet and Loukotka, 1952, p. 1140; McQuown, 1955, p. 525; Greenberg, 1956; Swadesh, 1959, p. 20; Dall' Igna Rodrigues, 1960, pp. 136-137.

4 We are indebted to Dra H. Becher and O. Zerries for letting us have a basic vocabulary of Surara-Pakidái and Waica respectively. Complete information on source material has been presented by Wilbert, 1961a.

In 1913, Koch-Grünberg[5] had observed that Yanoaman was different from Cariban and that it apparently represented an isolated language. While this opinion was shared by the majority of authors who subsequently referred to the language, two American linguists have recently broken with this tradition by forwarding suggestions of possible affiliations. Greenberg[6] classified "Shiriana" as a distinct group belonging to the "*Chibchan proper*," subfamily of the "*Macro-Chibchan*" family, and Swadesh[7] established a "*Macro-Siriana*" with an internal separation of 50 mc, including Chapacura (27 mc), and Sirisana (21 mc). He later suggested (personal communication) that Waraoan should also be reckoned in "*Macro-Siriana*," which would increase the internal divergence of this microphylum to that of 72 mc. Since the latter suggestion is of major interest to the distribution of the Diego antigen, we shall return to the discussion of the same after having presented the material on the Waica blood groups.

Cultural aspects. The Yanoama are a semi-nomadic forest people who rely for their subsistence chiefly on hunting, gathering, and arboriculture. Fishing is of a very subordinate importance and only peripheral groups, such as the northern Sanemá, have adopted agriculture from neighboring tribes. Although arboriculture is of vital importance among most of the Yanoama subtribes (plantains [*Musa paradisiaca normalis*], and pupunha [*Guilielma gasipaes*]), there can be little doubt that the basic economic and cultural pattern of the Yanoama has remained essentially on a Paleo-Indian culture level of the early hunting peoples of South America.

Yanoama technology is very little developed. The Waica produce thick-walled conical cooking pots, and Yanoama women make large twined carrying baskets. Cordage, belts, and one type of hammock are made of planted cotton, but weaving and metal work of any kind is unknown. Recently, several Yanoama groups have learned how to make dugout canoes, but their crafts and paddles still lack the perfection of the same artifacts among their masters (e.g. Caribs). Very long bows and arrows are the main weapons of these Indians, but stick-clubs may antedate the former.[8]

The local groups of the Yanoama are composed of bands of several extended families with nuclear family households. Residence rules have, as yet, not clearly been established, but judging from the Sanemá of the Erebato and from the

Waica

Duffy: The Fy (a+) ranged in these tribes from 77% to 92%, which is the usual range found in Indian tribes. 143

Kidd: The gene Jk^a showed comparable results in Yaruro 49% and in Waica 56%. The Warao were not tested for this gene.

Diego: As was mentioned before, the Waica showed absence of the gene Di^a; the Warao had a negative frequency among the Winikina sub-tribe and 1.9% among the Guayo sub-tribe; the Yaruro showed five Diego-positive cases out of 102 samples, but four of them were derived from eleven samples taken from a single band. For reasons mentioned elsewhere, the authors suggested that the Warao as well as the Yaruro were originally Diego-negative, and that their low Di^a frequencies are due to admixture with neighboring tribes exhibiting a relatively high frequency of the gene.

Other Blood Groups

The tribes tested for Lutheran, Kell, and Lewis showed negative frequency for Lu^a, K, and Le^a, as is seen also in other Indian tribes with non-Indian admixture.

As can be gathered from these comparisons, it is mainly on the basis of the Di^a gene that we could establish a sharply contrasting difference between the Marginal tribes and other South American tribes tested so far (Goajiro 8%, Paraujano 10%, Mundurukú 12%, Guahibo 14%, Caingang 17-46%, Aymara 17%, Caribs [Cariña 29%, Pemon 28%, Yupa 27%]), etc. . .

DISCUSSION

In a previous section we have tried to indicate that the absence or a very low frequency of the Diego gene appears to coincide with a culture pattern typical for hunting, fishing and gathering tribes of South America. On several other occasions [19] it has been pointed out as well that there seems to exist a coincidence of certain levels of cultural developments with characteristic ranges of Diego frequencies, and that these frequencies tend to be quantitatively similar or identical between tribes of "genetic" linguistic affiliation, in the sense Greenberg [20] uses the term. For Venezuela we have, in particular, made mention of the low frequency or absence of the Diego gene among the Waica, Warao, and Yaruro who exhibit a Marginal or Paleo/Meso-Indian type of culture. 143 114 104

We have also indicated that this parallel occurrence of Diego gene distribution and the culture pattern of its bearers coincides to a certain extent with a similar

Waica

classification, based on somatological and phenotypical characteristics of the American Indians as proposed by Coon, Garn, and Birdsell,[21] who distinguished between dolicephalic and somewhat mongoloid *Marginal American Indians*, and broader headed less mongoloid *Central American Indians. As a parallel and, of course, not as a causal phenomenon*, the cited authors (very much like the present authors) record that the *Marginal American Indians* include largely non-agricultural Indians of the Americas, while the latter are agricultural peoples of North and South America, especially of the central part. This observation receives substantial support from the recorded facts of the Diego gene distribution, and its importance for migration theory and culture history of South America may be significant. In the given frame of the present paper we shall restrict ourselves to the discussion of the importance of the absence of the Diego gene mainly among two Marginal tribes of Venezuela, the Waica and the Warao, trying to indicate a possible direction for future Diego research.[21a]

In a recent study, Canals Frau [22] observed that the oldest stratum of *Homo sapiens* in America was composed of five distinct racial types, i.e., the *Silvidos*, the *Sonóridos*, the *Láguidos*, the *Patagónidos*, and the *Huárpidos*, and that the last three were of South American distribution. It is interesting to recall in this connection that Canals Frau includes the Waica and the Piaroa in this antique stratum within which great phenotypical variation has been observed by Vinci, for the Yanoama, and by Baumgartner for the Piaroa.[23] It would seem that the actual occurrence of this variation in one and the same group could best be interpreted by fusion and interbreeding of the different racial types of Paleo-American Man.

Because of his early appearance, the culture of this Paleo-American Man will necessarily have been on a Paleo-Indian (hunters), and later Meso- Indian (fishermen) level of development.[24] Kirchhoff,[25] in referring to the hunting and fishing Marginals of Venezuela, observed that the "differences in subsistence are correlated with other cultural differences, indicating that there was not one basic culture type, but two, the Hunting Culture and the Fishing Culture;" that "Each in turn was divided into at least two subtypes," and that "Without further comparative research, it is impossible to say whether these subtypes were simply local variants of the two basic types or whether they too sprang from different origins."

Waica

The most typical representative of the Hunters among modern Venezuelan Indians are the Yanoama, while the most typical example of a people of Fishermen culture can be seen in the Warao. It is interesting for the discussion of Kirchhoff's problem that Swadesh (personal communication) suggests a linguistic affiliation between Yanoaman and Waraoan; interesting, because it is generally accepted that "genetic" linguistic relationship is most likely to have biological significance, since the ancestors of the speakers of genetically related languages[26] once belonged to the same gene pool.

In following up Swadesh's suggestion, the present authors have compared (a) the basic vocabularies of Yanoaman and Waraoan, and (b) all available pairs of about 1000 Yanoama (Sanema) words with their equivalents in the Warao dictionary recently published by Barral.[27] As a result of this comparison, more than twenty percent of the total pairs compared appeared to be cognate; a percentage certainly high enough to encourage further research. A preliminary glottochronological calculation resulted in 45 mc of separation, which corresponds to twenty six percent of common retentions. Accepting this result as a strong *prima facie* case, it would suggest that the *Yanoama* and *Warao* originally united, separated from each other some 4,500 years ago.[28]

If we compare the blood group phenotype frequencies found in these two tribes, we see that only the frequencies at Diego are very similar, whereas MN, Rh, and Duffy showed statistically significant variations. It is generally accepted that significant differences of gene frequencies in two populations are indicative of different origin, but in comparing small isolated populations, such as most Indian tribes, this statement may not be applicable without allowing for certain restrictions. The gene frequencies in these populations may, for instance, reflect the fortuitous results of gene drift, since in a population with an effective size of 200, an allele would require a selective advantage of 0.01 to avoid the action of drift.[29]

In our case, we are comparing the gene frequencies of blood groups, the majority of which have, until now, been considered to be of neutral selective value. Although the Waica and the Warao belong to the most numerous Indian tribes of Venezuela and lowland South America (8-10,000), they have been living in smaller isolated groups which might have favored the production of gene drift. On this basis, then, one could consider gene drift as the most probable explanation for the phenotype differences of the Rh, MN, and Duffy systems, especially, if we take into consideration a possible 4,500 years lapse of time since their separation.

133 the forest lands, and their tops are so high and so difficult of access that this has helped to preserve a biological world completely distinct not only from that of the surrounding lowlands of the Caroni, Paragua, Caura, and Orinoco valleys but also from that common to all other valleys in the American
● [114] continent. A few decades ago, when the aeroplane first enabled us to study these regions and their geological peculiarities, some observers proceeded to formulate wild theories which aroused more legitimate emotions in the breasts of explorers and scientists.

The formation of sandstone and conglomerate which overlays the original basic rock of this region to a depth of 2,500 metres was eroded almost completely on the periphery of these uplands, leaving the great flat-topped mountains isolated. This geological phenomenon began in the Secondary Era, when the plant and animal life on our planet was appreciably different from what it is today. The process of erosion continued right down to the ancient granite crust, while on the uplands flora and fauna continued as hitherto, restricted now to their new isolation. Communication between the heights and the plain became impossible. The pressure at 2,500 metres is very different from what it is at four hundred, and creates peculiar physiological changes in the organisms that adapt themselves to it.

13 It seemed possible that the flat tops of these mountains, which from the air
114 appeared to be covered with bush, would not only reveal unknown vegetable species but also animals which scientists believed to be extinct. Perhaps certain monsters from the Mesozoic age—the Saurians, it might be, the inspiration of so many fantasies—still lived and pastured in deep chasms scooped out by the waters of ages. Speculation wove many a scientific fantasy.

In reality, the monsters remained well and truly buried in their geological strata and no mountain could preserve forms of life surviving through a radical
137 change of atmospheric and geological conditions. What did come as a surprise, however, on these mountains—and the Sarisariñama itself proved the point—was an entirely individual flora: orchids, epiphytes, bromeliads and lianas of hitherto unknown types, which are likely to keep botanical students busy for a long time all over the world.

136 The usual fly-catchers, merry little birds I had already known closely on other high Guiana mountains, came to greet us. Never having seen animals bigger than themselves, these birds took us for strange trees with two big humid flowers distilling honey at the top: our eyes. First one of them came

Aracosa. There was something about the ring of the name. At last I pinned it down. I had seen it in an account of the journeys made by a certain Theodor Koch-Grünberg—a German who from 1911 to 1913 made a long trip from the Roraima savannah to the Upper Orinoco. He left a record of it in a famous five-volume work—a worthy monument to his venture. In Makiritari, *aracosa* means 'gun': it is a corruption of the old Spanish word *aracabuso*—arquebus. Koch-Grünberg had reached its mouth, and it was here that he made his first contact with the Shirians. Unfortunately he was unable to keep in touch with them for any length of time and only visited the isolated elements he met with in the course of his journey.

This German explorer naturally made the expedition in the company of Makushi and Makiritari Indians, who live in holy terror of the tribes they call Guaharibo. Their fear may not always be justified, for a good many Guaharibo have now settled down to a mild and perfectly harmless way of life. But they still arouse a rancorous contempt in other tribes. Koch-Grünberg returned to the same region eleven years later, when he made the journey up the Rio Branco, irresistibly drawn towards these people whom he could not understand and whom he described in his book as forming an '*isolierte Gruppe*'—an isolated group, with no affinities to other races. But at the very gateway of their world he died of fever, and his expedition (which had been organized by Hamilton-Rice) after losing its chief, packed its bags and turned south again.

VI

We left for the Samatari country on March 16th, accompanied by Uarema, Sempronio, and Hashimo, the latter's fee as guide being nothing less than my own fur jacket. Caio, for some inexplicable reason, had quietly declined to come with us. We embarked in a canoe acquired from Pancho's father, and in this swift, light craft we made easy progress up the flooded Merevari.

Heavy rain set in, for whole days at a time. Progress slowed down. The Indians grew weary and there was no more singing and laughter from them. The second evening out, when we had slung our hammocks in a hut we had made on an earlier trip, Luis Antonio told us that his brother wanted to quit: there was not enough cassava—we had brought about twenty pounds.

'You had time to prepare as much as you wanted,' I answered him shortly,

Sanema

123 always filled me with pride. By setting about it in the right way we can always manage to make ourselves acceptable to our superiors, but no such effort will ensure the same result with people more lowly placed than we are: for this, the all-important thing is to possess a natural bent, a certain humility of spirit and a sympathetic understanding. One must possess the faculty of becoming, up to a certain point, 'primitive' oneself, adopting all the healthiest attributes of the primitive state, without at the same time losing one's own value as a civilized being: one must be primitive and something more—not just the 'something more' alone, which rather amounts to something less.

114 It often happens that scientific expeditions, or explorers of one sort or another, venture into regions inhabited by primitive men with the intention of studying them. They approach them with all the preconceived and presumptuous notions of men who have read up all there is on the subject, and every single human being who shows up on the river-bank becomes a savage and must be catalogued like a butterfly. Thus the Shirians in all their slightly different types and sub-divisions are all called 'Guaharibos'—a name which means nothing and which the Shirians themselves have never heard. These scientific explorers may indeed take measurements of their faces and calculate the number of red corpuscles in their blood: the Shirians remain Sanemà for all that—people living in their own forest land, fighting their battles for their own special reasons, but ready to become men just like any others—because with a completeness and a simplicity that surpasses our own, they are men already. But scientific records lump the Sanemà and the Soto together under the barbarian headings of Guaharibo and Magnungòn, both contemptuous epithets, and humanity learns nothing from these explorers with their solar topees, who have scarcely got back to civilization after spending a few months in the forest and learning all there is to be known about the savages before they start writing books about it. If these books could be read and understood by the primitive people they treat with, the authors would be rewarded with a volley of arrows.

123 Living improved considerably and there was meat now in abundance: the banks of the Uraricoera were full of game. The best cuts were reserved for us,

[136]

/433/ Memoir on the Culture of the Guaika

By James Barker (*)

● 114 * The author of this work is a missionary of a North American mission, the "New Tribes Mission," who has lived for several years among the Guaika /Waica/ Indians of the Upper Orinoco, Venezuela. Without presuming to be an ethnologist, Mr. Barker has prepared this report containing his observations, and, having kindly sent it to the Ministro de Justicia for his information and for publication, the Comisión Indigenista has accepted it for these pages of the Boletín Indigenista Venezolano, considering its importance as firsthand information concerning a remote tribe scarcely studied up to now. Direct observations made over a period of several years, such as those revealed to us by Mr. Barker in a simple and objective fashion, are of positive utility for
[128] ethnologists and ethnographers. In the translation of the original from English to Spanish, we tried to adhere as closely as possible to the words and expressions of the author himself, without having recourse to technical terms. -- (Note by the translator, Walter
HDO Dupouy.) /It is to be noted that Mr. Dupouy was the original translater from the English to Spanish, but not the HRAF translator from the Spanish to English./

121 Most of the data included in this memoir are the result of my own observations. Observations made by other members of the staff of the "New Tribes" Mission, who have also collaborated, are included as well. They are: Mr. Edwin Killam and his wife,

/434 cont./

197 101 Nevertheless, what distinguishes the Guajaribo as a separate group from the Guaika, even more than the small differences in language, are certain differences in their habits and material culture.

101 197 The Guajaribo share a goodly portion of their habitation zone with the Maquiritare /Makiritare/ Indians, who live to the north. As a result of this, it appears that they have adopted [248] many things from Maquiritare culture; for example, they cultivate yuca more than the /435/ Guaika do. Their cotton hammocks [352] and those of the Guaika seem to be a simplified version [342] of the ones which the Maquiritare make. They also build some few ranchos [484] with double-sloped roofs. And, like the Maquiritare, they travel much farther than the Guaika.

191 192 A certain number of the Guajaribo are bilingual, and they speak Maquiritare in their commercial relations. They have also adopted a certain number of Spanish words through the Maquiritare and through their outside contacts, which have been more numerous than the contacts which the Guaika of the Orinoco have had with outsiders.

101 The title "Guajaribo" seems to be a name given to this tribe by outsiders and adopted by them for commercial reasons. The Maquiritare call the Guajaribo "Shidishana" or "Shiriana." These names, Shidishana and Shiriana, are the ones which the Guajaribo themselves employ when they talk among themselves or when they talk with the Guaika and the Maquiritare.

Maps

126 I have not been able to find a map of the exact territory inhabited by the Guaika /Waica/ and Guajaribo /Guaharibo/ [114] tribes. For example, on most of the maps the Ocamo River is shown running almost parallel to the Padamo River, when in reality it runs almost parallel to the Orinoco River. I have corrected some of these errors, but my maps are still only approximations.

126 628 On the map of the local area of El Platanal, I have tried to show the friendly and hostile relations between the settlements, as well as the approximate location of the Guaika

/435 cont./
126 628 rancherias. For anyone who might be preparing to travel or work in Guaika territory, these relations can be as important as the geographical location of the settlements. If a group of Guaika should be engaged to carry out certain tasks, they might be inclined to work well in certain areas, but doubtless would refuse to enter areas inhabited by their enemies.

126 /436/ On the map of the whole area inhabited by the Guaika and Guajaribo, I have tried to show the approximate limits of the two tribes. The areas which are shaded on the said map correspond to the zones where we have had contact with these tribes on several occasions. The settlements whose names appear underlined, that is to say, El Platanal and Ioeitedi, are native rancherias where we have lived and worked for long periods of time. These settlements continue to be our principal bases of operation.

[114]

103 The native names of the principal rivers are as follows:

Orinoco River	Majekodo-ko
Cunucunuma River	Ami-ko
Padamo River	Jaiyama-ko
Metacuni River	Wakawaka-ko
Ocamo River	Kia-ko
Mavaca River	Wachewa-ko
Manavichi River	Mata-ko

The native name of the Raudal de Guajaribos /Guaharibo Torrent/ is Kalebakbola.

I have not been able to discover even one name for the hill of Guaiaribo, but the most important peaks, starting below and going up the river, are: Wanidi-mak, Yabitao-mak, Kacholaoa-mak, and Wadubaoa-mak.

Geography

361 A few Guaika /Waica/ settlements are located along the principal rivers and are accessible by means of small boats or canoes with outboard motors. Nevertheless, most of the Guaika settlements are inland and can only be reached after one or more days of travel.

/437 cont./

Population -- 1953

361 It is known that there are about 23 Guaika /Waica/ settlements between the Orinoco and the Ocamo rivers and in the region of the Brazilian frontier to the north of the Orinoco River.

/438/ It is known that there are at least 28 other Guaika settlements to the south of the Orinoco River.

103 162 The approximate population of the Guaika settlements with which we have had the most contact is as follows:

Majekodotedi (Platanal).	100	Kacholaotedi	100
Bichaasatedi	100	Boleitaotedi	100
Lajalaowatedi	100	Patanaotedi	120
Yabitaotedi	75	Chibardiatedi	60

361 At least eight Guajaribo settlements are known to exist in the region of the Ocamo and Lower Padamo rivers. It is known that there are others on the Upper Padamo, a few others on the Ventuari River, and still others on the Upper Caura (also called the Merevari River).

103 162 The approximate population of the Guajaribo settlements with which we have had the most contact is as follows:

● [114]

Ioeitedi	60
Wakawakatedi	100
Kwaisitedi	100

162 The population of El Platanal can be divided by age and sex approximately as follows:

	Men	Women	Total
Great-grandparents	0	1	1
Grandparents	6	6	12
Parents	8	15	23
Newlyweds (childless)	5	6	11
Unmarried adolescents and children	33	21	54
	52	49	101

/457 cont./

323 the fire quite blackened when well baked. On my last trip up-
• [114] river I had the good luck to see how one of these pots was made, except for the baking in the fire. In spite of being very fragile, these pots are highly esteemed for cooking.

Constructions

342
335 The Guaika /Waica/ dwelling is a roof with only one slope and no walls. The basic structure is a triangle of beams supported at its vertices by uprights. The highest angle is supported by a long upright, while the two lower angles are held up by two short crossed stakes at each corner. Or one of these lower corners might be fixed to a living tree for greater stability.

The uprights are pointed at their lower end and stuck into the ground repeatedly until they are quite firm. Then the main beam, or bearing beam, is tied in place horizontally between the short uprights on which the roof is supported. Then the two diagonal beams which form a triangle with the main beam are put in place, and on this basic triangle are added four beams inclined toward both sides. Then the small beams which form the framework which will bear the leaves are put on top. (Fig. 3./see p. 29/.)

342
[824] The leaves are placed on top like tiles, but are not tied in place. Brush /breñas/ and sticks are put over the leaves so that the wind will not blow them off. Sometimes palm leaves and brush are drawn up against the back eaves so as to form a sort of back wall. /458/ /[illegible]/Fig. 3 appears here./

This basic structure may vary, two or more ranchos being joined laterally and their roofs united.

On sites more suitable for more stable constructions (that is to say, where there is considerable clayey ground and consequently fewer fleas or "niguas"), the Guaika build dwellings with the palm leaves of the roof fixed in place. These dwellings are similar to the more temporary constructions, but are generally larger, and the small beams of the framework are replaced by strings of vine stretched lengthwise across the inclined beams. The palm leaves are fixed to these strings, their stems being bent backwards and down, thus piercing the lower layer of leaves.

/487 cont./

804 They determine measures by comparing one thing with another. Thus, a man lies down on the ground to determine the distance which separates the posts which he is going to plant for setting up his hammock. In the same way the Indian measures the size of his belt by means of a string before making himself a woven cotton belt of the same length as that obtained with the string.

Weights are determined by lifting the object and mentally comparing its weight with that of other objects which have been lifted previously.

805 Time Reckoning

The Guaika /Waica/ divide the solar day as follows: morning, while the sun rises; the period of midday, while the sun is high in the heavens; afternoon, until the rapid setting of the sun; and night. A more precise time of day is indicated by pointing to where the sun is at the moment, where it was, or where it will be when a certain event will occur.

A period of time is correlated approximately with the distance that can be covered during this time. For example, they say: "We shall arrive at the house when the sun reaches that height (and they point to it)." Or they would say: "He will be back in the time that it would take you to go from here to the river."

The Guaika do keep count of the days. They count the weeks by the phases of the moon. They also count the lunar months. The seasons of the year are reckoned according to the cycle of the fruits. A year is the time that passed between two similar harvests.

Birth

Raids among the Guaika

By James Barker (*)

● 114

* Mr. James Barker has prepared this work as a result of his many years with the Guaika /Waica/ Indians of the Upper Orinoco, Venezuela. In this Boletín (Year I, Vol. I, Caracas, June-December, 1953, Nos. 3-4, pp. 433-489 /see 7: Barker, this file/) he presented a report of his observations under the title of "Memoria sobre la cultura Guaika /Memoir on the Culture of the Waica/." The present work is the result of his observations, which, revealed in an objective and simple manner, are of positive value for ethnologists and ethnographers.

121 I have been asked for more information about the raid. As I am not sure of which one I am asked about, I will tell about several, especially those about which I have quite detailed information.

574 628 In February of 1951 the aldea of Liacoatjeti invited the aldea of Bisheasetjeti to a Pijiguao or palm festival. The men of Liacoatjeti had gone on a special hunt to get a supply of meat. There was to have been an abundance of every type of food. There were to have been special dances, the taking of yopo, and other things which they do on such festive occasions.

574 628 721 But the invitation was a trick which those of Liatcoatjeti /sic/ had planned in order to be able to kill, if possible, all of the men of Bisheasetjeti and capture their women. Batanoetjeti and other aldeas which were enemies of Bisheasetjeti were invited to hide outside of the aldea and shoot at any man who tried to get away. Since they did not need to feed anybody, the Liacoatjeti did not bother to go hunting.

/156 cont./

721 In December of 1953 the Shibaatía-tjeti came back to make
123 another raid, accompanied by the Comishibueitjeti. But the Majecototjeti had camped outside, on the other side of the river. Some of the Shibaatía-tjeti approached us carrying an arrow, but leaving their bows in the woods with the other men. They explained that they were friendly visitors and asked where the Majecototjeti were, because they were supposed to visit them. But their black war-paint showed that they had come on a raid. (Visitors are painted with red or mulberry color, but not black.) When they saw that they were not going to get us to tell them where the people were, they asked us to give them matches and fishhooks. They gave us in exchange some knives made of tooth. After this things calmed down, but from this time on the people of Majecototjeti have lived inside their palisades when they were near their main farm.

[302] [574] [822] [412] [361]

166 The people of Majecototjeti started a new farm called
361 "Joitja-tjeca" to the south of the Orinoco, where they could
721 live without palisades and feel safe from raids by the Shibaatía-tjeti. The Majecototjeti did not plan any retaliatory raid, because they said, "None of our men have been killed."

727 In September of 1954 I had camped with the Majecototjeti at
361 their new farm to the south of the Orinoco River. Everybody was
[114] calmer there, and they seemed to feel freer than at any time since the first raid by the Shibaatía-tjeti had put them on the alert almost a year before.

222 Anyone who wished to do so could go out and gather fruit,
fish, or hunt crabs, even in small groups. The boys were having fun shooting at the fish in the many streams with their little arrows of split palm shoots and bows made of a curved stick and a piece of twisted bark. It was the season of the moriche fruit, and the /157/ women went out almost every day and came back carrying
726 baskets full of this fruit. One afternoon about 1:00 P.M. some came to the aldea and said that a great number of tracks had been seen not far from the aldea. A group of men went out to investigate.

[226] [411] [857]

/158 cont./

726 That night some of our missionaries were camped outside in a
● 114 casa abierta /"open house"/. Suddenly they were awakened by
a group of Yanomama men, who were standing and looking at
our missionaries, without saying anything. They all were painted
[302] black, as though to make it impossible to recognize them by
the light of the evening, or in the lesser light of the night.
Finally the silence was broken, and the men of Majecototjeti
told them that they were looking for the raiders who had killed
the man and the boy and had carried off the four women. Our
people had seen nothing of the raiders and were enormously sur-
prised at the news.

726 The following morning the men went to the place of the
attack and brought the arrows which were there. They did not
bring back the complete arrows, but only the ends with the feathers.
The arrows were not cut, but burned in two. The poisoned
points were brought also. The men carefully examined the arrows
and tried to make out from what aldea the raiders had come.
The arrows looked like those of the Liacoatjeti, but they had
seen a machete in that place, and who could imagine a
Liacoatjeti leaving a machete, even in a moment of danger.

There was also a rumor that a bark canoe had been found
some distance down the river. Probably the Shibaatía-tjeti had
crossed the river in this canoe. (This rumor later turned out
to be false.)

A search was carried out in a large circle in every direction
to try to find out what direction the raiders had taken. Finally
the track was found, and the Liacoatjeti were then recognized
as the raiders, and they had come from the south. Their path had
been made so as to cover the tracks, leaving the formation one
by one and reassembling farther on.

721 The Majecototjeti planned, in turn, a raid of /159/ re-
venge. First a banquet was held with tapir meat and cassava to
eat with the meat. A day or so later the men marched off on a
raid of revenge against the Liacoatjeti. The Majecototjeti had
gone off two weeks before, but had not found the Liacoatjeti in
their houses.

727 "Jolocoiue," a boy with a broken leg who had stayed with
[123] us, asked us to pray to God to send "Etemi" (one of the abducted
women) home safe and sound.

/159 cont./

727 women) home safe and sound. A few days after the Majecototjeti returned from their attempted raid, "Etemi" returned. When she returned, the whole aldea went back to the north bank of the Orinoco River, in case they were being followed.

She told how it was that she had had a chance to walk in front of an old woman, and, getting somewhat out in front along the way, she was able to get off the path without being seen and had returned.

We marveled at our little faith. Why had we not prayed to God to bring them all back?

721 The chief repeatedly called meetings for raids to get revenge on the Liatcoatjeti. Usually the aldeas of Bisheasetjeti
[628] and Macolimutjeti accompanied the Majecototjeti on their raids. Our missionaries and some of the believers and the Yanomama prayed together that the raiders would not kill anybody or lose any of their own. Once they did not find anybody in the houses. Another time they became lost and for lack of food had to return home. Another time the whole group was so sick that they had to return, having covered only a few days of travel from their point
721 of departure. When a Yanomama aldea or several aldeas are about to
726 to go on a raid, they hold an impressive ceremony. They make one or several effigies which represent the enemy. Then a simulated raid is acted out, in which these effigies are wounded, broken in two, and then thrown down. If the enemy is far away, they can do this at home and several times on the way to the enemy. Sometimes the simulated raid is carried to the point of dividing the group into two parts: one group which shoots at the effigies and then escapes (flees) with several girls from the aldea; the other group comes along a little later, /160/ finds that the women are gone, and pursues the raiders until it finds them hidden, sometimes out in the forest, with the girls. When the raiders are found, each one gives a loud war-cry and the ceremony ends.

● 114
721 In December of 1954 all our missionaries went down the river for our field conference, leaving the Frobenius expedition alone in Platanal. One night a man from Shibaatfa-tjeti slipped

/160 cont./
114 into the aldea of Platanal and shot at one of the men. His shot
721 wounded "Lublo-juu" in the thigh. Nevertheless, since he recovered, there was no gathering for a raid. The men of the Frobenius expedition treated his leg and prevented complications, since the wound was quite deep.

574
628 At the beginning of February 1955 the Macolimutjeti and the Bisheasetjeti were invited to a Pijiguao or palm (Peach) festival among the Majecototjeti. The Macolimutjeti all came, men, women, and children. But the Bisheasetjeti were somewhat afraid. The Majecototjeti had been somewhat friendly with the Batanoatjeti, bitter enemies of the Bisheasetjeti, and the Bisheasetjeti feared a trick. (Years before, in 1951, they had been tricked by the Liacoatitjeti.) But so as not to show their bad faith, the men came (or at least a few of them), but none of the women, in order thus to reduce the "desirability" of a trick to steal them.

926 In March of 1955 the men of Platanal had gone for a new attempt at a raid, leaving the rest of the people in the principal aldea, located to the north of the Orinoco. One day, when /illustration appears here/ /161/ all of them except the lame boy were out of the aldea, the Shibaatía-tjeti returned. They found "Joashimocaoue," who was returning from the farm at the head of the others who had gone to take advantage of the Pijiguao, or palm festival. The raiders shot him twice in the back, since he ran toward the refuge of the aldea. He was wounded by one bamboo point, not deeply, and by one point poisoned with curare, which caused a rather deep wound. In the aldea he told the lame
[123] boy to hide himself from the raiders who had killed him, and then, finding no help in the aldea, he ran to our house, about 200 to 300 meters away.

Waica

supple wood and well over six feet long, it is very powerful. With it the Waïka can shoot an arrow more than a hundred yards and can hit a *paujil*—a bird about the size of a turkey—at forty yards. Normally two or three arrows are carried and they are as long as, if not longer than, the bow itself. The shafts are made of reed which, Cardona said, is specially grown for the purpose on their plantations, and are feathered by falcon's feathers. The feathers are meticulously tied in a near-perfect spiral with thread of forest cotton or morisco palm fibre. Each arrow has a different head specially adapted to a particular purpose. Spare arrow-heads are carried in a quiver in which also is carried fire-making material to protect it from the damp.

The quiver is a simple bamboo case to which are also tied a firestick and a number of little knives made from the incisors of a large rodent called a capybara. It is carried on the back by means of a string slung round the forehead.

Such comprise the simple impedimenta of the Waïka on his journeys through the forest. The women, who accompany their mates on their many ceaseless wanderings, presumably have their own burdens to carry, but we saw nothing of them until we visited our first native village on the next day.

As we went up-river we came across the remains of a rude bridge which had formerly spanned the two hundred yards of river and which had been carried away by the flood waters. It was the biggest bridge we had seen although we had passed a number of lesser ones fashioned of lianas spanning the tributaries. On the bank where the bridge had been were some twenty natives and a handful of children.

"*Apo! Shori! Apo!*" they greeted us.

We knew from Butrón that, though his men were accustomed to replenish their banana stocks at this place, they had so far never been allowed to visit the village hidden somewhere in the forest.

The Waïka lives on wild fruits, fish, meat and the produce of plantations adjacent to his villages. Most of his time he spends wandering in the forest and his fleeting appearances at his village occur usually only when natural resources fail or when he has to defend himself against an enemy horde. He knows

Waica

I tried to take some photographs of them, but they cowered back behind each other, clucking like frightened chickens, and the men gestured to me to stop. One of them, a one-eyed old man, despatched a stream of spittle from his quid into my face.

"*Shori! Noji!*" I protested, and laughed. I got out my comb and combed my hair and beard. He came over and examined the comb and my hair and stroked my beard. Then he, too, laughed.

"*Shori!*" he repeated.

I set about combing his crown of short bristly hair. He laughed louder and spat heartily. I slipped my arm round his shoulders and placed the view-finder of my camera against his good eye. He groaned and hopped from one foot to another, and I pressed the release. Then he laughed again and allowed himself to be photographed but he would not allow me to take pictures of the women until we had made further gifts of knives.

In the missionaries' hut, which was identical with the others, we saw the beginnings of the first Waïka dictionary. While we were there a native came up and led me to a hut where his wife was suckling a few-week's-old baby. The baby's two-year-old brother was playing in the dust with two mangy dogs as thin as a skeleton and of no recognizable breed. The child's body was covered with scabs about the size of threepenny bits. Quite obviously the father expected me to do something about the affliction, and I made up my mind to give Barker some tubes of sulphonamide. Barker told me that infant mortality was high among the Waïkas, adding that he had never known a child to be born or to die within the village enclosure. Since the sojourns of these people within the village were invariably brief, birth and death invariably occurred in the course of their peregrinations.

The men and youths all had deep scars on their scalps, made the more conspicuous by their shaven crowns. In answer to our inquiries we were told in gestures that these came from some sort of stick or club, but whether in battle or ritual, we could not discover. (The following year King Leopoid II's expedition to the same area saw similar long head-scars among Waïka women.)

YANOMAMO WARFARE, SOCIAL ORGANIZATION AND MARRIAGE ALLIANCES

By Napoleon Alphonseau Chagnon

121 The purpose of this analysis is to show that the large discrepancy (over 50%) between ideal marriage rules and actual marriage practice among the Yąnomamö Indians of Southern Venezuela is necessitated by the politico-military milieu within which marriages are contracted. The data
• 114 covered in this thesis were collected from November 1964 through February 1966 during which time the author lived with these Indians. Inter-village warfare was chronic while the
124 field work was conducted. All the data were obtained from the Yąnomamö in their language.

162 Census data on five Yąnomamö villages are presented
847 to show that the male/female sex ratio is high. The shortage
595 of women, initially caused by female infanticide, is compli-
834 cated further by the practice of polygyny and coitus taboos
721 and is shown to be the basis of both internal and inter-
182 village fighting. Detailed historical data on village movements and warfare, collected from native informants and amplified by case materials on specific events that the author witnessed, are given to demonstrate the correlation of warfare to the shortage of women.

* 621 The imbalanced sex ratio is also shown to be the
613 basis of competition between co-residential patrilineal
578 descent groups, and how the members of these ally themselves
562 to other, patrilineal, local descent groups in order to maximize the number of women to which each group's members have access. When intra-village feuding over women becomes particularly intense, larger villages are shown to fragment into smaller, independent villages whose initial composition resembles a dual organization of inter-marrying patrilineal
000 descent groups. Genealogical data in both sociological and

[Introductory, R ii]

[Introductory, P. iii]

Genealogical data in both sociological and biological form are given for one small village to demonstrate the dual organization tendency. Similar data on two other villages from which this sample village recently split are presented to show that affinal ties between local descent groups are structurally more stable than agnatic ties between such groups, and that these affinal ties hold local descent groups together when larger villages fragment, resulting in the break-up of lineages and the redistribution of their members into mutually hostile, independent villages.

The intensity and tactics of warfare are shown to determine in large measure both the size of the village and the political conditions that promote inter-village alliances based on marriage. Finally, the techniques of slash-and-burn horticulture are discussed to show how economic dependence on cultivated food promotes the establishment of political alliances based on marriage exchanges and determines the direction of movement of relocated villages.

Three conclusions are drawn from the analysis. First, the frequency of intra-village fighting and inter-village warfare co-varies with the frequency with which males may legitimately satisfy sexual desires; anything that increases female/male ratio or the sexual activity of females reduces feuding. Second, the degree to which marriage practice conforms to marriage rules is predictable once the conditions of warfare are specified. When warfare is chronic, alliances between historically unrelated villages require a breach of marriage rules when women pass between these groups. Comparative data on Brazilian Yąnomamö social organization are given to support these conclusions. Third, the data bearing on Yąnomamö social organization support E. R. Leach's contention that the political and economic contexts within which marriages take place must be considered as part of the ongoing social organization and must be included in analyses of the latter. By so doing, the analysis shows that integration between Yąnomamö lineal descent corporations does not necessarily derive from inherent properties cognatic kinship as argued by Meyer Fortes.

ACKNOWLEDGMENTS[1]

OOO I am indebted to a number of the faculty members of the Anthropology Department for their guidance, counsel and personal attention during the course of my undergraduate and graduate program. In particular, I wish to express my gratitude to Professors Mervin J. Meggitt, Marshall D. Sahlins, Elman R. Service, Leslie A. White, and Eric R. [redacted] all they have done to assist me in planning and carrying out my curriculum and field work. Whatever may prove to be of worth in this dissertation derives ultimately from the training I received from them.

I owe special thanks to Dr. Robert L. Carneiro and Dr. Gertrude E. Dole for assisting me in particular phases of my field preparations and for the innumerable personal kindnesses they showed me before, during and after my field work among the Yanomamö.

• 114 122 During the seventeen months I spent in Venezuela planning and conducting my field work, a large number of people rendered me invaluable assistance. I wish to express my gratitude to the Staff of the Venezuelan Air Force Transport Group No. 6 for transporting me and my equipment into

[122] [1]This investigation was supported in part by a Public Health Service Predoctoral Fellowship F1 MH-25, 052, and an attached Research Grant NH 10575-01 BEH R04 from the National Institute of Mental Health.

114 and out of the Federal Territory of Amazonas, and to
122 Commander Dr. David Capriles of the Medical Section for assisting me in making these arrangements. I also wish to thank Dr. Armando Caballín T. of the Amazonas District of the Venezuelan Malaria Control Service (Malarialogía) for generously placing the facilities of that organization at my disposal, and for arranging the purchase and transportation of many of my supplies.

I am personally indebted to Dr. Marcel Roche, Director of the Venezuelan Institute of Scientific Research (I.V.I.C.), and to Dr. Miguel Layrisse, Chairman of the Physiopathology Department of that institute, for their cooperation in and assistance to my field work.

122 A number of Missionaries gave me invaluable assistance in the Yąnomamö language and generously placed the resources of their missions at my disposal. I particularly wish to thank Mr. James P. Barker and Mr. Cecil Neese of the New Tribes Mission, and Padre Luiz Cocco and Padre José Berno of the Salesian Mission for their generous aid.

116 I thank Kąobäwä, headman of Upper Bisaasi-tedi, for
126 his assistance and cooperation in the collection of some of the genealogical data; without his aid my data would have serious gaps.

I wish to thank Dr. James V. Neel, Chairman of the Department of Human Genetics at the University of Michigan, for encouraging and personally supporting my field work, and for generously making departmental office space available

124 omissions in ascending generations. The genealogies of
128 individuals from other villages were easier to collect, particularly if my informants had grudges against the members of those villages, but I employed the same techniques in these cases as well.

124 After I had established the genealogical relationships, I visited the various villages to make estimates of the ages of the individuals, as well as to collect other
124 kinds of information. This was always a touchy business, as
123 the Yąnomamö resent being called by their names, particularly
551 older and more influential individuals. Occasionally I would
554 say the name of an individual who had recently been killed in
769 a raid; this always resulted in an unpleasant and possibly dangerous situation, as most of them were unable to understand why a complete stranger should want to possess such knowledge unless it were for harmful magical purposes. My guides were constantly reminding me not to mention the names of dead people of the villages I visited and of the disastrous consequences that would follow should I fail to heed this advice.

124 In short, the collection of the genealogies was an unpleasant, full-time task and left very little time for intensive study of other aspects of Yąnomamö culture.

114 The two monographs dealing with the Yąnomamö mentioned above are quite superficial in their treatment of social organization; to date no intensive analysis of Yąnomamö social organization has been attempted using data

similar to that presented here, and I regard my own efforts in this area as supplemental to the generally excellent ethnographic work of Zerries (1964) and Schuster (1958). Without genealogical data it is not possible to estimate the degree to which marriage practices deviate from stated preference, nor to grasp the importance of these deviant cases in Yąnomamö politics.

The histories of the five villages are equally important, as they illustrate the role of warfare in determining settlement pattern, the development of political ties between villages, and the process of village splitting. These factors provide the matrix within which the genealogical data become meaningful.

Piecing together the history of these groups of villages proved to be a difficult task. The geographical area under discussion is unexplored and unmapped. Not even major rivers are accurately known in their upper courses, so that of two published versions of the Siapa River I have had to choose the one most consistent with the account given to me by the Indians. The major problem in this regard has been the identification of a large river known to the Yąnomamö as the Shukumöna-u, whose headwaters lie near the source of the Orinoco River. According to my Yąnomamö informants (people who have either lived on this river or have visited or raided villages located on it), the Shukumöna-u, in its middle course, is nearly as large as the Orinoco at its junction with the Mavaca River. It flows in a westerly

direction, and lies between the Mavaca River and a series of mountains. At a few points the Shukumõna-u may be reached from the Mavaca tributaries in less than a day's walk.

Early maps of Venezuela show the Siapa River extending nearly to the headwaters of the Orinoco River, as the Indians claim the Shukumõna-u does, and lying between the Mavaca River and the mountains that separate Brazil from Venezuela. I have therefore used a 1936 edition of a map published by the Venezuelan National Cartographic Office for the course of the Siapa River, which I take to be the Shukumõna-u of the Yąnomamõ. I have used more recent maps, also obtained from the same office, for the course of the Orinoco, and have drawn the Mavaca River from information I obtained from the Indians and my own exploration of this river up to the village of Iwahikoroba-tedi, which I unsuccessfully attempted to contact in September of 1965. Maps B and C, pp. 54 and 148, are based on these sources.

In reconstructing the history of the village movements, particularly in locating old habitation sites, I have relied on a few well-known geographical landmarks along the Orinoco River. Specifically, two large rapids have guided me; Penascal, above Ruemi-u (Shuwimõwi-bora in Yąnomamõ) and Raudal Guaharibo (Karãbã-bora in Yąnomamõ) near the present village of Kashorawã-tedi.

I employed three sources of information to locate present villages. First, my own knowledge for those villages I personally visited. Second, information from James P.

175 Karawatari's village.
648
[726] The raiders attacked the foreigners at dawn but were driven off by gunfire; a number of the Indians were killed, among them a man called Hokohenawä, and some of the foreigners were allegedly hit with arrows. The Indians managed to capture a young girl, taking her back to Karawatari's village on the Shukumöna-u. Shortly after arriving at Karawatari's village, the abductors were in turn raided by another Shamatari village, then on the Upper Mavaca River under the leadership of Matakuwä, one of the two "original" Shamatari men. Karawatari's group had split from Matakuwä's group and was on hostile terms with it. The girl was taken by Matakuwä's men on this raid and brought to the Mavaca River. Matakuwä's village was on a branch of the Mavaca River called Kedebaböwei-u when Nabäyoma was abducted from Karawatari's
• [114] group. Zerries (1964:14) gives 1934 as the date of the abduction of Nabäyoma, whereas Seitz (1963:21) places it a little earlier.

[593] In Matakuwä's village, Nabäyoma was given to Yoyonahi's
[952] son; he shot her with a barbed arrow for disobeying him and the girl fled into the woods to nurse her wound. At this time Matakuwä's group was on friendly terms with the residents of Patanowä-täka (who are now living in three distinct villages and constitute the groups from whom most of my data were
* [28] taken). On one of their visits, the residents of Patanowä-
[594] täka found Nabäyoma in the woods outside Matakuwä's village and took her home with them when they left after visiting.

what happened. The later descriptions obtained from much older informants were virtually identical with those I originally recorded from the younger informants. I believe, accordingly, that the accounts of the time period antecedent to the life-span of even my oldest informants are accurate in so far as their major features are concerned.

That the histories are filled with treachery, great violence, and much bloodshed will be apparent. The nature of Yąnomamö warfare, however, has not changed. It was being conducted as vigorously and in similar ways in 1964-1966 while I conducted my field-work.

CHAPTER I

YąNOMAMÖ CULTURE AND EARLIER ANTHROPOLOGICAL WORK[1]

101

A. Yąnomamö Culture

The Yąnomamö are discussed in the literature under such tribal designations as Guaica, Waika, Guaharibo, Maku, Sohiriana, Xiriana, Kirischana, Shidishana, Shamatari, Sanema, and Yanoama. Most of the terms are derogatory names applied to the Yąnomamö by their neighbors and characterize the people as being monkey-like or as savages.[2]

[114] In the upper Orinoco and the Mavaca basin where I conducted my field work, the Indians referred to themselves as Yąnomamö, which at once defines their mode of life, language, origin, and includes all people who share this mode of life, language and origin. All non-Yąnomamö are collectively

---

[114] [1]As there are very few reliable English sources describing Yąnomamö social organization and culture, I give a brief description of them here. The best source in English to date is Zerries' 1955 publication, but it deals only with particular traits of Yąnomamö culture.

[128] [94] [104] [2]The word Yąnomamö is nasalized on every syllable, but for ease of typing this manuscript, I have not indicated all the nasalization. The vowel /-ą-/ is written /-ö-/. I have written the /- ə -/ as "-ë-" and have indicated nasalization by /-,-/; whenever a Yąnomamö word has one nasalized syllable, all syllables in that word are nasalized.

101 Zerries (1964:19) has included the groups I studied in the Shamatari classification on the basis of information taken from Mahekodotedi informants. The members of these groups, however, deny the Shamatari identity and distinguish themselves from their southern neighbors, some of whom visit them regularly and are married into their villages.

101 361 [103] [951] The Shamatari,[1] according to my Bisaasi-tedi informants, take their name from one of the headmen, Kayabawë ("big tree"), who lived north of the Orinoco River in a village then [951] called Shǐhowë-tedi. Kayabawë was an unusually corpulent man and bore a second name, Shamatari, derived from their word (Shama) for the tapir, a large ungulate found throughout [103] tropical South America. Shamatari, when Shǐhowë-tedi split, led his faction south of the Orinoco River and settled in the headwaters of the river known to the Yąnomamö as the Shukumöna-u (see above), where his village became known as Mokayëaba-tedi. Other villages, related to Shǐowë-tedi, moved into the Shukumöna River and Havaca River basins after Shamatari's village was established, ultimately spreading as far southwest as the Cauabury headwaters in Brazil. The 101 [174] Shamatari expansion into this area took place around the turn of the century, according to my reconstruction of Shamatari history (see below). This is also supported by meagre

---

[1] There is another "Shamatari" group in the tributaries of the Upper Parima River of Brazil; these are not to be confused with the Shamatari under discussion here, although both groups are Yąnomamö. See Vinci, 1959, for an impressionistic account of his brief contact with the Parima Shamatari.

101 The term Waika or Guaica is used in much the same way as the term Shamatari, i.e., in reference to a geographical bloc of villages that have a common history. I have no knowledge concerning the origin of the term except its etymological derivation from the verb waikaõ: "to kill something that is already wounded," "to finish off an animal that is dying."[1]

The term Waika, or variants of it (Guaica, Uaica), has been in the literature the longest, appearing in Caulin's 1779 work. Zerries has adopted its usage, along with the term Schiriana, to refer to the entire Yąnomamõ group; ironically, members of the village in which he conducted his field work, Mahekodo-tedi, denied to me that they were Waika, explaining that the Waika lived further up the Orinoco River and inland.

Insofar as designations more precise than Yąnomamõ are required, the Indians themselves simply use their village names. The terms Shamatari and Waika do not refer to political entities, and the boundaries of the geographical zones including so-called Waika or Shamatari villages are difficult to fix. Only the members of those villages that are related historically to Kayabawã's group are properly designated as Shamatari. All of the Indians of this large area, however, regard themselves as Yąnomamõ, no matter what others call them, and I adopt this term to refer to the entire group.

000 Numerically, the Yąnomamõ are one of the largest

[114]

[1]Zerries, 1964:3, gives the same derivation for the term.

Numerically, the Yąnomamö[33] are one of the largest unacculturated tribes in South America, having a total population that approaches 10,000 in both Venezuela and Brazil. Most Yąnomamö live in Venezuela, occupying the area drained by the upper Orinoco, Mavaca, Manaviche, Ocamo, Padamo and Ventuari Rivers in the state of Amazonas, and the headwaters of the Caura and Paragua rivers of Estado Bolivar. In several drainages (Paragua, Caura, Ventuari and Padamo) the Yąnomamö are in contact with other tribes speaking Carib languages (Makiritare and Arekuna or Taulipang), from whom the Yąnomamö have traditionally obtained steel tools in trade and from whom a number of culture traits have been borrowed. Zerries has painstakingly analyzed these traits in his 1964 work.

No systematic census has been made of the entire Yąnomamö language family, although James P. Barker was commissioned by the Venezuelan Government to compile a census of the Yąnomamö occupying the Amazonas territory of that country. By both actual head-count and estimates of village size for groups that topography prevented him from visiting, Barker presently estimates the Venezuelan Amazonas Yąnomamö population to be well over 7,000.[1]

The population in Amazonas is distributed in some 80 to 100 villages, averaging between 60 and 100 people per village.[2] Villages occasionally contain as few as 40 people

[1] Personal communication. See Zerries (1964:5) for a discussion of Yąnomamö population size. He concludes that the Yąnomamö are ". . . the largest yet unacculturated aboriginal group in tropical South America." (Ibid. My translation.)

[2] The relationship to warfare tactics and village size is discussed in detail in Chapter 4.

[622 [554] women. During relatively peaceful times headmen are hardly more than equals among their followers and their ability to command respect and issue orders diminishes accordingly. [622] Political commitments to aid other villages in raiding, however, usually precludes long periods of peace and, should a village fail in such an obligation, its allies quickly turn on it and force it to participate. Thus, political circumstances are continually forcing villages into situations that require leadership.

• 114

B. Anthropological Work On the Yąnomamö

So far four anthropological expeditions have had an opportunity to study Yąnomamö groups, but only two of these spent an adequate amount of time in the field to collect data that substantially increase our knowledge of Yąnomamö culture. I refer to the expeditions of the Frobenius Institute in 1954-55 which brought Otto Zerries and Meinhard Schuster to the village of Mahekodo-tedi for some 10 months, and the expedition of Hans Becher in 1955-56 to the upper Demini River in Brazil, where he studied two villages for 9 months. The expeditions of Koch-Grünberg in 1911-12 and Johannes Wilbert in 1958 and 1960 made only brief contacts with Yąnomamö.

The results of Koch-Grünberg's contact with two groups of Yąnomamö are summarized in his Von Rorima zum Orinoco. He met two "hordes" of "Schiriana" in 1911 on the upper Uraricuera (Parima) River of Brazil. One group, whose

114 village was on the upper Uraricaparú, a left tributary of the Uraricuera, visited his camp on the Purumamó Rapids of the Uraricuera.[1] The second group, which he met about a month later, was settled on a small stream (Motomotó) off the Parima River near the Marutani Mountains. The latter group fled shortly after he contacted them; they feared the photographic equipment and firearms carried by the members of the expedition. Most of Koch-Grünberg's material comes from his contact with the first group and is limited to brief descriptions of physical type, material culture, house styles, body decorations, and a short vocabulary of the language (1923: 300ff; 1928). He was the first to conclude that the Guaica, Kirishana, Guaharibo, and Schiriana were in all probability the same group:

> We can admit with great probability that the Guaharibo are very closely related to, if not the same tribe as, the Schirianá of the Uraricuéra, just as the Waikas of the Parima Mountains may not be a group distinct from the tribe bearing that same name on the upper Uraricuéra. (My translation. 1923:299. See also pp. 290, 291 and his 1922 work, p. 225.)

As significant as this accurate conclusion in the development of Yanomamö ethnography is his inaccurate vignette of the economy and settlement pattern of this large group:

> In view of entire culture content (Habitus) I should like to consider the Schirianá and Waika as an extremely old population layer of these areas that, similar to the more primitive Makú of the Rio Negro area, is found scattered in small, mutually hostile bands having no fixed habitation site in the headwaters of the upper Uraricuéra tributaries and beyond to the upper Orinoco, and lives only on hunting,

---

[1] This is the group studied more recently by Migliazza, 1964.

10:Chagnon E-4.5 (1964-1966) 1967 SQ18 Yanoama SQ18

• 114 fishing and collecting forest fruits. (1923: 299-300. My translation. See also 1922:226.)

His assertion that the Yąnomamö lived only on hunting, fishing, and collecting wild forest fruit was unsupported not only by the existing accounts but also by his own observations; and it has never been verified by any field worker who has spent more than a few days with the Yąnomamö.[1] Nor was the conclusion warranted that the Yąnomamö had no fixed habitation sites; Koch-Grünberg was visited by one of the groups and the other had a garden site a short distance from where he met them. Finally, the antiquity of the group as a "population layer" is something that can only be speculated about at best; indeed, the concept 'population layer' is itself an analytic construct presupposing a considerable amount of knowledge concerning tribal distributions over a period of time which, at least for this area, is entirely lacking.

The expedition of the Frobenius Institute in 1954-55 conducted the first anthropological inquiry in this area that concentrated exclusively on the study of the Yąnomamö. The members of the expedition, Otto Zerries and his assistant, Meinhard Schuster, spent 10 months in the village of Mahekodotedi. They selected the Yąnomamö because of their interest in hunters and gatherers; the literature, especially the work of Koch-Grünberg, described the Yąnomamö as such. They

---

[1] "It is surprising to notice, that the Waica, formerly reported as a hunting and gathering tribe by visitors who had only superficial contact with them, are actually horticulturists." (Zerries, 1955:78.)

114 initiated their work among this group, in Zerries' words, ". . . to come a step closer to the problem of the world's oldest cultural layer of the hunter and collector."[1] On arriving at Mahekodo-tedi, however, Zerries was surprised to discover that the Yąnomamö were not in fact hunters and gatherers, but horticulturists:

> To our great surprise we were obliged to conclude right from the start of our investigations that the Waika are above all dependent on the cultivation of the plantain (platano) to a considerable degree. (1958:177. My translation.)

114 194 224 222 241 Although Zerries acknowledges the current horticultural status of the Yąnomamö, his work is frequently characterized by attempts to portray the Yąnomamö as hunting and gathering people who have only recently adopted cultivation and are still in transition from a pure hunting and gathering stage to a purely horticultural one. Thus, Zerries argues that the Yąnomamö divide their year into seasons fixed by the ripening of individual species of wild fruits (which I have not been able to verify), implies that peach palm (pijiguao) was recently a collected rather than a cultivated fruit, describes the Yąnomamö settlement pattern and annual cycle as half-nomadic or semi-nomadic, and generally emphasizes the role of hunting and collecting in determining the cultural status of the Yąnomamö in South American culture history, all of which detract, I believe, from an understanding of their culture as it exists at the present time and probably has

---

[1] 1964:1. My translation.

existed for the past several hundred years. At many points the data used by Zerries to infer that they were until recently hunters and gatherers lend themselves to other interpretations:

> Finally, the Waika connect the general word for food, "ni," with the word for archery, "niai," out of which results that in their conceptual world, subsistence itself in the last analysis results from hunting--which is symptomatic of the way of life of the hunting and gathering heritage of the Waika. (1958:180. My translation.)

The word nii (not ni) usually refers to vegetable food, most of which is cultivated by the Yąnomamö and generally does not include meat. The word for the latter, yąro, conversely, does not apply to vegetable food. Again, there are two words to describe hunger; ohi refers to that kind of hunger that can be satisfied by eating vegetable food, whereas naiiki is a kind of hunger that can only be satisfied by eating meat or fish. And, it is possible for individuals not to be ohi but be naiiki. One could easily argue that subsistence and cultivation are intimately linked, as their word for one form of hunger (ohi) is similar to their word for taro: ohina. The similarity, then, between the word for archery (niaö) and vegetable food (nii, not ni) tells us nothing about the cultural status of the Yąnomamö either in the past or at the present.

In general, Zerries' data are excellent and his conclusions sound; and his major work (1964) will remain the basic ethnographic source on the Yąnomamö for many years.

The Frobenius Expedition was followed by the work of

114 Hans Becher, who conducted field work in two Yąnomamö villages on the upper Demini and the Aracá rivers (Pakidái and Surára) from October 1955 to June 1956. His results are summarized in his 1960 monograph, a general description of all aspects of Yąnomamö culture.

114 619 His analysis of Yąnomamö social organization is inadequate and misleading, particularly his treatment of the political organization about which he asserts that the Yąnomamö are divided into two large, antagonistic political blocs:

> The suggestion of the Surára headman is significant in this connection, according to which there are, within the Yanonámi People, two powerful tribes that constantly make war upon each other; first, the Xiriána, whose name for themselves is "Harateri," and, secondly, the Waikâ. All of the smaller tribes are on the side of one or the other, but are at the same time liable to them for tribute and war duty. (1960:6. See also p. 73 and his 1957a:119 and 1957b:115 comments. Zerries [1964:1] expresses his dissatisfaction with this interpretation also. My translation.)

114 In 1958 and 1960 Johannes Wilbert briefly visited Yąnomamö (Sanema) villages in the upper Ventuari River and upper Caura River, summarizing his results in his 1963 publication.

Although Wilbert regards the villages he visited as representative of the Yąnomamö villages described in the works of Zerries and Becher, his reports are somewhat at variance with the accounts of the latter, particularly with respect to economy and aspects of social organization. On these topics Wilbert tends to accept Koch-Grünberg's state-

114 ments rather uncritically, largely because they support his own theory that 'Paleo-Indian' culture, Chibchan language, and low Diego gene frequency are correlated in South America. In treating Yąnomamö economy as 'Paleo-Indian' in nature, Wilbert ignores the only data based on field work bearing on Yąnomamö economic life--that reported by Zerries and Becher in the two monographs mentioned above.

Again, it is difficult to determine when Wilbert is reporting facts, when he is making theoretical conclusions, or when he is guessing. This is particularly true of his 114 601 comments on social organization and data relevant to analyzing it:

> We did not succeed, for lack of an informant, in obtaining a list of kinship terms. Our impression is that it would be an Hawaiian System. (1963:211. My translation. [His statements in other publications are quite emphatic on this point: "The kinship system is of the Hawaiian type." Layrisse, Layrisse, and Wilbert, 1962:82.])

The kinship terminology of the groups in the area visited by Wilbert is bifurcate-merging (Iroquois) in type (Migliazza, 1964), as it is in the upper Orinoco area.[1]

114 In addition to the field work conducted by these ethnologists, numerous travelers, adventurers, botanists,

---

[1]Migliazza's publication was not available to Wilbert when the latter concluded that the Yąnomamö have an Hawaiian kinship terminology. A part of the discrepancy between Wilbert's data and that reported by Zerries (1964) and Becher (1960) stems from the fact that Wilbert's Sanema differ appreciably from the more southerly Yąnomamö groups. Wilbert, however, intends his generalizations on the Sanema to apply to all the Yąnomamö. I might point out that my own analysis applies to the Upper Orinoco and Mavaca River Yąnomamö. See Conclusions, Chapter 6.

• 114 geographers and explorers have from time to time passed through or near the Yąnomamö area. Their observations have not materially increased our knowledge or understanding of Yąnomamö culture except, in a few instances, in a geographic-distributional sense. Koch-Grünberg (1922) and Otto Zerries (1964:7 ff.) have summarized the results. Finally, a number of missionaries or linguists employed by missions have made significant contributions to Yąnomamö ethnography. Of major importance are the works of James P. Barker (1953, 1959) and Ernesto Migliazza (1964, Migliazza and Grimes, 1961).

CHAPTER II

THE DEMOGRAPHIC BASIS OF WARFARE, POLITICAL ALLIANCE, AND SETTLEMENT DYNAMICS[1]

A. The Shortage of Women and Feuding

As outlined in the Introduction, the shortage of women among the Yąnomamö has far-reaching consequences in almost every aspect of their social organization. In this chapter I will establish the general functional relationship between this demographic fact and the dynamics of village feuding, village splitting, and village re-location. These phenomena will be discussed in more detail in later chapters, particularly with reference to the kinship system.

The Yąnomamö practice male and female infanticide. There are a number of reasons accounting for this practice. First, young couples do not relish the prospect of a long period of celibacy that pregnancy and lactation taboos impose on them. From the time a woman discovers she is pregnant until the time she weans her child, she is not allowed to have sexual relations. The time period involved varies from

[TEXT CONTINUED ON PAGE 55]

[1]The data discussed in this and subsequent chapters are drawn from the 5 villages, listed in Table 1, in which I spent most of my time. The historical and genealogical relationships of these villages are given later in the text. My generalizations on Yąnomamö culture and social organization are applicable to those groups occupying the Upper Orinoco and the Mavaca River basis. (See Map B, next page.)

847 [848] child: he had scrupulously observed the coitus taboo during lactation--the wife had not.

Most cases of infanticide take place when a couple already has a small child. Sickness takes a heavy toll during the early months of a child's life, and women are reluctant to jeopardize a child that has already survived the first two years. So, they frequently kill the new-born so that their older child will have no competition for milk. Bahimi, a woman of some 30 years, killed a new male baby shortly after I started my fieldwork in Bisassi-tedi. She explained, tearfully, that she did not feel that she could successfully raise the new child because she still had a son that was nursing.

847 562 162 These cases do not, however, explain why there is a consistent bias to kill females rather than males. When I discovered how significantly the sex ratio diverged from the expected value of 1.0 in some villages, I tried to get an explanation from the Yąnomamö. I was surprised to find out that they were ignorant of their own bias in killing children. [842] What did come to light, however, was the fact that Yąnomamö prefer to have a male baby for their first child and, if it turns out that the first child is a girl, they will frequently kill her. If, however, a couple prefers to have a girl and the first child is a boy, they generally do not kill the boy.[1]

[114] [582] [1]Whatever the reason may be for the preference toward males as eldest children, there is one structural effect that deserves further enquiry. Rose (1960) effectively showed that where males tend to marry females that are younger than them-

847 562 162 Several kinds of demographic data suggest that the rate of female infanticide is high. Table 1 gives the sex ratios of five Yąnomamö villages. The sex ratio for the total population sample (576 individuals) gives a more meaningful estimate of the rate of female infanticide, as there is considerable variation by village in the value of the sex ratio. The excess of males in the total population (8%) gives a first 562 approximation of the frequency of female infanticide. The 162 variation in the sex ratio by the village, on the other hand, 628 expresses the political relationships of the villages to 722 their allies. That is, the distribution of women in these [583] five villages is a function of the military requirements of the particular villages in the marriage alliance network. Thus, the cline in sex ratio from Reyabobŏwei-tedi to Bisaasi-tedi (ignoring the Patanowŏ-tedi, who are not allied to the other groups) reflects a dominance gradient in politico- 125 military requirements of each village. The total sample of 847 576 individuals must be considered in order to estimate the 162 628 frequency of female infanticide among the Yąnomamö, but the 562 political relationships between the villages must be understood to account for the variation by village of the value

[TEXT CONTINUED ON PAGE 69]

847 562 162 114 982 selves, it is highly unlikely that men will marry a FaSiDa, despite the kinship terminology. Rose did not, however, consider the possibility that sibships may have a systematic bias in their composition; if males tend to be older than their sisters considering all sibships, the probability that a FaSiDa is of marriageable age is increased. I specifically questioned the relationship between female infanticide and FaSiDa marriage, and the Yąnomamö denied any correlation between the two practices. There can be no doubt, however, that the occurrence of FaSiDa marriage among the Yąnomamö is made more probable by female infanticide.

avoid the raids from the PatanowÃ-tedi, the man in question used this opportunity to have an affair with KonoreiwÃ's wife, presuming that he would not be discovered because the village was filled with people. He was discovered, despite his discretion, and challenged to a duel by KonoreiwÃ. The entire village participated in the club fight. KonoreiwÃ punished his wife by hitting her in the mouth with a glowing fire brand, severely burning her lips.

Finally, and most drastically, the woman shortage is remedied by raiding other villages to abduct women. This, however, is war. The ever-present possibility of this occurring, however, is a constant threat to the stability of political alliances, for allies occasionally turn on each other with the intent of seizing females. It is largely for this reason that allies cede women to each other peacefully by contracting marriage alliances. In November 1964 the PatanowÃ-tedi arrived at Bisaasi-tedi to participate in a feast. This was the first time the groups had gathered as groups since they separated from each other on hostile terms in ca. 1944. They intended to make peace at this feast, but a party of men from Monou-tedi, a village that also formed part of the group before the 1944 split, arrived uninvited and abducted seven women from the PatanowÃ-tedi. This ultimately provoked a war between the PatanowÃ-tedi and Monou-tedi, and determined the settlement pattern of both groups, as well as their political activities, all during my field work. The war was still being actively prosecuted when I

726 left the field in February 1966, and had by that time in-
114 volved the Bisaasi-tedi.

B. The Effects of Warfare On Settlement Pattern and Economic Practices[1]

*621 628 837 578 721 [241] When feuds, usually over women, can not be resolved peacefully, club fights between the supporters of the woman's lover and husband develop, leading to village splits and the establishment of mutually hostile, independent villages. The timing of the split, however, is determined by the nature of Yąnomamö agriculture: unless a large village has two gardens separated by a considerable distance, the factions in the feud can not separate to form independent villages.

*628 726 722 241 361 The situation is similar with respect to inter-village warfare and village movement. The Yąnomamö depend to such an extent on their cultivated foods that their pattern of warfare necessitates the formation of political alliances with other groups. Occasionally members of a village find themselves in a situation where they have no choice except to move into the village of an ally and depend on the produce of the latter's garden. For the most part, the Yąnomamö attempt to avoid

---

[241] [361] [191] [128] [1] Yąnomamö economy deserves intensive treatment, as certain groups of Yąnomamö practice 'pioneering' slash-and-burn cultivation, i.e., are moving into unoccupied territory. In this, they exhibit some interesting parallels to, and differences from, the Iban of Sarawak (Freeman, 1955. See also Carneiro, 1956 and Conklin, 1961 on shifting cultivation). For the purposes of this dissertation, however, I am concerned only with the general limitations that Yąnomamö economic practices impose on settlement pattern and how these practices affect Yąnomamö social organization.

these situations[1] by establishing new gardens as new wars develop; occasionally, however, the wars take on unpredictable intensity before new gardens can be established, and the members of the villages concerned necessarily seek refuge with their allies.

To the Yąnomamö, gardens (hikari) are the fount of subsistence. They acknowledge the relationship between chronic warfare and village relocation by being constantly on the lookout for new lands to settle. Men are always discussing the agricultural merits of the forested areas in which they hunt, and most new sites are selected on the basis of information collected by hunters. Thus, when the Namowei-tedi split up at Patanowä-tëka, the Bisaasi-tedi faction moved to Shįhota, an area they knew well because they customarily hunted there.[2] In 1965 the Monou-tedi cleared a new garden at Moyanabŏwei for the same reason. I accompanied hunting parties from Bisaasi-tedi on several occastions to new areas not normally frequented by these hunters, and the topic of agriculture invariably came up during the evening résumé of the day's experiences.

Other factors besides density of jungle, type of floral association, and general topography are considered by

[1]They avoid these situations because the hosts usually demand either sexual access to the women of the refugees, or wives for their bachelors. The refugees, of course, are reluctant to do either, but are frequently obliged to do both. The cost of the alliance, once again, is measured in terms of women lost.

[2]See Map C, and Chapter 5.

*628 361 241 the Yąnomamö when they make new gardens. The relative location of friendly and hostile villages with respect to the new site is very important. The Monou-tedi moved west in 1965, clearing their new site in the direction away from their major enemies, the Patanowë-tedi. Their allies, the Mǫmaribǫwei-tedi and the Reyabobǫwei-tedi, lived to their west. Furthermore, their old enemies, the Mǫwëraoba-tedi and Iwahikoroba-tedi, lived to their southeast, a direction the Monou-tedi wished to avoid. Finally, by moving to the west, the Monou-tedi crossed a large river (Mavaca), a natural barrier that would interfere with the retreat of raiding parties that initiated in the east.

361 241 245 Another factor influences the choice of site when the members of a village must abandon their existing garden: the location of a previously cultivated site. Old gardens are desirable sites because they continue to produce peach palm long after they are deserted. As the fruit of this palm seasonally provides an important and desirable addition to the diet of the Yąnomamö, they prefer to move into an old garden rather than start a new peach palm grove from seedlings. The Yąnomamö frequently return to their old, abandoned sites in order to harvest the peach palm crop. This is usually a dangerous undertaking, as their old enemies are also aware of the fruit, and exploit it themselves. In February 1965 I accompanied a group of Bisaasi-tedi men to Barawë-tëka,[1]

361 241 245 • 114 +628

[1]See Map C, and Chapter 5.

abandoned in about 1959, to harvest the peach palm of that garden. We approached the site with great caution lest we run into a group of Patanowä-tedi. We discovered that somebody, probably the Patanowä-tedi, had beaten us to the garden and harvested the fruit.

During 1965 raids were so intense on the Patanowä-tedi that they were forced to abandon their site at Patanowä-tëka. The Bisaasi-tedi and the Monou-tedi predicted that the Patanowä-tedi would make their new site at one of two possible locations: Shihota or Shamata, two abandoned gardens. Their predictions were right on both counts, for the Patanowä-tedi began utilizing both sites because peach palm was to be found at either. By occupying two sites, the Patanowä-tedi were also better able to avoid their enemies by moving frequently from one to the other.

The several variables to be considered in re-locating villages during especially hostile wars may be briefly summarized: (1) the members of a village will make their new garden site in a direction away from their major enemy; (2) if the members of a village have allies, they tend to make their new garden in the direction of these allies, provided that the direction brings them no closer to their enemies; (3) if abandoned villages whose gardens contain producing groves of peach palm are to be found in a suitable direction from the old site, these will be the ideal choices for new garden sites.

The cultivation practices of the Monou-tedi in 1965

584 583 591 578 935 613 *621 627 affair with his wife. The parties in question armed themselves with sharpened clubs and faced each other in the center of the village, but actual fighting was averted. Despite the legitimacy of Rerebawë's claims, no one stepped forward to take his side in the feud, so he backed down. After this incident, Rerebawë threatened to kill Koima, but [602] the headman dissuaded him. Koima and her mother then fled to Monou-tedi and took refuge with kinsmen there, reducing the probability of Rerebawë shooting Koima. Her mother tried to coax her into abiding by the wishes of her kinsmen and go to Rerebawë, but she obstinately refused. She ultimately eloped with Bëkotawë, and the two of them fled to a distant village on the Padamo River. Rerebawë discovered where they had gone and attempted, unsuccessfully, to recover Koima. If she returns to Bisaasi-tedi she will be given to Rerebawë, who will have ample reason to thrash her soundly.

B. Yąnomamö Kinship[1]

602 The structural relationships between descent groups within Yąnomamö villages can be expressed in terms of dyadic kin ties. Considerable theoretical attention has been devoted to this analytical procedure in recent structural treatments

[1] Migliazza (1964) published a kinship diagram for the Uraricaa Yąnomamö. Although the terms differ from those current among the Upper Orinoco Yąnomamö, the pattern (Iroquois) is the same. I defer discussion of the complete kinship terminology to a later publication, as there are enough peculiarities in usage to warrant a more complete treatment than would be appropriate here.

[601] [114] [128]

602 of social organization,[1] and in analyses of particular societies.[2] It is not assumed here that the nature of the [114] social organization itself stems from the nature of the sentiments associated with particular dyadic kin ties, as was implied in Homans and Schneider's work (1955). Dyadic ties are a product of political, military, ideological and economic forces that shape Yąnomamö social organization, and reflect, rather than cause, that organization.

Of the large number of logically possible kinship dyads, only a few have structural relevance to this analysis. In particular, ties between agnates and ties between brothers-in-law must be considered to render intelligible the mechanics of Yąnomamö social organization.

602 Ties between distantly related agnates are the most
+621 ambiguous, and the ones that usually break when villages split.
578 Conversely, ties between closely related agnates are strong and less likely to be severed in village splits.

609 Of the affinal ties, those linking brothers-in-law to each other are of the greatest structural importance and are often stronger than ties between distantly related agnates.

606 Secondarily, ties between a man and his son-in-law are strong,
601 but have fewer structural consequences than either brother-in-law (shoriwë) or brother (aiwë, osheya) ties.

[128]

[1]Based on residents of Monou-tedi, Bisaasi-tedi, Patanowä-tedi, Mąmariböwei-tedi, and Reyaboböwei-tedi. I was not able to get age estimates on a number of individuals in Reyaboböwei-tedi and Patanowä-tedi, accounting for the difference in total population given in Table 5, Chapter IV. The sex ratio for the above population is 1.22, and male excess is 9.5%, compared to 1.19 and 8.35% in Table 5.

*62
70
72
[122]

effectiveness of the raiding party. As someone must stay home to guard the women, the guards usually come from the too young and too old. Usually, however, one or two '<u>waitedi</u>' (fierce ones), men who have a great deal of experience in warfare and who would bravely defend the village, also remain behind. Thus, a village of 100 people could, at best,

701 organize a raiding party of approximately 20 to 25 men.[1]

*[62] The smallest raiding party I saw during my field work comprised 10 men. This seems to be the lower limit to the size of an effective raiding party; most raiding parties are of the order of 35-40 men, although I have seen as many as 60 men leave on a raid.[2] There are several reasons why raiding parties require ten or more men. First, the Yanomamö are not brave warriors; in a party of 10 men, a significant fraction of them would rather remain in the village where it is safer, and these men always look for excuses to drop out of the raiding party before the party meets and joins the enemy. The usual excuses given are sickness or sore feet. Thus, even in small raiding parties there is considerable dissent among the men, particularly the younger ones. Such problems would be insurmountable if the party contained fewer than ten men, as even the most determined of the raiders would lose his enthusiasm by listening to the complaints and pessimistic comments of the more reluctant members of the raiding party. I accompanied one Monou-tedi raiding party a portion of the way to their objective; most of the younger men in the raiding party complained of having dysentery, malaria, or sore feet. I had promised to give them malaria

701 703 721

701 703 721 123 114

---

[1] This presumes that there are no sick or injured men in the village; there are always some.

*[628] [2] The larger raiding parties are always composite, involving the members of two or more villages.

701 pills before the raiding party left, but I forgot them.
703 This almost ended the raiding party, as the younger men
721 jumped on this as an excuse to stay home. The older men,
123 however, forced them into line and severly chastized them for
114 being cowardly.

701 Raiding tactics also require that approximately ten
721 men be included in the raiding party. The raiding party
725 usually splits into two or more groups when it approaches the village of the enemy. This increases the probability that the raid will be successful; two groups are more likely to confront individuals of the enemy village while at the same time splitting up reduces the possibility that the raiders will be accidentally discovered by the enemy. After the raiders shoot one or more of the enemy, they retreat in a standardized pattern. Groups of two men retreat a specified distance, their retreat being covered by two men who lie in ambush along the trail most likely to be taken by pursuers. The guarding pair then retreats, being covered by the first pair who lie in ambush. If the raiding party has separated into two groups, retreat tactics will necessitate at least 8 men.

721 The purpose of a raid is to kill one or more of the
727 enemy and retreat before being discovered. A raid is successful only if one or more of the enemy is killed and none of the raiders is wounded or killed. When a joint raiding party from Mahekodo-tedi and Bisaasi-tedi raided Riakowë's village in the early '50s to revenge the deaths of two

CHAPTER V

THE HISTORY OF FIVE YĄNOMAMÖ VILLAGES

I shall briefly outline in this chapter the history of the movements of Bisaasi-tedi, Moncu-tedi, Patanowë-tedi, Mąmaribŏwei-tedi and Reyabobŏwei-tedi, including those movements during the fifteen-month period (November 1964 through February 1966) covered by my field work. The historical data I collected on village movements enable me to discuss the village histories from about 1875 to the present.

The first three of the above-mentioned groups lived together at one time and the present residents of these villages are closely related. The last site they occupied as one village was called Namowei-tedi, and for sake of simplicity I adopt this name in the discussion of their movements up to that point in time. Similarly, the last two villages of the five mentioned above have a common history, being called Paruritawë-tedi immediately prior to their splitting in 1960.

I wish to make several points in the discussion that follows. The histories indicate (1) that villages move only when forced to do so by raids from other villages; (2) that villages are structurally unstable and tend to split into factions because of internal disputes; (3) that the newly-established cognate villages frequently enter into hostilities with each other; and (4) that it is necessary to know the

remained on good terms with each other. Their split occurred in 1954, perhaps a year earlier.

When I initiated my field work in 1964 Monou-tëka was still occupied, but its population, the Monou-tedi, was in the process of making a new garden (Moyanaböwei) west of Monou to avoid the raids of the Patanowë-tedi, with whom they had entered into a new war in 1964.

The faction that moved to Barawë remained at that site about five years. They moved to the mouth of the Mavaca River, taking the name Bisaasi-tedi, in 1959, splitting into two villages, each located on opposite banks of the Mavaca River. By 1958 the Venezuelan Government had initiated a malaria-control program in this area of Amazonas and had established a small field station at the mouth of the Mavaca River. Venezuelans associated with this field station invited the Barawë-tedi to move to the Mavaca River; the Indians accepted the invitation, hoping to gain access to steel tools. This was the beginning of contact with outsiders for the Kreiböwei-tedi; prior to 1959 the only foreigners they had known were the missionary at Mahekodo-tedi, James P. Barker, and the members of the Frobenius Institute Expedition, Meinhard Schuster and Otto Zerries, who they visited occasionally at Mahekodo-tedi.

Area 12: Bisaasi-tedi

The Bisaasi-tedi began friendly contacts with a Shamatari village, Pararitawë-tedi, after they moved to the mouth of the Mavaca River.

10:Chagnon E-4.5 (1964-1966) 1987 SQ18 Yanoama SQ18

628 583 Bisaasi-tedi are the dominant partners in the bride-exchange network with their Shamatari allies, a dominance that is reflected in the disproportionate number of women they have managed to coerçe out of their allies.

361 621 114 While I conducted my field work the Bisaasi-tedi lived in two villages on opposite banks of the Mavaca River. The group on the east bank was beginning to split by the time I left the field, and the split took place a few months later,[1] one of the factions moving to the north bank of the Orinoco River, but still within view of the other group.

B. The History of the Paruritawë-tedi

174 621 The Shamatari came into being as an identifiable group shortly before 1900. The Shamatari identity, as I have shown above (p. 28 ff.), is a function of the historical connections between the villages that split off from Shihowë-tedi's parental group, as well as geographical considerations.

My informants consistently spoke of two 'true' Shamatari men: Kayabawë (Shamatari) and Matakuwë. The villages of these two men have a common origin, but I was unable to get data on the nature of the events that led to the separation of these two groups. This event took place long before the life-span of my oldest informants, and none of them knew any details of the splitting. By 1875, however, there were two distinct Shamatari groups north of the Orinoco headwaters, one of which bore the name Shihowë-tedi. Kayabawë

195 101 861

[1] Personal communication, James P. Barker.

others. Matakuwä's group was being raided by Kayabawä's followers and by the splinter group that separated from Aramamisi-kähö. These raids forced Matakuwä and his followers to abandon Aramamisi-kähö and settle at Shirakoböwei. This move took place about 1900, perhaps a few years later.

Area 2: Shirakoböwei

Matakuwä's followers established several sites in this area, as they were harried by the raids from Kayabawä's followers. An internal village feud developed between the factions led respectively by Karehewä and Orakawä. During the fighting a young man from Karehewä's group was killed with a spear, and Karehewä moved to the Mavaca basin. Karehewä's followers raided the group at Shirakoböwei, and the latter reciprocated, forcing Karehewä to move further north. Karehewä's son, Riakowä, became headman of this village and played host to the 1950 treacherous feast in which the Kreiböwei-tedi lost a large number of men. This village is presently called Iwahikoroba-tedi, and is led by Riakowä's son, Börösöwä. In 1965 rumors reached the Bisaasi-tedi that Iwahikoroba-tedi had split into two factions, both moving down the Mavaca River. In September 1965 I attempted unsuccessfully to make the first contact with this group, but my guides forced me to turn back when we began seeing signr (bridges and trails) made by Börösöwä's group. They feared Börösöwä would kill us.

Another faction, led by Waiyahowä, split off from

[Paruritawä-tedi Group]

and move to Kakamoba. This site was occupied for just a few years, and by 1950 Sibarariwä's group was living at Amąrokobõ-wei: the 1950 treacherous feast for the Kreibõwei-tedi was conducted while Sibarariwä's group was here. After 1950 Sibarariwä's group fled south to avoid the raids of the survivors of that treacherous feast, establishing the garden of Dądamobõwei. This garden was abandoned because of raids mounted by the Paruritawä-tedi, and Sibarariwä returned to Amąrokobõwei about 1955. The Paruritawä-tedi eventually became friendly to Sibarariwä's group and were able to lure some of them, at the instigation of the Monou-tedi and Bisaasi-tedi, to a treacherous feast in 1960, during which three men were murdered and four women captured. In 1964 Sibarariwä's group moved to the headwaters of the Mavaca River, being known as the Mõwäraoba-tedi. Monou-tedi and Mąmaribõwei-tedi sent a raiding party against them at this location about the time I started my field work, and killed one man.

Area 6: Paruritawä-tedi

The Paruritawä-tedi made friendly contact with the Monou-tedi and the Bisaasi-tedi about 1960, and have entered into alliance with these groups. The Monou-tedi and the Bisaasi-tedi persuaded the Paruritawä-tedi to invite members of Sibarariwä's group to a feast in 1960 and, with the aid of the Paruritawä-tedi, murdered three men and seized four women. Sibarariwä's group avenged this by mounting raids

[Paruritawä-tedi Group]

against the Paruritawä-tedi, and the latter abandoned their site and moved north. When they abandoned Paruritawä-tedi, the group split into two factions, each making a separate garden: Mõmaribõwei and Reyabobõwei. The two factions are still on friendly terms with each other and both are allied to the Monou-tedi and the Bisaasi-tedi. The Reyabobõwei-tedi are presently attempting rapprochement with Sibarariwä's group, and are being forced by their allies, the Monou-tedi and the Bisaasi-tedi, to use their newly established friendship to effect another treacherous feast. In February 1965 the Reyabobõwei-tedi succeeded in inviting Sibarariwä's entire village to a feast and were intending to trick them after they arrived. However, one of the individuals met Sibarariwä's group half-way and warned them of the treachery, frustrating the attempt by the Bisaasi-tedi, the Monou-tedi, and the Paruritawä-tedi to get their revenge on Sibarariwä's group.

C. The War Pattern From November 1964 to February 1966

The effects of raiding and internal feuds on village composition, stability, splitting, and relocation that I have described above may also be observed among these villages at the present time. Raiding was intense during my field work. Patanowä-tedi, for example, was raided at least 25 times while I was in the field, raids that were mounted by a dozen different villages. Not all the raids were successful, but the frequency of the raiding was so high that it was never safe for the Patanowä-tedi to venture away from the village.

10:Chagnon E-4.5 (1964-1966) 1967 SQ18 Yanoama SQ18

CHAPTER VI

CONCLUSIONS

128 In the body of this dissertation I have attempted to demonstrate that two variables in particular exert an overriding effect on Yąnomamö social structure. These are, respectivley, the shortage of women and the intensity of actual warfare. In this final chapter, I should like to accomplish two ends. First, I should like to set my conclusions against different material recently gathered among the Yąnomamö in northern Brazil.[1] Second, I should like to bring my material to bear on the discussion between Leach (1957) and Fortes (1959a, 1959b) regarding the relationship of kinship, marriage ties, descent and politics.

121 721 582 183 Let us turn first to comparative Yąnomamö ethnology. If it is true, as I have argued, that warfare enhances the

[114] [1]After I had completed the text of the thesis I had an opportunity to discuss with Ernesto Migliazza the social organization of a number of Brazilian Yąnomamö groups. Migliazza, a linguist, spent nearly six years among the Uraricaá Yąnomamö, working for a Baptist Mission and, more recently, for the Goeldi Museum in Belém. I thank him for permission to use much of the comparative material presented below; some of it has already been published in his 1964 work. I introduce this new data because it very effectively demonstrates the interrelationships between the variables discussed in the thesis. I would have arrived at the same conclusions, by employing arguments similar to those used by Meggitt (1965), but the contrast provided by this new material makes the conclusions more defensible.

10:Chagnon E-4.5 (1964-1966) 1967 SQ18 Yanoama SQ18

accusations of sorcery or by the desire to abduct women.

Another major difference between the Uraricaá and the Mavaca Yąnomamö is the manner in which they treat extra-marital liaisons. On the Uraricaá, liaisons are tacitly permitted and fighting rarely develops between a man and his wife's lover. Should fighting occur, it is generally caused by some incident unrelated to the affair itself. In short, men permit their wives to have extra-marital affairs, provided the women are discreet.

Of major analytical significance is the fact that the Uraricaá Yąnomamö closely adhere to their rules of ambilateral cross-cousin marriage.[1] This stems from the fact that political alliances between villages there never involve the transfer of women from one group to the other. The Yąnomamö of the Uraricaá are endogamous within each congeries of villages having a common history. It would seem, therefore, that the absence of intensive warfare permits marriage practice to follow marriage rules.

The Uraricaá settlement pattern and village organization differ considerably from those found among the Yąnomamö of the Mavaca basin. What I have called a small village of 40 people among the latter segments, on the Uraricaá, into clusters of extended family units separated from each other by as much as half a mile (Migliazza, 1964). The village in which Migliazza lived, for example, comprised 80 persons

[1] Migliazza was not able to give me statistical data on actual marriage practices. I intend to collect this kind of information in January-February 1967 when I visit the Uraricaá area.

114 121 602 Among the Yąnomamö consanguineal kinship does not have the quality attributed to kinship in general by Fortes, and we therefore cannot explain the stability that exists in terms of these alleged properties. The fact that affinal ties do promote a certain amount of stability between Yąnomamö descent groups supports Leach's arguments, and, for the reasons implied by Leach: Yąnomamö marriages occur within a political context that promotes military obligations and concomitants not predictable from first principles regarding the putative nature of kinship itself. Descent groups exchange women with an eye toward maximizing military advantage in a milieu of hostile political relationships. The stability brought about by such marriages is, therefore, largely a function of the politico-military ends served by marriage and is only tangentially, if at all, a result of kinship.

613 613 682 722 681

121 I would also like to discuss the nature of the relationship between corporation and descent from another point of view, for the nature of the estate of the Yąnomamö descent corporation gives a particular quality to the corporation. Most corporate lineal descent groups have as one of their major functions the control over and disposition of property. The property is usually real property. Pastoralists, of course, have as their estates, herds and use rights to forage areas. Some Northwest Coast and northern California tribes have corporate groups whose estates are acorn groves and portions of salmon streams.

In addition to real property, corporate groups

Foreword

About the Series

These case studies in cultural anthropology are designed to bring to students, in beginning and intermediate courses in the social sciences, insights into the richness and complexity of human life as it is lived in different ways and in different places. They are written by men and women who have lived in the societies they write about and who are professionally trained as observers and interpreters of human behavior. The authors are also teachers, and in writing their books they have kept the students who will read them foremost in their minds. It is our belief that when an understanding of ways of life very different from one's own is gained, abstractions and generalizations about social structure, cultural values, subsistence techniques, and the other universal categories of human social behavior become meaningful.

About the Author

Napoleon Chagnon was born the second of twelve children in Port Austin, Michigan, in 1938. He is married and has two children. At present he is an Assistant Professor of Anthropology and holds a joint appointment as Research Associate in the Department of Human Genetics, University of Michigan Medical School. This department has developed a long-term project for the study of the Yąnomamö from a medical-genetics viewpoint in a team approach involving specialists in several fields. Dr. Chagnon is the ethnological member of the team. He began his academic training in the Michigan College of Mining and Technology, but switched to anthropology, receiving a B.A. in anthropology at the University of Michigan in 1961, an M.A. in 1963, and a Ph.D. in 1966. He has spent nineteen months in direct contact with the Yąnomamö of Venezuela and Brazil, studying demography, social organization, and warfare, and about one month with the Carib-speaking Makiritare of Brazil and Venezuela, studying social organization. He has published several articles in *Natural History* and *Proceedings of the National Academy of Science* and has presented papers at meetings of the American Anthropological Association and the National Academy of Science. He plans to return to the Yąnomamö in several field trips over the next three years, having completed two cooperative trips with members of the Instituto Venezolano de Investigaciones Científicas.

About the Book

This is indeed a book about a fierce people. Yąnomamö culture, in its major focus, reverses the meanings of "good" and "desirable" as phrased in the ideal postulates of the Judaic-Christian tradition. A high capacity for rage, a quick flash point, and a will-

11: Chagnon E-5 (1964-1968) 1968 SQ18 Yanoama SQ18

ingness to use violence to obtain one's ends are considered desirable traits. Much of the behavior of the Yąnomamö can be described as brutal, cruel, treacherous, in the value-laden terms of our own vocabulary. The Yąnomamö themselves, however, as Napoleon Chagnon came to intimately know them in the year and a half he lived with them, do not all appear to be mean and treacherous. As individuals, they seem to be people playing their own cultural game, with internal feelings that at times may be quite divergent from the demands placed upon them by their culture. This case study furnishes valuable data for phrasing questions about the relationship between the individual and his culture.

The Yąnomamö appear to be constantly on the verge of extranormal behavior, as we define it, and their almost daily use of hallucinogenic drugs reinforces these drives to what might seem to the outside observer to be the limits of human capacity. Life in their villages is noisy, punctuated by outbursts of violence, threatened by destruction by enemies. To the ethnographer it is frightening, frustrating, disgusting, exciting, and rewarding, and in this case study the ethnographer lets the reader know how he feels. His honest reactions help us, as interested outsiders, to know the Yąnomamö.

This is a study of a fierce people who engage in chronic warfare. It is also a study of a system of controls that usually hold in check the drive toward annihilation. Conflict among the Yąnomamö is regulated through a series of graded escalations, from chest-pounding and side-slapping duels, through club fighting, spear throwing, to raiding in a state of war, to the ultimate—the *nomoboni*—massacre by treachery. The processes of avoidance, settlement, or escalation of disputes are discussed in detail in this case study. There are implications that range beyond the Yąnomamö, and beyond primitive peoples, to the "civilized" world in which we live, for we too live in a state of chronic warfare and are threatened by annihilation.

The Yąnomamö goad each other, within their own villages, to the brink of an explosion (and they goaded the ethnographer in the same way). This hostility is projected on a larger scale in the negotiating of alliances between villages. Each principal must establish the credibility of his own threats, as well as discover the point at which the opposite party's bluffing will dissolve into action. It is, as the author says, a politics of brinksmanship, all too familiar to us.

The study is, however, not confined to a description of regulated violence. Dr. Chagnon provides us with an unusually clear chapter on social organization, with the genealogical details of kinship. The models he produces in his analysis are cast in sharper relief because he also discusses deviations from these models in actual behavior. He links social organization with the processes of fission that produce new villages and the alliances that are created in response to the threat of annihilation, reinforced and validated by the mutual ceding of women between villages. Social organization is presented not as an abstraction but as a dynamic process interrelated with other significant dimensions of life. The anthropological novice will find the analysis of social organization detailed but, with close attention, entirely understandable. The more experienced anthropological reader will grasp the full theoretical implications of the analysis and will find the author's references to various debates in the anthropological literature stimulating.

1

Doing Fieldwork among the Yąnomamö

THE YĄNOMAMÖ[1] INDIANS live in southern Venezuela and the adjacent portions of northern Brazil (see frontispiece map, p. iv). Some 125 widely scattered villages have populations ranging from 40 to 250 inhabitants, with 75 to 80 people the most usual number. In total numbers their population probably approaches 10,000 people, but this is merely a guess. Many of the villages have not yet been contacted by outsiders, and nobody knows for sure exactly how many uncontacted villages there are, or how many people live in them. By comparison to African or Melanesian tribes, the Yąnomamö population is small. Still, they are one of the largest unacculturated tribes left in all of South America.

But they have a significance apart from tribal size and cultural purity: the Yąnomamö are still actively conducting warfare. It is in the nature of man to fight, according to one of their myths, because the blood of "Moon" spilled on this layer of the cosmos, causing men to become fierce. I describe the Yąnomamö as "the fierce people" because that is the most accurate single phrase that describes them. That is how they conceive themselves to be, and that is how they would like others to think of them.

I spent nineteen months with the Yąnomamö,[2] during which time I acquired some proficiency in their language and, up to a point, submerged myself in their culture and _____ way of life.

[1]The word Yąnomamö is nasalized through its entire length, indicated by the diacritical mark [ą]. When this mark appears on a word, the entire word is nasalized. The terminal vowel [-ö] represents a sound that does not occur in the English language. It corresponds to the phone [ə] of linguistic orthography. In normal conversation, Yąnomamö is pronounced like "Yah-no-mama," except that it is nasalized. Finally, the words having the [-ä] vowel are pronounced as that vowel with the "uh" sound of "duck." Thus, the name Kąobawä would be pronounced "cow-ba-wuh," again nasalized.

[2]I spent a total of twenty-three months in South America of which nineteen were spent among the Yąnomamö on three separate field trips. The first trip, November 1964 through February 1966, was to Venezuela. During this time I spent thirteen months in direct contact with the Yąnomamö, using my periodic trips back to Caracas to visit my family and to collate the genealogical data I had collected up to that point. On my second trip, January through March 1967, I spent two months among Brazilian Yąnomamö and one more month with the Venezuelan Yąnomamö. Finally, I returned to Venezuela for three more months among the Yąnomamö, January through April 1968.

The fact that the Yąnomamö live in a state of chronic warfare is reflected in their mythology, values, settlement pattern, political behavior, and marriage practices. Accordingly, I have organized this case study in such a way that students can appreciate the effects of warfare on Yąnamamö culture in general and on their social organization and politics in particular (Fig. 1–2).

I collected the data under somewhat trying circumstances, some of which I will describe in order to give the student a rough idea of what is generally meant when anthropologists speak of "culture shock" and "fieldwork." It should be borne in mind, however, that each field situation is in many respects unique, so that the problems I encountered do not necessarily exhaust the range of possible problems other anthropologists have confronted in other areas. There are a few problems, however, that seem to be nearly universal among anthropological fieldworkers, particularly those having to do with eating, bathing, sleeping, lack of privacy and loneliness, or discovering that primitive man is not always as noble as you originally thought.

This is not to state that primitive man everywhere is unpleasant. By way of contrast, I have also done limited fieldwork among the Yąnomamö's northern neighbors, the Carib-speaking Makiritare Indians. This group was very pleasant and charming, all

Fig. 1–2. One way that warfare affects other aspects of Yąnomamö social organization is in the great significance of intervillage alliances. Here members of an allied village dance excitedly in their hosts' village in anticipation of the feast and chest-pounding duel that will follow.

of them anxious to help me and honor bound to show any visitor the numerous courtesies of their system of etiquette. In short, they approached the image of primitive man that I had conjured up, and it was sheer pleasure to work with them. The recent work by Colin Turnbull (1966) brings out dramatically the contrast in personal characteristics of two African peoples he has studied.

Hence, what I say about some of my experiences is probably equally true of the experiences of many other fieldworkers. I write about my own experiences because there is a conspicuous lack of fieldwork descriptions available to potential fieldworkers. I think I could have profited by reading about the private misfortunes of my own teachers; at least I might have been able to avoid some of the more stupid errors I made. In this regard there are a number of recent contributions by fieldworkers describing some of the discomforts and misfortunes they themselves sustained.[3] Students planning to conduct fieldwork are urged to consult them.

My first day in the field illustrated to me what my teachers meant when they spoke of "culture shock." I had traveled in a small, aluminum rowboat propelled by a large outboard motor for two and a half days. This took me from the Territorial capital, a small town on the Orinoco River, deep into Yąnomamö country. On the morning of the third day we reached a small mission settlement, the field "headquarters" of a group of Americans who were working in two Yąnomamö villages. The missionaries had come out of these villages to hold their annual conference on the progress of their mission work, and were conducting their meetings when I arrived. We picked up a passenger at the mission station, James P. Barker, the first non-Yąnomamö to make a sustained, permanent contact with the tribe (in 1950). He had just returned from a year's furlough in the United States, where I had earlier visited him before leaving for Venezuela. He agreed to accompany me to the village I had selected for my base of operations to introduce me to the Indians. This village was also his own home base, but he had not been there for over a year and did not plan to join me for another three months. Mr. Barker had been living with this particular group about five years.

We arrived at the village, Bisaasi-teri, about 2:00 PM and docked the boat along the muddy bank at the terminus of the path used by the Indians to fetch their drinking water. It was hot and muggy, and my clothing was soaked with perspiration. It clung uncomfortably to my body, as it did thereafter for the remainder of the work. The small, biting gnats were out in astronomical numbers, for it was the beginning of the dry season. My face and hands were swollen from the venom of their numerous stings. In just a few moments I was to meet my first Yąnomamö, my first primitive man. What would it be like? I had visions of entering the village and seeing 125 social facts running about calling each other kinship terms and sharing food, each waiting and anxious to have me collect his genealogy. I would wear them out in turn. Would they like me? This was important to me; I wanted them to be so fond of me that they would adopt me into their kinship system and way of life, because I had heard that successful anthropologists always get adopted by their people. I had learned during my seven years of

[3] Maybury-Lewis 1967, "Introduction," and 1965*b*; Turnbull, 1966; L. Bohannan, 1964. Perhaps the most intimate account of the tribulations of a fieldworker is found in the posthumous diary of Bronislaw Malinowski (1967). Since the diary was not written for publication, it contains many intimate, very personal details about the writers' anxieties and hardships.

anthropological training at the University of Michigan that kinship was equivalent to society in primitive tribes and that it was a moral way of life, "moral" being something "good" and "desirable." I was determined to work my way into their moral system of kinship and become a member of their society.

My heart began to pound as we approached the village and heard the buzz of activity within the circular compound. Mr. Barker commented that he was anxious to see if any changes had taken place while he was away and wondered how many of them had died during his absence. I felt into my back pocket to make sure that my notebook was still there and felt personally more secure when I touched it. Otherwise, I would not have known what to do with my hands.

The entrance to the village was covered over with brush and dry palm leaves. We pushed them aside to expose the low opening to the village. The excitement of meeting my first Indians was almost unbearable as I duck-waddled through the low passage into the village clearing.

I looked up and gasped when I saw a dozen burly, naked, filthy, hideous men staring at us down the shafts of their drawn arrows! Immense wads of green tobacco were stuck between their lower teeth and lips making them look even more hideous, and strands of dark-green slime dripped or hung from their noses. We arrived at the village while the men were blowing a hallucinogenic drug up their noses. One of the side effects of the drug is a runny nose. The mucus is always saturated with the green powder and the Indians usually let it run freely from their nostrils. My next discovery was that there were a dozen or so vicious, underfed dogs snapping at my legs, circling me as if I were going to be their next meal. I just stood there holding my notebook, helpless and pathetic. Then the stench of the decaying vegetation and filth struck me and I almost got sick. I was horrified. What sort of a welcome was this for the person who came here to live with you and learn your way of life, to become friends with you? They put their weapons down when they recognized Barker and returned to their chanting, keeping a nervous eye on the village entrances.

We had arrived just after a serious fight. Seven women had been abducted the day before by a neighboring group, and the local men and their guests had just that morning recovered five of them in a brutal club fight that nearly ended in a shooting war. The abductors, angry because they lost five of the seven captives, vowed to raid the Bisaasi-teri. When we arrived and entered the village unexpectedly, the Indians feared that we were the raiders. On several occasions during the next two hours the men in the village jumped to their feet, armed themselves, and waited nervously for the noise outside the village to be identified. My enthusiasm for collecting ethnographic curiosities diminished in proportion to the number of times such an alarm was raised. In fact, I was relieved when Mr. Barker suggested that we sleep across the river for the evening. It would be safer over there.

As we walked down the path to the boat, I pondered the wisdom of having decided to spend a year and a half with this tribe before I had even seen what they were like. I am not ashamed to admit, either, that had there been a diplomatic way out, I would have ended my fieldwork then and there. I did not look forward to the next day when I would be left alone with the Indians; I did not speak a word of their language, and they were decidedly different from what I had imagined them to be. The whole situation was depressing, and I wondered why I ever decided to switch from civil en-

11: Chagnon E-5 (1964-1968) 1968 SQ18 Yanoama SQ18

114 123 gineering to anthropology in the first place. I had not eaten all day, I was soaking wet from perspiration, the gnats were biting me, and I was covered with red pigment, the result of a dozen or so complete examinations I had been given by as many burly Indians. [515] These examinations capped an otherwise grim day. The Indians would blow their noses into their hands, flick as much of the mucus off that would separate in a snap of the wrist, wipe the residue into their hair, and then carefully examine my face, arms, legs, hair, and the contents of my pockets. I asked Mr. Barker how to say "Your hands are dirty"; my comments were met by the Indians in the following way: They would "clean" their hands by spitting a quantity of slimy tobacco juice into them, rub them together, and then proceed with the examination.

Mr. Barker and I crossed the river and slung our hammocks. When he pulled his hammock out of a rubber bag, a heavy, disagreeable odor of mildewed cotton came with it. "Even the missionaries are filthy," I thought to myself. Within two weeks, everything I owned smelled the same way, and I lived with that odor for the remainder of the fieldwork. My own habits of personal cleanliness reached such levels that I didn't even mind being examined by the Indians, as I was not much cleaner than they were after I had adjusted to the circumstances.

So much for my discovery that primitive man is not the picture of nobility and sanitation I had conceived him to be. I soon discovered that it was an enormously time-consuming task to maintain my own body in the manner to which it had grown accustomed in the relatively antiseptic environment of the northern United States. Either I could be relatively well fed and relatively comfortable in a fresh change of clothes and do very little fieldwork, or, I could do considerably more fieldwork and be less well fed and less comfortable.

114 122 It is appalling how complicated it can be to make oatmeal in the jungle. First, I had to make two trips to the river to haul the water. Next, I had to prime my kerosene stove with alcohol and get it burning, a tricky procedure when you are trying to mix powdered milk and fill a coffee pot at the same time: the alcohol prime always burned out before I could turn the kerosene on, and I would have to start all over. Or, I would turn the kerosene on, hoping that the element was still hot enough to vaporize the fuel, and start a small fire in my palm-thatched hut as the liquid kerosene squirted all over the table and walls and ignited. It was safer to start over with the alcohol. Then I had to boil the oatmeal and pick the bugs out of it. All my supplies, of course, were carefully stored in Indian-proof, rat-proof, moisture-proof, and insect-proof containers, not one of which ever served its purpose adequately. Just taking things out of the multiplicity of containers and repacking them afterward was a minor project in itself. By the time I had hauled the water to cook with, unpacked my food, prepared the oatmeal, milk, and coffee, heated water for dishes, washed and dried the dishes, repacked the food in the containers, stored the containers in locked trunks and cleaned up my mess, the ceremony of preparing breakfast had brought me almost up to lunch time!

Eating three meals a day was out of the question. I solved the problem by eating a single meal that could be prepared in a single container, or, at most, in two containers, washed my dishes only when there were no clean ones left, using cold river water, and wore each change of clothing at least a week to cut down on my laundry problem, a courageous undertaking in the tropics. I was also less concerned about sharing my provisions with the rats, insects, Indians, and the elements, thereby eliminating the need

11: Chagnon E-5 (1964-1968) 1968 SQ18 Yanoama SQ18

for my complicated storage process. I was able to last most of the day on *café con leche*, heavily sugared espresso coffee diluted about five to one with hot milk. I would prepare this in the evening and store it in a thermos. Frequently, my single meal was no more complicated than a can of sardines and a package of crackers. But at least two or three times a week I would do something sophisticated, like make oatmeal or boil rice and add a can of tuna fish or tomato paste to it. I even saved time by devising a water system that obviated the trips to the river. I had a few sheets of zinc roofing brought in and made a rain-water trap; I caught the water on the zinc surface, funneled it into an empty gasoline drum, and then ran a plastic hose from the drum to my hut. When the drum was exhausted in the dry season, I hired the Indians to fill it with water from the river.

I ate much less when I traveled with the Indians to visit other villages. Most of the time my travel diet consisted of roasted or boiled green plantains (see Glossary) that I obtained from the Indians, but I always carried a few cans of sardines with me in case I got lost or stayed away longer than I had planned. I found peanut butter and crackers a very nourishing food, and a simple one to prepare on trips. It was nutritious and portable, and only one tool was required to prepare the meal, a hunting knife that could be cleaned by wiping the blade on a leaf. More importantly, it was one of the few foods the Indians would let me eat in relative peace. It looked too much like animal feces to them to excite their appetites.

I once referred to the peanut butter as the dung of cattle. They found this quite repugnant. They did not know what "cattle" were, but were generally aware that I ate several canned products of such an animal. I perpetrated this myth, if for no other reason than to have some peace of mind while I ate. Fieldworkers develop strange defense mechanisms, and this was one of my own forms of adapeation. On another occasion I was eating a can of frankfurters and growing very weary of the demands of one of my guests for a share in my meal. When he asked me what I was eating, I replied: "Beef." He then asked, "What part of the animal are you eating?" to which I replied, "Guess!" He stopped asking for a share.

Meals were a problem in another way. Food sharing is important to the Yąnomamö in the context of displaying friendship. "I am hungry," is almost a form of greeting with them. I could not possibly have brought enough food with me to feed the entire village, yet they seemed not to understand this. All they could see was that I did not share my food with them at each and every meal. Nor could I enter into their system of reciprocities with respect to food; every time one of them gave me something "freely," he would dog me for months to pay him back, not with food, but with steel tools. Thus, if I accepted a plantain from someone in a different village while I was on a visit, he would most likely visit me in the future and demand a machete as payment for the time that he "fed" me. I usually reacted to these kinds of demands by giving a banana, the customary reciprocity in their culture—food for food—but this would be a disappointment for the individual who had visions of that single plantain growing into a machete over time.

Despite the fact that most of them knew I would not share my food with them at their request, some of them always showed up at my hut during mealtime. I gradually became accustomed to this and learned to ignore their persistent demands while I ate. Some of them would get angry because I failed to give in, but most of them accepted

11: Chagnon E-5 (1964-1968) 1968 SQ18 Yanoama SQ18

it as just a peculiarity of the subhuman foreigner. When I did give in, my hut quickly filled with Indians, each demanding a sample of the food that I had given one of them. If I did not give all a share, I was that much more despicable in their eyes.

A few of them went out of their way to make my meals unpleasant, to spite me for not sharing; for example, one man arrived and watched me eat a cracker with honey on it. He immediately recognized the honey, a particularly esteemed Yąnomamö food. He knew that I would not share my tiny bottle and that it would be futile to ask. Instead, he glared at me and queried icily, "Shaki![4] What kind of animal semen are you eating on that cracker?" His question had the desired effect, and my meal ended.

Finally, there was the problem of being lonely and separated from your own kind, especially your family. I tried to overcome this by seeking personal friendships among the Indians. This only complicated the matter because all my friends simply used my confidence to gain privileged access to my cache of steel tools and trade goods, and looted me. I would be bitterly disappointed that my "friend" thought no more of me than to finesse our relationship exclusively with the intention of getting at my locked up possessions, and my depression would hit new lows every time I discovered this. The loss of the possession bothered me much less than the shock that I was, as far as most of them were concerned, nothing more than a source of desirable items; no holds were barred in relieving me of these, since I was considered something subhuman, a non-Yąnomamö.

The thing that bothered me most was the incessant, passioned, and aggressive demands the Indians made. It would become so unbearable that I would have to lock myself in my mud hut every once in a while just to escape from it: Privacy is one of Western culture's greatest achievements. But I did not want privacy for its own sake; rather, I simply had to get away from the begging. Day and night for the entire time I lived with the Yąnomamö I was plagued by such demands as: "Give me a knife, I am poor!"; "If you don't take me with you on your next trip to Widokaiya-teri I'll chop a hole in your canoe!"; "Don't point your camera at me or I'll hit you!"; "Share your food with me!"; "Take me across the river in your canoe and be quick about it!"; "Give me a cooking pot!"; "Loan me your flashlight so I can go hunting tonight!"; "Give me medicine . . . I itch all over!"; "Take us on a week-long hunting trip with your shotgun!"; and "Give me an axe or I'll break into your hut when you are away visiting and steal one!" And so I was bombarded by such demands day after day, months on end, until I could not bear to see an Indian.

It was not as difficult to become calloused to the incessant begging as it was to ignore the sense of urgency, the impassioned tone of voice, or the intimidation and aggression with which the demands were made. It was likewise difficult to adjust to the fact that the Yąnomamö refused to accept "no" for an answer until or unless it seethed with passion and intimidation—which it did after six months. Giving in to a demand always established a new threshold; the next demand would be for a bigger item or favor, and the anger of the Indians even greater if the demand was not met. I soon learned

[4] "Shaki," or, rather, "Shakiwë," is the name they gave me because they could not pronounce "Chagnon." They like to name people for some distinctive feature when possible. *Shaki* is the name of a species of noisome bee; they accumulate in large numbers around ripening bananas and make pests of themselves by crawling into the fruit, showering the people below with the debris. They probably adopted this name for me because I was also a nuisance, continuously prying into their business, taking pictures of them, and, in general, being where they did not want me.

11: Chagnon E-5 (1964-1968) 1968 SQ18 Yanoama SQ18

that I had to become very much like the Yąnomamö to be able to get along with them on their terms: sly, aggressive, and intimidating.

Had I failed to adjust in this fashion I would have lost six months of supplies to them in a single day or would have spent most of my time ferrying them around in my canoe or hunting for them. As it was, I did spend a considerable amount of time doing these things and did succumb to their outrageous demands for axes and machetes, at least at first. More importantly, had I failed to demonstrate that I could not be pushed around beyond a certain point, I would have been the subject of far more ridicule, theft, and practical jokes than was the actual case. In short, I had to acquire a certain proficiency in their kind of interpersonal politics and to learn how to imply subtly that certain potentially undesirable consequences might follow if they did such and such to me. They do this to each other in order to establish precisely the point at which they cannot goad an individual any further without precipitating retaliation. As soon as I caught on to this and realized that much of their aggression was stimulated by their desire to discover my flash point; I got along much better with them and regained some lost ground. It was sort of like a political game that everyone played, but one in which each individual sooner or later had to display some sign that his bluffs and implied threats could be backed up. I suspect that the frequency of wife beating is a component of this syndrome, since men can display their ferocity and show others that they are capable of violence. Beating a wife with a club is considered to be an acceptable way of displaying ferocity and one that does not expose the male to much danger. The important thing is that the man has displayed his potential for violence and the implication is that other men better treat him with respect and caution.

After six months, the level of demand was tolerable in the village I used for my headquarters. The Indians and I adjusted to each other and knew what to expect with regard to demands on their part for goods, favors, and services. Had I confined my fieldwork to just that village alone, the field experience would have been far more enjoyable. But, as I was interested in the demographic pattern and social organization of a much larger area, I made regular trips to some dozen different villages in order to collect genealogies or to recheck those I already had. Hence, the intensity of begging and intimidation was fairly constant for the duration of the fieldwork. I had to establish my position in some sort of pecking order of ferocity at each and every village.

For the most part, my own "fierceness" took the form of shouting back at the Yąnomamö as loudly and as passionately as they shouted at me, especially at first, when I did not know much of their language. As I became more proficient in their language and learned more about their political tactics, I became more sophisticated in the art of bluffing. For example, I paid one young man a machete to cut palm trees and make boards from the wood. I used these to fashion a platform in the bottom of my dugout canoe to keep my possessions dry when I traveled by river. That afternoon I was doing informant work in the village; the long-awaited mission supply boat arrived, and most of the Indians ran out of the village to beg goods from the crew. I continued to work in the village for another hour or so and went down to the river to say "hello" to the men on the supply boat. I was angry when I discovered that the Indians had chopped up all my palm boards and used them to paddle their own canoes[8] across the river. I knew that if

[8]The canoes were obtained from missionaries, who, in turn, got them from a different tribe.

11: Chagnon E-5 (1964-1968) 1968 SQ18 Yanoama SQ18

114 I overlooked this incident I would have invited them to take even greater liberties with
123 my goods in the future. I crossed the river, docked amidst their dugouts, and shouted for the Indians to come out and see me. A few of the culprits appeared, mischievous grins on their faces. I gave a spirited lecture about how hard I had worked to put those boards in my canoe, how I had paid a machete for the wood, and how angry I was that they destroyed my work in their haste to cross the river. I then pulled out my hunting knife and, while their grins disappeared, cut each of their canoes loose, set it into the current, and let them float away. I left without further ado and without looking back.

They managed to borrow another canoe and, after some effort, recovered their dugouts. The headman of the village later told me with an approving chuckle that I had done the correct thing. Everyone in the village, except, of course, the culprits, supported and defended my action. This raised my status.

Whenever I took such action and defended my rights, I got along much better with the Yąnomamö. A good deal of their behavior toward me was directed with the forethought of establishing the point at which I would react defensively. Many of them later reminisced about the early days of my work when I was "timid" and a little afraid of them, and they could bully me into giving goods away.

Theft was the most persistent situation that required me to take some sort of defensive action. I simply could not keep everything I owned locked in trunks, and the Indians came into my hut and left at will. I developed a very effective means for recovering almost all the stolen items. I would simply ask a child who took the item and then take that person's hammock when he was not around, giving a spirited lecture to the others as I marched away in a faked rage with the thief's hammock. Nobody ever attempted to stop me from doing this, and almost all of them told me that my technique for recovering my possessions was admirable. By nightfall the thief would either appear with the stolen object or send it along with someone else to make an exchange. The others would heckle him for getting caught and being forced to return the item.

121 With respect to collecting the data I sought, there was a very frustrating problem.
124 Primitive social organization is kinship organization, and to understand the Yąnomamö
551 way of life I had to collect extensive genealogies. I could not have deliberately picked
114 a more difficult group to work with in this regard: They have very stringent name taboos. They attempt to name people in such a way that when the person dies and they can no longer use his name, the loss of the word in the language is not inconvenient. Hence, they name people for specific and minute parts of things, such as "toenail of some rodent," thereby being able to retain the words "toenail" and "(specific) rodent," but not being able to refer directly to the toenail of that rodent. The taboo is maintained even for the living: One mark of prestige is the courtesy others show you by not using your name. The sanctions behind the taboo seem to be an unusual combination of fear and respect.

114 I tried to use kinship terms to collect genealogies at first, but the kinship terms
123 were so ambiguous that I ultimately had to resort to names. They were quick to grasp
124 that I was bound to learn everybody's name and reacted, without my knowing it, by
60 inventing false names for everybody in the village. After having spent several months
551 collecting names and learning them, this came as a disappointment to me: I could not cross-check the genealogies with other informants from distant villages.

11: Chagnon E-5 (1964-1968) 1968 SQ18 Yanomama SQ18

They enjoyed watching me learn these names. I assumed, wrongly, that I would get the truth to each question and that I would get the best information by working in public. This set the stage for converting a serious project into a farce. Each informant tried to outdo his peers by inventing a name even more ridiculous than what I had been given earlier, or by asserting that the individual about whom I inquired was married to his mother or daughter, and the like. I would have the informant whisper the name of the individual in my ear, noting that he was the father of such and such a child. Everybody would then insist that I repeat the name aloud, roaring in hysterics as I clumsily pronounced the name. I assumed that the laughter was in response to the violation of the name taboo or to my pronunciation. This was a reasonable interpretation, since the individual whose name I said aloud invariably became angry. After I learned what some of the names meant, I began to understand what the laughter was all about. A few of the more colorful examples are: "hairy vagina," "long penis," "feces of the harpy eagle," and "dirty rectum." No wonder the victims were angry.

I was forced to do my genealogy work in private because of the horseplay and nonsense. Once I did so, my informants began to agree with each other and I managed to learn a few new names, real names. I could then test any new informant by collecting a genealogy from him that I knew to be accurate. I was able to weed out the more mischievous informants this way. Little by little I extended the genealogies and learned the real names. Still, I was unable to get the names of the dead and extend the genealogies back in time, and even my best informants continued to deceive me about their own close relatives. Most of them gave me the name of a living man as the father of some individual in order to avoid mentioning that the actual father was dead.

The quality of a genealogy depends in part on the number of generations it embraces, and the name taboo prevented me from getting any substantial information about deceased ancestors. Without this information, I could not detect marriage patterns through time. I had to rely on older informants for this information, but these were the most reluctant of all. As I became more proficient in the language and more skilled at detecting lies, my informants became better at lying. One of them in particular was so cunning and persuasive that I was shocked to discover that he had been inventing his information. He specialized in making a ceremony out of telling me false names. He would look around to make sure nobody was listening outside my hut, enjoin me to never mention the name again, act very nervous and spooky, and then grab me by the head to whisper the name very softly into my ear. I was always elated after an informant session with him, because I had several generations of dead ancestors for the living people. The others refused to give me this information. To show my gratitude, I paid him quadruple the rate I had given the others. When word got around that I had increased the pay, volunteers began pouring in to give me genealogies.

I discovered that the old man was lying quite by accident. A club fight broke out in the village one day, the result of a dispute over the possession of a woman. She had been promised to Rerebawä, a particularly aggressive young man who had married into the village. Rerebawä had already been given her older sister and was enraged when the younger girl began having an affair with another man in the village, making no attempt to conceal it from him. He challenged the young man to a club fight, but was so abusive in his challenge that the opponent's father took offense and entered the village circle with his son, wielding a long club. Rerebawä swaggered out to the duel and

11: Chagnon E-6 (1964-1968) 1968 SQ18 Yanomama SQ18

114 123 124 518 839 hurled insults at both of them, trying to goad them into striking him on the head with their clubs. This would have given him the opportunity to strike them on the head. His opponents refused to hit him, and the fight ended. Rerebawë had won a moral victory because his opponents were afraid to hit him. Thereafter, he swaggered around and insulted the two men behind their backs. He was genuinely angry with them, to the point of calling the older man by the name of his dead father. I quickly seized on this as an opportunity to collect an accurate genealogy and pumped him about his adversary's ancestors. Rerebawë had been particularly nasty to me up to this point, but we became staunch allies: We were both outsiders in the local village. I then asked about other dead ancestors and got immediate replies. He was angry with the whole group and not afraid to tell me the names of the dead. When I compared his version of the genealogies to that of the old man, it was obvious that one of them was lying. I challenged his information, and he explained that everybody knew that the old man was deceiving me and bragging about it in the village. The names the old man had given me were the dead ancestors of the members of a village so far away that he thought I would never have occasion to inquire about them. As it turned out, Rerebawë knew most of the people in that village and recognized the names.

114 124 I then went over the complete genealogical records with Rerebawë, genealogies I had presumed to be in final form. I had to revise them all because of the numerous lies and falsifications they contained. Thus, after five months of almost constant work on the genealogies of just one group, I had to begin almost from scratch!

114 123 124 Discouraging as it was to start over, it was still the first real turning point in my fieldwork. Thereafter, I began taking advantage of local arguments and animosities in selecting my informants, and used more extensively individuals who had married into the group. I began traveling to other villages to check the genealogies, picking villages that were on strained terms with the people about whom I wanted information. I would then return to my base camp and check with local informants the accuracy of the new information. If the informants became angry when I mentioned the new names I acquired from the unfriendly group, I was almost certain that the information was accurate. For this kind of checking I had to use informants whose genealogies I knew rather well: they had to be distantly enough related to the dead person that they would not go into a rage when I mentioned the name, but not so remotely related that they would be uncertain of the accuracy of the information. Thus, I had to make a list of names that I dared not use in the presence of each and every informant. Despite the precautions, I occasionally hit a name that put the informant into a rage, such as that of a dead brother or sister that other informants had not reported. This always terminated the day's work with that informant, for he would be too touchy to continue any further, and I would be reluctant to take a chance on accidentally discovering another dead kinsman so soon after the first.

114 123 124 551 These were always unpleasant experiences, and occasionally dangerous ones, depending on the temperament of the informant. On one occasion I was planning to visit a village that had been raided about a week earlier. A woman whose name I had on my list had been killed by the raiders. I planned to check each individual on the list one by one to estimate ages, and I wanted to remove her name so that I would not say it aloud in the village. I knew that I would be in considerable difficulty if I said this name aloud so soon after her death. I called on my original informant and asked him to tell

11: Chagnon E-5 (1964-1968) 1968 SQ18 Yanomama SQ19

me the name of the woman who had been killed. He refused, explaining that she was a close relative of his. I then asked him if he would become angry if I read off all the names on the list. This way he did not have to say her name and could merely nod when I mentioned the right one. He was a fairly good friend of mine, and I thought I could predict his reaction. He assured me that this would be a good way of doing it. We were alone in my hut so that nobody could overhear us. I read the names softly, continuing to the next when he gave a negative reply. When I finally spoke the name of the dead woman he flew out of his chair, raised his arm to strike me, and shouted: "You son-of-a-bitch![6] If you ever say that name again, I'll kill you!" He was shaking with rage, but left my hut quietly. I shudder to think what might have happened if I had said the name unknowingly in the woman's village. I had other, similar experiences in different villages, but luckily the dead person had been dead for some time and was not closely related to the individual into whose ear I whispered the name. I was merely cautioned to desist from saying any more names, lest I get people angry with me.

I had been working on the genealogies for nearly a year when another individual came to my aid. It was Kąobawä, the headman of Upper Bisaasi-teri, the group in which I spent most of my time. He visited me one day after the others had left the hut and volunteered to help me on the genealogies. He was poor, he explained, and needed a machete. He would work only on the condition that I did not ask him about his own parents and other very close kinsmen who were dead. He also added that he would not lie to me as the others had done in the past. This was perhaps the most important single event in my fieldwork, for out of this meeting evolved a very warm friendship and a very profitable informant-fieldworker relationship.

Kąobawä's familiarity with his group's history and his candidness were remarkable. His knowledge of details was almost encyclopedic. More than that, he was enthusiastic and encouraged me to learn details that I might otherwise have ignored. If there were things he did not know intimately, he would advise me to wait until he could check things out with someone in the village. This he would do clandestinely, giving me a report the next day. As I was constrained by my part of the bargain to avoid discussing his close dead kinsmen, I had to rely on Rerebawä for this information. I got Rerebawä's genealogy from Kąobawä.

Once again I went over the genealogies with Kąobawä to recheck them, a considerable task by this time: they included about two thousand names, representing several generations of individuals from four different villages. Rerebawä's information was very accurate, and Kąobawä's contribution enabled me to trace the genealogies further back in time. Thus, after nearly a year of constant work on genealogies, Yąnomamö demography and social organization began to fall into a pattern. Only then could I see how kin groups formed and exchanged women with each other over time, and only then did the fissioning of larger villages into smaller ones show a distinct pattern. At this point I was able to begin formulating more intelligent questions because there was now some sort of pattern to work with. Without the help of Rerebawä and Kąobawä I could not have made very much sense of the plethora of details I had collected from dozens of other informants.

[6] This is the closest English translation of his actual statement, the literal translation of which would be nonsensical in our language.

Fig. 1-3. Kaobawä, the male leader, listens to identify a strange noise in the jungle.

I spent a good deal of time with these two men and their families and got to know them well. They frequently gave their information in a way which related themselves to the topic under discussion. We became very close friends. I will speak of them frequently in the following chapters, using them as "typical" Yanomamö, if, indeed, one may speak of typical anything. I will briefly comment on what these men are like and their respective statuses in the village.

Kaobawä is about 40 years old (Fig. 1-3). I say "about" because the Yanomamö numeration system has only three numbers: one, two, and more-than-two. He is the headman of Upper Bisasi-teri. He has had five or six wives so far and temporary affairs with as many more women, one of which resulted in a child. At the present time he has just two wives, Bahimi and Koamashima. He has had a daughter and a son by Bahimi, his eldest and favorite wife. Koamashima, about 20 years old, recently had her first child, a boy (Fig. 1-4). Kaobawä may give Koamashima to his youngest brother. Even now the brother shares in her sexual services. Kaobawä recently gave his third wife to another of his brothers because she was bashi: "horny." In fact, this girl had been married to two

nant, while other plants allegedly cure the same evils. Kaobawä's followers do not cultivate many of these malevolent magical plants; they claim, however, that the "Waikas"[8] use them extensively and blow harmful charms at their enemies through hollow tubes. The failure of Kaobawä's group to use magical plants in this fashion is cited as a distinguishing feature that sets it aside from other groups of Yanomamö.

101
014

[8]The Yanomamö are sometimes referred to in the literature by such designations as Shiriana, Xiriana, Guaharibo, and Waika. The first three terms are foreign words meaning "howler monkey" and have been applied to the Yanomamö by their northern neighbors, the Carib-speaking Makiritare Indians. A good deal of the early information came from the quite unreliable accounts travelers obtained from the Makiritare. The term "*Waika*," however, from the verb *waikai*, is a Yanomamö word meaning "to kill an animal (or man) that is already dying from a wound." Zerries (1964) used the term "*Waika*" in much the same sense that I am using the term "Yanomamö." *Waika*, however, is very ambiguous and imprecise. For example, members of village "A" will assert that members of village "B" are "Waikas." If you ask members of village "B" if they are Waikas, however, they will deny it and say they are Yanomamö, adding that the members of village "C" are Waikas. When you question members of village "C," you will get the same answer: The Waikas live in the next village, only Yanomamö live here. Nevertheless, the term does have currency in the villages near the headwaters of the Orinoco River. One of my informants claimed that the blood of "Moon" (see the third section of this chapter) changed into Waikas, but they became extinct because they were so fierce. He also asserted that the Waikas were Yanomamö.

11: Chagnon E-5 (1964-1968) 1968 SQ18 Yanoama SQ18

The noreshi animals are inherited patrilineally for men and matrilineally for women.[12] Kąobawï, for example, inherited his *noreshi* animal, the black monkey, from his father and transmitted it to his son. All his male kinsmen have the black monkey as their *noreshi*. Bahimi, Kąobawï's wife, has the dog for her *noreshi* animal, as does her mother and her daughter by Kąobawï. The *noreshi* animal of a woman always travels on the ground below the animal of the husband.

Noreshi animals duplicate the behavior of the person to whom they correspond. When Kąobawï goes hunting, so does his *noreshi* animal. When he is sick, so is his *noreshi* animal. If he takes a journey of two days, the animal likewise travels an equal distance, and so forth.

The *noreshi* animal and the person to whom it corresponds are always in complementary distribution. That is, they never come close to each other, for if they should see each other, they would both die. Their mutual existences are coextensive and coterminous: One lives only as long as the other, and both die at precisely the same instant. If a hunter should shoot Kąobawï's *noreshi* animal and kill it, Kąobawï would also be shot and would die. Similarly, if Kąobawï is shot by raiders and killed, his *noreshi* animal would suffer the same fate.

The soul aspect of the *noreshi*, however, can leave the human body at will and wander. Sickness results when the *noreshi* has left the body; unless it is brought back soon, the person will die. The *noreshi* is the vulnerable portion of the complete being, the part that is the target of witchcraft and harmful magic. The shamans (*shabori*) wage constant war against the evil demons (*hekura*) of enemy groups who have been sent to capture the *noreshi* parts of children. They, in turn, send their own *hekura* to capture the *noreshi* of enemy children; the wars that take place between men who raid to kill are likewise carried over into the domain of the supernatural.

When sickness is deemed to be the result of soul loss, the people who are closely related to the sick person hunt for his *noreshi*. I participated in one of these soul hunts. Kąobawï's group had set up a temporary camp across the river from its main village site, as they suspected raiders would attack them. While they were camped in their temporary village, one of the children became ill, and her malady was thought to be caused by soul loss. When the threat of raiders passed, the temporary camp was abandoned and the group moved back into the main village.

The child's condition worsened, so a group of women and children returned to the temporary camp, suspecting that the *noreshi* had remained there. I went along and, with the others, cut a branch from a shrub and began sweeping the site and calling for the *noreshi* to return. We swept the entire area and converged at one point. Everybody was convinced that the *noreshi* had been herded into this central point. We then lured the *noreshi* back across the river and into the body of the sick child.

The vulnerability of the *noreshi* to magical spells is best examplified by the fact that the shamans of every village spend most of their time chanting to the *hekura* (demons) with the intention of persuading them either to attack the *noreshi* of other (enemy) children or to drive off the *hekura* sent by enemy shamans. Again, the Yąnomamö used two of their concepts of the soul to describe photographs and tape recordings. They were very hostile to me when I attempted to take photographs, especially of children, because

[12]The inheritance of these "alter-ego" animals has nothing to do with marriage rules and patrilineage exogamy.

11: Chagnon E-5 (1964-1968) 1968 SQ18 Yanoama SQ18

611 the village, the members of which being related to each other as brother and sister, and
602 the fact that individuals must marry outside their own lineages.
582 The important features of the lineages X and Y are now clearly visible in genera-
613 tion II: The lineages are patrilineal and exogamous. That is, males and females belong to the lineage of their father (patrilineality), and individuals must marry people who belong to a different lineage (exogamy). This can be seen more clearly in the symbols
601 used in Fig. 3-1. All males of lineage X are designated by triangles (x_1, x_2, x_3 . . . x_n), and all females of lineage X are designated by hexagons. Similarly, all males of lineage Y are designated as squares and all females by circles. Males of lineage X marry females of lineage Y. Their children belong to lineage X because their *father* (patrilineality) is of lineage X.

601 The Yąnomamö kinship system also reflects the rules of lineage exogamy, brother-
613 sister exchange and reciprocity. Their kinship system is called the "bifurcate merging"
582 type with "Iroquois" cousin terms (see Glossary). Within each generation, all the males of one lineage call each other "brother," and all the women call each other "sister." Males of lineage X call males of lineage Y "brother-in-law" and are eligible to marry their sisters. In fact, the males of lineage X call the females of lineage Y "wife" *whether or not they marry them.* This is likewise true for the males of lineage Y with respect to the females of lineage X. This brings us to another important Yąnomamö marriage rule: A male must marry a woman of the category called *nabëya*—"wife." This is called a *prescriptive* marriage rule.[2] To state it more precisely, Yąnomamö society is characterized by a rule that enjoins a man to marry a woman of a specific kinship category; he has no choice with respect to the category.

582 There is an important controversy over the meaning and implications of the term
•114 "prescriptive." I have given the definition held by British anthropologists generally,
128 by Needham (1962*a*:9) in particular. This definition emphasizes the fact that men have no choice with respect to the category of women from which their wives must come, that men are forbidden to marry women of other categories, and that the society itself is said to be characterized by the prescriptive rule. The opposition to this definition comes largely from certain American anthropologists, who maintain that a society can only be said to have a prescriptive marriage rule when a high percentage (close to 100 percent) of the people marry according to the rule (see Coult and Hammel 1963:291). The issues involved are not quite as simple as this, but a glimmering of the area of contention can be seen in an example provided by Leach (1965). Rephrasing his example, the rule (in our society) "thou shalt not kill" is like the rule (among, say, the Yąnomamö) "thou shalt marry a woman of category A." These rules can be said to exist in the respective societies irrespective of the homocide rate in New York or the frequency of aberrant marriages in a Yąnomamö village. That is, Leach (and Needham) maintain that one cannot discover such a rule by counting examples of murder (or, rather, "non-murder") or marriages of men to women of category A. The more basic issue, however, is the

[2]Professor Lévi-Strauss, who read an earlier draft of this chapter, quite correctly pointed out that to say a marriage system is "prescriptive" is to say no more than "a man must marry a marriageable female," which is a tautology. Nevertheless, we must have some way to distinguish a system that permits marriage with only a single category of women from those that permit marriage with women of several categories. By showing what is meant by the Yąnomamö category *nabëya*, as I have attempted to do in Fig. 3-2, the reader will gain some idea of what is meant by that marriage type. I have used the term "prescriptive" because it is the current usage.

11: Chagnon E-5 (1964-1968) 1968 SQ18 Yanoama SQ18

meaning of, in this case, "category A." It is customary to represent primitive kinship categories in models (for example, Fig. 3–1) by their closest biological equivalents in *our own kinship system*. Many critics of Needham's definition of prescription fail to appreciate the fact that *FaSiDa* and *MoBrDa* in a model like the one given in Fig. 3–1 represent just *two* of several kinds of kinswomen who fall into the prescribed category. That is, they interpret the native's kinship category from the narrow point of view of one of that category's biological meanings in *our own kinship system*. (I have given ten examples of actual Yąnomamö marriages in Fig. 3–2, discussed later, to illustrate what the categories FaSiDa and MoBrDa mean to the Yąnomamö.) The use of Needham's definition of prescription to characterize Yąnomamö marriage rules can be justified, therefore, on several grounds. First, the Yąnomamö assert that a man must marry a woman of the *suaböya* category. Second, of the six primary categories used by men to classify female relatives, five of them embrace women who stand in incestuous relationship to the male speaker, and he is forbidden to marry any woman that falls into any of these five additional categories. Third, we will see below how closely the alternative definition of prescription fits the Yąnomamö, using their own notions of kinship to reckon relationships between males and females.[3]

In Fig. 3–1, marriageable women are related to their husbands as both FaSiDa and MoBrDa; this is an artifact of the way in which the model is drawn. These two kinds of kinswomen are the closest biological equivalents in our kinship system for the Yąnomamö term "*suaböya*:" "wife." It must be emphasized, however, that given the classificatory nature of the Yąnomamö kinship system (for example, men of the same generation and of the same lineage are "brothers"), there are several ways to be related to a woman as "wife."

Something new has happened in generation III. A man (w_1) from a distant village, along with his sister, has joined the group. Both he and his sister have married into lineage X. Thus, there are three lineages represented in the village (W, X, and Y), and the *dual organization* characterizing generations I and II is now lost.[4] A Yąnomamö village can incorporate new lineages into its social life by an extension of marriage ties to its members. As can be seen from Fig. 3–1, the same rules—exogamy, reciprocity, patrilineal descent, and brother-sister exchange—that characterize the behavior of the members of lineages X and Y also hold for the members of the new lineage, W. The incorporation of lineage W takes place this way. W_1 joined the village in 1928 (generation III) because x_3 and x_4 promised him one of their sisters. As shown in Fig. 3–1, he did, in fact, marry one of their sisters and gave, in exchange, one of his sisters to x_3.

This (potentially) brings about an important structural change in the village with

[3]For an excellent summary of the various arguments concerning "prescriptive alliance," see Maybury-Lewis 1965a.

[4]A society is said to have dual organization when, for example, it is comprised of two intermarrying kinship groups, such as lineages X and Y in generations I and II of Fig. 3–1. In some societies the intermarrying kin groups are named, for example, "Bear Clan (or Moiety)" and "Thunderbird Clan (or Moiety)." The Yąnomamö do not have named kinship groups such as this. Dual organization is, however, implied in their kinship terminology and marriage rules and, as will be seen, villages tend to have two (and only two) politically dominant lineages that intermarry. In short, the Yąnomamö village tends to be comprised *in fact* of two dominant kinship groups but lacks some of the ideology, such as named pairs of intermarrying kin groups, of classical dual organization. See: Maybury-Lewis, 1960 and 1967; Lévi-Strauss, 1963, Chapter VIII; Nimuendajú and Lowie, 1937; and Malinowski, 1926, for further descriptions and analyses of societies having dual organization.

11: Chagnon E-5 (1964-1968) 1968 SQ18 Yanoama SQ18

him to do a favor, whereas he could ask this of a brother-in-law.[6] As shall presently be seen, the dynamics of Yąnomamö social organization originate in the politics of obtaining a wife. Within this context, agnates are competitors and affines are allies. This has an important effect on the manner in which villages fission and form new groups. The point to remember at this juncture is that ties of marriage are in many cases stronger than ties of blood.

I emphasize this because many anthropologists argue from "first principles" that ties of blood are—by definition—more capable of promoting solidarity and amity than ties by marriage. The controversy over "complementary filiation" between E. R. Leach (1957) and M. Fortes (1959), still not satisfactorily resolved, was essentially a debate about the analytical significance of marriage ties. Focusing on only one of the issues and rephrasing the arguments so as to apply to Fig. 3–2, the debate ran something like this: Both Leach and Fortes seemed to agree that in societies having lineal descent groups (lineages), the descent groups would tend to fall apart unless some kind of tie bound the members to each other. That is, lineages X and Y of Fig. 3–2 would, in short, pull away from each other unless they were held together by some special social tie. Fortes argued that this special tie was the solidarity and amity that grew out of the cognatic (see Glossary) kinship ties between the two lineages which arise when individuals marry blood relatives. Looking at generation V, for example, Fortes would argue that lineages X and Y are bound to each other because x_8 and y_5 married women to whom they are related by blood (as FaSiDa and MoBrDa). He argues from first principles that solidarity emanates from the blood ties. Leach, however, states that in generation V the two lineages are bound to each other by obligations to reciprocate goods, services, and women and that the solidarity of the two lineages derives from the affinal ties themselves (shown as "15" and "16" in Fig. 3–2). If we look only at generation V, the argument cannot be resolved, since the data support both arguments equally well, or at least do not convincingly support one rather than the other. I might add that both arguments can be supported by data not given in Fig. 3–2; Fortes' arguments are supported, for example, by the additional fact that Yąnomamö men do not stringently have to avoid their mothers-in-law when they are related to them in the fashion shown in Fig. 3–2, whereas the avoidance taboo is very onerous when a man's mother-in-law is not a blood relative. If, however, attention is focused on the events of generation III and their consequences examined, it can readily be seen that the affinal (marriage) ties in generation V are stronger than some of the agnatic (blood) ties, and the latter break when the village fissions. (This can be even more readily seen in Fig. 3–4 and 3–5, discussed later.) Thus, it cannot be argued that Yąnomamö lineage solidarity derives exclusively from blood ties and "complementary filiation." There is another issue. Structural analyses depend in large measure on a sharp distinction between marriage (affinal) ties and blood (consanguineal) ties. Fortes seems to deny that affinal ties as such exist independently of blood ties, and he has "subsumed" them into his concept of "complementary filiation." If there is no such thing as affinal ties between lineal descent groups, then structural

[TEXT CONTINUED ON PAGE 61]

[6] In addition, it is by no means rare for agnates to get into club fights over women. I even have recorded a number of cases of men shooting and killing a "brother" during raids. This happened on two occasions during my first stay in the field, and I have reports of several additional cases obtained from informants who were describing past raids.

11: Chagnon E-5 (1964-1968) 1968 SQ18 Yanoama SQ18

analysis of reciprocal marriage exchanges between such groups and the obligations implied in such exchange is seriously hampered. In short, if Yąnomamö marriage exchanges over a number of generations and the kinship basis of village fissioning are examined, the data support Leach's arguments. They do not, however, invalidate Fortes' argument that blood ties create some solidarity, but they do call into question the contention that blood ties by definition, or, rather, on "first principles," account exclusively for the solidarity occurring between lineages.

In summary, Fig. 3–1 represents a number of important features of Yąnomamö social organization. First, people reckon descent through males and are grouped into exogamous, patrilineal lineages. These are called *mashi* by the Yąnomamö, although none of them bear distinctive names.[7] Second, members of these lineages tend to intermarry with the members of a second lineage over a number of generations, being bound to them by obligations to reciprocate women in marriage. This results in a dual organization of kinsmen within the village, whose residents fall into one or the other of the two lineages. Third, new lineages can be incorporated into the village by an extension of marriage ties, potentially bringing about "structural faults" within the lineages of that village. Fourth, men are obliged to marry a woman of a single, specific category, *suakörya*. This category defines a variety of women, two subcategories of which can be translated into the English biological equivalents MoBrDa and FaSiDa. Yąnomamö men prefer to marry women of these subcategories because they are relieved of much of the discomfort of avoiding their mothers-in-law.[8]

The ten partial genealogies shown in Fig. 3–2 show how the Yąnomamö actually marry. The genealogies have been selected with the intention of illustrating how the Yąnomamö reckon relationships between kinsmen in general, and between husband and wife in particular. All ten exemplify prescriptive marriage. They are more or less arranged in decreasing order of correspondence to our own biological concepts of kinship and illustrate the classificatory nature of their kinship system.

The people shown on these genealogies are (or were) real people. Many of the individuals in the examples are related to each other in such ways that all ten of the examples could be drawn as a single, unified genealogy.

The first eight examples are drawn from the village of Patanowä-teri; the last two are from Bisaasi-teri. In case J, for example, the fifth individual of the second generation is Kąobawä. To give a rough idea of the incompleteness of each genealogy, only one of Kąobawä's four marriages is shown and only one of his four children. None of his brothers and sisters are shown either, nor is the fact that he married a MoBrDa indicated.

Case A illustrates the identification procedure to be used in relating the genealogies to the text. There are three generations shown in case A; the first is symbolized by the Roman numeral I, the second, by II, the third, by III. Each individual in each generation is given a number; the number series runs from left to right and begins anew with 1 in each generation. Hence, every individual bears a generation number and a position-within-generation number. Case A illustrates the marriage of individuals III–1 to III–2;

[TEXT CONTINUED ON PAGE 63]

[7] *Mashi* means "species," "group," "cluster of similar things," and, in the context of kinship, "that group of people to whom I am related through males;" that is, "patrilineal kinsmen."

[8] I draw attention to the fact that the category is *prescribed*, but within it there are *preferences*. There are very few analyses of societies that have a prescriptive rule within which there are preferences, although Needham has devoted some attention to this interesting phenomenon (1962*a*, 1962*b*, and 1963).

11: Chagnon E-5 (1964-1968) 1968 SQ18 Yanoama SQ18

Monou-teri, Lower Bisaasi-teri, and Kąobawä's group. All their other neighbors, allied to the victims of the treacherous feast, relentlessly raided them. They were, in short, extremely dependent on Kąobawä's group and the two other villages related to Kąobawä's group.

Kąobawä and his followers have astutely finessed this situation in two ways. First, they have managed to coerce the two Shamatari villages into ceding women without reciprocating an equal number of their own in return. The men who have obtained Shamatari wives have, as well, managed to cut short their period of bride service in the Shamatari village. Conversely, Shamatari men who have been promised women of Kąobawä's group are pressed into very lengthy bride service, sometimes up to three years. Secondly, Kąobawä's group has prevented the two Shamatari allies from re-establishing friendly contacts with the other Shamatari to their southeast by chicane, threat, and intimidation. One of the two Shamatari allies, the Reyaboböwei-teri, has attempted a rapprochement with the Shamatari enemies of Kąobawä's group. In 1965, several months after I had been living in Kąobawä's village, Kąobawä's group managed to stage another treacherous feast for the old enemies by taking advantage of the renewed ties between the Reyaboböwei-teri and the enemies. They learned that the Reyaboböwei-teri planned to invite one of the villages to a feast, so they, along with the Monou-teri, Lower Bisaasi-teri, and Mǫmariböwei-teri, went to the feast in order to ambush the guests. The Reyaboböwei-teri, however, were reluctant to go through with the plan and warned the visitors about it. The visitors were en route to the village when word of the treachery reached them. This had the effect of creating even more difficulties for the Reyaboböwei-teri, for it is highly unlikely that they will succeed in gaining the confidence of their neighbors to the southeast. Nevertheless, some visiting between the groups still continues.[17]

The historical relationships between the villages helps account for the reasons behind contemporary alliance patterns. The discrepancy between marriage rules and actual marriage practice in Lower Bisaasi-teri is a result of the political advantages that group enjoys over one of its allies. It has used this advantage to gain a favorable imbalanced marriage exchange pattern, but one that is only temporary. The Shamatari are also shrewd in their alliance practices, and have succeeded in neutralizing their disadvantages by capitalizing on schisms between Kąobawä's group and Lower Bisaasi-teri. This has been done largely by confining their marriage exchanges to important men in the dominant lineages of Upper and Lower Bisaasi-teri. One of the Shamatari villages, Mǫmaribowei-teri, has restricted its exchanges to Lower Bisaasi-teri and Monou-teri, while completely ignoring Upper Bisaasi-teri. The other Shamatari village has given its women only to Upper Bisaasi-teri. This has resulted in the weakening of ties between the three villages of Upper Bisaasi-teri, Lower Bisaasi-teri, and Monou-teri, whose members are

[17] I plan to use these visiting ties to establish contact with the Shamatari villages in that area, none of which have had contact with outsiders. These uncontacted Shamatari, however, know who I am because I attempted to reach them in 1965. They subsequently sent a message out urging me to visit them, angry because my guides forced me to turn back on my first attempt. In 1966 they even sent an old man to Kąobawä's village by way of Reyaboböwei-teri with an invitation for me to visit them. I had already left Venezuela by that time. Most of the men in the two contacted Shamatari villages tried to prevent me from going by telling horrible tales of the treachery that awaited my visit, describing how the Shamatari will kill me. The truth of the matter is that they know that I will bring the uncontacted Shamatari machetes and axes that might otherwise be given to them. The headman of one of the uncontacted villages has a brother in Mǫmariböwei-teri. He privately conceded that no harm would befall me and offered to take me to visit in 1967. He was, unfortunately, bitten by a snake just before I arrived in March of 1967, and my plans were deferred until 1968.

11: Chagnon E-5 (1964-1968) 1968 SQ18 Yanoama SQ18

interdependency. The Yąnomamö cannot simply arrive at the village of a potential ally and declare that they need military assistance because of the raids of a superior enemy. Doing so would admit vulnerability and perhaps invite predation from the potential ally. Instead, they conceal and subsume the true motive for the alliance in the vehicles of *trading* and *feasting*, developing these institutions over months and even years. In this manner they retain an apparent modicum of sovereignty and pride, while simultaneously attaining the true objectives: intervillage solidarity and military interdependence.

Three distinct features of Yąnomamö trading practices are important in the context of alliance formation. First, each item must be repaid with a different kind of item: The recipient is under an *obligation* to repay his partner in a type of exchange called *no mruiba*. Secondly, the payment is delayed, a temporal factor in the trading techniques that is likewise implied by the *no mruiba*. The consequence of these two trading features is that one trade always calls forth another and gives the members of different villages both the excuse and the opportunity to visit each other; and once the trading starts, it tends to continue, for one village in an alliance always owes the other trade goods from their last confrontation. The third significant trade feature is the peculiar specialization in the production of trade items. Each village has one or more special products that it provides to its allies. These include such items as dogs, hallucinogenic drugs (both cultivated and collected), arrow points, arrow shafts, bows, cotton yarn, cotton and vine hammocks, baskets of several varieties, clay pots, and, in the case of the several contacted villages, steel tools and aluminum pots.

This specialization in production cannot be explained in terms of the distribution of natural resources. Each village is, economically speaking, capable of self-sufficiency. (The steel tools and other products from civilization constitute the major exceptions.) The explanation of the specialization must be sought, rather, in the sociological aspects of alliance formation. Trade functions as the social catalyst, the "starting mechanism," through which mutually suspicious allies are repeatedly brought together in direct confrontation. Without these frequent contacts with neighbors, alliances would be much slower in formation and would be even more unstable once formed: A prerequisite to stable alliance is repetitive visiting and feasting, and the trading mechanism serves to bring about these visits.

Clay pots are a good example of the specialization in labor that characterizes Yąnomamö production and trade. The Mǫmariböwei-teri (see map, Fig. 2–8) are allied to both Kąobawä's group and the people of a distant Shamatari village, the latter being mortal enemies of Kąobawä. When I first began my fieldwork, I visited the Mǫmariböwei-teri, specifically asking them if they knew how to make clay pots. They all vigorously denied knowledge of pot-making, explaining that they once knew how to make them but had long since forgotten. They explained that their allies, the Möwaraoba-teri, made them in quantities and provided all they needed, and therefore they did not have to make them anymore. They also added that the clay in the area of their village was not of the proper type for making pots. Later in the year their alliance with the pot makers grew cool because of a war, and their source of pots was shut off. At the same time, Kąobawä's group began asking them for clay pots. The Mǫmariböwei-teri promptly responded by "remembering" how pots were made and "discovering" that the clay in their neighborhood was indeed suitable for pot manufacturing. They had merely created

11: Chagnon E-5 (1964-1968) 1968 SQ18 Yanoama SQ18

undertake it if it meant getting rid of their first group of visitors, who, by this time, had spent nearly a week eating Kaobawä's produce.

On the morning of the feast three large pieces of bark from the *arapuri* tree were cut and brought to the village. These were made into troughs to contain the boiled, ripe plantain soup. All day long Kaobawä's younger brothers, who had returned from the hunt the day before, labored at cooking the enormous quantity of ripe plantains, pouring each boiling containerful into the trough as it was prepared.[3]

The plantains that Kaobawä had hung in his *shabono* roof a week before were now ripe. The young men who were preparing the soup would cut the bunches of plantains from the roof, split each fruit with their thumb, throw the two halves of the flesh into a cooking pot, and toss the skins onto a pile. They worked at this task from early morning until late afternoon, in addition to boiling a nearly equal quantity of green plantains, which provided the green vegetable food that customarily accompanies the presentation of meat. Yanomamö etiquette dictates that meat must be accompanied by vegetable food and vice versa.[4] It is an insult, for example, to offer someone meat without simultaneously offering a vegetable food with it. Peeling green plantains is a little more difficult than peeling ripe ones, which are very tough and brittle. The Yanomamö solve this problem, like they solve so many others, by using their teeth. Each plantain is bitten along its length several times, cracking the peel, which in turn is removed with the fingernails and further application of the dentition. On this particular occasion, two young men peeled, with their thumbs, enough ripe plantains to make approximately 95 gallons of soup, and, with their teeth, a sufficiently large quantity of green plantains to fill a dozen large pack-baskets.

In the morning on the day of the feast, Kaobawä went to the center of the village clearing where all could see him and proceeded to pull weeds. The clearing has to look presentable to the visitors, as it functions as the dancing plaza. As noted before, since Yanomamö headmen cannot directly order their followers to execute tasks such as these, they usually initiate them and hope that others will follow. By and by, a number of older men joined him, as well as a few women, and when a sufficient number of workers were pulling weeds and hauling them out, Kaobawä quietly retired to his hammock, from which he oversaw the food preparations and calculated the distribution of meat.

Excitement in the village grew conspicuously as the hours passed, and by noon there was a constant din of laughter and chatter, punctuated now and then with a shrill scream from some young man overcome with the thrill of the feast. Occasionally, the visitors would reply to the shouts, setting off a brief contest of screaming between hosts

---

[3]Kaobawä's group has access to aluminum pots now and uses them extensively in food preparations. Most Yanomamö groups still use crude clay pots, although these are being rapidly replaced by aluminum ware, which is traded inland to the more remote villages.

[4]The three vegetable foods considered to be suitable accompaniments for the meat presentation are: boiled green plantains, boiled *ruuhe* fruit, and cassava bread. A number of missionaries and a few scientific observers have identified the Yanomamö feast strongly with the *ruuhe* fruit (Zerries 1955; de Barandiaran 1966). If it is to be identified with any food, it should be called the "plantain feast," but to identify the feast with a food that sometimes (*ruuhe*) or invariably (plantains) accompanies it is to overlook the sociopolitical causes of the feast. *Ruuhe* is so unnecessary to the feast that it was served at only two of six feasts I attended. In short, the Yanomamö feast is a social and political event, not a harvest ceremony, and occurs independently of the abundance or availability of *ruuhe* fruit. *Ruuhe* fruit ripens in February, the peak of the dry season. It is only in the dry season that feasts can be held, because travel is difficult or impossible at other times of the year. The correlation of the ripening of *ruuhe* and feasting is rather more fortuitous than causal.

11: Chagnon E-5 (1964-1968) 1968 SQ18 Yanoama SQ18

they were about to release their arrows point-blank at Kaobawä's attackers, but when he and his aides turned them back, the crisis was over. The leaders of the visiting group rejoined the other men, some of whom had picked up glowing brands of firewood, and they backed out of the village, weapons still drawn, their way illuminated by those who were waving the brands.[7]

Kaobawä's group took no further action in this affair and was not invited to feast at Mahekodo-teri. Later in the year, their relationships worsened because of a club fight in yet another village, and for a while both groups threatened to shoot each other on sight. A temporary rapprochement developed after the club fight, when a group of raiders from Kaobawä's group met a group of hunters from Mahekodo-teri while en route to attack the village of one of their enemies. The men from both villages traded with each other and departed on friendly terms, the raiders abandoning their raid and returning to their village lest they be later ambushed on the way home by the Mahekodo-teri. They are presently on trading terms with each other, but their relationship is still somewhat strained and potentially hostile.

In general, feasts are exciting for both the hosts and the guests and contribute to their mutual solidarity. Under normal circumstances, allies that customarily feast with each other do not fight. Nevertheless, even the best allies occasionally agree beforehand to terminate their feast with a chest-pounding duel, thereby demonstrating to each other that they are friends, but capable of maintaining their sovereignty and willing to fight if necessary (Fig. 4–4). Kaobawä's group had a chest-pounding duel with one of its staunchest allies in 1966, as each had heard that the other was spreading rumors that it was cowardly. Of the six feasts I witnessed during the nineteen months I spent with the Yanomamö, two of them ended in fighting.

Any Yanomamö feast can potentially end in violence because of the nature of the attitudes the participants hold regarding canons of behavior and obligations to display ferocity.

Still, the feast and its attendant trade serve to reduce the possibility of neighbors fighting with each other at a more serious level of violence, and they contribute to intervillage solidarity and mutual interdependence.

[7] At this time, I was crouched in the house behind the line of bowmen, trembling in my boots.

11: Chagnon E-5 (1984-1988) 1988 SQ18 Yanoama SQ18

Although few raids are initiated solely with the intention of capturing women, this is always a desired side benefit. A few wars, however, are started with the intention of abducting women. I visited a village in Brazil in 1967 that had a critical shortage of women. A group of missionaries had moved into this village a few years earlier and learned of the treachery by which the group managed to obtain a number of their women. One of them gave me this account. The headman of the group organized a raiding party to abduct women from a distant group. They went there and told these people that they had machetes and cooking pots from the foreigners, who prayed to a spirit that gave such items in answer to the prayers. They then volunteered to teach these people how to pray. When the men knelt down and bowed their heads, the raiders attacked them with their machetes and killed them. They captured their women and fled.

Treachery of this kind, the *nomohoni*, is the ultimate form of violence. Kaobawä's group suffered a massacre in 1950, as I have mentioned earlier, but the treachery in this case was in revenge for a murder. Still, their assailants attempted to abduct women after the objectives of their treachery were accomplished. Had it not been for their greed to capture women, the massacre would have been even more complete. Many escaped because the assailants turned their attention to the women.

Generally, however, the desire to abduct women does not lead to the initiation of hostilities between groups that have had no history of mutual raiding in the past. New wars usually develop when charges of sorcery are leveled against the members of a different group. Once raiding has begun between two villages, however, the raiders all hope to acquire women if the circumstances are such that they can flee without being discovered. If they catch a man and his wife at some distance from the village, they will more than likely take the woman after they kill her husband. If, however, the raiders are near the village, they may flee without dragging a captured woman along, as the body of their victim will be discovered quickly and pursuit will be immediate. Hence, they do not take a chance on hindering their flight by dragging a reluctant captive with them. A captured woman is raped by all the men in the raiding party and, later, by the men in the village who wish to do so but did not participate in the raid. She is then given to one of the men as a wife. If the captured woman is related to her captors, she is not raped.

Most wars are merely a prolongation of earlier hostilities, stimulated by revenge motives. The first causes of hostilities are usually sorcery, murders, or club fights over women in which someone is badly injured or killed. Occasionally, food theft involving related villages also precipitates raiding. This was the cause of the first raids between Kaobawä's group and the Patanowä-teri; they split from each other after a series of club fights over women. Each group made a new garden and returned periodically to the old one to collect peach-palm fruit, a crop that continues to produce long after the garden itself has gone to weeds. Someone stole the peach-palm fruit belonging to a man in the other group, resulting in another food theft for revenge, a club fight, and then raiding, but it should be pointed out that the raiding came about only after a long history of disputes between the groups; food theft was merely the catalyst that finally initiated the hostilities.

The Yanomamö themselves regard fights over women as the primary causes of their wars. I was in one of the more remote villages in 1967, visiting with people I had met on my first field trip. The headman of the village, Sisiwä, coveted my British commando knife and kept begging me to give it to him. He wanted me to tell him all about the knife, its origin, history, and how often it had been exchanged in trades. When I told

11: Chagnon E-5 (1964-1968) 1968 SQ18 Yanoama SQ18

was killed in the incident. Manasinawä, his wife, and his daughter remained with Kąobawä's group, and he ultimately gave the daughter to Kąobawä for a second wife. Kąobawä still has her.

At this time, the groups, of Damowä and Kąobawä, respectively, were still at war with the Patanowä-teri, from whom they separated some fifteen years earlier. Damowä's group, after separating from Kąobawä's, attempted to make peace with the Patanowä-teri, as they were now vulnerable and could ill afford to remain on hostile terms with them. Damowä's group also made an alliance with the two Shamatari villages, which had given them cooperation when they staged the revenge treacherous feast discussed in the last chapter. For about five years relationships between Damowä's group and the Patanowä-teri were relatively amicable, but as the former's alliances with the Shamatari grew in strength, their relationship to the Patanowä-teri grew cool once again.

The Patanowä-teri then became embroiled in new wars with several villages on the Orinoco River and turned to Kąobawä's group for aid, hoping to patch up their old grievances and remain at peace. The first day I began my fieldwork marked the initiation of complete peace between Kąobawä's group and the Patanowä-teri: They were having a feast together in Bisaasi-teri. Damowä's group, the Monou-teri, were not participating in the feast, but a large number of men came anyway. They discovered a group of seven Patanowä-teri females outside the main village and could not resist the temptation: They forcefully took them back to Monou-teri. Later that day the Patanowä-teri men discovered that the women were missing, so they searched the neighborhood and found the tracks of the Monou-teri men at the site of the abduction, where signs of struggling abounded. The next morning they went to Monou-teri armed with clubs: They were bound to get their women back, but did not care to start another shooting war with the Monou-teri. They took five of the women away from the Monou-teri in a heated struggle, but had to pull back without the remaining two, unless they were willing to shoot to kill: The Monou-teri were determined to keep the other women at all costs.

The significance of this incident is this: The headman of Monou-teri realized that the Patanowä-teri would not risk getting into a shooting war with them since they already had more enemies than they could comfortably handle. Hence, this provided an excellent opportunity for the Monou-teri to abduct women with relatively little chance of getting shot in retaliation.

Damowä, the headman of Monou-teri, was angry because the Patanowä-teri had recovered so many of their women. He then threatened to ambush the Patanowä-teri when they left for home after the feast at Bisaasi-teri was over. The Patanowä-teri, in view of this, cut their stay short and left for home before the feast was over, hoping to avoid trouble with the Monou-teri.

Damowä was not satisfied, however, that he forced the Patanowä-teri to capitulate, leave for home, and not attempt to recover the two remaining women. He decided to raid them. In January of 1966 he and a party of men from Monou-teri raided the Patanowä-teri at the latter's village. They caught Bosibeei climbing a *rasha* tree, a prickly, cultivated palm that must be climbed slowly and with the aid of a pair of moveable stick frames in order to avoid getting pierced by the needle-sharp thorns that protrude from the tree's trunk (see Fig. 2–6). Bosibeei was almost to the top of the tree when the raiders caught him—he made an excellent target silhouetted against the sky. They shot and killed him with one volley of arrows as he reached for the fruits of the palm. One of

located the enemy, but Panowë refused to go any farther. When he turned back, so did the entire party.

The Monou-teri and Bisasi-teri raided against the Patanowë-teri six times while I lived with them, and each time the preparations for the raid closely followed the description given above. The Monou-teri returned to their producing site only when the jungle was inundated; only at that time could they raise without the support of their allies. The remainder of the year they had to take refuge with members of allied villages or expose themselves to the risk of being attacked by superior forces by remaining in their own producing garden.

The Monou-teri also raided the Patanowë-teri without aid from their allies. One of the raids was conducted near the end of the rainy season, and I was staying in their village at the time the raid was held.

A special ceremony took place the day before the raid. The gourds containing the ashes of the slain Dimowë were put on the ground in front of his brother's house.

know of several cases. Neither do we deny proven and concrete cases of attacks by the Indians on Creoles; we have certain proof of several. But, does not this same thing also occur among us in every city, town, or village?

53. In particular there is talk of the untamable wildness of the Siriana of the Paragua River and of the Motilón of the Zulia. As for the former, there is no doubt whatsoever that such butchers do not exist, as we were able to prove in the expedition made in the year 1940 and we reported this in an article published in the Boletín de la Sociedad Venezolana de Ciencias Naturales, Volume VIII, No. 53, to which we refer now.

As for the latter, what is certain is that they have trade relations with the Indians of the Tukuku River, with which statement at least half of the legend is destroyed, that part which says that the Motilón did not permit even dealing with or the approach of other tribes. And regarding their hate of Creoles and their aggressiveness, I refer to the judgment of Mr. Gsell, quoted by A. Jahn in his book, Los Aborígines del Occidente de Venezuela /The Aborigines of Western Venezuela/, page 99, where he says: "As for the temperament of the Motilón, Gsell's opinion is that he does not consider them dangerous whilst they have not been molested by the Creoles; so that their hostility towards the whites is always motivated by a spirit of revenge."

He himself says: "Creole peons are too cowardly and imprudent to be able to enter into dealings with the Motilón and when they have had the fortune to run across a plantation of yucca and plantain trees, made by the Indians, they pull up the tubers and cut the ripe fruit, in this way provoking their ire." While holding the same ideas as Mr. Gsell, we can add that, as we well know from the not short time spent living among the Indians and the not narrow circle of our observations, the abuses he denounces are the least; other much more important ones, which it is not necessary to name, have caused and do cause reprisal; and what is remarkable is

/V cont./

114 as well as by Herr Prof. Dr. José Antonio Benton, Herr Prof. Dr. Wilhelm Saake, S.V.D., Herr Harald Schultz and Frau Wilma, all of São Paulo.

I found helpful assistance in Manaus on the part of Herr Alipio Edmundo Lage, the head of the I. Inspetoria Regional do Serviço de Proteção aos Índios, as well as in the small German colony there on the part of the families of Prof. Dr. Harald Sioli, Kurt Polack, and Gerhard Lindemberg.

122 With profound gratitude I mention my kind friends, the
123 Surára and Pakidái Indians, who were so hospitable to me and indefatigably helpful in my work; they are primarily the ones who deserve credit for the successful outcome of the undertaking.
• [115] Above all the Surára chief Hewemão and his brothers Kurikayawõ and Inxinemá, my little interpreter Jibeauwõ (see p. 258), and the Pakidái chief Karemauõ and the war chief Porõhiwõ deserve special mention here.

I also owe much to my faithful servant, the Tukano /Tucano/ Indian Mateus Dias, a member of the Indian protection post Ajuricaba on the middle Rio Demini. He was an indispensable helper to me in all emergencies during these nine months.

/VI/ I am likewise very much indebted, however, to the Brazilian country people on the Rio Negro and on the Demini and Aracá rivers, as well as to the personnel of the Indian protection post Ajuricaba on the middle Demini and the mission station of the Salesians in Barcelos. No matter where I went, I was shown such hospitality as is scarcely imaginable. Mention should be made here above all of the Spanish planter, Manuel Antonio Gómez, of the Rio Aracá, and the German nun, Klara Jakob, of the Salesian mission in Barcelos, who devotedly nursed me during my attacks of malaria. Equal thanks are due the physicians and sisters in the Hospital de Isolamento "Emilio Ribas" in São Paulo, where, after my return, I was treated without charge for two months and cured of a serious liver infection.

114 I thank Herr Dr. Koch and Herr Müller of the Bayer branch
122 in Rio de Janeiro for the medicines they donated. This made it possible for me to help many sick Indians and caboclos and to alleviate my own sufferings.

/6 cont./

101 beyond the Uraricuera and the Parima range, respectively.
114 There can no longer be any doubt about the ethnic affiliation of this population. Koch-Grünberg was already of the opinion that in the case of the Xiriâna (Schirianá) and Waikâ (Waika) "it is not a matter of two different tribes, but merely of two divisions of one large nation" (25) (26). At the same place, however, the

25. Koch-Grünberg, 1922, p. 224.

26. Koch-Grünberg, 1923a, p. 290.

investigator expresses the conjecture, which was confirmed by the opinions of neighboring tribes, that the Waikâ represent merely a subdivision of the Xiriâna, "with whom they live either peaceably or in bitter enmity" (25) (26) /see the footnotes above/. Their isolation from other tribes is, according to Ourique, "an example of the instinctive precaution of the race against its own deterioration and its downfall" (27).

27. Ourique, 1906, p. 24.

101 In this connection there is a significant hint by the Surára chief,
619 according to which there are two powerful tribes within the
● [115] "Yanoamí nation" first the Xiriâna, who call themselves "Harateri," and secondly the Waikâ, who, however, are constantly warring. All the smaller tribes are on the side of either one or the other, but at the same time are obliged to pay tribute
[438] and render service in war (28). The Surára and Pakidái, the
[114]

28. With regard to the Xiriâna, Koch-Grünberg already mentions this vassal relationship (Koch-Grünberg, 1922, p. 226), and Métraux also refers to it (Métraux, 1948, p. 861).

chief told me further, are allies of the Xiriâna and occasionally

/7 cont./

114 inhabited by an old population living in a wholly primitive state.
174 The Aruak were said to have been subjugated later by the Karaiben /Carib/, who, in turn, met powerful resistance on the part of the warlike Xiriâna and Waiká (36). Elsewhere the same

36. Koch-Grünberg, 1923a, pp. 15/16.

investigator writes: "On the Merewari and upper Orinoco Karaiben live together with Arowaken, whereas the upper Uraricuéra and the Parima Range are entirely in the hands of the allophylian Schirianá and Wafka" (37). I, too, met neither Karaiben nor

37. Koch-Grünberg, 1922, p. 233.

Aruak tribes in the Demini-Aracá region.
114 131 174 On a tribal map of that region drawn by Nimuendajú (38),

38. This map is in the possession of the scientific division of the Serviço de Proteção aos Índios in Rio de Janeiro.

Xiriâna are given as the inhabitants of the Rio Demini, along with the date 1874. Rodrigues also reports that at the end of the nineteenth century members of this tribe lived both along the banks of that stream and along its tributaries, the Cuieiras and Mamimêu; from there they extended their roving expeditions as far as the Catrimani (39).

39. Rodrigues, 1885, p. 136.

173 115 [131] /8/ Today only one civilized Xiriâna family is living on the lower Demini as planters, but it no longer has any connection at all with its original, living fellow-tribesmen. This family, whose members speak Portuguese exclusively, told me that the region of the Demini has been the land of the Xiriâna from olden times. On account of frequent attacks on the part of the Waiká,

/8 cont./

however, they had withdrawn into regions remote from the river. Their last maloka on the Demini was taken over by a Waikâ tribe in 1934. This is the place where today the Indian protection post "Ajuricaba" is located, on the right bank of the middle Demini, just below the Cachoeira Auatsinaua (40) (41). In 1939, the

40. Holdridge visited the Xiriâna here in 1932. (Holdridge, 1933, p. 380.)

41. According to information which Nimuendajú obtained in Manaus in 1927 from a man named Domingos Campos, Aruak-speaking Indians on the Demini were supposed to have been called Xiriâna (Nimuendajú, 1955, pp. 150/51). This brings up all kinds of questions which are yet to be solved. Thus, there could have been an Aruak tribe of this name, for the shards which I found on the Demini, as well as the name of this river, indicate that members of that linguistic group once lived here. It might also be possible, however, that Aruak groups, after their subjugation by the Xiriâna, became assimilated with the latter. On the other hand, it is not impossible that individual Xiriâna adopted the Aruak language, and finally there still remains open the surmise that the Indians mentioned by Domingos Campos are not identical with the actual Xiriâna, but were merely called that by the caboclo population.

In the literature, the two tribal designations "Xiriâna" (members of the Aruak linguistic family) and "Xirianâ" (independent linguistic family) (Loukotka, 1942,

/8 cont./

175 According to statements of old palm-fiber gatherers on the
648 Aracá, no Indians appeared on this river from the end of the previous century to the end of the twenties of our century. During the months of October and November of the year 1927, palm-fiber gatherers on their way to their places of work saw for the first time small and relatively light-skinned Indians disappearing into the forest thickets. In December, 1927, and January/February, 1928, the settlements were attacked by Indians several times, but the palm-fiber gatherers always managed to put them to flight. During the forenoon of June 28, 1928, there was another attack during which two wives of rubber gatherers and a 12-year-old girl were abducted. After this abduction there was no further Indian attack. Not until 16 years later, in January, 1944, did six
[439] Indians appear, but this time with friendly intent. They called themselves Surára and wanted to barter for articles of civilization. Later they admitted that their tribe had carried out the earlier attacks. In reply to questions about the two abducted women and the girl, they said that they had died. /9/ The palm-fiber gatherers did not bear them any malice for their previous hostile attitude, for they were glad that they could now carry on their work without fear of the Indians.

439 The Surára cling to their old habits and customs and visit the palm-fiber gatherers only when they want to barter for knives,
• [115] axes, pots, etc. According to the statements of the chief of the Surára, they are forced by the Xiriána to barter with the palm-fiber gatherers, for they are obliged to deliver to them all the articles obtained (see also pages 157/163); the Xiriána themselves never have any contact with the civilized inhabitants.

648 In August of the year 1944 the Indian protection post founded in 1940 on the Rio Demini was visited for the first time by some Pakidái. At rather long intervals there have been further visits
[619] by various families of this tribe up to the present time. They, too, however, come at the request of the Xiriána and must hand over to them all the gifts.

Surára
Pakidái

/57 cont./

VII. Social Organization

1. General

619

In the case of the Surára and the Pakidái, these are sovereign tribes, who, however, live together in connubium. The same extends to the friendly Xiriána /Shiriana/, Pusebeweterf, Aramamesterf, etc.

648 161 [842] [164] [165] [726]

Although the Indians investigated by me have very little contact with palm-fiber gatherers or the personnel of the Indian protection post Ajuricaba on the Demini, their population is steadily decreasing for the following reasons: birth control; high infant mortality as a result of the lack of hygiene; diseases, chiefly measles epidemics (312), but also chicken pox and grippe;

> 312. In 1952/53, for example, a measles epidemic spread like a wave from the lower Amazonas as far as the Brazilian-Colombian border area and brought death to many Indians. (Statement by Herr Alipio Edmundo Lage, Inspector of Ia. Inspetoria do Serviço de Proteção aos Índios, Manaus).

● [115]

and frequent wars (313).

> 313. On the occasion of an attack on a hostile maloka, an attempt is made to kill all the men, young men, and boys, insofar as possible, while the women and girls are taken along as captives.

2. Names

551 162 [160]

The exact number of Surára at the time of my stay among them amounted to only 64 (314) and consisted of the following:

[114]

> 314. In the first reports of my investigations I erroneously gave the number as 42 (Becher, 1957a, p. 118; Becher, 1958, p. 157).

/113 cont./

526 between two men embracing each other, which is performed in a sitting position (see p. 233); the tug of war (see p. 244); and the throwing of wet earth at one another (see p. 244).

539

IX. Myths and Legends

[115] The following myths and legends were told me by the Surára chief Hewemãõ:

The Creation of the Yanomámi

The earth already existed and was full of plants and animals, but as yet was without human beings. But one day the first man, Uruhí, came out of the leg of the xiapõ, a small bird with black and yellow feathers similar to the japim. A short time later the bird-leg gave birth to a second man, then a third, a fourth, and finally a woman, Petá. These four men and the woman lived together in perfect harmony. Petá, to be sure, was the wife of Uruhí, the first-born, but the other three brothers also had the right to have sexual intercourse with her (552).

[835] 552. Among the Surára and Pakidái, the younger, unmarried brothers likewise have the right to have sexual intercourse with the wives of their elder brothers. Moreover, the members of both tribes believe that a woman is able to have strong children only if she has frequent intercourse with other men during her pregnancy.

[843]

After a year Petá gave birth to a strong, healthy boy who grew rapidly and called all four men "father" (553). The boy's

[801] 553. The Surára and Pakidái children also call the unmarried brother of their father, not uncle, but likewise father.

123 609 speeded them with threats of dubious efficacy as they retreated to a safe distance.

'*Ami*,' said the old man. We took him up in chorus and by evening the merriment reached its height, punctuated by the howls of the Shirians as they trampled our food supplies, grimacing over them like apes. The howling and shouting gradually gave place to something a little more musical; soon they were singing, and this in its turn excited them to dancing and stylised movements that were of great interest to us. Ami repeated anything we said, without hesitation. Sometimes the imitation was perfect, but for the most part our barbarous language tied his tongue up, so that he would be saying '*gweeno*' for '*oregano*' (wizard) and '*dirifichappa*' for '*aeroplano*', amid general hilarity.

By the time the Great Bear had appeared in the cold sky over the Sarisariñama, a certain madness had invaded us too, and in an innocent, unutopical sort of way we ran mildly amok. We got hold of the gun and fired shots into the air. This made the Indians jump for joy. Some of them started dancing and howling in a fine frenzy round and round the hut, sweating like pigs and led by Mouni armed with a big aluminium saucepan on which he kept up a rhythmic beat with a machete. The song and dance finished when the performers had no strength left, and no voice. The most dogged of them, however, even after they had flung themselves down on the benches, or on the ground, or lay stretched out on the table, still managed a last raucous imitation of the refrain they had learned from us: '*Parautapparche, che, che, che.*'

When morning came the men of Ami went off promising to return with bananas and sugar-cane: we undertook to purchase these, giving them in exchange those things which the women had vainly tried to lift from us. Then the long file of dirty dwarfs vanished among the trees, and with them our windsock which they had taken off its pole at some stage of the proceedings and were now carrying off as a trophy.

● [115] We learned more that same day about the 'windsock' from Luis Antonio, a Shirian speaking perfect Spanish who had come up the river with two other Indians: they didn't exactly inspire confidence, though he presented them as brothers.

'I saw one of the Obatiri Shirians wearing it,' he told us, giving the Ami men their proper name. 'He was running about in the woods with one leg on and one off.'

842
846 the male as continuing in importance not only after conception—at which stage, in our own positivist scientific view, the male role ceases to count—but for a certain period after the actual birth. The male, the cause, is still in the picture, according to the Indian mind, when the mother and child are living a normal life.

843
844 I had known other native peoples, and in regard to these Indian beliefs on the subject of childbirth, Luis Antonio confirmed what had already come to my [128] knowledge.

● [115] 'In order for the birth to be a success,' he told me, 'when the wife is five [225] months gone, the husband should stop eating peccary, snake or *carite* (the name given in Venezuela to the carnivorous fish known in Brazil as *piranha*), and the flesh of any animal of an aggressive nature.' (Here, principles of hygiene were mingled with elements of magic, as happens also in the more advanced [846] religions.) 'Then, before the birth, during the birth and after, the man must stay in the hammock without stirring, because any strain on his part, or any mishap that came his way, would affect the child and might have dire results.'

[562] The explanation sounds quite normal and natural once one admits the principle of continued causation in the man, the woman being regarded simply as a means. In fact there is no need for her to obey the injunction to stay in the hammock. She will continue her daily round until she feels 'something break inside her'. Then, with the midwife, she will hurry to the appointed place on the river-bank.

*123
844 I once had the chance of being present at a birth. I was with the Taurepan Indians of the Gran Sabana, and I watched hidden behind a cluster of Mauritius palm, where I could follow the principal stages of the proceedings. The woman, with her head tilted back, was seated on the clay bank in a sort of arm-chair shaped hollow which had been scooped out—whether naturally or made for the purpose I do not know. The midwife knelt at her feet, waiting. For some time both remained in this position. The woman kept giving little cries—but not really cries of pain. After a brief labour, the mother uttered one long howl which sounded to me like an 'u . . . u . . . uh' of rapture, and the midwife rose to her feet, holding up a tiny, mottled infant head downwards by the heels.

Still holding the baby by the feet, the old lady washed him in the river—with exactly the motions you might expect from a washerwoman giving the final rinsing to some heavy garment. I couldn't see the next step, but a few

6: Vinci T-5 (1950) 1959 SQ18 Yanoama SQ18
Sanema

to use our machetes to open up a fair-sized space so that we could drag the canoes up on to dry ground beyond the reach of possible floods. Behind the bamboos we could see traces in the undergrowth of an old track, which after crossing thirty-two hills and the length of the Aracoea river would lead us to a horde of howling ape-men, who cultivated cane for their arrows, and nothing else.

Uaremo had a young dove which he had caught alive on the way along the Merevari, and was looking after it. He gave it the affectionate name of Pipa. Sempronio helped him by looking for little berries, which the pretty little bird took greedily. The others were meanwhile busy putting up a shelter for the night and clearing a little more space around it, while Hashimo and Solituan went off to make a brief reconnaissance of the all but vanished track. Uaremo paid no attention to anything but his Pipa, calling its name softly and fondling it like a child.

A love for animals always seems strange among these Indians, and when it exists it is subject to the wildest caprice. For instance, a monkey, after being brought up among them with every sign of affection, will suddenly become a comic target for their blunt arrows and die a slow death from its wounds.

For the moment Uaremo was lavishing all his affection on Pipa, and when I accidentally trod on the bird, squashing it flat as a pancake, he turned on me instinctively, as if he was going to throw himself on me: the Guayca Indian in him had suddenly come out, roused by this offence against his love for the poor little dove crushed under the foreigner's foot. But suddenly his mood changed and without a word he picked up the squashed bird, under whose wings there was still a flutter of life, and threw it far off, with an air of disgust.

Sempronio watched the incident, laughing very quietly as he always did and looking up at me: he seemed to regard me as some sort of personal protector of his own. Then he went off in search of Pipa. Rolled up in a few leaves, the bird was put aside for his private cuisine.

Sempronio came from Auui stock. He was a mere boy, not fully developed, and he had joined us in this Samatari venture simply because I had told him to come. 'He doesn't want to come, but you want him to, so he comes'—these were the exact words into which Uaremo had translated Sempronio's brief remarks. And he came everywhere with us, even to the Samatari, who were considered by his own people—a good, smiling people, whose only remaining primitive trait lay in their inordinate passion for theft—to be monsters ready at

6: Vinci T-5 (1950) 1959 SQ18 Yanoama SQ18
Sanema

any moment to fall on human beings and devour them. With us Sempronio knew no fear, and he always wore a smile. He would run round our legs like a puppy, and was always ready to do things, taking on the heaviest tasks under the worst conditions. He ate with us. He ate purposefully and he went on eating. His voracity had to be seen to be believed, when you considered his slim delicate build. He ate our rations. Then he ate the special ones which the Indians prepared for themselves, and on top of that he ate an endless number of things which with great foresight he had collected on the way: grubs, honeycomb with brood cells, honey and all, small fish, worms, birds' eggs taken from the nest, frogs, young snakes, palm hearts from young palm trees—he ate everything with rapid and relentless mastication, cooking what could be cooked on the fire, and devouring the rest raw.

When he had eaten everything he would start a regular licking of his fingers, and of the leaves which might still be wet with the juices of whatever strange meats he had wrapped in them. Then he would prepare fresh delights with the innards of any game we ourselves had cooked, adding heads, claws, wing-sinews and any other odd tit-bits he could find. With a knife he would work on them like lightning. Each little delicacy was attacked at full speed, entrails were devoured, heads were crunched right up to the beak, claws cleaned of every shred of meat. Then came the time to inspect the bones we had thrown away. He split them with a knife, and if there was any marrow he could be trusted to suck it out. Finally, after a last careful lick of each finger in turn, Sempronio, the little fellow from the Shirian metropolis of Auxi, would go to roost in his hammock over the fire which wrapped him in its warm blanket of heat.

[P 96 - H]

114 and out of the Federal Territory of Amazonas, and to
122 Commander Dr. David Capriles of the Medical Section for assisting me in making these arrangements. I also wish to thank Dr. Armando Caballín T. of the Amazonas District of the Venezuelan Malaria Control Service (Malarialogía) for generously placing the facilities of that organization at my disposal, and for arranging the purchase and transportation of many of my supplies.

I am personally indebted to Dr. Marcel Roche, Director of the Venezuelan Institute of Scientific Research (I.V.I.C.), and to Dr. Miguel Layrisse, Chairman of the Physicpathology Department of that institute, for their cooperation in and assistance to my field work.

122. A number of Missionaries gave me invaluable assistance in the Yąnomamö language and generously placed the resources of their missions at my disposal. I particularly wish to thank Mr. James P. Barker and Mr. Cecil Neese of the New Tribes Mission, and Padre Luiz Cocco and Padre José Barno of the Salesian Mission for their generous aid.

116 I thank Kąobëwä, headman of Upper Bisaasi-teri, for
124 his assistance and cooperation in the collection of some of the genealogical data; without his aid my data would have serious gaps.

I wish to thank Dr. James V. Neel, Chairman of the Department of Human Genetics at the University of Michigan, for encouraging and personally supporting my field work, and for generously making departmental office space available

direction, and lies between the Mavaca River and a series of mountains. At a few points the Shukumöna-u may be reached from the Mavaca tributaries in less than a day's walk.

Early maps of Venezuela show the Siapa River extending nearly to the headwaters of the Orinoco River, as the Indians claim the Shukumöna-u does, and lying between the Mavaca River and the mountains that separate Brazil from Venezuela. I have therefore used a 1936 edition of a map published by the Venezuelan National Cartographic Office for the course of the Siapa River, which I take to be the Shukumöna-u of the Yanomamö. I have used more recent maps, also obtained from the same office, for the course of the Orinoco, and have drawn the Mavaca River from information I obtained from the Indians and my own exploration of this river up to the village of Iwahikoroba-tedi, which I unsuccessfully attempted to contact in September of 1965. Maps B and C, pp. 54 and 148, are based on these sources.

In reconstructing the history of the village movements, particularly in locating old habitation sites, I have relied on a few well-known geographical landmarks along the Orinoco River. Specifically, two large rapids have guided me; Penascal, above Rusmi-u (Shuwimöwi-bora in Yanomamö) and Raudal Guaharibo (Karibö-bora in Yanomamö) near the present village of Kashorawö-tedi.

I employed three sources of information to locate present villages. First, my own knowledge for those villages I personally visited. Second, information from James P.

126 Barker, a member of the New Tribes Mission, who visited a
361
• [145] larger number of villages in the course of the 15 years he
[179] has lived among the Yąnomamö. Finally, on information
[184] obtained from the Indians. Most of the Venezuelan Yąnomamö have not yet been contacted by outsiders, and informants' accounts necessarily must suffice to locate many of the villages. Thus, when I visited villages such as Mąmaribŏwei-tedi or Patanowä-tedi, I had the residents point in the direction of other, uncontacted, villages; I made compass readings of these bearings, noting also the number of "sleeps" required to reach these villages.

174 Fixing the location of old sites geographically was somewhat easier than determining the date of occupation of those sites. A limiting factor in my attempts to obtain
[502] detailed chronological movements of particular villages was the poverty of the Yąnomamö language in indicating numbers. The language can express only three numbers: one (moni, mahu, dahiabä), two (porakĕbä), and more-than-two (bruka). In establishing dates of specific events, therefore, I have relied almost exclusively on my estimates of the ages of the Indians. By noting also their places of birth, I was able to estimate the length of time each site was occupied before being abandoned.

175 In reconstructing portions of the history of the five villages I have been guided by two historically known events. One event was the arrival of James P. Barker at Mahekodo-tedi in September 1950, the first foreigner to make sustained

101 called nabä--"stranger" or "foreigners." Nabä have degenerated from an original Yąnomamö stock and are regarded, therefore, with some contempt by the Yąnomamö, an attitude that is further manifested in the language; Yąnomamö in linguistic usage requires an honorific pronoun whereas nabä takes the common pronouns.

[[29]] I adopt the term Yąnomamö to refer to the entire group whose geographical distribution is shown in Map A,[1] using the term in a linguistic-cultural sense to define the tribe. Others have adopted the same usage with minor differences in spelling.

Several of the above-mentioned terms, Sanema, Waika, and Shamatari deserve further discussion, as they are used either as self-designations or in reference to local groups of Yąnomamö occupying specific geographical areas.

The term Sanema (Wilbert, 1963) is used in the upper Caura River as a self-designation. In this dialect the [[94]] initial phone /y/ has been replaced throughout the language by /s/, Sanema thus being a local pronunciation of Yąnomamö.[2]

The term Shamatari is used by all the Yąnomamö Indians on the upper Orinoco River to refer to the congeries of villages that occupy the large area south of the Orinoco River and adjacent portions of Brazil. Ierries (1964:19)

---

[1] See next page.

[[85]] [2] Ernesto Migliazza, personal communication. According to Migliazza, the word Sanema is pronounced /Sanẽma/.

[TEXT CONTINUED ON PAGE 29]

Numerically, the Yąnomamö[33] are one of the largest unacculturated tribes in South America, having a total population that approaches 10,000 in both Venezuela and Brazil. Most Yąnomamö live in Venezuela, occupying the area drained by the upper Orinoco, Mavaca, Manaviche, Ocamo, Padamo and Ventuari Rivers in the state of Amazonas, and the headwaters of the Caura and Paragua rivers of Estado Bolivar. In several drainages (Paragua, Caura, Ventuari and Padamo) the Yąnomamö are in contact with other tribes speaking Carib languages (Makiritare and Arekuna or Taulipang), from whom the Yąnomamö have traditionally obtained steel tools in trade and from whom a number of culture traits have been borrowed. Zerries has painstakingly analyzed these traits in his 1964 work.

No systematic census has been made of the entire Yąnomamö language family, although James P. Barker was commissioned by the Venezuelan Government to compile a census of the Yąnomamö occupying the Amazonas territory of that country. By both actual head-count and estimates of village size for groups that topography prevented him from visiting, Barker presently estimates the Venezuelan Amazonas Yąnomamö population to be well over 7,000.[1]

The population in Amazonas is distributed in some 80 to 100 villages, averaging between 60 and 100 people per village.[2] Villages occasionally contain as few as 40 people

---

[1] Personal communication. See Zerries (1964:5) for a discussion of Yąnomamö population size. He concludes that the Yąnomamö are ". . . the largest yet unacculturated aboriginal group in tropical South America." (Ibid. My translation.)

[2] The relationship to warfare tactics and village size is discussed in detail in Chapter 4.

Table 2: Causes of death of 240 (adult) ancestors of the Namowei-tedi.

Stated Cause of Death[1]	Males	Females	Total	Percentage

Childbirth	0	3	3	1.2
Other	2	0	2	0.8
Totals:	138	102	240	99.9

1. These diagnoses were made by the Yanomamö. Some of the biological implications of these statistics have been brought to my attention by Dr. James V. Neel; I intend to discuss them in a later publication.

2. These deaths were probably due to such pathological causes as malaria. When malaria first reached epidemic proportions in some of the Yanomamö villages in the middle 1950's most of the deaths were attributed to the practice of harmful magic on the part of enemies.

3. This is a peculiar sickness associated with intense pains in the upper abdominal region; the pains may last several days. In most cases the Indians recover from this illness.

Mahekodo-tedi men and the victims of the 1950-51 treacherous feast, they succeeded in destroying Riakowë's village and garden, recapturing two of the women abducted by the Shamatari, killing three men, and abducting Riakowë's son.[1] They did not consider the raid a success because the Shamatari succeeded in killing one of the raiders. Again, in 1965 a joint raiding party comprised of Monou-tedi and Bisaasi-tedi men raided the Patanowë-tedi, killing one man. One of the Monou-tedi, Konoreiwë, was badly wounded by the Patanowë-tedi and almost died. The raid was only partially successful according to the raiders.

The tactic of ambush and retreat does not require the participation of large numbers of men. Raiding parties of 60 men, therefore, are somewhat less effective than raiding parties of 25-30 men, because raiding parties of this size usually involve the cooperation of two or more villages. Then, the organization of such large numbers of men is a problem, as each village will have its own leader, and therefore the contingency of raiders provided by allied villages in a joint raid has its own leadership. Thus, joint raids are invariably less effective because of the numbers of men involved and the difficulty of organizing them properly. The contingency of allies in a joint raiding party is less enthusiastic about the raid than the group from the aggrieved village, and if the enemy is not to be found at the site being

[1] Both Barker and my informants gave me an account of this raid. The two versions were identical.

Moiyowë had two wives, Borehima and her older sister, Kumaiema. Borehima thought she was being treated badly by her husband and deserted him, taking refuge with another man, Makerawë. Moiyowë attempted to get his wife back from Makerawë, precipitating a club fight between two factions of the village. During the club fight, Makerawë stabbed Moiyowë with the sharp end of his club, wounding him badly. This enraged the leader of Moiyowë's faction, Rakoiwë, who then attacked Makerawë, running him through with a sharpened club, killing him. Makerawë's faction fled from Patanowë-tedi and joined their relatives in Monou-tedi, knowing that the latter would welcome their assistance in future raids against the Patanowë-tedi. The Monou-tedi, assisted by the Patanowë-tedi refugees, raided the Patanowë-tedi two times shortly after the refugees joined them. On the second raid they caught two Patanowë-tedi men hunting outside the village. They killed one of them, but let the second one go, as he was Epabëwë's actual son by a previous marriage and they did not want to risk a war with the Bisaasi-tedi by killing this man, Shinahewë. In a recent letter from James P. Barker, I learned that a part of the refugee faction joined Bisaasi-tedi.

The woman over whom the internal feud started was taken away from Makerawë's group. Moiyowë cut both her ears off to punish her.

Fig. 1-3. Kaiwaiwä, the new leader, listens to (thought) a strange voice in the jungle.

I spent a good deal of time with these two men and their families and got to know them well. They frequently gave their information in a way which related themselves to the topic under discussion. We became very close friends. I will speak of them frequently in the following chapters, using them as "typical" Yąnomamö. If, indeed, one may speak of typical anything. I will briefly comment on what these men are like and their respective statuses in the village.

Kaiwaiwä is about 40 years old (Fig. 1-3). I say "about" because the Yąnomamö numeration system has only three numbers: one, two, and more-than-two. He is the headman of Upper Bisasi-teri. He has had five or six wives as for and temporary affairs with as many more women, one of which resulted in a child. At the present time he has just two wives, Bakimi and Kosamabima. He has had a daughter and a son by Bakimi, his oldest and favorite wife. Kosamabima, about 30 years old, recently had her first child, a boy (Fig. 1-4). Kaiwaiwä may give Kosamabima to his youngest brother. Even now the brother shares in her sexual services. Kaiwaiwä recently gave his third wife to another of his brothers because she was lonely. "horny." In fact, this girl had been married to two

11: Chagnon 8-6 (1964-1965) 1981 SCSS Yanomamo SCSS

115

other men, both of whom discarded her because of her infidelity. Kąpawrë had one daughter by her; she is being raised by his brother.

Kąpawrë's oldest wife, Bakimi, is about thirty-five years old. She is his first cross-cousin (see Glossary). Bakimi was pregnant when I began my fieldwork, but she killed the new baby, a boy, at birth, explaining tearfully that it would have competed with Arowë, her nursing son, for milk. Rather than expose Arowë to the dangers and uncertainty of an early weaning, she killed the new child instead. By Yąnomamö standards, she and Kąpawrë have a very tranquil household. He only beats her once in a while, and never very hard. She never has affairs with other men.

Kąpawrë is quiet, serious, wise, and unobtrusive. He leads more by example than by threats and coercion. He can afford to be this way as he established his reputation

Fig. 1-4. Kamakawë (Kąpawrë's younger) playing with playing with her son, who is holding a toy frog

11: Chagnon E-5 (1964-1968) 1968 SQ18 Yanomama SQ18

for being fierce long ago, and other men respect him. He also has five mature brothers who support him, and he has given a number of his sisters to other men in the village, thereby putting them under some obligation to him. In short, his "natural" following (kinsmen) is large, and he does not have to constantly display his ferocity. People already respect him and take his suggestions seriously.

Rerebawë is much younger, only about twenty-two years old (See Fig. 1-5). He has just one wife by whom he has had three children. He is from Karohi-teri, one of the villages to which Kąobawë's is allied. Rerebawë left his village to seek a wife in Kąobawë's group because there were no eligible women there for him to marry.

Rerebawë is perhaps more typical than Kąobawë in the sense that he is concerned about his reputation for ferocity and goes out of his way to act tough. He is, however, much braver than the other often his age and backs up his threats with action. Moreover, he is concerned about politics and knows the details of intervillage relationships over a large area. In this respect he shows all the attributes of a headman, although he is still too young and has too many competent older brothers in his own village to expect to move easily into the position of leadership there.

He does not intend to stay in Kąobawë's group and has not made a garden. He feels that he has adequately discharged his obligations to his wife's parents by providing them with fresh game for three years. They should let him take the wife and return to his own village with her, but they refuse and try to entice him to remain permanently in Bisasi-teri to provide them with game when they are old. They have even promised to give him their second daughter if he will stay permanently.

Although he has displayed his ferocity in many ways, one incident in particular shows what his character is like. Before he left his own village to seek a wife, he had an affair with the wife of an older brother. When he was discovered, his brother attacked him with a club. Rerebawë was infuriated so he grabbed an axe and drove his brother out of the village after soundly beating him with the flat of the blade. The brother was so afraid that he did not return to the village for several days. I recently visited his village with him. He made a point to introduce me to this brother. Rerebawë dragged him out of his hammock by the arm and told me, "This is the brother whose wife I had an affair with," a deadly insult. His brother did nothing and shrank back into his hammock, shamed, but relieved to have Rerebawë release the vise-grip on his arm.

Despite the fact that he admires Kąobawë, he has a low opinion of the others in Bisasi-teri. He admitted confidentially that he thought Bisasi-teri was an abominable group: "This is a terrible neighborhood! All the young men are lazy and cowards and everybody is committing incest! I'll be glad to get back home." He also admired Kąobawë's brother, the headman of Monou-teri. This man was killed by raiders while I was doing my fieldwork. Rerebawë was disgusted that the others did not chase the raiders when they discovered the shooting: "He was the only fierce one in the whole group; he was my close friend. The cowardly Monou-teri hid like women in the jungle and didn't even chase the raiders!"

Even though Rerebawë is fierce and capable of being quite nasty, he has a good side as well. He has a very biting sense of humor and can entertain the group for hours on end with jokes and witty comments. And, he is one of few Yąnomamö that I feel I can trust. When I returned to Bisasi-teri after having been away for a year, Rerebawë was in his own village visiting his kinsmen. Word reached him that I had returned, and

11: Chagnon E-5 (1964-1968) 1968 SQ18 Yanoama SQ18

he immediately came to see me. He greeted me with an immense bear hug and exclaimed, 115
"Shaki! Why did you stay away so long? Did you know that my will was so cold while you were gone that at times I could not eat for want of seeing you?" I had to admit that I missed him, too.

Of all the Yąnomamö I know, he is the most genuine and the most devoted to his [156]
culture's ways and values. I admire him for that, although I can't say that I subscribe to or endorse these same values. By contrast, Kąobawä is older and wiser. He sees his own [829]
culture in a different light and criticizes aspects of it he does not like. While many of his peers accept some of the superstitions and explanatory myths as truth and as the way things ought to be, Kąobawä questions them and privately pokes fun at some of them. Probably, more of the Yąnomamö are like Rerebawä, or at least try to be.

spent according to a schedule of work alternated with periods of rest. They would live in the Mahekodo-teri village for about three weeks at a stretch, resting from their gardening tasks, and return to their new gardens for about three weeks of intensive clearing and cultivation. Their plantings and seeds were provided by the Mahekodo-teri.[16] They carried their provisions from the Mahekodo-teri gardens while they worked at their new gardens, sending men back for more as these ran short. As soon as one of the new gardens was producing, they moved away from the Mahekodo-teri. The second garden was completed after their move, and the Monou-teri separated from Kąbowī's group. This was about 1954. During the time they lived with the Mahekodo-teri, they raided the Shamatari frequently, and were raided in return. The Shamatari ambushed and killed two Mahekodo-teri on one raid, causing the Mahekodo-teri to actively prosecute the war with the Shamatari to avenge these deaths.

Kąbowī's group abondoned the new site and moved to the Orinoco River shortly after the Monou-teri separated from them. They had established a garden on the Orinoco during the time that the Monou-teri were completing their own site. In short, the garden that was made while Kąbowī and his group lived with the Mahekodo-teri was simply a vantage point that permitted the group to take leave of its protectors as soon as possible, while they established gardens in more desirable locations.

Kąbowī's group moved down the Orinoco River in 1959–1960, after having lived at the new site only five years. This move was stimulated by the appearance of a government malaria team that established a small station at the mouth of the Mavaca River. Kąbowī's group moved across the river from them in order to be in a position to obtain steel tools from the newly arrived foreigners. Kąbowī's group fissioned again in the process of this move; the Lower Bisaasi-teri established a separate garden and built their own village just across the Mavaca River from Kąbowī's group. The fission was not complete, however, as both sections of Bisaasi-teri built a common village that they occupied during the dry season, when they conducted their feasts and went on raiding parties.

Kąbowī's group made contacts with a large Shamatari village, Paruritawä-teri, shortly after having moved to the mouth of the Mavaca River in 1959–1960. This village had fissioned from one of the Shamatari groups that participated in the treacherous feast in 1950 and was on semifriendly terms with it. Thus, Kąbowī and his group saw an opportunity to get revenge on their archenemies. They cultivated an alliance with the Paruritawä-teri and succeeded in getting them to participate in a treacherous feast. The Paruritawä-teri themselves were fissioning into two groups, so they made two new gardens southwest of Kąbowī's village in preparation for the treacherous feast. The feast invitation was sent (1960) to the unsuspecting Shamatari by the Paruritawä-teri. But many of them were sick, and only five men and four women ultimately came to the treacherous feast at Paruritawä-teri. Kąbowī and his followers, as well as the Monou-teri, secreted themselves outside the village while the Paruritawä-teri entertained the hapless guests inside. They managed to kill three of the five men and seized all of the women. The Paruritawä-teri abandoned their garden, anticipating the inevitable revenge raids and moved to the two new sites, fissioning into two groups of about 95 people.

This treacherous feast put the Paruritawä-teri in a very poor position. They were (and are) the westernmost Yąnomamö in the area, and their closest neighbors were the

[16]James Barker informed me of the schedule followed by Kąbowī and his group.

11: Chagnon I-5 (1964-1968) 1968 SQ18 Yanoama SQ18

original cause being quite irrelevant. Each of the principals in the dispute busily recruited aid from their allies. Kaobawë's group sent a delegation of young men to the village that took the woman away from the cruel husband.

When the cruel husband's incensed group and their allies arrived, about a week after the challenge, they entered their opponent's village and drove them out in a hail of spears. Many of them were wounded superficially, but one old man, not able to dodge missiles as well as he used to, suffered a bad wound and subsequently died. The victors stole all the hammocks, machetes, and cooking pots they could find and fled. The losers regrouped and gave chase, this time intending to escalate the fight to shooting. Some of them tied pieces of steel to their spears to make them more effective.

They caught up to the victorious group and another spear fight took place. This time tempers grew hot because one man in each of the fighting groups had managed to borrow a shotgun from the missionaries associated with the respective villages; these were repeatedly discharged over the heads of the fighters. The Yąnomamö had deceived the missionaries into loaning them two guns on the pretext of getting fresh game for the mission personnel. One of the shotgun-wielding Indians, standing at the front of his group, was struck by two sharpened spears. At this, he discharged his shotgun into the face of the headman of the other group, terminating the fight. The wounded man nearly died from the blast, but after many months of nursing by the missionaries he managed to recover. He still carries several balls of lead in his face.[1] Thereafter, the two groups were at war and raided each other with the intention of killing.

The Raid and Nomohoni

The raid is the next level in the scale of violence; this is warfare proper. The objective of the raid is to kill one or more of the enemy and flee without being discovered. If, however, the victims of the raid discover their assailants and manage to kill one of them, the campaign is not considered to be a success, no matter how many people the raiders may have killed before sustaining their single loss. Rerebawë told me of a raid he went on several years before I arrived. They managed to kill the headman of the village they raided, abduct his small son, and kill one more man as he fled to the village to recruit help. They were chased, but kept ahead of their pursuers for almost two days. Their pursuers caught up with them after dark on the second day and attacked them while they slept. They killed one man in his hammock, but in so doing, alarmed the others. A skirmish between the two groups developed, and the raiders managed to kill two more of their enemy in this struggle. Still, according to Rerebawë, the raid was not a good one because one of their own men was killed. The son of the slain headman was later shot by Torokoiwë, who presently lives in Monou-teri. The little boy was persecuted and tormented by the other children. Finally, Torokoiwë got sick of seeing this, so he shot the little boy as he was bathing in the stream.

---

[1] The members of two villages in contact with the missions occasionally borrow shotguns from the missionaries. The missionaries are very cautious about loaning the Yąnomamö firearms, knowing that these would be used in the wars. Shotguns are beginning to be rather common in Brazilian Yąnomamö villages, so the Indians there now have opportunities to make contacts with settlers and backwoodsmen and do not have to rely on missionaries for these weapons. This, however, is a recent development. Brazilian Yąnomamö, armed with these shotguns, have raided into Venezuela against villages that have not yet had any contact with outsiders.

The Sociology of the Waica
[Die Soziologie der Waika]

by Meinhard Schuster

Copenhagen: 1958
Proceedings of the 32nd International Congress of Americanists
Pages 114-122

Translated from the German by Shelton Hicock

Human Relations Area Files

1966

[Title page]

/114/

I shall describe to you in the following some aspects of the social structure of the same Indian tribe whose conceptions about the soul Herr Dr. Zerries has just discussed. The title, "Sociology," is too presumptuous, insofar as today I intend to deal with only the larger social units and thus touch upon only a small sector of the sociological field. I shall be able to present to you only raw expedition-material; the comparative arrangement of these data in South American cultural history will be the work of the next few months.

The Waika /Waica/ inhabit the upper Orinoco river region in southern Venezuela; their area of habitation, however, is not limited by the Sierra Parima, in which the Orinoco rises and which forms the mountain border with Brazil, but rather extends into Brazilian soil far beyond this mountain chain, about to the middle of the northern tributaries of the Rio Negro and Rio Branco. The Sierra Parima therefore is more the backbone of the living space of this Indian group, which, according to the best estimates, contains about fifty thousand persons and an area of about half the size of West Germany. According to external appearances, this region is counted as tropical rain forest; seasonal differences are only slight and are practically without influence on the life and culture of the people. The critical cultural importance of the forest lies in its isolating effect: between the habitation area of the Waika and the first mixed settlement there extends an almost uninhabited forest-belt several hundred kilometers wide, and since there is very little river traffic and as other means of transportation there are only onerously traversable Indian paths, the culture of the Waika has been able to remain almost completely pure. Only a few material things from our world have as yet found their way to them: a few machetes and axes, a few matches and fishhooks, which an American mission working from 1947 to 1955 under very difficult conditions and we ourselves brought along; since the Waika do not maintain any contacts of their own downriver, however, the barely begun acculturation process does not go on /115/ by itself, but ebbs away the moment the visiting whites leave Waika country.

/115 cont./

101
(197)

Thus the geographic situation of the Waika and their extremely limited contact with civilization are depicted in a few words. Because the name is simple and well-known, I have so far spoken only of the "Waika," but now it is time to make a more precise distinction when first we turn to the question of tribal organization. On Venezuelan soil this people is divided into three large groups, all of whom, disregarding slight differences, speak the same language and have the same culture. The Shidishana /Shiriana/ live north of the Ocamo, a northern tributary of the upper Orinoco; to the north their territory is bordered by the Cariban Makiritare, with whom the Shidishana have in many ways entered into a close economic and social symbiosis. Adjacent to the Shidishana on the south are the Waika proper (the name means "killer"); they inhabit the region between Ocamo and Orinoco and with a few of their villages extend over to the southern Orinoco bank. The large and completely unexplored region south of the Orinoco to the Brazilian border and beyond, however, belongs, at least in its northern part, to the Shamatairi /Samatari/, the "tapir people," who are one of the most primitive groups of this people, stand strictly inimically opposed to any contact, and thus do not show even the slight traces of acculturation that the Waika do. As far as I can see, there is no reliable information available concerning the population groups east of the Sierra Parima, and unquestionably the picture for the Venezuelan area from whose northeastern part another group, named Okomatairi, has been reported will be improved later. The terms Waika and Shidishana (or Shiriana) used in the literature as a collective designation for these culturally similar virgin-forest groups are not very suitable, since they refer to subgroups; on the other hand, the name Guaharibo used by foreigners does not belong to the language of this people and is recognized only by the Shidishana. The only name that encompasses all the subgroups and is understood by the natives themselves as a general term is the word "Yanoama," which means "voice of the house" and contrasts with "nabe," by which all foreigners are meant indiscriminately -- all who do not speak

/115 cont./

101 the language of the Waika, Shidishana, or Shamatairi, therefore the neighboring Indians as well.

Thus the term "Yanoama" refers to the cultural and linguistic identity; it does not have the least political aspect. There is no tribe of the Yanoama, nor is there any tribe of the Waika, the Shidishana, or the Shamatairi. At most one can speak of the "people"; but one must bear in mind that there is no institution, no office, that is representative of this people. Also the cognizance of this term in the thinking of the natives /116/ remains general and therefore inevitably vague, parallel to the small amount of geographical knowledge, which is limited to what they themselves have traversed, that is, as a rule, to the circle of the nearest villages, which are about one to two days' journey away from one's own.

101 621 Geopolitical thought, which would find expression in a more extensive political organization, is unknown to the Yanoama; their conceptual world revolves around the village.

The village is the unit in which one thinks and after which one names himself: when questioned a Waika will never answer that he is a Waika or a Yanoama, but rather will give his village name, say, "Bolitaotedi," whereby "tedi" (village), like the Spanish "pueblo," refers less to the settlement and more to the

829 people who live in it. It seems obvious that one is a Waika, for the slight contact with civilization has not yet led in their thinking to distinguishing their own culture from that of foreigners; the foreigner has remained an individual guest with peculiar habits and has not yet become the representative of a large, strange

101 621 world. It is not obvious, however, to which village one belongs; village membership is the decisive political and sociological characteristic of the individual.

361 Externally the village is a clearing in the virgin forest, usually oval in ground plan, with a large diameter from 30 to 100 meters;

[62] the houses line the edge of this clearing. On the average a village is inhabited by about 100 persons. The villages of the Shamatairi south of the Orinoco, however, are much larger; according to our

/116 cont./

361 scanty knowledge, their population varies between 200 and 300.
161 Whereas there in the unexplored south organizational forms for
[621] larger numbers of people have evidently developed, the sociological system of the Waika is organized for only the above-named figure of a hundred village inhabitants; a surplus of births is answered by village partition.

628 The politically independent villages are partners in war and peace and for trading and visiting, and the momentary, frequently changing relationships of the villages to one another give the political situation in Waika territory its stamp. Let us first look
721 at the hostile relationships. Affairs involving women are for the
[583] most part the cause of war; if a wife is sought in other villages, and if the offer is turned down, one resorts to abducting a woman. Once there has been bloodshed in quarrels originating from this, the war is self-perpetuating; the original cause has not been forgotten, to be sure, but because of its slight intensity in the conceptual world it in no way suffices as a motive for the continuation
726 of the war. Rather, what does not permit breaking the chain of attacks repeated at intervals of a few months, in which the enemy men are killed, but the women abducted, /117/ is ideas and analogous
728 to blood revenge. Concluding peace is possible only when there has been no bloodshed for a long period of time, and hostile relations
628 often last for generations. Thus Waika country is covered with a network of hostile relationships of varying degrees, and, picking a village at random, one can distinguish a series of villages that are friendly, benevolently indifferent, neutral, sympathetic with
[726] the enemy, and, finally, completely hostile. For no two villages, however, is this series completely identical; there are no extensive alliances; war is an affair of the individual village, and a friendly village is aided only if there are personal reasons for hostility. No Waika village is without an enemy, and because of the many crisscrossings of the degrees of relationships the political situation is extremely complicated. We therefore see that even on the broadest social plane -- that of the people as a cultural and linguistic whole -- there is a very pronounced

/117 cont./

628 tendency toward the independence of the next smaller parts acting on this plane and forming it -- namely, the villages.

These hostile relationships between the villages are external evidence of a centrifugal force in Waika culture seeking detach-
628 ment. The opposite tendency, the centripetal force toward bind-
574 ing the villages together, finds its expression in active intercourse
438 for trading and visiting. These trips, which are performed with such zeal that practically every second day there is some associa-tion with another village, from or to it, can be divided into sev-
438 eral groups, according to their purpose. First, trips purely for trade take place: each village prefers to produce or procure a certain article of the material culture so that it practically has a monopoly on it. One village supplies especially fine tobacco, another is favorably located in a place where much arrow-cane grows, a third produces pots because good clay is present in the vicinity, another is the supplier of hunting dogs for the neighbor-hood, and the village closest to us naturally barters primarily with European ironware. This formation of centers for specific goods naturally favored the development of commercial traffic; the trading itself is carried out over very long periods and thus resembles a gift-exchange behind which there is a certain amount
437 of compulsion. When one knows that the partner has more objects of a kind than he justifiably needs for himself, it is requested very urgently, and the one so entreated may not refuse, if he does not want to risk enmity and war -- he can, of course, get his revenge
[182] in his own way the next time. This system successfully prevents
556] any accumulation of capital; no Waika possesses noticeably more
565] than his neighbor; there are no social distinctions, and consequently no vertical classes.

628 Besides trade, the transmission of news, which proceeds in the
574 form of a /118/ ceremonial conversational-singing and not in
[203] simple dialogue, is also one purpose of such trips, as are wife-
[533] seeking and courting in other villages. As a rule all these trips
[584] are made by a group of men or young people who are guests for one or at most two nights in the strange village and then, after the trading has been done, oddly enough not until the last minute

574 628 /118 cont./ on the morning of departure, return to their own village. In contrast to this hastily accomplished visiting by small groups or even individuals, there is the migration of whole villages. During the 796) great palm-fruit festival, which takes place in February and of which I shall show you a film in a few days, the villages visit each other, which is often done in such a way that the two villages celebrate first in the settlement of the one and the other. The various above-mentioned purposes of this intervillage intercourse [184] are naturally combined in practice. The trading and visiting trips are responsible for the remarkable cultural unity of the Waika region, and the consciousness of this in the minds of the inhabitants. 574 On the other hand, in many cases they are the occasion and op- 721 portunity for quarrels and warfare; refusal to trade and refusal of 628 a girl lead at least to ill feeling, and, as was reported to us, neutral villages are sometimes invited to the palm-fruit festival solely for the purpose of attacking the men at a favorable moment in order to kill them and keep the women as booty. The language has a special word for this type of hostile act, and the procedure was described to us in detail, so there can be no doubt about its occasional occurrence.

628 In summary, the following may be said about the intervillage 182 relations presented in brief form. The balance between the two tendencies, the binding one and the separative one, both of which -- probably in correspondence to each other -- are expressed in remarkably vivid form, stamps the picture of the political organization in Waika country. The separative forces, in that they protect the detachment of the villages, prevent the formation of alliances on a wider scale, which could lead to political ascendancy, to regional groupings, to divisions -- in any case to a political unit extending beyond the village. Thus, in a cultural sense, these separative forces act indirectly in the same direction as the binding ones: both promote and maintain cultural homogeneity in a large territory. For since the individual villages are too weak to detach themselves from the leveling tensions /Verspannung/ with their neighbors, but, on the other hand, lasting, stable alliances cannot be achieved, political and cultural divisions

/118 cont./

628 are not feasible. The villages remain /119/ dependent on one
182 another in economic, sociological, and political respects, in connection with which the frequent change of partners guarantees the multiplicity of the contacts. Politically independent, with equal rights, and not anchored in any superordinate organization, the villages are the knots in a tightly woven network of active mutual relationships, in part of a positive kind, in part negative; the tension inherent in these relationships represents, on the one hand, the dynamic factor and, on the other hand, the stabilizing factor in the social life of the Waika.

621 Up to now I have used the term village as though it represented a stable unit; if we look at its internal structure, however, it turns out that this local body, the settlement community, very tightly united in itself, again is made up of individual groups which are distinguished from one another on certain occasions.
621 In many cases the festivals of human beings rather than their daily
796 life offer the opportunity to recognize the nature of their social
182 grouping: during festive occasions the community itself is represented and confirms this representation in ceremonial. Among
621 the Waika the ceremonial gift-exchange was the key to under-
431 standing the village structure. That is, after a successful large-scale hunt, in which the men of almost every house take part, it is customary to exchange baskets of roasted meat and a few bananas within the village. This exchange takes place, however, not between the individual houses, but between groups of houses: no baskets of meat are exchanged within the same group of houses, but rather only to and from the houses of the other groups. The village investigated by us was divided, according to the paths of exchange, into three groups of houses, which -- perhaps by chance -- were arranged in strips: on both sides of the oval several houses were combined in a group, and the two houses opposite each other in the middle likewise did not exchange gifts.
621 Now the next step must be to look at the reflection of the
611 sociologically inadequate term "group of houses" on the kinship level: the members of the individual groups of houses are to be characterized, according to their kinship relations, as bilateral and bilocal groups of families.

/19 cont./

000 and bilocal groups of families. The group of families -- the
621 multiplicity of relationships permits no other designation --
931 is therefore the next smaller constituent element of the village unit; to be sure, the ceremonial gift-exchange emphasizes the subdivision of the village, in that it underlines the affiliation of the partner to one of the two other groups of families, but, on the other hand, also joins the three groups of families as common inhabitants of the same village.

It might now seem that the group of families, which appears in the gift-exchange as a functional unit, is only a chance conglomeration of nuclear families and thus of minor importance.
621 It comes into operation, however, on another decisive occasion,
166 namely, in connection with /120/ the migratory movements, which I shall sketch for you in a few words. The inhabitants of a
[361] village never remain longer than about three to four weeks in their
[342] main village, that clearing in the virgin forest with relatively permanently built houses; then they leave home for a period at least equally long, but seldom farther away than one to two days of travel, and build themselves in a favorable spot in the forest a row of small, triangular huts which are just large enough to provide room for a nuclear family, i.e., the parents and their unmarried children. The new place is chosen according to the
262 possibilities that it offers for gathering forest fruits and for hunting;
245 nevertheless economic reasons are not actually the cause for this
194 migration, for even during this period they continue to live from
166 the very fruitful banana planting near the main village. About every ten days a group of men go and fetch additional supplies of bananas, which the Waika today use for about 90 per cent
[222] of their diet. To be sure, during this forest period they live on
[224] gathered fruits and by hunting more than they do in the main village, and we shall therefore hardly go wrong in assuming that there are involved in these short-term forest sojourns traditionally preserved reminiscences of the era of pure hunting for wild food on the part of the Waika, undoubtedly still not very far in the past.

/120 cont./

621 166 241 These periodically recurring radial movements from a fixed center (the village with its planting) do not affect, in sociological respects, the substance of the village: normally the whole village migrates. In this respect, however, it is different with regard to a second type of village movement, which is not characterized by the going back and forth of the short forest-sojourns, but rather takes place over longer periods of time and only in one direction. The Waika live only about five years from one planting and then move to a new one laid out beforehand, which is usually about a day's journey away. Practically every village known to us has an old and a new planting, for since the chonta palm (Guilielma gasipaes), still cultivated today and useful in many ways, has a different life span than the various types of bananas, overlapping in the utilization of the plantings cannot be [173] avoided. If a newly established planting is bearing enough bananas, the whole village is moved to the new planting; the names and the site of earlier plantings are remembered exactly, however, so that from this the history of each individual village, i.e., its shifting in Waika territory, and consequently the history of the Waika themselves in their territorial aspect, can be reconstructed for two to three generations. Such a move to a new place, however, is also the occasion for changes in the composition of the village, for a split as a rule, for in the meantime, because of the enormous /121/ surplus of births, which the Waika have to register today, the village has grown far beyond the limit of the number of persons that can be governed well under their institution-poor system. The partition of the village is not done at discretion, but exactly along the lines of separation indicated by the above-mentioned composition by groups of families. One or more groups [431] of families are the bearers of the new villages, and the memory [182] of the way the new village was founded by the union of several groups of families is ceremonially represented as shown, in the gift-exchange.

621 166 161 193

/121 cont./

Therefore two types of nomadism are superimposed on each other in the migratory movements of the Waika: the nomadism of the very active hunting for wild food, which is represented today as a radial movement from an agricultural central-point, stamps the annual cycle, whereas the agricultural village-move, which follows the fields cleared by burning, occurs in a cycle of a few years and has a greater spatial range than the wild-food forays. To express it in a different manner: a wild-food nomadism more restricted spatially and temporally fills out the periods of the more extended agricultural migrations. Even at the ends of these periods, when both cycles overlap, they are felt by the Waika to be quite different matters and not mutually substitutable: after they have worked for a time in the new, scarcely begun planting, and the external reasons for a forest sojourn (such as change of living place and more favorable possibilities for gathering and hunting) are assuredly present, they still move off once more in the traditional manner to another place in the forest -- the laying out of a new plantation, even with the great similarity of external circumstances, is basically different from the forest life of hunting for wild food and in no way a substitute for it.

The short sojourns in the forest are, as was said, usually made by the whole village, whereas with the laying out of new plantings the group of families comes into the foreground as the working unit. One might conclude from this fact that the formation and the sociological importance of the groups of families is connected with the introduction of agriculture. I should like to make the opposite conclusion, however, that merely the old wild-food settlement-unit has maintained itself in these groups of families in the present larger agricultural village-society. The relationship of the groups of families to hunting for wild food is clear from the fact that the gift-exchange carried on by the groups of families is quite predominantly an exchange of meat, to which a few roasted bananas are added, and can only take place after a hunt.

Thus the sociological findings regarding the larger social units of the Yanoama reflect the picture of the other cultural

/121 cont./

105 621 182 realms of this people: /122/ elements related to hunting for wild food, such as the group of families connected by kinship in various ways, for which, in accordance with its structure, one could probably use "roving horde" or similar terms, have held their ground and actively maintained themselves against those forms connected with agriculture and sedentariness, in our case the permanent village society. The Waika are now just at the point where the high economic preponderance of cultivated plants is beginning to make corresponding changes in the noneconomic cultural spheres.

[P.114]

DIE SOZIOLOGIE DER WAIKA

Meinhard Schuster, *Frankfurt a.M.*

Aus der sozialen Struktur des gleichen Indianerstammes, dessen Seelenvorstellungen Herr Dr. Zerries soeben behandelt hat, will ich Ihnen im folgenden einige Aspekte schildern. Der Titel »Soziologie« aber ist insofern zu anspruchsvoll, als ich mich heute nur mit den grösseren Sozialeinheiten befassen will und deshalb nur einen kleinen Sektor des soziologischen Feldes berühre. Ich werde Ihnen nur rohes Expeditionsmaterial vorlegen können; die vergleichende Einordnung dieser Daten in die südamerikanische Kulturgeschichte wird die Arbeit der nächsten Monate sein.

Die Waika bewohnen den Flussraum des oberen Orinoco im südlichen Venezuela; ihr Wohngebiet wird aber nicht durch die Sierra Parima begrenzt, in der der Orinoco entspringt und die das Grenzgebirge nach Brasilien bildet, sondern greift weit über diesen Gebirgszug hinaus auf brasilianischen Boden über, etwa bis in die Mitte der nördlichen Zuflüsse von Rio Negro und Rio Branco. Die Sierra Parima ist also vielmehr das Rückgrat des Lebensraumes dieser Indianergruppe, die nach den besten Schätzungen etwa fünfzigtausend Menschen umfasst und eine Fläche von der halben Grösse Westdeutschlands in Besitz hält. Der äusseren Beschaffenheit nach zählt dieses Gebiet zum tropischen Regenwald; jahreszeitliche Unterschiede kommen nur schwach zum Ausdruck und sind praktisch ohne Einfluss auf Leben und Kultur der Menschen. Die entscheidende kulturelle Bedeutung des Waldes liegt in seiner isolierenden Wirkung: zwischen dem Wohngebiet der Waika und der ersten Mischlingssiedlung dehnt sich in einer Breite von mehreren hundert Kilometern ein fast unbewohnter Waldgürtel, und da der Flussverkehr sehr gering ist und an sonstigen Verkehrsmöglichkeiten nur schwer begehbare Indianerpfade zur Verfügung stehen, konnte sich die Kultur der Waika fast gänzlich rein erhalten. Nur wenige materielle Dinge aus unserer Welt fanden bisher ihren Weg zu ihnen: ein paar Macheten und Äxte, ein paar Streichhölzer und Angelhaken, die eine von 1947 bis 1955 unter sehr schwierigen Umständen arbeitende amerikanische Mission und wir selbst mitbrachten; da aber die Waika von sich aus keine eigene Verbindung flussabwärts unterhalten, trägt sich der kaum begonnene Akkulturationsprozess

1: Schuster SQ18 Yanoama

nicht von allein weiter, sondern verebbt in dem Moment, da die besuchenden Weissen das Waikaland verlassen.

So stellen sich in kurzen Worten die geographische Situation der Waika und ihr äusserst spärlicher Kontakt zur Zivilisation dar. Der Einfachheit und der Bekanntheit dieses Namens wegen sprach ich bisher immer nur von »Waika«, doch gilt es nun, wenn wir uns als erster der Frage nach der Stammesgliederung zuwenden, eine genauere Unterscheidung zu treffen. Auf venezolanischem Boden gliedert sich dieses Volk in drei grosse Gruppen, die, abgesehen von kleinen Differenzen, alle die gleiche Sprache sprechen und die gleiche Kultur besitzen. Nördlich des Ocamo, eines nördlichen Zuflusses des oberen Orinoco, leben die Shidishana; im Norden wird ihr Gebiet von den karibischen Makiritare umsäumt, mit denen die Shidishana vielfach eine enge wirtschaftliche und soziologische Symbiose eingegangen sind. Südlich an die Shidishana schliessen sich die eigentlichen Waika (der Name bedeutet »Töter«) an: sie bevölkern das Gebiet zwischen Ocamo und Orinoco und greifen mit einigen ihrer Dörfer auf das südliche Orinocoufer über. Das grosse und gänzlich unerforschte Gebiet südlich des Orinoco bis zur brasilianischen Grenze und darüber hinaus gehört aber wenigstens in seinem Nordteil den Shamatairi, den »Tapirleuten«, die zu den ursprünglichsten Gruppen dieses Volkes gehören, jeder Annäherung strikt feindlich gegenüberstehen und deshalb nicht einmal die geringen Akkulturationsspuren der Waika aufweisen. Über die Bevölkerungsgruppierung östlich der Sierra Parima liegen, soweit ich sehe, keine zuverlässigen Nachrichten vor, und ohne Frage wird sich auch das Bild für den venezolanischen Raum, von dessen nordöstlichem Teil eine weitere Gruppe namens Okomatairi vermeldet wird, noch verfeinern. Für eine Gesamtbezeichnung dieser kulturgleichen Urwaldgruppen sind die in der Literatur benützten Termini Waika und Shidishana (oder Shiriana) also nur wenig geeignet, da sie sich auf Untergruppen beziehen: der von Fremden benutzte Name Guaharibo hingegen gehört nicht der Sprache dieses Volkes an und wird nur von den Shidishana anerkannt. Die einzige Bezeichnung, die alle Untergruppen umfasst und von den Eingeborenen selbst als Oberbegriff verstanden wird, ist das Wort »Yanoama«, das »Stimme des Hauses« bedeutet und den Gegensatz zu »nabe« bildet, womit unterschiedslos alle Fremden gemeint sind – alle, die nicht die Sprache der Waika, Shidishana oder Shamatairi sprechen, also auch die benachbarten Indianer.

Der Begriff »Yanoama« ist demnach auf die kulturelle und sprachliche Identität bezogen; er besitzt nicht den mindesten politischen Aspekt. Es gibt keinen Stamm der Yanoama, es gibt auch keinen Stamm der Waika, der Shidishana oder der Shamatairi. Im besten Fall kann man von »Volk« sprechen; doch muss man dabei beachten, dass es keine Institution, kein Amt gibt, das eine Repräsentation dieses Volkes wäre. Auch die Bewusstheit dieses Begriffs im Denken der Eingeborenen

1: Schuster SQ18 Yanoama

bleibt allgemein und deshalb notwendig verschwommen, parallel zu dem geringen Mass an geographischer Kenntnis, die sich auf das selbst Erwanderte beschränkt, d.h. in der Regel auf den Kranz der nächsten Dörfer, die vom eigenen etwa eine bis zwei Tagereisen entfernt sind. Grossräumiges Denken, das in einer weiterreichenden politischen Organisation seinen Niederschlag fände, ist den Yanoama unbekannt; ihre Begriffswelt kreist um das Dorf.

Das Dorf ist die Einheit, in der man denkt und nach der man sich nennt: ein Waika wird auf Befragen nie antworten, dass er ein Waika oder ein Yanoama sei, sondern er wird seinen Dorfnamen angeben, also etwa »Bolitaotedi«, wobei mit »tedi« (= Dorf) ähnlich wie mit dem spanischen »pueblo« weniger die Siedlung als vielmehr die Menschen gemeint sind, die darin wohnen. Dass man ein Waika ist, erscheint selbstverständlich, denn die geringe Berührung mit der Zivilisation hat in der Vorstellung noch nicht zur Abhebung der eigenen Kultur von der der Fremden geführt; der Fremde blieb individueller Gast mit eigentümlichen Gewohnheiten und wurde noch nicht zum Vertreter einer grossen fremden Welt. Nicht selbstverständlich ist aber, zu welchem Dorf man gehört: die Dorfzugehörigkeit ist das entscheidende politische und soziologische Charakteristikum des Individuums.

Im Äusseren ist das Dorf ein Kahlschlag im Urwald von meist ovalem Grundriss und einem grossen Durchmesser von dreissig bis zu hundert Metern; die Häuser begleiten den Rand dieser Lichtung. Ein Dorf wird im Mittel von etwa hundert Menschen bewohnt; die Dörfer der Shamatairi südlich des Orinoco sind jedoch weit grösser: ihre Kopfzahl schwankt nach unserer geringen Kenntnis zwischen zwei- und dreihundert. Während man dort im unerforschten Südraum offenbar Organisationsformen für grössere Menschenzahlen entwickelt hat, ist das soziologische System der Waika nur auf die genannte Zahl von hundert Dorfbewohnern eingerichtet; Geburtenüberschuss wird mit Dorfteilung beantwortet.

Die politisch unabhängigen Dörfer sind die Partner in Krieg und Frieden, für Handel und Besuch, und die jeweiligen, oft wechselnden Beziehungen der Dörfer zueinander prägen die politische Situation im Waikagebiet. Betrachten wir zunächst die feindlichen Beziehungen. Den Anlass zum Krieg bilden in der Regel Frauenangelegenheiten: man wirbt in anderen Dörfern um Ehefrauen, und wenn diese Werbung abgewiesen wird, nimmt man seine Zuflucht zum Frauenraub. Sind in so entstandenen Streitfällen erst einmal Blutverluste eingetreten, so lebt der Krieg von sich aus weiter; man hat den ursprünglichen Anlass zwar nicht gerade vergessen, doch reicht er nach seiner geringen Intensität in der Vorstellungswelt keinesfalls mehr als Beweggrund zur Fortsetzung des Krieges aus. Was die Kette der im Abstand von wenigen Monaten wiederholten Überfälle, bei denen die feindlichen Männer getötet, die Frauen aber geraubt

1: Schuster SQ18 Yanoama

werden, nicht abreissen lässt, sind vielmehr blutracheähnliche Gedanken. Ein Friedensschluss ist nur möglich, wenn einmal längere Zeit kein Blut geflossen ist, und feindliche Beziehungen überdauern oft Generationen. So ist das Waikaland mit einem Netz von Feindschaftsverhältnissen verschiedenen Grades überzogen, und von einem beliebigen Dorfe aus betrachtet, kann man eine Reihe von befreundeten, wohlwollend indifferenten, neutralen, mit dem Feind sympathisierenden und schliesslich direkt feindlichen Dörfern unterscheiden. Für keine zwei Dörfer jedoch ist diese Reihe völlig identisch; man kennt keine ausgedehnten Bündnisfronten, der Krieg ist eine dorfindividuelle Angelegenheit, und man hilft einem befreundeten Dorf nur dann, wenn man selbst auch einen Grund zur Feindschaft besitzt. Kein Waikadorf ist ohne Feind, und durch die vielen Überkreuzungen der Beziehungsstufen ist die politische Lage ausserordentlich verwickelt. Wir sehen also, dass sich schon auf der breitesten gesellschaftlichen Ebene – der des Volkes als kulturell-sprachlicher Gesamtheit – eine Tendenz zur Unabhängigkeit der auf dieser Ebene agierenden und sie bildenden nächstkleineren Teile – nämlich der Dörfer – sehr lebhaft bemerkbar macht.

Diese feindlichen Verhältnisse zwischen den Dörfern sind das äusserliche Zeugnis eines zentrifugalen, die Vereinzelung suchenden Dranges in der Waikakultur. Die Gegenrichtung, der zentripetale Drang zur Bindung der Dörfer aneinander, findet in regem Handels- und Besucherverkehr seinen Niederschlag. Nach ihrem Zweck kann man diese Reisen, die so eifrig durchgeführt werden, dass praktisch jeden zweiten Tag eine Verbindung von oder zu einem anderen Dorf besteht, in mehrere Gruppen aufteilen. Zunächst finden reine Handelsreisen statt: jedes Dorf erzeugt oder beschafft sich mit Vorliebe einen bestimmten Artikel aus der materiellen Kultur, so dass es dafür fast ein Monopol besitzt. Ein Dorf liefert besonders guten Tabak, ein anderes liegt günstig an einem Platze, wo viel Pfeilrohr wächst, ein drittes produziert Töpfe, weil guter Lehm in der Nähe vorkommt, ein weiteres ist der Lieferant von Jagdhunden für den Umkreis, und das uns nächstgelegene Dorf tauschte natürlich in erster Linie mit europäischen Eisenwaren. Diese Schwerpunktbildung für bestimmte Güter begünstigte natürlich die Ausbildung eines Handelsverkehrs; der Handel selbst wird sehr langfristig durchgeführt und ähnelt damit einem Geschenkaustausch, hinter dem ein gewisser Zwang steht. Man bittet sehr dringend, wenn man weiss, dass der Partner mehr Gegenstände einer Sorte hat, als er billigerweise für sich selbst benötigt, und der so Gebetene darf, will er nicht Feindschaft und Krieg riskieren, nicht ablehnen – er kann sich ja beim nächsten Mal auf seine Weise revanchieren. Dieses System verhindert jegliche Kapitalbildung mit Erfolg; kein Waika besitzt merkbar mehr als sein Nachbar, man kennt keine sozialen Unterschiede und folglich auch keine Vertikalklassen.

Ausser dem Handel ist auch die Nachrichtenübermittlung, die in Form eines

1: Schuster SQ18 Yanoama

zeremoniellen Sprechgesangs und nicht in einfacher Rede und Gegenrede vor sich geht, ein Zweck solcher Reisen, ferner Brautschau und Brautwerbung in anderen Dörfern. Alle diese Reisen werden in der Regel von einer Gruppe von Männern oder jungen Leuten durchgeführt, die für eine oder höchstens zwei Nächte in dem fremden Dorfe zu Gast sind und dann wieder, nachdem eigentümlicherweise erst in der letzten Minute am Morgen des Aufbruchs der Handel getätigt worden ist, in ihr eigenes Dorf zurückkehren. Diesem hastig durchgeführten Besuchsverkehr von kleinen Gruppen oder auch Einzelgängern steht die Wanderung ganzer Dörfer gegenüber. Beim grossen Palmfruchtfest, das im Februar stattfindet und wovon ich Ihnen in ein paar Tagen einen Film vorführen darf, besuchen sich die Dörfer gegenseitig, wobei man oft so verfährt, dass die zwei nämlichen Dörfer zunächst in der Siedlung des einen und wenige Tage später dann in der Siedlung des andern feiern. Die aufgeführten verschiedenen Zwecke dieses zwischendörflichen Verkehrs werden in der Praxis natürlich miteinander verknüpft. Die Handels- und Besuchsreisen sind verantwortlich für die auffallende kulturelle Einheitlichkeit des Waikaraumes und deren Bewusstwerden in der Vorstellung seiner Bewohner; andererseits sind sie auch in vielen Fällen Anlass und Gelegenheit zu Streit und Krieg: Verweigerung des Handels und Verweigerung eines Mädchens führen mindestens zu Verstimmung, und man lädt, wie uns berichtet wurde, andere, neutral stehende Dörfer bisweilen nur deshalb zum Palmfruchtfest ein, um in einem günstigen Augenblick über die Männer herzufallen, sie zu töten und die Frauen als Beute zu behalten. Die Sprache kennt ein eigenes Wort für diese Art feindseliger Handlungen, und der Vorgang wurde uns in allen Details geschildert, so dass an seiner gelegentlichen Durchführung nicht zu zweifeln ist.

Zusammenfassend lässt sich zu den in kurzer Form dargelegten zwischendörflichen Beziehungen etwa folgendes sagen. Das Gleichgewicht zwischen beiden Tendenzen, der bindenden und der trennenden, die beide – wohl in Entsprechung zueinander – in auffällig lebhafter Form zum Ausdruck kommen, prägt das Bild der politischen Gliederung im Waikaland. Die trennenden Kräfte verhindern, indem sie die Vereinzelung der Dörfer schützen, eine Bündnisbildung breiteren Ausmasses, die zu politischen Übergewichten, zu Regionalgruppierungen, zu Teilungen – jedenfalls zu einer über das Dorf hinausgreifenden politischen Einheit führen könnte. In kulturellem Sinne wirken diese trennenden Kräfte damit indirekt in gleicher Richtung wie die verbindenen: beide fördern und erhalten die kulturelle Gleichartigkeit in einem grösseren Gebiet. Denn da einzelne Dörfer zu schwach sind, um sich aus der nivellierenden Verspannung mit ihren Nachbarn zu lösen, solide, langfristige Bündnisse andererseits aber nicht erreicht werden können, sind politische und kulturelle Sonderungen nicht durchführbar. Die Dörfer bleiben in ökonomischer, soziologischer und poli-

1: Schuster SQ18 Yanoama

tischer Hinsicht aufeinander angewiesen, wobei der häufige Partnerwechsel die Vielseitigkeit der Kontakte gewährleistet. Politisch unabhängig, einander gleichberechtigt und in keiner übergeordneten Gliederung verankert, sind die Dörfer die Knoten in einem engmaschigen Netz lebhafter gegenseitiger Beziehungen teils positiver, teils negativer Art; die diesen Beziehungen innewohnende Spannung stellt einerseits den dynamischen, andererseits den stabilisierenden Faktor im gesellschaftlichen Leben der Waika dar.

Bisher habe ich den Begriff des Dorfes immer so benutzt, als stelle es eine feste Einheit dar; betrachten wir aber seine innere Gliederung, so stellt sich heraus, dass auch der an sich sehr festgefügte Lokalverband, die Siedlungsgemeinschaft, aus einzelnen Gruppen besteht, die sich bei gewissen Gelegenheiten voneinander abheben. In vielen Fällen bieten die Feste der Menschen eher als ihr Alltag dazu Gelegenheit, die Beschaffenheit ihrer sozialen Gruppierung zu erkennen; bei festlichen Anlässen stellt sich die Gemeinschaft selbst dar und verfestigt diese Darstellung im Zeremoniell. Bei den Waika war der zeremonielle Geschenkaustausch der Schüssel zum Verständnis des Dorfaufbaus. Nach einer erfolgreichen Grossjagd nämlich, an der Männer aus fast jedem Hause teilnehmen, ist es üblich, dass man Körbe mit geröstetem Fleisch und wenigen Bananen innerhalb des Dorfes austauscht. Dieser Tausch geschieht nun aber nicht zwischen den einzelnen Häusern, sondern zwischen Häusergruppen: innerhalb der gleichen Häusergruppe werden keine Fleischkörbe getauscht, sondern nur zu und von den Häusern der jeweils anderen Gruppen. Das von uns untersuchte Dorf gliederte sich nach Massgabe der Tauschwege in drei Häusergruppen, die – vielleicht zufällig – in Streifen angeordnet waren: an den beiden Seiten des Ovals waren je mehrere Häuser zu einer Gruppe zusammengefasst, und die beiden in der Mitte sich gegenüberliegenden Häuser tauschten gleichfalls untereinander keine Geschenke aus. Der nächste Schritt muss nun der Spiegelung des soziologisch ungenügenden Begriffs »Häusergruppe« auf der verwandtschaftlichen Ebene gelten: die Bewohnerschaften der einzelnen Häusergruppen sind ihren Verwandtschaftsbeziehungen nach als bilaterale und bilokale Familiengruppen zu kennzeichnen. Die Familiengruppe – die Vielfältigkeit der Beziehungen erlaubt keine andere Bezeichnung – ist also das nächstkleinere konstituierende Element der Dorfeinheit; der zeremonielle Geschenkaustausch betont demnach zwar die Untergliederung des Dorfes, indem er die Zugehörigkeit der Partner zu einer der beiden anderen Familiengruppen unterstreicht, verbindet aber andererseits auch die drei Familiengruppen als gemeinsame Bewohner des gleichen Dorfes.

Es könnte nun scheinen, als sei die Familiengruppe, die im Geschenkaustausch als funktionale Einheit hervortritt, nur ein zufälliges Konglomerat von Kernfamilien und deshalb von minderem Belang. Sie kommt jedoch noch bei einem anderen entscheidenden Anlass zur Wirkung, nämlich im Zusammenhang mit

1: Schuster SQ18 Yanoama

den Wanderbewegungen, die ich Ihnen in kurzen Worten skizzieren will. Die Bewohner eines Dorfes verbleiben nie länger als etwa drei bis vier Wochen in ihrem Hauptdorf, jener Lichtung im Urwald mit relativ fest gebauten Häusern; dann ziehen sie für eine mindestens gleichlange Zeit auf Wanderschaft, jedoch selten weiter weg als eine bis zwei Tagereisen, und bauen sich an einem günstigen Platz im Wald eine Reihe von kleinen dreieckigen Hütten, die gerade gross genug sind, um einer Kernfamilie Platz zu bieten, d.h. den Eltern und ihren unverheirateten Kindern. Der neue Ort wird nach den Möglichkeiten ausgewählt, die er zum Sammeln von Urwaldfrüchten und zur Jagd bietet; dennoch sind aber nicht im eigentlichen Sinn wirtschaftliche Gründe der Anlass zu dieser Wanderung, denn man lebt auch in dieser Zeit weiterhin von der reich tragenden Bananenpflanzung nahe dem Hauptdorf: alle zehn Tage ungefähr kommt eine Gruppe von Männern und holt Nachschub an Bananen, von denen sich die Waika heute zu etwa neunzig Prozent ernähren. Allerdings lebt man während dieser Waldzeit stärker von gesammelten Früchten und von der Jagd als im Hauptdorf, und wir werden deshalb in der Annahme kaum fehlgehen, dass es sich bei diesen kurzfristigen Waldaufenthalten um traditionell bewahrte Reminiszenzen an die zweifellos noch nicht lange zurückliegende rein wildbeuterische Epoche der Waika handelt.

Diese periodisch wiederkehrenden radialen Bewegungen von einem festen Mittelpunkt (dem Dorf mit seiner Pflanzung) aus tasten in soziologischer Hinsicht die Dorfsubstanz nicht an: das Dorf wandert normalerweise gemeinsam. Anders verhält es sich in diesem Punkte aber mit einer zweiten Art von Dorfbewegung, die nicht durch das Hin und Zurück der kurzfristigen Waldaufenthalte charakterisiert wird, sondern sich in längeren Zeiträumen und nur in einer Richtung abspielt. Die Waika leben nur etwa fünf Jahre von einer Pflanzung und wechseln dann in eine vorher angelegte neue über, die im Regelfall etwa eine Tagesreise davon entfernt ist. Praktisch jedes uns bekannte Dorf hatte eine alte und eine neue Pflanzung, denn da die heute gleichfalls angebaute vielseitig verwertbare Shontapalme (Guilielma gasipaes) eine andere Lebensdauer hat als die verschiedenen Bananensorten, sind Überschneidungen in der Auswertung der Pflanzungen nicht zu vermeiden. Trägt eine neu angelegte Pflanzung genügend Bananen, so wird das ganze Dorf zu der neuen Pflanzung verlegt; man erinnert sich aber noch genau an die Namen und den Ort der früheren Pflanzungen, so dass daraus die Geschichte jedes einzelnen Dorfes, d.h. seine Verschiebung im Waikagebiet, und damit die Geschichte der Waika selbst in ihrem territorialen Aspekt für zwei bis drei Generationen rekonstruiert werden kann. Eine solche Übersiedelung an einen neuen Ort ist aber auch der gegebene Zeitpunkt für Veränderungen in der Zusammensetzung des Dorfes, im Regelfall für eine Spaltung, denn in der Zwischenzeit ist das Dorf durch den enormen Geburten-

1: Schuster SQ18 Yanoama

überschuss, den die Waika heute zu verzeichnen haben, wieder über die Grenze der mit ihrem institutionsarmen System günstig zu lenkenden Menschenzahl hinaus angewachsen. Die Dorfteilung erfolgt nun nicht nach Gutdünken, sondern genau entlang den durch die vorhin erwähnte Zusammensetzung in Familiengruppen vorgezeichneten Trennlinien. Eine oder mehrere Familiengruppen sind die Träger der neuen Dörfer, und die Erinnerung an die Art der Gründung eines neuen Dorfes durch den Zusammenschluss mehrerer Familiengruppen wird, wie gezeigt, im Geschenkaustausch zeremoniell dargestellt.

In den Wanderbewegungen der Waika haben sich also zwei Arten von Nomadismus überlagert: der sehr lebendige wildbeuterische Nomadismus, der sich heute als Radialbewegung von einem pflanzerischen Mittelpunkt aus darstellt, prägt den Jahresrhythmus, während die pflanzerische Dorfverlegung, die den Brandrodungsfeldern folgt, im Rhythmus weniger Jahre geschieht und auch eine grössere räumliche Reichweite besitzt als das wildbeuterische Schweifen. Um es anders zu sagen: ein räumlich und zeitlich engerer wildbeuterischer Nomadismus füllt die Perioden der weiter gespannten pflanzerischen Wanderbewegungen aus. Auch an den Endpunkten dieser Perioden, wo sich beide Rhythmen überlagern, werden sie von den Waika als ganz verschiedene und gegenseitig nicht substituierbare Dinge empfunden: wenn man etwa eine Zeitlang in der neuen, kaum begonnenen Pflanzung gearbeitet hat, die äusserlichen Momente eines Waldaufenthaltes (wie Wechsel des Wohnortes und günstigere Jagd- und Sammelmöglichkeiten) also durchaus gegeben waren, zieht man dennoch gleich hinterher noch einmal in der herkömmlichen Weise an eine andere Stelle in den Wald – die Anlage einer neuen Pflanzung ist selbst bei grosser Ähnlichkeit der äusseren Umstände etwas grundsätzlich anderes als das wildbeuterische Waldleben und in keiner Weise ein Ersatz dafür.

Die kurzfristigen Waldaufenthalte werden nun, wie gesagt, meistens vom Dorfganzen durchgeführt, während sich bei der Anlage neuer Pflanzungen die Familiengruppe als handelnde Einheit in den Vordergrund schiebt. Aus diesem Tatbestand könnte man den Schluss ziehen, dass die Bildung und die soziologische Bedeutung von Familiengruppen mit der Einführung des Pflanzenanbaus zusammenhingen. Ich möchte aber umgekehrt folgern, dass sich in diesen Familiengruppen nur die alte wildbeuterische Siedlungseinheit im jetzigen grösseren pflanzerischen Dorfverband erhalten hat. Die Beziehung der Familiengruppen zum Wildbeutertum erhellt auch daraus, dass der von Familiengruppen getragene Geschenkaustausch ganz überwiegend ein Austausch von Wildfleisch ist, dem man nur ein paar geröstete Bananen beigefügt hat, und ausschliesslich nach einer Jagd stattfinden kann.

Der soziologische Befund in bezug auf die grösseren Gesellschaftseinheiten der Yanoama spiegelt demnach das Bild der anderen Kulturbereiche dieses Volkes

1: Schuster SQ18 Yanoama

wider: wildbeuterische Elemente wie die auf verschiedenen verwandtschaftlichen Wegen verknüpfte Familiengruppe, für die man ihrer Struktur nach wahrscheinlich auch »schweifende Horde« oder ähnliche Termini gebrauchen könnte, haben sich gegen die mit Pflanzenanbau und Sesshaftwerdung verbundenen Formen wie in unserem Falle den festen Dorfverband behauptet und lebendig erhalten: die Waika stehen jetzt gerade an dem Punkt, wo das hochgradige wirtschaftliche Übergewicht der angebauten Pflanze entsprechende Veränderungen auf den nichtwirtschaftlichen Kulturgebieten zu bewirken beginnt.

Foreword

114 101 This monograph contains the results of a nine-month investigation which I conducted from October 1955 to June 1956 among two Indian tribes of northwest Brazil which are as yet unknown to science.

121 My journey and the analysis of its results were made possible through the generous support of the Deutschen Forschungsgemeinschaft /German Research Association/, for which I am deeply indebted to it.

114 I should like cordially to thank my esteemed teacher, Herr Prof. Dr. Franz Termer, for regarding this work, the completion of which he supported actively and in an advisory capacity, worthy of inclusion in the series of reports of the Hamburg Museum für Völkerkunde und Vorgeschichte /Museum for Ethnology and Prehistory/.

I was encouraged by Herr Prof. Darcy Ribeiro, head of the study division of the Serviço de Proteção aos Índios, to seek out these as yet uninvestigated tribes north of the middle Rio Negro. [122] Through his efforts I also obtained the approval of the Director and was given all possible assistance by this organization founded by Marshal Cândido Mariano da Silva Rondon, as well as a free flight with a military plane from Rio de Janeiro to Manaus. Hence I feel a sincere desire to express my gratitude to the Serviço de Proteção aos Índios, especially to Herr Prof. Darcy Ribeiro and the Brazilian Air Force.

122 I thank the University of São Paulo, above all the Dean, Herr Dr. Paulo Sawaya, and the Assistant Dean Herr Prof. Dr. Antonio Soares Amora, for granting me a stipend from June 1954 to September 1955, which made it possible for me to broaden my knowledge of Brazilian ethnology under such outstanding scholars as Herr Prof. Dr. Herbert Baldus and Herr Prof. Dr. Egon Schaden and to prepare myself thoroughly for the subsequent work in the field. To these two gentlemen I shall remain deeply indebted.

114 Valuable advice which was very useful to me on my expedition was given me by Herr Prof. Dr. med. Henrique da Rocha Lima (†).

/V cont./

114 as well as by Herr Prof. Dr. José Antonio Benton, Herr Prof. Dr. Wilhelm Saake, S.V.D., Herr Harald Schultz and Frau Wilma, all of São Paulo.

I found helpful assistance in Manaus on the part of Herr Alipio Edmundo Lage, the head of the I. Inspetoria Regional do Serviço de Proteção aos Índios, as well as in the small German colony there on the part of the families of Prof. Dr. Harald Sioli, Kurt Polack, and Gerhard Lindenberg.

122 With profound gratitude I mention my kind friends, the
123 Surára and Pakidái Indians, who were so hospitable to me and indefatigably helpful in my work; they are primarily the ones who deserve credit for the successful outcome of the undertaking.
[115] Above all the Surára chief Hewemão and his brothers Kurikayawõ and Inxinemá, my little interpreter Jibeauwõ (see p. 258), and the Pakidái chief Karenauõ and the war chief Porêhiwõ deserve special mention here.

I also owe much to my faithful servant, the Tukano /Tucano/ Indian Mateus Dias, a member of the Indian protection post Ajuricaba on the middle Rio Demini. He was an indispensable helper to me in all emergencies during these nine months.

/VI/ I am likewise very much indebted, however, to the Brazilian country people on the Rio Negro and on the Demini and Aracá rivers, as well as to the personnel of the Indian protection post Ajuricaba on the middle Demini and the mission station of the Salesians in Barcelos. No matter where I went, I was shown such hospitality as is scarcely imaginable. Mention should be made here above all of the Spanish planter, Manuel Antonio Gómez, of the Rio Aracá, and the German nun, Klara Jakob, of the Salesian mission in Barcelos, who devotedly nursed me during my attacks of malaria. Equal thanks are due the physicians and sisters in the Hospital de Isolamento "Emílio Ribas" in São Paulo, where, after my return, I was treated without charge for two months and cured of a serious liver infection.

114 I thank Herr Dr. Koch and Herr Müller of the Bayer branch
122 in Rio de Janeiro for the medicines they donated. This made it possible for me to help many sick Indians and caboclos and to alleviate my own sufferings.

/VI cont./

I thank my friend and colleague, Dr. Dall'Igna Rodrigues, for important suggestions given to me in connection with completing this monograph and for the appendix of comparative linguistic material /see 3: Rodrigues, this file/.

I am also deeply grateful to my co-workers at the Hamburg Museum für Völkerkunde und Vorgeschichte, who contributed so much to the fashioning of the present work. They are Herr Dr. Herbert Tischner, who helped me with advice and experience in the printing, Fräulein Dascha Detering, who made the drawings and the map with great care and who independently worked out the textile techniques presented in this work; also Herr Hans Cantzler, who photographed a number of objects and made enlargements of my photographs.

In conclusion I should like to thank Herr Prof. Dr. Herbert Freudenthal and my wife for their tireless help in reading proof, and the printing firm J. J. Augustin for their excellent technical work on the present book.

126 The ethnographic collections are in the possession of the Museu Paulista, São Paulo, and the Hamburg Museum für Völkerkunde und Vorgeschichte. All the inventory numbers in the index of figures and illustrations are those of the specimens in the Hamburg Museum.

Hamburg, Christmas 1959. Hans Becher

Location of the Settlement Area of the Surára and Pakidái

/1/

I. Geographical Introduction

131 The habitation and roaming area of the Surára and Pakidái lies between the Demini and Aracá rivers -- a terra incognita within the large area between Rio Branco, Rio Uraricuera, Serra Parima, and Rio Negro, which up to now has been so little opened up ethnologically and geographically.

133 The Rio Demini is a left tributary of the middle Rio Negro. Its source is in the Serra Parima, in the Brazilian-Venezuelan border area, and its mouth is just above Barcelos, the former capital of "Capitania do Rio Negro." The water of this river is
133 white, whereas the numerous lakes along its banks and all its
134 tributaries, such as the Aracá, a right tributary of the lower Demini, have black water. The tributaries of the Aracá, on the other hand, are characterized by clear water. This peculiarity is connected with soil conditions, soil erosion, and the topography of the catchment areas. Thus, soil erosion in very mountainous terrain causes a light coloring, whereas in a very flat, swampy region dark humus substances overflow into the water and darken it. It is further noteworthy that black water is healthier and
133 tastier and, in standing, does not leave a dirty sediment. Even
136 water turtles and fish that have lived in black water are tastier than the same animals taken from white-water rivers or lakes. Moreover, it should be pointed out that mosquitoes appear in considerably smaller numbers along black water than along white. On the Rio Demini one can scarcely defend oneself from the small piums (Simulium sp., day gnats) and the large carapanãs (Anopheles); the latter are the dangerous malaria-carriers. The lower course and part of the middle course are therefore completely fever-infested.

137 The two types of water also result in different kinds of vegetation. Characteristic for the Rio Demini are the igapós (inundated forests with tall trees standing close together), between which there is very seldom any terra firma. On the higher banks of the Aracá, however, one finds primarily low scrub-forest. The

/1 cont./

137 most important useful plants along the middle course of the Demini are the seringueiras (rubber trees -- Hevea brasiliensis Muell. Arg.), and along the Aracá and its tributaries the piaçaba palms (Attalea funifera Mart. and Leopoldinia piassaba Wal.). The chestnut forests that occur in the area around the mouth of the Demini and on the lower course of the Aracá also have economic significance. The chestnut, or more precisely, the chestnut of Pará (Bertholletia excelsa H.B.K. -- its fruits are known in Germany as Pará nuts), is regarded as the queen of the Amazonian primeval forests on account of its tall crown, with which it towers over all the other trees. On the lower Aracá the itaúba tree (Silvia itaiúba Pax.) is of special importance because it furnishes the best lumber in that region. Finally, a few other species of trees and palms, which occur along the Demini as well as along the Aracá, should be mentioned:

a) Trees: imbauba (Cecropia palmata Wild.), angelin-amargoso (Andira vermifuga Mart.), macaranduba (Mimusops sp.), embireira (Anonaceae sp.), matamatazeiro (Eschweilera matamata Hub.), taxizeiro (Cesalpenaceae sp.), ingàzeiro (Inga sp.), abiurana (Lucuma sp.), cajueiro (Anacardium sp.), lucuma (Lucuma /2/ macrocarpa Hub.), wild cacao tree (Theobroma sp.), wild lemon tree (Rubiacea sp.), and cedars (Meliaceae sp.).

b) Palms: acaí (Euterpe oleracea Mart.), bacaba (Oenocarpus distichus Mart. or Oenocarpus bacaba Mart.), buriti (Mauritia vinifera Mart.), bucu (Manicaria saccifera Gaertn.), curua (Attalea spectabilis Mart.), inaja (Maximiliana regia Mart.), patauá (Oenocarpus bataua Mart.), paxiuba (Iriartea exorrhiza Mart.), pupunha (Guilielma speciosa Mart.), tucuma (Astrocaryum sp.), and ubim (Geonoma sp.).

133 The two rivers have many bends and during the summer months, October to March, flow relatively sluggishly. Their water level during this time is extremely low, so that numerous sandbanks [134] stand out. On the Demini the color of the sand is yellowish, whereas on the Aracá it is gleaming white. The average width of the Demini along its lower and middle course is 200-300 meters,

/2 cont./

133 that of the Aracá 300-400 meters. This may be why, on old maps, the Aracá is erroneously designated as the main river; the course of the Demini, however, is considerably longer. In the middle and upper courses of the aforementioned rivers there are rapids, the crossing of which often endangers life.

The area lying between the rivers represents one of those inselberg landscapes which are so characteristic for the region
133 of the middle and upper Rio Negro. Cone-, dome-, or ridge-
137 shaped granite mountains which individually or occasionally in groups rise up to 400 meters in the form of small massifs or short mountain chains offer a conspicuous contrast to the plain covered with dense primeval forest. Their relatively flat peaks and the gently sloping alluvial cones at the foot are likewise
133 densely forested. At the middle height, however, there appear steep, smooth granite walls looking fluted because of the many rain furrows.

Morphologically these elevations belong to a type which Passarge discusses in his Kalahari work (1) and elsewhere (2) and

1. Passarge, 1904a.

2. Passarge, 1904b.

which he has defined, following Bornhardt, as inselberge. These granite mountains in the Rio Negro region have already been strikingly described by Spruce (3). According to Brandt, who dealt

3. Spruce, 1908, p. 383.

in detail with the morphogenesis of isolated granite mountains, their cone-shaped appearance may be traced back to a "peeling process" of periclinal granite folds (4).

4. Brandt, 1917, pp. 52 ff.

/2 cont./

132 Because of the nearness of the equator, it is very hot, humid, and oppressive in this region, yet not unbearable. For, on account [164] of the high moisture content of the air, there is, for example, no heat prostration and no sunstroke here. One can also sleep quite well at night, since the temperature then drops several degrees and is accompanied by a refreshing breeze. During the day the temperature of the air comes to 32-36° and at night 24-28°, whereas that of the water is usually between 29-32°.

136 As a result of the scarcity of human beings that prevails here, there are a great many wild animals and birds in the forests, in addition to the abundance of water turtles, caymans, and fish in the rivers, several species of which will be enumerated in the following:

a) Mammals: spotted jaguar (Felis onca L.), black jaguar (Panthera onca L.), puma (Felis concolor), maracajá (Felis pardalis Neuw.), tapir (Tapirus americanus Briss.), deer (Cervidae sp.), wild pig (Pecari tajacu), capybara (Hydrochoerus hydrochaeris Erxl.) paca (Cuniculus paca L.), cutia (Dasyprocta aguti L.), armadillo (Dasypodidae sp.), sloth (Bradypus sp.), ant bear (Myrmecophaga sp.) monkeys, such as the howling monkey (Alouatta sp.), cuxiú-negro (Chiroptes satanas Humb.), cuatá (Ateles paniscus L.), macaco-da-noite (Aotus infulatus), etc., sea cow (Trichechus inunguis Desmaret), etc.

b) Birds: mutum (Crax sp.), urumutum (Crax sp.), mutum-cavalo (Mitu mitu L.), jacamim (Psophia crepitans L.), cujubim (Pipile pipile cajubi Pelz.), jacu (Penelope sp.), japim (Cacicus cela L.), inambu (Crypturellus sp.), inambu-relógio (Crypturellus strigulosus Temm.), toucan (Rhamphastus /3/ sp.), arara vermelha (Ara macao L.), arara amarela (Ara ararauna L.), papagaio moleiro (Amazona sp.), papagaio curica (Amazona sp.), garça branca (Casmerodius albus egretta Gm.), gavião-real (Thrasaetus harpyia L.), gavião-caipira (Hypomorphnus urubitinga urubitinga Gm.), urubus (Cathartes foetens, Cathartes aura, etc.), etc.

c) Water turtles: tracajá (Emys sp.), cabeçuda (Podocnemis dumeriliana), etc.

d) Land turtles: jabuti (Testudo tabulata Woelb.), etc.

/3 cont./

136 e) Caymans: jacaretinga or jacaré-de-óculos (Caiman sclerpos Schneid.), etc.

f) Fish: aracu (Leporinus copelandi Steind.), piranha (Pygocentrus sp. and Serrasalmus sp.), pirarucu (largest fresh-water fish, reaches a length of over three meters; belongs to the family of the bone-tongues (Osteoglossidae). The hard tongue serves as a grater for Indians and whites), piraíba (Brachyplatystoma filamentosa), surubim (Platystoma sp.), jandiá (Sciluridae sp.), mandi (Rhamdia sp.), curimatã (Prochilodus sp.), pescada (Gadus sp.), dourado (Salminus brevidens), tambaquí (Characinidae sp.), mandubi (Auchenipteridae sp.), anujá (Trachycoristes sp.), cuiúcuiú (Oxidoras niger Vall.), etc.

There are also snakes in large numbers:

a) Nonpoisonous snakes: sucuriju (Eunectes murinus), jibóia-vermelha (Epicrates cenchris), etc.

b) Poisonous snakes: surucucu (Lachesis muta L.), cascavel (Crotalus terrificus terrificus), jararaca (Lachesis sp.), jararacussu (Bothrops jararacussu Lacerda), cobra-coral (Elaps corallinus Wied.), etc.

II. The Civilized Inhabitants of the Demini-Aracá Region

162 In the case of the civilized population, which lives along the lower and middle course, there is a mixture of Indians, whites, Negroes, and mulattoes who make a living as rubber gatherers, palm-fiber gatherers, woodcutters, fishermen, and planters.

Rubber gatherers work exclusively in the Demini river basin, palm-fiber gatherers and woodcutters only in the Aracá region. Planters, fishermen, and a few ambulant traders may be found on terra firma along both rivers. While the rubber gatherers on the Demini live in families far apart from one another, the distances are 10-20 kilometers and more, the woodcutters and palm-fiber gatherers along the Aracá have joined together in small settlements.

/3 cont./

648 On the Rio Demini, slightly below the Cachoeira (rapids)
484 Auatsinaua, is the Indian protection post "Ajuricaba" (Ill. 1).
From the mouth to that point is a six-day journey in a small boat
161 with a four-horsepower outboard motor. On this long stretch
178 there are only two dozen families. Fifty years ago the banks
along the lower third were more densely settled than they are
164 today. But malaria and a terrible beriberi epidemic, 1907/08,
165 carried off the majority of the inhabitants. After the great forest
fire which raged along the Demini in 1926, health conditions
648 improved temporarily. In the most recent times a motor boat
164 of the National Malaria Service travels up the Demini and Aracá
once a year, and the palm-straw huts of the inhabitants are sprayed
with DDT. Nevertheless, malaria still takes its toll. Often it
also leads to a protracted liver ailment; above all, there is a
164 lack of any kind of medication. A second scourge is tuberculosis,
262 the cause of which, aside from the humid, hot climate, may
probably be traced to the poor and unbalanced diet. It consists
predominantly of manioc meal, small fish, the salted, sun-dried
meat of the pirarucu, salted wild-pig meat, and, to a considerably
smaller extent, birds and game, for the men generally do not
have time to hunt. In addition, /4/ for rubber and palm-fiber
gatherers, fruit and vegetables are practically unknown luxuries.
164 As a result of the crowded life of the individual families and the
lack of hygiene, children too are not free from tuberculosis.
Moreover, mention must be made of a dangerous eye infection
which often leads to blindness. This comes about because a fine
dust is constantly trickling down from the palm-straw roofs of the
huts, in which there are many insects, and it gets into the eyes of
the people asleep in their hammocks. An infectious skin disease
that causes light spots on the skin is also widespread. Worm and
intestinal ailments occur frequently, as does syphilis. Finally,
it is noteworthy that adults and children have very poor teeth.
162 The reason for this may again probably be sought in the unbalanced
diet, for all of the free Forest Indians who have more variety in
165 their meals, have excellent teeth. Mortality is highest among
the children, and next come the women, a relatively large num-
ber of whom die in childbirth since there is, of course, no medical
assistance.

/4 cont./

648 The last hut of a rubber gatherer stands one day's journey from the Indian protection post, while the post itself represents the last station of civilization. Above it the territory of the Indians begins. Here, numerous tribes hitherto entirely unknown to science still live as they did before the period of discovery. They are very warlike, so there are often bloody conflicts between them. Their malokas are usually far from the riverbank, deep in the interior of the virgin forests. Occasionally some of them visit the post in order to get gifts, that is, knives, axes, pots, glass beads, etc. They never come in contact with the civilized population on the Demini.

The personnel of the post consists of 12 men, among them several pure-blooded, civilized Tukano /Tucano/ Indians, who lead here a hard and dangerous life full of privations. Before they entered the Indian protection service, they had to pledge themselves, in their association with the free Indians, always to observe the following motto which was set up by the founder of this magnificent organization, Marshall Cândido Mariano da Silva Rondon: "Morrer se preciso fôr, matar nunca!" ("Die if necessary, never kill!"). Their only connections with the outside world are a radio station and the motor boat of the Inspetoria des Serviço de Proteção aos Índios in Manaus, which once or twice a year brings them food supplies and commodities, as well as gifts for the Indians.

Besides attending to Indian visitors, the post personnel must also see to it that the members of free Indian tribes are not exploited and badly treated by the undesirable elements of civilization, in the form of gold-seekers and other adventurers. The protection of all free Forest Indians is legally anchored in Brazil. Accordingly, no civilized person may seek out Indian tribes without permission from the management of the Serviço de Proteção aos Índios in Rio de Janeiro (5a). Thus, the posts represent police

5a. The Serviço de Proteção aos Índios is a division of the Ministério da Agricultura.

Surára
Pakidái
Shiriana
Waica

/4 cont./

648 agencies, so to speak, in the primeval forest. It is also one of the duties of the personnel, however, to lay out plantations for their own living, where they grow manioc, maize, sweet potatoes, bananas, mamão /papaya/, beans, tobacco, sugar cane, etc. In addition, they hunt and fish.

Since living conditions are more favorable on the Aracá and the work of the piaçabeiros (palm-fiber gatherers) is more remunerative than that of the rubber gatherers, the population here is four times as large as on the Demini. The region of the Indians begins at the Cachoeira dos Indios (Ills. 2 and 3). There is not as yet, however, any Indian protection post on the Rio Aracá.

/5/

114 III. The Ethnic Affiliation of the Surára and Pakidái

As early as the beginning of the previous century important investigators, among them Alexander von Humboldt, Robert Schomburgk, Jean Chaffanjon, and Theodor Koch-Grünberg, undertook ethnographic and in part linguistic studies in the northern and western part of the area between Rio Branco, Uraricuera, Serra Parima, and Rio Negro among a few groups of the Xiriâna /Shiriana/ (5b) and Waiká /Waica/, which were broadened and

[104] 5b. X is pronounced like sch /in German/.

deepened by Otto Zerries and Meinhard Schuster in 1954/55, especially with regard to the Waiká (6a) (Waika) in the catchment

[194] 6a. When the Surára and Pakidái pronounce the tribal name of the Waiká, their worst enemies, they always accent the final a.

[197] area of the upper Orinoco (6b). Their work was supported by North

11. The area between Rio Branco, Rio Uraricuera, Serra Parima, and Rio Negro, as well as the region east of the Rio Branco, have for a long time been regarded as dangerous because, as Alexander von Humboldt and Robert Schomburgk have already reported, several of the tribes living there are supposed to have a very

/5 cont./

114
648

11. (cont.)
hostile attitude toward the whites as well as toward neighboring Indians. Since the rubber gatherers, palm-fiber gatherers, etc. on the Demini, Aracá, and the other rivers usually do not advance beyond the middle course, to say nothing of visiting the regions away from the rivers, the Indians only rarely feel disturbed in their territory. The incidents mentioned below, however, which have taken place there within the last 30 years, confirm that hostility on the part of a few tribes continues and may at any time lead to new acts of violence:
1928: Surára Indians, in an attack on a settlement of palm-fiber gatherers on the Rio Aracá, abducted two white women and a girl.
1942: Jaú Indians shot at the Brazilian-Venezuelan border commission on the upper Demini and forced it to turn back; two members of the commission were seriously wounded by arrow shots.
1945: Five American officers were killed by arrow shots by the Aimirí Indians on the Rio Jauaperi. They had gone up the river in a motor boat in order to take motion pictures of Indians there. The Brazilian guide, who was the only one to escape, later said that the Indians disliked the whirring of the camera and had several times urged the Americans to go back.
1946: The Aimirí Indians attacked the Indian protection post on the Rio Jauaperi and killed ten men of the personnel.

it was possible to determine that the societies investigated belong to a relatively uniform culture group and even linguistically differ

Surára. Pakidái. Shiriana Waica

/6 cont./

114 101 [127] from each other only slightly in dialectal deviations (see the appendix /see 3: Rodrigues, this file/) (21). How great their

[197]

21. Loukotka and Rivet already established the relationship of a few of these languages and grouped them under the general term "Širianá linguistic family," in which they include Širianá, Karimé, Waíka, and Pusárakaú. (Loukotka, 1942, pp. 8/9; Rivet et Loukotka, 1952, p. 1140).

homogeneity is may be seen by the fact that the Surára and Pakidái call themselves Yanonámi and the Waiká and Xiriána, according to Zerries and Schuster, call themselves Yanoáma (22) (23).

22. Zerries, 1956a, p. 187.

23. Schuster, 1958a, pp. 115/16.

However, members of the Aramamesterí, Karauaterí, Puseheweterí, and even of the Xiriána, whom I met in the malokas of the Surára and Pakidái as wives, visitors, and captives, said that they were Yanonámi. Furthermore, the Surára chief Hewemão enumerated for me 42 more tribes between Catrimani and Rio Negro (24), friendly and hostile, pointing out that these

24. Becher, 1956.

must likewise be included.

In view of this and on the basis of the linguistic and cultural relationship, it would seem to be appropriate to adopt into South American ethnology Yanonámi or Yanoáma as a new designation for the linguistic and culture group made up of these small-sized and light-colored Indians of the northern Amazon. According to the investigations up to now, they occupy a relatively compact area which is bounded in the east and south by the Rio Branco and the Rio Negro, respectively, but in the north and west extends

/6 cont./

101 beyond the Uraricuera and the Parima range, respectively.
114 There can no longer be any doubt about the ethnic affiliation of this population. Koch-Grünberg was already of the opinion that in the case of the Xiriána (Schirianá) and Waiká (Waíka) "it is not a matter of two different tribes, but merely of two divisions of one large nation" (25) (26). At the same place, however, the

25. Koch-Grünberg, 1922, p. 224.

26. Koch-Grünberg, 1923a, p. 290.

investigator expresses the conjecture, which was confirmed by the opinions of neighboring tribes, that the Waiká represent merely a subdivision of the Xiriána, "with whom they live either peaceably or in bitter enmity" (25) (26) /see the footnotes above/. Their isolation from other tribes is, according to Ourique, "an example of the instinctive precaution of the race against its own deterioration and its downfall" (27).

27. Ourique, 1906, p. 24.

101 In this connection there is a significant hint by the Surára chief,
619 according to which there are two powerful tribes within the
[115] "Yanonámi nation" first the Xiriána, who call themselves "Haraterí," and secondly the Waiká, who, however, are constantly warring. All the smaller tribes are on the side of either one or the other, but at the same time are obliged to pay tribute
[438] and render service in war (28). The Surára and Pakidái, the
[114]

28. With regard to the Xiriána, Koch-Grünberg already mentions this vassal relationship (Koch-Grünberg, 1922, p. 226), and Métraux also refers to it (Métraux, 1948, p. 861).

chief told me further, are allies of the Xiriána and occasionally

101
69
[43] /6 cont./ obtain by barter clay vessels, clay plates, bows, arrows, hammocks, baskets, belts, and upper-arm ornaments (29).

[323]
411
[352] 29. Pottery is not practiced at all by the Surára and Pakidái, and their self-made bows, arrows, hammocks, etc. are inferior in quality to those of the Xiriána.

/7/ IV. Historical Data

At the present time, in the winter months (rainy season), April-September, the Surára live at the Cachoeira dos Índios (Ill. 2 and 3), on the upper Rio Aracá, and the Pakidái in Taraquá, on a right branch of the middle Demini. The summer months (dry season), October-March, on the other hand, the two tribes spend together in a large, open maloka, which belongs to the Surára, in the virgin forest region between the Demini and Aracá rivers. This maloka lies 70 kilometers northeast of the Cachoeira dos Índios and about 100 kilometers south of the source region of the Orinoco.

114
103 Koch-Grünberg, on his map accompanying the work Vom Roroíma zum Orinoco /From the Roroíma to the Orinoco/, showed neither the Rio Demini nor the Rio Aracá and designates this region as "unknown territory." In his text he also says, "the entire large area between Rio Negro, Rio Branco and Uraricuéra is unexplored to this day" (30). Baldus likewise points out that in this area

30. Koch-Grünberg, 1923a, p. 287.

"surprises still await the seeker of unknown tribes" (31).

31. Baldus, 1956a, p. 294.

/7 cont./

114
103 Demini and Aracá were first introduced into the literature by João Barbosa Rodrigues, although he did not write Demini, but rather Demeune (32), and the Rio Aracá was called Uaraca by him (33).

32. On maps of that period one likewise finds the entry Demeney.

33. Rodrigues, 1885, pp. 136, 148.

174
114
103 With regard to the name Demini, it may be assumed that the ending "ini," according to the linguistic studies of Koch-Grünberg (34a), is derived from the Aruak /Arawak/ word "eni" =

34a. Koch-Grünberg, 1923a, p. 15.

172
323 river, water. This assumption is confirmed by many very old finds of shards which I discovered on the entirely unpopulated terra firma on the riverine lakes of the Demini. They are yellowish gray shards, which are decorated with spiral lines, meanders, and other plaiting designs and resemble the earthenware vessels which Koch-Grünberg described for the Aruak tribes (34b).

34b. Koch-Grünberg,1910a, pp. 227/28 and Ills. 152-155.

The fact that I found only shards is undoubtedly linked with the custom of the Aruak described by Koch-Grünberg, according to which all the clay vessels that belonged to a deceased person must be broken to pieces, for otherwise the spirit of the dead would punish the greed of the relatives (35).

35. Koch-Grünberg, 1910a, p. 151.

This would also confirm the surmise of Koch-Grünberg that at one time Aruak tribes coming from the west and southwest penetrated into the region between Rio Branco and Orinoco, which was

/7 cont./

114 inhabited by an old population living in a wholly primitive state.
174 The Aruak were said to have been subjugated later by the Karaiben /Carib/, who, in turn, met powerful resistance on the part of the warlike Xiriâna and Waiká (36). Elsewhere the same

36. Koch-Grünberg, 1923a, pp. 15/16.

investigator writes: "On the Merewari and upper Orinoco Karaiben live together with Arowaken, whereas the upper Uraricuéra and the Parima Range are entirely in the hands of the allophylian Schirianá and Waíka" (37). I, too, met neither Karaiben nor

37. Koch-Grünberg, 1922, p. 233.

Aruak tribes in the Demini-Aracá region.

114 On a tribal map of that region drawn by Nimuendajú (38),
131
174

38. This map is in the possession of the scientific division of the Serviço de Proteção aos Índios in Rio de Janeiro.

Xiriâna are given as the inhabitants of the Rio Demini, along with the date 1874. Rodrigues also reports that at the end of the nineteenth century members of this tribe lived both along the banks of that stream and along its tributaries, the Cuieiras and Mamimêu; from there they extended their roving expeditions as far as the Catrimani (39).

39. Rodrigues, 1885, p. 136.

173 /8/ Today only one civilized Xiriâna family is living on the
115 lower Demini as planters, but it no longer has any connection
131 at all with its original, living fellow-tribesmen. This family, whose members speak Portuguese exclusively, told me that the region of the Demini has been the land of the Xiriâna from olden times. On account of frequent attacks on the part of the Waiká,

/8 cont./

however, they had withdrawn into regions remote from the river. Their last maloka on the Demini was taken over by a Waiká tribe in 1934. This is the place where today the Indian protection post "Ajuricaba" is located, on the right bank of the middle Demini, just below the Cachoeira Auatsinaua (40) (41). In 1939, the

40. Holdridge visited the Xiriána here in 1932. (Holdridge, 1933, p. 380.)

41. According to information which Nimuendajú obtained in Manaus in 1927 from a man named Domingos Campos, Aruak-speaking Indians on the Demini were supposed to have been called Xiriána (Nimuendajú, 1955, pp. 150/51). This brings up all kinds of questions which are yet to be solved. Thus, there could have been an Aruak tribe of this name, for the shards which I found on the Demini, as well as the name of this river, indicate that members of that linguistic group once lived here. It might also be possible, however, that Aruak groups, after their subjugation by the Xiriána, became assimilated with the latter. On the other hand, it is not impossible that individual Xiriána adopted the Aruak language, and finally there still remains open the surmise that the Indians mentioned by Domingos Campos are not identical with the actual Xiriána, but were merely called that by the caboclo population.

In the literature, the two tribal designations "Xiriána" (members of the Aruak linguistic family) and "Xirianá" (independent linguistic family) (Loukotka, 1942,

Surára
Pakidái
Shiriana
Waica

/8 cont./

114
174
101

41. (cont.)
pp. 8, 24, 52; Ribeiro, 1957, p. 99) have already become current. Nevertheless, I incline to the view that in the case of the Xiriâna it is a matter of one and the same large, widely scattered Yanonámi tribe. The material and spiritual culture of the Xiriâna with whom the Surára and Pakidái are allied (the latter and the Xiriâna whom I met among them themselves regularly accent the first a) corresponds perfectly with the one that Koch-Grünberg calls "Schirianá." The latter points out in one work that "Schirianá" is their self-designation, while "Schirischâna" is a name which their neighbors and mortal enemies, the "Maquiritáres," gave them (Koch-Grünberg, 1913, p. 454). It should also be mentioned that the designation "Shrirana," according to Vinci, is a Makuxí /Macusi/ word (Vinci, 1956, p. 107).

167 In 1939, the
648 Waiká, too, gave up this maloka and moved to the Rio Mapulau, a left tributary of the upper Demini. Here, at the beginning of the year 1956, at the time of my stay among the Surára, they were attacked by a Xiriâna tribe and destroyed. Surára warriors told me that all the Waiká men were killed and the women and girls were taken captives.

101
114 As inhabitants of the Rio Aracá, Nimuendajú entered on the above-mentioned map of this region (see p. 16), with the date of 1874, the Bahuana, an Aruak tribe. With reference to this, the Surára chief remarked that this tribe also goes by the proper name of Pootarí and was an enemy of the Surára, Pakidái, Xiriâna, etc.; at the present time it lives in the source region of the Aracá.

/8 cont./

175 According to statements of old palm-fiber gatherers on the
648 Aracá, no Indians appeared on this river from the end of the previous century to the end of the twenties of our century. During the months of October and November of the year 1927, palm-fiber gatherers on their way to their places of work saw for the first time small and relatively light-skinned Indians disappearing into the forest thickets. In December, 1927, and January/February, 1928, the settlements were attacked by Indians several times, but the palm-fiber gatherers always managed to put them to flight. During the forenoon of June 28, 1928, there was another attack during which two wives of rubber gatherers and a 12-year-old girl were abducted. After this abduction there was no further Indian attack. Not until 16 years later, in January, 1944, did six
[439] Indians appear, but this time with friendly intent. They called themselves Surára and wanted to barter for articles of civilization. Later they admitted that their tribe had carried out the earlier attacks. In reply to questions about the two abducted women and the girl, they said that they had died. /9/ The palm-fiber gatherers did not bear them any malice for their previous hostile attitude, for they were glad that they could now carry on their work without fear of the Indians.

439 The Surára cling to their old habits and customs and visit the palm-fiber gatherers only when they want to barter for knives,
[115] axes, pots, etc. According to the statements of the chief of the Surára, they are forced by the Xiriána to barter with the palm-fiber gatherers, for they are obliged to deliver to them all the articles obtained (see also pages 157/163); the Xiriána themselves never have any contact with the civilized inhabitants.

648 In August of the year 1944 the Indian protection post founded in 1940 on the Rio Demini was visited for the first time by some Pakidái. At rather long intervals there have been further visits
[619] by various families of this tribe up to the present time. They, too, however, come at the request of the Xiriána and must hand over to them all the gifts.

Surára
Pakidái

/9 cont./

114 This shows that nothing has changed since 1948, when Métraux,
198 following the accounts of Koch-Grünberg and other investigators
181 traveling through this region, quite justifiably wrote: "The
648 Shiriana are very warlike people who succeeded in dominating several weaker tribes" /cited in English/ (42).

42. Métraux, 1948, p. 861.

141 V. Physical Characteristics

With regard to physical characteristics, the Surára and Pakidái are identical. Their height is below average, for the men are only 1.50-1.60 meters tall and the women 1.40-1.50 meters.
142 Both sexes have soft but muscular body forms, yet frequently a
291 protruding abdomen and often relatively thin legs. Since they always go barefoot, their feet have retained the ability to serve as prehensile organs for climbing tree trunks, and their toes are not squeezed together as much as in the case of civilized persons who wear shoes all the time. The considerable gap between the great toe and the second toe is striking (Ill. 14) (43). The color

43. Crevaux has already pointed this out in connection with the Oyampí Indians in French Guiana: "The great toe, very much set apart, always turns inward, while the third, fourth, and fifth are turned outward" /translated from the French/ (Crevaux, 1880, p. 76 and ill., left).

of their skin is very light, almost white. The forehead of the dolicocephalic head is often flat. Their broad noses with the nostrils directed slightly upward are noteworthy; the root of the nose, on the other hand, is narrow. The Mongoloid strain is clearly evident in the prominent cheekbones and the slanting, dark-brown, almost black-looking eyes. Between the slightly

Surára, Pakidái, Waica Shiriana

/9 cont./

142 pouting lips of a mouth that is never too large, there are always two gleaming rows of sound teeth. Their beautiful, always straight hair is a very dark brown. They all have a thick head of hair, but lose it in old age. No bald spot appears, however; the hair then simply looks as though it had been cut very short all over the head. Individual men have a thin growth of beard on [302] either side of the lips and on the chin; occasionally they pluck out the beard hair. The rest of their body hair is limited to the pubic region. Women pluck out their pubic hair, as well as their eyebrows and lashes. Young girls usually have well-formed, hemispherical, firm breasts, which, however, become slack and pendulous after the first child, although at that time the women have often not even reached the age of 18 or 19 years old.

114 142 These observations parallel the descriptions which Alexander von Humboldt gives of the Waikâ (Guaicas) and Guaharibo. He also describes them as tribes "with whitish skin color and very small stature." He adds, however, "the shortness of the Guaicas and the whiteness of the Guaharibos, /10/ whom P. Caulín calls [141] Guaharibos blancos, are equally exaggerated" (44). The Guaicas

44. A. von Humboldt, 1860, IV, pp. 113 ff.

measured by Alexander von Humboldt were "on the average four feet seven inches to four feet eight inches (according to the old French measurement)" (44) /see footnote above/, in other words, about 1.52-1.55 meters. Koch-Grünberg gives the same body height for the Waikâ (Wafka) whom he met in Motomotó on the Uraricuera and whom he likewise describes as very light-skinned (45). In

45. Koch-Grünberg, 1923a, p. 293.

[141] another place Koch-Grünberg writes: "The Schirianâ and Wafka of Motomotó were small people, on the average about 1.52 meters tall. In no case did the height exceed 1.55 meters... Older people had distended abdomens and thin legs... These people, who were by nature ugly almost throughout, were even more

Surára
Pakidái
Waica
Shiriana

/10 cont./

114 repellent because of the lack of any kind of body care" (46).
142

46. Koch-Grünberg, 1923a, p. 304.

Chaffanjon expressed himself in a similar manner, but even more disapprovingly, with regard to the Guaharibos: "Small and puny, thin limbs, a stomach enormously distended, hair long and dirty, a bestial countenance make them look repulsive. [291] They are absolutely naked; two men have a long and scraggly [411] beard; their complexion is lighter than that of all the Indians whom I have thus far mentioned; their only weapon is a stick" 114 /translated from the French/ (47). Finally, it should be men- 141

47. Chaffanjon, 1889, pp. 308-311.

tioned that, of approximately 40 adult Waiká, Zerries established an average figure of 151.5 centimeters for men and 142 centimeters for women (48a).

48a. Zerries, 1956a, p. 186.

114 Comparisons show that the Surára and Pakidái have the same
142 physical characteristics as the Guaharibo, Xiriána, and Waiká (48b).

48b. Only recently there appeared a work by the same author, "Beiträge zur Anthropologie der Waika- und Schiriana-Indianer im Grenzgebiet zwischen Venezuela und Brasilien /Contributions to the Anthropology of the Waica and Schiriana Indians in the Border Region Between Venezuela and Brazil/," which is supplemented by excellent illustrative material (Zerries, 1959, pp. 31-41).

It is therefore astonishing that Chaffanjon and Koch-Grünberg describe the Indians that they studied as so strikingly ugly. It

Surára
Pakidái

/10 cont./

114 142 is true, the related Surára and Pakidái, as well as the Waiká in the catchment area of the upper Orinoco, embody a type that is strange to us (see Ills. 9-24 /see pp. 270-274/ and ills. in Zerries, 1959), but certainly not one that is repulsive to that extent.

342

VI. Technology and Material Culture

1. House Forms

The Surára and Pakidái are familiar with four different house-forms. The simplest and probably the earliest form, which at present, however, is used only as overnight quarters by one family during the expeditions in the virgin forest, is similar to a wind-screen /Windschirm/ (Ill. 4). It is built in the following way: In front, one or two supports, 2-2.50 meters long, are set into the ground at intervals as long as a hammock; about three meters behind these there are two weaker supports, 1-1.50 meters long, at somewhat longer intervals. The upper ends are joined together with poles; cipó-titica (a type of liana) serves as lashing material. The poles are also frequently tied to trees standing a short distance apart, instead of the rear supports. Over this 12 to 15 thinner poles are placed crosswise, and on top of these four to six are placed lengthwise. This results in a more or less steep frame-work which has the shape of a lean-to roof (Ill. 4). Palm leaves are laid on this so that the hut gives secure protection against the rain; even the most severe tropical thunderstorms cannot harm the Indians sleeping under it. The hammocks are fastened in the form of a triangle around the fire burning in the center; In the case of larger families, two hammocks often hang one above the other.

[824] [352] [354]

361 /11/ If the entire tribe is on the march, the huts of the individual families are always placed in a circle around the chief's hut standing in the center, after the virgin forest has been hastily cleared to a certain extent beforehand. The space between the huts is five to eight meters.

/11 cont./

342 114 184) Exactly the same construction is shown by Salathé for the Karimé (49), Zerries for the Waiká (50), and Koch-Grünberg for

49. Salathé, 1931/32, pp. 298-300 and Fig. 1 and 2.

50. Zerries, 1956a, p. 184.

the Xiriâna (Schirianá) on the upper Uraricaparâ; the latter, however, calls the lean-to type of hut a storm-shelter /Wetterschirm/ (51). This name is not suitable, however, for a

51. Koch-Grünberg, 1923a, p. 300 and Pl. 43 b and c.

genuine storm-shelter, also called windscreen, touches the ground on one side. In the method of construction described and likewise in Koch-Grünberg's drawings, however, the roof rests on supports everywhere. The circular arrangement of the huts is also mentioned in Koch-Grünberg. In this connection the scholar expresses 361 114 the opinion that this is only a temporary camp (52), which I am

52. Koch-Grünberg, 1923a, p. 300 and Plate 43 a.

now able to confirm with respect to the Surára and Pakidái. On the other hand, Koch-Grünberg, Salathé, and Zerries say nothing about a hut standing in the center. Among the Surára and Pakidái, however, this is never absent. The reason for it, these Indians [622] told me, was to protect the chief sleeping in it from hostile attacks. Moreover, two warriors must always guard the camp at night.

361 Along the routes of travel of the Surára and Pakidái in the area between the Demini and Aracá rivers, one finds many such abandoned camps. They are never occupied a second time as overnight quarters, however, although the construction is often

/11 cont./

361 very well preserved and only the roofs would need to be covered with fresh palm leaves.

One exception is Camp Xiwarí, which is 35 kilometers north of the Cachoeira dos Índios on the upper Aracá. Three-fourths [342] of the circle, which is 28 meters in diameter, is made up of ten of the small huts described, while a similarly constructed dwelling seven meters long and five meters high occupies the remaining fourth. In the center of the circle, as usual, stands the chief's [241] hut. Around the camp, rocas (forest clearings) have been laid out, where bananas, pupunha palms, manioc, species of sweet [227] potatoes, and tobacco are planted. The Surára stay here every [156] year between the months of October and December. In the large huts at that time two young men about 20 years old are always trained as medicine man's helpers for two months by the chief and his brother (see pp. 143 f.).

342 The second house-form is a large, open, almost circular
361 maloka which lies in a valley between three short mountain ranges, 70 kilometers northeast of the Cachoeira dos Índios and about 100 kilometers south of the source region of the Orinoco (Ill. 5). This is a construction (see Fig. 1 /see p. 27 /) which has not been documented up to now for South American Indians. During the dry season it is occupied by the Surára and Pakidái jointly. As the more detailed explanation will show, this house form developed from the circularly arranged small huts which serve as overnight quarters. Camp Xiwarí described above clearly shows the transitional form.

361 Around an area 52 meters long and 48 meters wide three curved
342 windscreens about six meters high are erected (Ill. 6), as well as a rectangular house with gable roof, open toward the inner area. The length of the largest windscreen is 74.40 meters and that of the other two 28.60 and 25.40 meters, respectively. The chief's rectangular house is 9.70 meters long. Four entrances, 8 meters, 6.80 meters, 6.30 meters, and 2 meters wide respectively, lead toward the large open circular area. A fifth entrance, which is only one meter high and 50 centimeters wide, however, is inside the largest windscreen. Moreover, it should be mentioned that

343 /11 cont./ Moreover, it should be mentioned that
342 between the chief's house and the windscreen that is 24.80 meters
361 long there stands a four-meter-long, rectangular, open gabled-hut, the rooster coop (Ill. 7). /12/ /Fig. 1 appears here./

342 /13/ The three windscreens are built as follows: Toward the interior, posts 3.30-3.60 meters high are set up at irregular intervals. Behind them, at intervals of 2.60 meters, stand smaller posts which are about 1.20 meters high. The front and rear posts are joined by strips which are allowed to project about two [824] meters at the top. Here, too, cipó-titica, a type of liana, serves for fastening them. Over these strips, at intervals of 50-70 centimeters, 31-35 thinner cross-strips are laid, which produces a windscreen construction. In contrast to the lean-to type of hut described above, these are genuine, albeit specially large windscreens, for they touch the ground on one side. They are about seven meters deep and the height of the roof is up to six meters. [824] For roof covering the leaves of the ubim palm (Geonoma sp.) are [171] used, the "tiles" of the Amazon. The rubber gatherers, the palm-fiber gatherers, the planters, and woodcutters also use these leaves as roof and wall covering, the durability of which is four to five years.

824 The ubim palm, which is very common in the Demini-Aracá area, reaches a height of only 1.50-2 meters. The leaves are 80 centimeters to one meter long and from 25 to 30 centimeters [461] wide. The gathering of these is quite strenuous and demands four to five hours of hard work. They are cut off or broken off and at first laid on top of one another in piles. When the Indian has gathered enough leaves, he clears a small rectangular place in the forest for a distance of about four meters. At this distance he thrusts three sticks, one meter high, into the ground on either side directly opposite one another. These are joined together with lianas. Then piles of eight to ten leaves are placed next to one another over the three liana strips. When he comes to the end, the Indian places additional piles of eight to ten leaves in the interspaces, but this time with the stem pointing toward the opposite side. He repeats this several times until finally all the gathered

622

Fig. 1a-c. Ground plan and cross-section of the open maloka with chief's hut.

/13 cont./

824 leaves are neatly piled up on top of one another. Then he pulls out the three poles on one side and rolls up the leaves, along with the three liana strips on which they are lying, like a carpet. The ends of the lianas are then pulled together securely and one [482] stuck into the other. A carrying-strap of embira is wrapped around the ball, whereupon the Indian carries the heavy 60-70 kilogram load with his head or chest, in the latter case with the carrying-strap running over the chest and the two upper arms, 30 to 40 minutes or more through the pathless forest to his maloka. [481] The pace which the Indians strike up in doing this is so swift that I, without a load, always had difficulty following them.

824 285 Having arrived at the dwelling, on the same day or the following day, the leaves are worked up into rectangular mats which are to serve as roof covering, at which the women help. In this technique the efficiency and the inventiveness of the Indian are impressive.

Over a stalk of the paxiúba palm (Iriartea exorrhiza Mart.) 60-100 ubim leaves are laid next to one another with the underside on top, and, to be sure, in such a way that only the end of the leaf lies above the paxiúba stem, while the long stem of the ubim leaf projects beyond it. Each ubim leaf, moreover, consists of three to four V-shaped sides. From the right side there is now begun the fitting of the leaves together into a firm structure. The lower part of the right V-shaped side is now folded under. Then the long ubim stem is bent, wrapped around the paxiúba stem, led upward to the right of the leaf, and then laid over the leaf toward the left. The same procedure is followed with the adjacent leaves. The stem end of the last leaf on the left is fastened with a piece of liana wound around the paxiúba stem, or simply by bending this stem to the right, by way of exception, and shoving it under the other leaves. With this a pano (rectangular mat) is completed, generally with a length of five to eight 342 meters and a width of half a meter. Depending on the length 824 of the windscreen, 80-100 or more of these panos /14/ are now laid on the roof framework over one another tile-fashion at intervals of 30-50 centimeters and fastened with lianas.

342 /14 cont./
592 Under these windscreens the families live, one beside the other. The space for each family amounts to three to four meters. In the center burns the fire, which is kept going day and night.
354 To the right and left of it hangs a hammock each for the man
352 and the woman (Ill. 29). In the case of larger families, the
592 hammocks are hung around the fire in a triangle and, if neces-
342 sary, one above the other. In the latter case, the chief wife always sleeps below and the man above, while the second wife and the older children, or the grandmother, lie in the hammocks
353 on the opposite side of the fire. Above and behind the hammocks
342 the implements, bows, arrows, quivers, knives, baskets, etc.,
231 are hung on the roof framework. In addition, most families
342 have a square or rectangular wooden framework set up far in the background, which is about one meter high, one-half to at most one meter long, and is provided with side walls 30 to 50 centimeters high, in which the young dogs sleep, the so-called
[174] dog-bed (Ill. 30). Whether this arrangement is indigenous or was taken over from Karaiben /Carib/ tribes some time in the past could not as yet be determined. According to a statement
[171] by the German Franciscan monk, Protasius Frikel, of Santarem, similar dog-beds are also in use among the Karaiben tribes on the Rio Trombetas (53).

53. Personal statement by P. Frikel on the occasion of the XXXI. Int. Amerik. Kongr. in São Paulo, 1954.

342 The chief's hut obviously owes its origin to the model of the
622 huts of the planters, and rubber and palm-fiber gatherers. It
[177] has a rectangular ground plan, the broad side is turned toward the courtyard, and it is also open on this side. The length is 9.70 meters, the width six meters, and the height, exactly the same as the windscreens, about six meters. In the center stand four posts five meters long, at both the front and back four smaller ones, each of which is 2.55 meters high. The small

/14 cont./

342 622 posts are joined by crossbeams; in addition, horizontal strips lead to the tall posts, whereby a gable roof is formed. Over this again lie small, thin cross-strips, on which, exactly as in the case of the large windscreens, the panos, the rectangular palm-leaf mats, are fastened. In the same manner, the rear wall and the two side-walls are also provided with panos. Between the two ends of the front side there are fastened three poles half a meter high, which are often used as sitting places. The entrance, which is one meter wide, is on the right-hand narrow side. The fire burns in the center of the hut, and in a triangle around it are fastened the hammocks in which the chief, his two wives, and the children sleep. All the implements hang on the crossbeams and on the plaiting of the rear wall.

[354] [352] [353]

343 To the right, next to the chief's house, stands a small, open hut which is four meters long, two meters wide, and six meters high. Here, too, the roof has a gable-shape and is likewise covered with panos made of ubim leaves. Under the roof is found a latticework pen about 1.60 X 2 meters, which is used as a rooster coop.

342 From an architectural standpoint, this open, almost circular construction, in which, to be sure, the chief's hut and the coop for the roosters form two foreign bodies added later -- represents an unexcelled method of building, particularly for this hot, tropical region. The circular shape prevents the wind from entering, and the rain, too, cannot reach the families living in the dead angle under the roofs. Moreover, there is always pleasantly fresh air, so that even upon leaving this maloka there is no danger of catching cold. Tribes or groups living in closed malokas are much more subject to respiratory ailments when they leave the warm community house and step out into the cool morning or night air. This maloka of the Surára may doubtless be regarded as one of the oldest and most primitive types of construction of the South American Indians. Around the community house, plantings have been laid out (Ill. 37) and at the present time extend to the middle of the mountain slopes.

[174] 241

Surára
Pakidai

/15/

342
184 As a third house-form, on the Cachoeira dos Índios on the upper Aracá I became acquainted with a closed, circular maloka ten meters high with a gable roof. The Surára told me that this type of construction is customary among the Xirišna. Up to now, however, there has been no description of it.

36
313 The construction, as in the case of the open maloka, is carried out by all the men of the tribe, under the direction of the chief, as communal work. I had the good fortune to be present at this construction in all its phases. First, a section of the forest, upon which the maloka is to be erected, is cleared. The men start by cutting down the small trees and bushes and pulling out the roots. Then they proceed to fell the large trees. Before two men with their axes set to work on a tree, however, one man climbs it and fastens a very long liana just under the crown. When the tree is then notched so far that it threatens to fall, three or four men pull it down to the ground by means of the liana and, as the tree falls, quickly leap to one side. When all the trees are cut, the roots are dug out with the help of the terçados (large bush-knives) and the hands. Meanwhile other men pull out the underbrush on the ground. During the next two or three days, trees are cut in the virgin forest to serve as building material. After that the chief, assisted by two or three men,
342 marks off a circular area by means of a liana. Then the building starts, and, after only eight days, presents the following completed construction: On either side of three center posts ten meters high, which constitute the ridge, four posts eight meters high stand in a semicircle. At a greater distance from these posts 21 small stakes, each five meters high, are driven into the ground in a semicircle around the posts mentioned. The tall posts, as well as the medium-sized and small ones, are joined by means of two cross-strips at the upper ends and two meters below this. Moreover, numerous horizontal rods are fastened to the cross-strips of the 21 outer posts, by means of which the house wall is formed. Sixty-nine horizontal poles, which are supposed to support the frame of the roof, run from the upper cross-strips of the small posts, over those of the middle posts, which serve as supports, to those of the

/15 cont./

342 large posts. On each of the two narrow sides of the three tall middle posts, 11 thin sticks are attached, organ-fashion, between the supported horizontal poles and form the two gable faces. [824] Here, too, cipó-titica is used exclusively as the lashing material. To the right on the front broad-side and to the left on the rear one there is a small entrance only one meter high and one meter wide. After the framework is completed (Ill. 8), the panos (rectangular mats made out of the leaves of the ubim palm) are again laid over one another on the roof, like shingles, and fastened to the rafters. It is the same technique as has already been described in the construction of the large, open maloka. The upper part of the two gable sides is left open so that light may penetrate into the interior of the house and the smoke be carried off. The walls, too, are completely covered with panos, and in front of the entrances palm-leaf mats that can be drawn back are hung by means of lianas. Inside the house, the center part is left free for holding festivals and dances, while the families, in the same way as in the open maloka, live comparatively close to the wall, one [622] family beside the other. For the chief and his family a particularly large space is reserved on the side toward the river.

342 171 114 The astonishing fact in this form of house is that the ground plan is circular whereas the roof is gable-shaped. Ordinarily for houses with a circular ground-plan, the conical roof is characteristic, as Olga Coudreau (54) and Koch-Grünberg (55) have shown

54. Olga Courdreau, 1903, p. 121.

55. Koch-Grünberg, 1923a, p. 18 and Pl. 2 (1a, 1b, 2a, 2b).

for Karaiben /Carib/ tribes. In this case, one or at most two center posts are used. Koch-Grünberg also mentions, to be sure, a construction with three and writes: "If the two center posts are set farther apart or if, instead of two center posts, three or more are used, /16/ the ridge is lengthened and the circular ground-plan gradually becomes an elliptical one" (56).

56. Koch-Grünberg, 1923a, p. 22 and Pl. 2 (4).

/16 cont./

342 In the building method described by me, however, the
174 circular ground-plan is retained, in spite of the three center posts.
177 According to Koch-Grünberg, the gable roofs and huts with elliptical
ground-plan and others of a square shape owe "their origin obvi-
[114] ously to European influence" (57). On this point I am in com-

57. Koch-Grünberg, 1923a, p. 22.

plete agreement with the above-mentioned investigator and therefore believe that this maloka built by the Surára, which they modeled after the community house of the Xiriána, actually developed from the Karaiben conical-roofed hut, while the roof represents a borrowing from the civilized world (palm-straw huts of the caboclos). This is also indicated by the construction of the chief's hut within the periphery of the large, open maloka,
[184] which likewise has a gable roof (see p. 29). It is noteworthy, however, that the maloka of the Surára has a height of ten meters, while the round huts mentioned by Koch-Grünberg show
342 a height between 4.20-5.57 meters (58). My question as to why
825

58. Koch-Grünberg, 1923a, p. 21.

the Surára in the sierra occupy an open maloka and on the Cachoeira dos Índios on the upper Aracá a closed one was answered to the effect that in the higher, cooler region between Demini and Aracá there are practically no mosquitoes, whereas there are relatively many along the riverbank of the Aracá. This explanation is very plausible, for in the closed community-houses of the Indians there are no gnats. They avoid the semidarkness and the smoke of the constantly burning fire.

2. Bridges

501 Boats are not used by the Surára and Pakidái. When, on
484 their narrow forest paths which are scarcely discernible to our
491 eyes, they come to brooks, they simply wade across. In the case of wider brooks which are greatly swollen during the rainy

/16 cont./

484 season, or in case their banks are steep, a tree trunk is simply
491 laid across as a footbridge. To cross small rivers, for example, the Rio Deminisinho, a left tributary of the upper Aracá which empties into it one kilometer beyond the Cachoeira dos Índios, the Surára even use a regular bridge. The Rio Deminisinho is 38 meters wide at the place where it is crossed, and on either side
499 there are steep banks eight meters high. The bridge, which was built here during the summer, when the riverbed was relatively shallow, consists of 12 crossed tree-trunks 12-14 meters long, which were rammed into the riverbed. Over the places where they crossed, two thinner trunks were laid next to each other and fastened with liana lashings. At the projecting ends of the supporting posts, lianas form a sort of railing. Since they hang very loosely, however, they can scarcely offer a grip. To secure the bridge, both ends have been additionally anchored to thick trees by means of lianas. Because of this, the construction looks like a hanging bridge at first glance. Since it is one meter higher than the banks, however, small rung-ladders 60 centimeters wide are attached at either side and fastened with liana lashings.

484 While I always had to fight with great difficulty to keep my
491 balance in crossing this and other tree-trunk bridges, the Indians,
[481] men, women, and children, always strode across effortlessly, even when they were carrying a great deal of baggage. This may be connected with the fact that they hardly place their feet outward at all, so that one might almost believe them parallel (Ill. 17) (59).

[114]
[141]

59. There are similar accounts by Crevaux with regard to the Oiana /Oyana/ (Rukuien /Rucuyen/, Roucouyennes). The investigator sought the reasons for this and believed he found them in the pelvis. The white women, too, he said, more than the men, walk with their feet placed inward, because their pelvis is wider. On account of the foot position, he concludes that the Indians also have a wider pelvis (Crevaux, 1875, p. 255).

These bridges are nothing new, for they were already mentioned in similar form by Alexander von Humboldt from the Raudal de Guaharibos (60). An absolutely classic description of

60. A. von Humboldt, 1860, IV, pp. 111, 112, 119.

this method of construction observed among the Guaharibo is given by Chaffanjon: "Finally, toward half-past four in the evening we discover a sort of lake with a rayol, at the end of which some branches, regularly placed across the stream, attract our attention; planted between crevices in the rocks, they form a foot-bridge. For constructions of this type, the Indians wait until the river is very low. They look for branches or young trunks of single growth, such as are often encountered in the forest. The thickness varies from 12 to 15 centimeters in diameter, the length differs according to the depth of the water. The posts which we examine do not exceed four meters in length; they are, like all the branches, either broken off or burned; none bears any trace of ax or knife. The supports in an X, set at intervals, have their forks joined by cross-pieces both at the lower part and at the upper part. The whole is firmly fastened with very resistant lianas. In order to make the supports planted in the crevices or between the rocks more secure, they are tied to trees along the bank, which gives them the appearance of a hanging bridge. The Indians walk along the two lower cross-pieces and use the upper one as a handrail" /translated from the French/ (61). Such bridges

491

411

3. War and Hunting Weapons and Accessories

For war and hunting expeditions the Surára and Pakidái, exactly like most of the other forest nomads of South America, use very large bows -- hâtonahî -- and arrows -- xeréka (Ill. 12).

[824] The bows, so-called simple bows because they consist of only one piece, are made out of the heavy black wood of the pupunha or chonta palm (Guilielma speciosa Mart.) and are between 2.03-2.12 meters long. Their tension-strength weight is 32 kilograms and the length of stretch 71 centimeters (64). As

64. Pertinent comparisons with bows of other South American tribes may be found in Ranke's chart (Ranke, 1903, p. 347).

the result of a not too marked, but uniform curvature, they have a symmetrical appearance. While the outer side is flat, the inner side is rounded, so that the cross-section, which in the center amounts to 2-2 1/2 centimeters, appears semicircular. The two ends come to a point (Fig. 2 i).

411 With regard to their construction it may be said that now-
412 adays the bow-staff is first roughly shaped with ax and tercado
322 (large bush-knife (65). (I did not find any stone axes, which

[439]

65. They obtain these objects by barter with piacabeiros (palm-fiber gatherers) and as gifts from the personnel of the Indian protection post Ajuricaba on the middle Demini.

[439] were perhaps once used in former times.) Subsequently the men shape them with a small knife, which they likewise obtain by barter.

Surára
Pukidai
Shiriana
Yamatari

/17 cont./

411 barter. For smoothing, they use the inner edge of the eye-tooth
412 from the lower jaw of a wild pig and the rough leaves of the
322 curatella (Cecropia peltata), which gives the bow a beautiful,
237 shiny appearance.
824 The bowstring -- penahitábe --, which consists of three
411 strands of curaná (Bromeliaceae) fiber strings twisted to the right,
283 is fastened to the bow ends with a simple knot. If one wants to tighten up the bow, the string must be twisted more, which makes it shorter.

411 The bow described may be immediately classified as one of
191 the typical bow-forms of Guiana, which Métraux characterizes as
114 follows: "Guiana bows were generally convex on the belly while the back or outer surface was concave or flat" /cited in English/ (66).

66. Métraux, 1949, p. 232.

According to Meyer's classification, on account of its semi-circular cross-section, it would /18/ belong to the North Brazilian bow-type; on the basis of the material, however, to the Peru group, because it is not the reddish-brown, smooth leguminous wood, but that of the pupunha palm (67). P. Schmidt also

67. Meyer, no date, p. 31.

devotes a rather long section to this "reverse form of the flat bow" and already lists the following tribes north of the Amazonas where it occurs: "Kanamare on the Rio Jurua, Trio, Ojana, Makusi, Wapisiana, Uaupe, Porokoto, Passe (child's bow), Siriana on the Rio /Fig. 2 appears here./ /19/ Uraricapara,
411 Motomoto" (68). On the basis of the descriptions and illustra-
184
114

tions of the Xiriána bow which Koch-Grünberg gives (69), it is

69. Koch-Grünberg, 1923a, p. 311 and Pl. 47 (1 and 2a, b, c, d).

almost identical with that of the Surára and Pakidái, except for the fact that the former is set off at the ends. This confirms the statements made by the Indians investigated by me who said that they obtained bows of this kind and the knowledge of how to make them themselves from the Xiriána. In reply to my question as to why their bows were not set off at the end, I was told that the Xiriána demand this deviation. In the Hamburg Museum für Völkerkunde und Vorgeschichte /Museum for Ethnology and Prehistory/, there are two Xiriána bows which were collected by Koch-Grünberg (12.25:29, 12.25:31). They are relatively small specimens, however, for they are only 1.92 and 1.82 meters high, respectively. A bow which came from the Xamatári of the Rio Maiá, a left tributary of the Rio Cauaboris, and which is also in the Hamburg Museum für Völkerkunde und Vorgeschichte (Boeldecke Collection, 56.15:4) and is two meters high, has exactly the same shape as the Surára and Pakidái one, that is, without the offset ends. This is not surprising, for, according to the statement of the Surára chief Hewemão, the Xamatári are likewise satellites of the Xiriána (see p. 12). Finally, it should be mentioned that the same bow-form has also been documented for the Waiká in Venezuela (70).

The arrows -- xerêka --, whose total length comes to between 2-2.12 meters (shaft length 1.89-1.94 meters; weight, 60-90 grams) (71) (72), are made out of arrow cane -- xerekaîbe --

[114]

71. These measurements confirm Weule's statement when he says that the arrow must correspond in length, shape, and weight to the bow, in order to guarantee a certain accuracy of aim (Weule, 1899, p. 6).

72. Pertinent comparisons with other South American tribes are to be found in the chart by Ranke (Ranke, 1903, p. 347).

Surára

/19 cont./

411 which the Surára and Pakidái plant in the vicinity of their malokas
[249 on the upper Aracá and the middle Demini, respectively. All five
[824 of the arrow types used by them have the same feathering --
[237 jaromahîk --, which consists of two halves of the black wing feathers of the mutum (Crax sp.) -- pararí. They are placed against the cane in such a way that they alternately show the upper and the
[283 lower side of the feather. At several places on the hand end they are held by two threads of the tight winding of Bromelia fibers -- pemakasiurakama. Inside this winding, which is supposed to strengthen the weak cane against the pressure of the bowstring, there is stuck on the end of the cane in addition a small wooden peg fastened with resin, which has a notch in its thickened outer part, which is set on the bowstring. This is supposed to prevent the cane from splitting when the arrow flies off. The upper end of the feather shaft is wound with a second, narrower winding, in which, between the two halves of the arrow feathers, two additional small black mutum feathers are frequently stuck as ornaments (Fig. 2f).

411 The feathering described belongs to the Guiana type of
184 feathering, according to the classification by Meyer (73). Koch-
114

73. Meyer, no date, p. 9.

Grünberg (74) confirms it for the Xirišna, and it can also be recog-

74. Koch-Grünberg, 1923a, p. 312 and Pl. 47 (4, 7, 8).

nized on the arrows which that investigator brought back for the Hamburg Museum für Völkerkunde und Vorgeschichte (Koch-Grünberg Collection, 12.25:33-42). The arrows in the Alfred Boeldecke Collection (56.15:5-7) in the same museum and the drawings by Vinci (75) show that the Xamatári likewise use this

411 184 114 feathering, and, according to Salathé, it is also to be found among the Karimé (76).

76. Salathé, 1931/32, p. 300 and Figs. 3 and 4.

411 There is an astonishingly wide range of variation for the arrow points, of which the following five different types occur among the Surára and Pakidái:

1. Kantaná -- It is a wide, lancet-shaped bamboo point, 25-28 centimeters long, both /20/ ends of which come to a point; the [531] width in the center is 3-4 centimeters. The upper side is rounded off, and the lower one, occasionally somewhat hollowed out, is [283] sometimes painted with black dots. It is inserted in the slightly split arrow shaft and tightly wound with Bromelia fibers (Fig. 2a). Since the arrows with this large point have particularly great penetrating power, they are used chiefly for the hunting of tapirs and jaguars; moreover, they are used for warlike encounters. Every Surára and Pakidái man always carries two or three such reserve points in his quiver.

411 184 114 Salathé found similar points among the Karimé (77) and

77. Salathé, 1931/32, pp. 299/300 and Fig. 3b.

Vinci among the Xamatári (78). Moreover, they are confirmed

78. Vinci, 1956, pp. 145 and 146, Fig. b.

for the latter Indians by a specimen in the Hamburg Museum für Völkerkunde und Vorgeschichte. (Alfred Boeldecke Collection, [531] 6.15:5. Length, 23 centimeters; width in the center, three centimeters. On the lower hollowed-out side, this point is painted with a black, serpentine line.)

Shiriana
Surára
Pakidái

/20 cont./

411 184 114 [283]

The lancet-shaped bamboo points of the Xirišána investigated by Koch-Grünberg, on the other hand, have a somewhat different shape. Here the two ends do not come to a point, as among the Surára, Pakidái, Karimé, and Xamatári, but rather one end is thickened, hollowed out, and, wound with Bromelia fibers, is set on a wooden shaft inserted in the arrow cane (79). Three such

79. Koch-Grünberg 1923a, p. 312 and Pl. 47 (5, 8).

Xiriana arrow points of the Koch-Grünberg Collection in the Hamburg Museum für Völkerkunde und Vorgeschichte have, moreover, the respectable length of 34 centimeters (12.25:37) and 35 centimeters (12.25:34-35).

Inasmuch as the Surára and Pakidái, according to their own statements, borrowed their lancet-shaped bamboo points from the Xirišána, the ensuing alteration process is quite significant, since, indeed, the point is no longer mounted on a wooden shaft, but is inserted directly into the arrow cane.

Furthermore, lancet-shaped bamboo points have been confirmed for the Waiká by Zerries (80) and Schuster (81), but it is

80. Zerries, 1956b, p. 151.

81. Schuster, 1958b, p. 17.

not clear from their texts whether this is the same type as that of the Surára, Pakidái, etc. or that of the Xirišána.

411 171

How greatly the lengths and attachment possibilities of such bamboo points vary among South American Indians is very clearly shown by the comprehensive investigations of Meyer (82) and

82. Meyer, no date, pp. 18, 19, 25, 27, 30, 36, 37, 47, 48, 49, and Plates I, 11, 13; II, 16; III, 14; IV, 8, 15.

/20 cont./
Métraux (83).

83. Métraux, 1949, pp. 236/37 and Fig. 64.

2. Rahakâ -- This is a narrower lancet-shaped bamboo point which is inserted in the arrow cane wound with Bromelia fibers in the same way as the kantanâ (Fig. 2b). The individual points are 20-22 centimeters long and 1.5 - 2 centimeters wide in the middle. Wild pigs, water hogs (capybara), deer, pacas, and cutias (see p. 4) are killed with them. It is noteworthy that such narrow bamboo points have hitherto not been mentioned in the literature.

3. Kantarîm -- Point with barb, made from a twin-pointed piece of bone from the cuatâ (Ateles paniscus L.). This is lashed, by means of a winding of Bromelia fibers additionally coated with pitch, parallel to the upper end of a wooden shaft inserted in the arrow cane (Fig. 2c). With this arrow tip, which is very widespread in South America, the Surára and Pakidái shoot birds and fish.

According to the classification by Métraux, it belongs to the second principal type of arrow points occurring in the tropical forest region of South America (84). Meyer mentions that it is

84. Métraux, 1949, p. 237.

used in Guiana, but also in western Brazil and among the Karajá /Caraja/ (85). Within the Yanomámi group, they have furthermore

85. Meyer, no date, p. 18.

been documented for the Xiriâna (86), Karimé (87), Xamatári (88),

86. Koch-Grünberg, 1923a, p. 312 and Pl. 47 (7).

87. Salathé, 1931/32, p. 300 and Fig. 3c.

und Vorgeschichte, there are, /21/ moreover, three Xiriâna arrows with this point (Koch-Grünberg Collection, 12.25:39-41) and an arrow from the Xamatâri (Boeldecke Collection, 56.15:6).

411 4. Ranaká -- Forked wooden point of a bird arrow; length, 12-15
[824] centimeters. The material is furnished by a tree -- paioórimá -- which shows countless such forkings. The lower part of the stem is pointed and is set in the arrow cane wound with Bromelia fibers (Fig. 2e). Thus far there is a parallel for this arrow point only among the Waiká (91a).

91a. Barker, 1953, p. 464.

5. Unamú -- Wooden arrow-point with a coating of poison. A thin, pointed rod of the hard wood of the pupunha palm, 22-24 centimeters long, is coated with arrow poison, giving it a black appearance. The rear end is inserted in the arrow cane wound with
[824] Bromelia fibers (Fig. 2d). Such poisoned arrows are used exclusively for hunting monkeys, since these animals living in the tall trees are otherwise difficult to kill. According to the statements of Surára and Pakidái informants, they never shoot poisoned arrows at human beings.

411 Other Yanonámi tribes who likewise use poisoned arrows are
184 the Xiriâna (91b), Karimé (92), and Waiká (93) (94). Moreover,

Surára
Pakidái

/21 cont./

411 184 there is a Xamatâri poisoned arrow in the possession of the Hamburg Museum für Völkerkunde und Vorgeschichte (Boeldecke Collection, 56. 15:7).

411 171 114 [139] Métraux writes with reference to the poisoned arrows: "Poisoned arrows were not so widely used by the Indians as is commonly assumed from the exaggerated accounts of the Spanish conquistadors. Curare, which is the most deadly poison known to the Indians, is prepared by relatively few tribes though it is traded throughout wide regions" /cited in English/ (95). Among

95. Métraux, 1949, p. 242.

Karaiben /Carib/ tribes in Guiana, poisoned arrows which are shot with a bow are not very often encountered, for they are documented only for the Makuxí /Macusi/ by Richard Schomburgk (96) and for

96. Richard Schomburgk, 1847, p. 428.

411 171 the Trio by de Goeje (97). It should be mentioned in this connec-

97. de Goeje, 1906, p. 15; Pl. V, Figs. 10-12; Pl. XI, Fig. 22.

tion, however, that many Karaiben, for example, the Arekuná-Taulipang /Arecuna/, shoot small poisoned arrows with a blowgun; this weapon is unknown to the Surára and Pakidái.

278 Arrow poisons:

[192] [184] According to what my Surára informants reported to me, they use three kinds of poison of different strengths, all of which, however, they designate by the general name -- mamokôrimaunâpe. This name is almost the same as the one which the Waiká, according to Zerries, use for arrow poison -- mamokordi (98).

98. Zerries, 1956b, p. 151.

Surára
Pakidái
Shiriana

/21 cont./

278 The strongest poison is said to be obtained from the milk of a tree which, in the language of the Surára, is called -- patemá. [824] This tree was not pointed out to me; I was told that it only grows in a very distant region. To prepare an allegedly weaker poison the milk of the -- tototó -- (Strychnos toxifera) is used.

As soon as it is obtained, the particular type of milk is [415] boiled in a clay vessel. This makes it turn black, and subsequently [413] it is painted on the arrow points by means of a wooden stick which [415] is wrapped with cotton. Special bags -- kanabó --, which are made [824] out of the leaves of the acaf palm (Euterpe oleracea Mart.) and sewed with lianas, are used for storing them. There is never anything left of the poison itself.

278 438 I was also told that of the tribes allied with the Xiriána only the Surára were entrusted with the preparation of these two types of poison. All the Indians who were friendly with them, even the Xiriána, thus obtained their poisoned arrows from them by barter. The Surára chief Hewemão, however, emphasized that the detested Waiká also knew how to prepare arrow poisons, which they used [114] above all to shoot at human beings. The latter statement is confirmed by Zerries (99).

99. Zerries, 1956b, p. 151.

278 /22/ The third type of arrow poison is the weakest. It is made out of snuff powder -- epená -- (see pp.190/193, which is mixed with water and boiled. This method is also supposed to be familiar to the Pakidái and Xiriána.

Unfortunately, I could not take part in the preparation of the poisons, for, with the exception of the chief /Fig. 3 appears here/ and his brother, only a few older men are familiar with them and they are kept strictly secret even from all the other members of the tribe. The meager information about them is limited to oral statements.

/22 cont./

411 Boys' bow:

524 The boys' bow -- hauoá -- is 80-90 centimeters long and
[824] consists of a curved branch of the paioôrimá tree, which also furnishes the material for the bird arrow-points. As in the case of all branch-bows, the arms are of different lengths, so that an unsymmetrical shape is produced, which affects the accuracy of the

Fig. 3. Position for shooting with the bow.

shot. This is of no consequence, however, since these are merely
283] toy bows for small boys. On both ends the bow staff is tapered and
[824] set off to receive the bowstring -- pebatábe -- which is made out of a liana (cipó-titica) (Fig. 2g).

Boys' arrows:

[192] Ruhumacík is the name of the thin arrow, 80-90 centimeters
[824] long, for boys, which the fathers make out of the wood of the
[237] inaja palm Maximiliana regia Mart.) -- kareximací. The feather-
[283] ing -- jaronahík -- consists of two small halves of mutum feathers,
which are lashed to the shaft with a thread of cotton. Instead of
[192] an arrow point mounted separately, the arrow here is only slightly pointed (Fig. 2h); the designation for it is -- peimacikenâme.

/22 cont./

411
[482] In the forest the Surára and Pakidái as a rule carry their bows and arrows longwise with one or both hands above their heads, but occasionally also on the right or left shoulder.

In shooting, the bow is held in a horizontal position with the left hand. The arrow lies to the left of the bow, between thumb and index finger. The man holds the end of the arrow between the index finger and middle finger of the right hand and simultaneously stretches the bowstring with the second joints of these fingers (Fig. 3); occasionally he also adds the second joint of the ring finger, if the shot is to be reinforced. This is a form
411 which, following Morse, is designated as the "Mediterranean re-
171 lease" /cited in English/. This practice has been documented
114 also for Eskimo tribes and Siberian peoples (100), but never for

100. Morse, 1885, pp. 12-15 and Figs. 8 and 9.

South American Indians. Concerning the tribes on the Aiarý, Koch-Grünberg says that here the men hold the end of the arrow with thumb and index finger of the /23/ right hand, while they simply press the other three fingers against the palm of the hand (101).

101. Koch-Grünberg, 1909, p. 104 and Ill. 58.

The Yurakare /Yuracare/, too, hold the arrow with the thumb and index finger of the right hand, and they use the remaining three fingers for stretching the bow (102). These latter forms seem to be

102. von Holten, 1877, p. 111.

the most customary in South America, but unfortunately this cannot be definitely established because the information concerning this is too meager. Friederici has already justifiably complained: "With reference to the manner of grasping and stretching the bow and aiming and shooting the arrow, reports are unfortunately very scarce;

Surára
Pakidái

/23 cont./

411 the few that are available are not the type from which rules could
171 be deduced" (103). If the arrow is to be shot upward, the left arm
114

103. Friederici, 1907, p. 329.

is stretched out and the bowstring is pulled up to the right eye with the right hand (Ill. 13). I did not meet any left-handed archers. Koch-Grünberg mentions one and remarks that he was assured there were many of them (104). Among the Mosquito

104. Koch-Grünberg, 1923a, p. 73.

Indians in Central America left-handedness seems even to be quite pronounced, for Sapper shows their typical handling of the bow and arrow in the photograph of a Mosquito boy shooting left-handed (105).

105. Sapper, 1903, p. 54.

411 The best shooting performances, which I tested with men and boys, were between 40-50 meters for the former, who shot straight through an empty gasoline can with the large, mounted, lancet-shaped arrow-point, and between 8-10 meters for the latter. Yet even at a distance of 100 meters, most of the men hit the target; the penetrating power, however, was considerably diminished. These figures agree very closely with the statements compiled from the literature by Friederici (106). Several warriors

106. Friederici, 1907, p. 326.

were also able to shoot indirectly, which is shown by the following experiment which I carried out with Hewemão, the chief of the Surára, his younger brother Kurikajawõ, the Surára man Brakaiwõ, and the warrior chief of the Pakidái, Poréhiwõ. I placed three white leaves of standard size on the ground, one behind the other, at a distance of 30, 28, and 26 meters from the

Surára
Pakidái

/23 cont./

411 individual archers. The aforementioned men then shot three arrows into the air successively (one with a large lancet-shaped point, one with a small lancet-shaped point, and one with a bone point), and each one hit the leaf, usually even the center of it. This Indian [114] ability to hit targets even with an indirect shot has already been pointed out by Friederici and substantiated in the sources (107).

107. Friederici, 1907, p. 329.

I also observed, however, that not all the men were equally good archers, although from childhood on, of course, they are constantly handling bow and arrow. My servant Mateus and I each carried a shotgun, 20 caliber, with us, and the use of our guns aroused the interest of only a few men. The aforementioned three Surára and the Pakidái, however, as well as several other warriors, after a very short time, knew how to handle them just as well as bow and arrow.

[114] Koch-Grünberg came to similar conclusions on his journeys, for he writes: "This is not to say that every Indian is an accomplished hunter. Among these people, too, talents and inclinations are unevenly distributed..." (108).

108. Koch-Grünberg, 1923a, p. 59.

[422] It should be mentioned further that bows and arrows repre-
[796] sent the most valuable private property of every man, and they
[156] also play a large part in all magical and religious practices (cures of the sick, festivals, dances, etc.). Furthermore, the weapons
[437] are favorite trade items and gifts of honor which the Surára and
[431] Pakidái occasionally receive from the Xiriána or give the latter during visits (see pp. 13, 159/160). A young man who wants to
[584] marry a girl must also first make a bow and five different arrows
[764] for his future father-in-law. /24/ If a warrior dies, his weapons are burned with him, so that he may use them on his journey to the moon and on the moon itself (see p.150).

411 Before the Surára and Pakidái adopted the large reverse flat
173 bow from the Xiriána, I was told, their forefathers were acquainted with only the branch-bow.

/24 cont./

000 411 194 with only the branch-bow. Accordingly, the present-day child's toy would resent a "survival" /quoted in English/. The Waikâ, Zerries reports, had a tradition according to which they completely lacked 173 411 even bows and arrows in olden times. Wars at that time were waged only with clubs. He also found a few specimens and describes them 726

411 415 531

a b

Fig. 4a-b.
Bamboo quiver and a rubbing of the incised design.

173 411 726 as long, flat sword-clubs, called "hímo," which are made from the wood of the pupunha palm (109). Moreover, he mentions long

411 171 578 wooden poles with which, to this day, local conflicts are settled, which reminds him of the duels of the Botokuden /Botocudo/ (110) (111).

109. Zerries, 1956a, p. 185.

110. Zerries, 1956a, p. 184.

111. Zerries, 1954b, p. 75.

Surára
Pakidái

/24 cont./

411 824 Among the Indians investigated by me, I observed neither poles nor clubs (112), but I did see an intermediate form, namely, sticks

112. Among the Xiriâna, too, Koch-Grünberg did not discover any native clubs (Koch-Grünberg, 1923a, p. 313).

made of pupunha wood 1.30-1.40 meters long, which are somewhat thicker at one end and the name of which is likewise -- hímo. With these the men, for certain reasons, engage in 411 578 191 stick-duels (113) which resemble those of the Guayakí (114);

113. Becher, 1959, pp. 162 ff.

114. Baldus, 1939, p. 113.

they differ greatly, however, from the stick combats of the 411 184 Botokuden (115). Nevertheless, there are distinct parallels be-

115. Prince zu Wied-Neuwied, 1820, pp. 368-370.

tween the poles or clubs of the Waikâ and the sticks of the Surára and Pakidái, first of all, on account of the similar use to which they are put and, secondly, because of the similar name. It is [174] therefore to be assumed that pole and stick represent very primitive weapons, from which, presumably as a result of external influences, the club was developed.

411 Quivers:

The bamboo quivers -- tôra -- 32 to 40 centimeters long, with a diameter of four to five centimeters, are an important accessory for the hunting and war weapons. They are for the [581] most part decorated with incised serpentine lines and zigzag designs (Figs. 4a, 4b).

411 The quiver, in which there are always a few poisoned arrow-482 points wrapped in palm leaves and several large, as well as small,

411 482 /24 cont./ lancet-shaped bamboo points, is worn on a neck cord by every hunter and warrior, who has it hang down on his back so that it does not interfere with the stretching of the bow.

411 184 /25/ Quivers of the same form and carried in the same way are also found among the Waiká, as may be seen from a photograph by Zerries (116). Moreover, the Hamburg Museum für Völkerkunde und Vorgeschichte owns such a quiver, though without decoration, from the Xamatári (Boeldecke Collection, 56.15:3a).

372 4. Fire-making Apparatus

Tied by means of a string of cotton or curauá (Bromelia fiber) to every Surára and Pakidái quiver at the top and bottom is the fire-drilling apparatus -- borôrohík -- which consists of a lancet-shaped hearth -- panâibequehík -- and two drilling sticks -- [824] [184] ihirupehík (Fig. 5). Both parts are made from the soft wood of the wild cacao tree -- porôroš -- exactly as among the Waiká (117).

117. Schuster, 1958b, p. 17.

372 114 Koch-Grünberg documents such a fire-drilling apparatus for the Xirianá (118), but without mentioning the material. On the basis

118. Koch-Grünberg, 1923a, p. 311.

of a specimen which he brought back for the Hamburg Museum für Völkerkunde und Vorgeschichte (Koch-Grünberg Collection, 12.25:124), however, one may state that it is likewise made of the wood of the wild cacao tree. He says nothing at all about [411] quivers and thus does not seem to have found any. Nor did I find elsewhere in the literature any parallels for the very practical combination of quiver and fire-making apparatus (119). Nevertheless,

392 411 184 114 119. That it is well-known among the Xamatári, however, is proved by two objects from that tribe in the Hamburg Museum

/25 cont./

372
411
184
114

119.(cont.) für Volkerkund und Vorgeschichte (Boeldecke Collection 56. 15. 3a and b), and presumably the pre-fire-making apparatus is likewise fastened to the quiver among the Waiká. Definite statements about this by Zerries and Schuster have not yet been made.

Fig. 5. Bamboo quiver with fire-drill apparatus tied on.

372 Nevertheless,
[484] it is perfectly obvious, for if the Surára and Pakidái men on war and hunting expeditions are unable to return to the maloka in the evening, they are able to kindle a fire along the way in three to four minutes. To do this a man in a squatting position holds the hearth on the ground with one foot and drills with the palms of his hands (Ill. 31). The holes of the hearth are previously bored with a knife made of the sharp tooth of the cutia (Dasyprocta aguti L.)
[412] [237] (See P. 116) and are /26/ connected with a small groove at the side.

Surára
Pakidái

372 /25 cont./
(see p.116) and are /26/ connected with a small groove at the side. The hole is enlarged by the drilling. There is loosened a fine dust which slowly starts to smoke and glow and, by way of the groove, falls on tinder previously placed next to it (dry grass, leaves, or dry splinters of bamboo), which quickly catches fire. Cautiously the man blows upon it, and a short time later a flame leaps up. This requires a great deal of practice and skill, however; often he
[171] has blisters on his hands after drilling. This is the most widely distributed method of producing fire in South America (120). In their malokas

120. Nordenskiöld, 1924, pp. 118-125 and Map 13.

the Surára and Pakidái preserve the fire.

283

5. Twining and Spinning

[824] For making thread and cord the leaf fibers of a Bromeliaceae, curauá (121), and cotton are used, the latter, however, only in more recent times.

[114] [171]

121. Koch-Grünberg also verifies the use of this material for the northwestern Brazilian tribes (Koch-Grünberg, 1910, p. 210).

[462] While to this day the curauá fibers are worked, mostly by men and only occasionally by women, with the right hand against the right thigh in the direction of the knee, to produce thread twisted to the right (122), a spindle is used to make cotton thread,

[171]

122. Threads which are not spun with the spindle are twisted to the right among most of the South American tribes. There are exceptions, however, for among a few nations of northwestern South America threads twisted to the left are more prevalent, and

/26 cont./

283
[171]

122. (cont.)
in Guiana as well as in the Gran Chaco both thread twisted to the right and thread twisted to the left appear (Frödin and Nordenskiöld, 1918, p. 50).

[462] with which, however, a left twist is associated. The treatment of cotton -- xinarí --, starting with picking, then drying and bleaching, removal of the seeds, loosening and plucking apart, up to the spinning, is women's work.

The spindle -- xinarikã -- consists of a smoothed stick -- ruhú -- 30-35 centimeters long, for which the rib of a palm leaf is also often used, on the upper end of which a small barb -- nhobaná -- of the same material is attached with a cotton thread. [321] The disk-shaped whorl -- tankarã --, made by the men out of bone [322] or wood, is slipped onto the stick from below and rests in the cen- [462] ter of it. To prevent it from slipping off when the woman holds her spindle in a vertical position, there is a wrapping of cotton below the whorl.

283
171 From the description it may be seen that this is a typical Guianese variation of the "Bakaïrí /Bacairi/ spindle." "Only in Guiana and on the Amazon River," Frödin and Nordenskiöld write in their study, "Uber Zwirnen und Spinnen bei den Indianern Südamerikas /On Twining and Spinning among the Indians of South America/, "do we find the spindles provided with barbs, which, however, differ from the other Bakaïrí spindles only in that the spindle whorl rests near the center of the stick (Fig. 40)" (123).

123. Frödin and Nordenskiöld, 1918, p. 24.

In two other respects, however, the spindles of the Surára and Pakidái differ somewhat, for among them the stick is not thickened at the bottom, and the whorl is held by a wrapping of cotton.

283 /26 cont./
171 Up to now there has been only one parallel to this, namely
184 a Quechua spindle (124). The spindle of the Karimé, on the
114

124. Frödin and Nordenskiöld, 1918, pp. 26/27.

basis of the drawing in Salathé s article, seems to resemble those of the Surára and Pakidái (125). Unfortunately, Salathé does

125. Salathé, 1931/32, p. 305, Fig. 14.

not indicate whether the whorl is held in position by a wrapping put on below it or perhaps by means of resin or wax, as is the case, for example, for the spindles of the Chama and Pauserna (126).

126. Frödin and Nordenskiöld, 1918, pp. 26/27.

283 This already exhausts the comparisons with regard to the securing of the whorl by means of a wrapping, wood, or wax, so that no conclusions about origin and distribution can as yet be drawn about it.

283 During the time I lived with the Surára and Pakidái, I
123 found that many women preferred to use the lids of my empty powder-boxes and skin-cream jars as whorls, /27/ and they preferred to spin the surgical cotton which I carried with me rather than their cultivated cotton, because, they said, the threads spun from it were stronger and more durable.

283 Spinning is done in the following way: The woman sits on a thin tree trunk with the lower part of her legs bent back. The cotton that is to be worked hangs over her left shoulder and from there the thread is fed out with the fingers of the left hand. She first rolls the spindle, on the barb of which she has fastened the thread, in a horizontal position with the palm of her right hand on her slightly sloping right thigh, moving her hand rapidly from the knee upwards. This gives the thread a

/27 cont./
283 left twist. Then she lets the spindle fall to a vertical position between her legs and rotate on the ground.

[190] This method belongs to Variation I of the Bakaïri spinning (127), which is extraordinarily characteristic for the

127. Frödin and Nordenskiöld, 1918, pp. 34 and 46.

Guiana tribes and which is described in a similar manner by Koch-Grünberg (128), Frödin-Nordenskiöld (129), Im Thurn (130),

128. Koch-Grünberg, 1923a, p. 86.

129. Frödin and Nordenskiöld, 1918, pp. 52 and 56.

130. Im Thurn, 1883, p. 282.

and Roth (131).

131. Roth, 1929, p. 23 and Pl. I and II.

283 436 437 The spun threads are wound into round balls, which in this form are used as tribute payment to the Xiriâna (see pp. 159/160) and also represent popular trade items, exactly as in the case of the Arekuná-Taulipang and their neighbors (132).

132. Koch-Grünberg, 1923a, p. 86.

283 174 The cotton, the spindle, and the technique of spinning it to the left presumably reached the Surára and Pakidái from Karaiben /Carib/ tribes by way of the Xiriâna. The fact that cotton and spindle represent imports becomes clear in particular from the technique of the left twist, since in the case of the original material, the curauá fibers, the threads are always twisted to the right. Im Thurn already points out that in Guiana

[191] [114]

283 /27 cont./
191 it is chiefly the Karaiben who spin thread out of cotton, and he
194 believes that they also brought along cotton and the spindle
114 when they immigrated into Guiana (133). The latter assumption

133. Im Thurn, 1883, p. 287.

has, however, not yet been proved, for on the upper Rio Negro Koch-Grünberg met Karaiben tribes who were acquainted with neither cotton nor the spindle. To an inquiry by Frödin and Nordenskiöld about this, he replied in a letter as follows: "It is an absolute mystery to me why the Indians on the upper Rio Negro do not plant cotton for spinning and have no spindles. It would be important to investigate how far this absence of spindles extends down the Rio Negro and into its tributaries, which, to be sure, from the Curicuriary downward, are almost completely unknown ethnographically" (134).

134. Frödin and Nordenskiöld, 1918, p. 21, footnote 1.

283 Within the Yanonámi group, cotton and spinning are known,
184 in addition to the Xiriána, Surára, and Pakidái, also to the
194 Puseheweteri, Aramamesteri, and Karauateri, members of
114 whom I met in the malokas of the Surára and Pakidái, and also to the Karimé (135) and the Waiká, who, according to Schuster,

135. Salathé, 1931/32, p. 305 and Fig. 14.

presumably became acquainted with cotton through the Karaiben Makiritare (136).

136. Schuster, 1958b, p. 16.

/27 cont./

6. Dress and Ornament

291 a) Hip cords and belts

From the age of four on both sexes constantly wear a hip [824] cord -- nhamaaxí -- which is made by the women, but occasionally also by men, out of curauá fibers, the original ma- [283] terial (see p. 55), or out of cotton. For the former, two strands are twisted to the right, and for the latter, to the left. The old technique of the right twist in the working of curauá fibers was thus retained, in spite of the adoption of cotton. There is, how- [292] ever, a further important difference. Whereas the hip cord of cotton represents the everyday dress, so to speak, /28/ the one made out of curauá fibers is at present used almost solely for ceremonial purposes.

All male Surára and Pakidái tie the penis up by means of the hip cord, which is done before donning it by tying a knot and drawing the foreskin through it.

With the hip cord these Indians feel clothed, and they therefore never take it off, not even for sleeping or bathing. Once when I was out hunting with the war chief of the Pakidái, Poréhiwö, he happened to tear his hip cord. He modestly stepped behind the nearest tree immediately and tied it together again. Later he told me that it would be the most flagrant offense against good form to walk about without the hip cord. The women would then cover their faces and scream loudly. [689] Hence a man may never appear with his penis hanging down, and it would be a positively execrable crime, which is punished by blows, if he exposed his glans to the eyes of women and girls.

This shows that among the Surára and Pakidái the hip cord in general, for women and girls also use it without covering anything with it, and the tying up of the penis in particular are associated with feelings of propriety (137). I am herewith able to

[171] [482]

137. The hip cord is never used as a device for carrying utilitarian articles, as Baldus noted, for example, among the Tapirapé

Surára
Pakidái

/28 cont./

291
[171]
[482]

137. (cont.)
(Baldus, 1945, pp. 87/88), because there is the very likely danger that it might tear.

291
114
[171]

I am herewith able to confirm an opinion which Ehrenreich already holds with regard to the covered glans penis among the Xingú Indians (138), which,

138. Ehrenreich, 1890, p. 86.

however, is shared neither by Karl von den Steinen (139) nor by

139. Karl von den Steinen, 1894, p. 195.

Koch-Grünberg (140). According to the opinion of these two

140. Koch-Grünberg, 1910b, p. 89.

scholars, and also of Nordenskiöld (141) and Krickeberg (142),

141. Nordenskiöld, 1922, p. 94.

142. Krickeberg, 1922, p. 251.

the tying up of the penis is supposed to protect the glans from penetrating insects, thorns, etc. This assumption, as far as the Surára and Pakidái are concerned, is at most of secondary importance, for the uncovered female vagina is, of course, equally threatened by penetrating insects. But magical conceptions, too, with which Karsten (143) tries to explain the tying up of the

143. Karsten, 1926, pp. 151/52.

penis, are not applicable in the case of the Indians investigated by me. Hence, the second conjecture expressed by Karl von den Steinen, in which he connects this custom directly with the sex life and points out that it might have the same purpose as

Surára
Pakidái

/28 cont./

291
114 circumcision, is more suggestive. "Not that the opening is enlarged; it is a matter of a gymnastic treatment of phimosis rather than an operative one. Do they not stretch the skin which the others cut? Do they not make room inside, where the others make it toward the outside? This may be doubted least of all for the clamping of the preputium by means of the hip cord, which, as has already been mentioned, seems to be the oldest form, for the hip cord has been retained everywhere. The skin was roughly pulled forward with the cuff. Among young men it often looked sore and scraped. The European has the shoemaker put shoes that are too tight upon the last, but in the interior of Brazil, where only finished, imported goods are bought, a man of social standing thinks nothing of appearing in patent leather shoes which he has widened by a couple of vigorous slashes. His knife is to the shoemaker's last what the circumcising splinter or thorn is to the hip cord"(144).

144. Karl von den Steinen, 1894, p. 199.

Besides the verified feeling of modesty, this assumption may
[833] quite possibly be a second reason. One would then have a parallel, as it were, to the girls who are deflowered with the finger by the mother after the first year of life; it is expressly stated that this is done to facilitate sexual intercourse later on (see p. 135).

291
184 Among other Yanonámi tribes, too, the hip cord of plant fibers or cotton is used by both sexes, /29/ and the men likewise tie up the penis with it. I was able to verify this among members of the Xirišana, Pusheweteri, and Aramamesteri who, as wives or visitors, were staying in the malokas of the Surára and Pakidái. The captive Karauateri girl, Nikeromá, also always wore a hip cord and told me that this was characteristic for her tribe and that the men likewise stuck the member under it. Similarly, Zerries (145) and Hübner (146) point out that the

145. Zerries, 1956a, p. 184.

146. Hübner, 1907, p. 231 and Fig. 12.

Surára
Pakidái

/29 cont./

291 Waiká use a hip cord to bind up the member, and, according to
184 a statement of the last-named author, the Xiriána too. There is further substantiation for the Karimé (147).

147. Salathé, 1931/32, p. 305.

291 In connection with P. Schmidt (148) and Nordenskiöld (149),
171
184

148. P. Schmidt, 1913, p. 1047.

149. Nordenskiöld, 1924, pp. 147/48.

I investigated this strange custom in my study, "Gürtel und Hüftschnüre südamerikanischer Naturvölker /Belts and Hip Cords of South American Primitive Peoples/," and found them verified for 39 tribes, to which six more are now added, the Surára, Pakidái, Puseheweterí, Aramamesterí, Karauaterí, and Karimé. It is even to be suspected that among all the tribes or groups that belong to the ethnic unit of the Yanonámi the membrum is tied
291 up. Since this custom is likewise common among the Pano and
171 Tukano /Tucano/ tribes, as well as among the Makú /Macu/, and
174 three San Agustín statues prove the pre-Columbian occurrence (150).

150. Preuss, 1929, I, p. 79; II, Plates 1; 55 (1); 64 (1).

the northwestern part of South America clearly stands out as the nuclear area and probably the area of origin of this very old custom. On the other hand, the Karaiben /Carib/ and Aruak /Arawak/ tribes, which, according to the investigations up to now, did not immigrate into Guiana until later, do not observe it, with the exception of the Yauapery /Yauaperi/ (151), and

151. Hübner, 1907, p. 231.

the Tupi even regard the tying up of the penis as abominable

/29 cont./
291 and ridiculous (152) (153) (154).
171
174

152. Nimuendajú, 1914, pp. 321/22.

154. Becher, 1955, pp. 144/45.

292 On festival and ceremonial occasions, men, women, and
[192] children from the age of four on also tie over the hip cord a cotton belt -- nyõ -- (155), which is always open in front. As

155. It is the same word that is used to designate the cotton hammock.

a rule, the belts are made by the women; bachelors, however, must make their own.
[171] These are the string belts typical for Guiana (156) (157),

156. Becher, 1951, I, p. 169.

157. Becher, 1955, p. 138.

which, however, take on an appearance somewhat different from the familiar form because of wrappings or cross-bindings. /Fig. 6 appears here./
292 All the men's and boys' belts are roll-shaped and have a
284 length of 70-80 centimeters and 40-50 centimeters, respectively. The diameter for the former is 4-5 centimeters, and for the latter, 2-3 centimeters. They are very simple to make, for around two small sticks thrust into the ground, the distance between them determining the length of the belt, a long cotton thread is looped until a thick layer is finally obtained. This is then simply tightly wound with a thin string of cotton or

/29 cont./

292 284 curauá fibers at /30/ /Fig. 7 appears here/ intervals of 1.5-2 centimeters for men's belts and 0.5-1 centimeter for boys' belts, which produces bulges and grooves. Before the belt is slipped off the sticks, a small, two to five-strand twisted cord of cotton or curauá fibers is drawn through the openings and knotted into a loop by means of the two ends three to five centimeters long. These two loops are twisted into each other in front, over the abdomen, by the wearer, and the knots keep the belt secure (Fig. 6a and b, Ill. 23). After [531] [386] they are finished, serpentine lines, circles, or dots are painted on these belts with urucú, for which a small stick is used: often, however, they are colored red all over.

Surára
Pakidái

/30 cont./

292
284

Fig. 7a
Young men's belt, detail.

Fig. 7b
Young men's belt, diagram.

Among the Surára and Pakidái, besides the men's and boys' belts, there is another special kind for young men, made with a plaiting technique. They are started in the manner described above, but after the layer of cotton is obtained, it is divided into two equally thick bundles which are tightly wound, alternately, at intervals of 1-1.5 centimeters. The belt therefore consists of two adjacent thin rolls of cotton, each two centimeters in diameter (Fig. 7a and b). Tie-strings and the wearing style correspond to the men's and boys' belts, as does the painting.

Women's and girls' belts are characterized by a wide, flat shape. The lengths vary between 55-70 centimeters and the widths between 6-8 centimeters for women's belts and 35-46 centimeters and 4-5 centimeters, respectively, for girls' belts. In making them, again two sticks are used, around which the cotton threads are wound. The resultant layer is divided into 6-8 equally thick bundles, each of which is wound with a cotton thread in the manner shown in Fig. 8a-c, and in this way the bunches of warp threads are held together. In other words, the longitudinal threads are held side by side by means of cross-bindings. The distance between these weft-threads is 2.5-3 centimeters for the belts of young women and

Surára
Pakidái
Pusheweteri

292 /30 cont./
284 girls and 0.5 centimeter for those of old women. This distin-
guishing feature was always pointed out to me. Tie strings and
292 the wearing style correspond in this case too with the men's belts,
53 as does the painting with urucú, which is applied on the outer
[386] side. As a result of their width, these belts are much easier to
paint than those of the men. Most often one sees serpentine lines,
occasionally circles are placed between them, and sometimes too
the painting only consists of circles, or circles and dots (Fig.
9 a-e; Fig. 10 a-d); there are also belts, however, which are
colored red all over.

292 ! Xiriána women who are married to Surára and Pakidái
184 men wear the same belts, as did the little captive of the Surára,
Nikeromá, from the hostile tribe of the /31/ /Figs. 8 and 9 ap-
pear here/ /32/ /Fig. 10 appears here/ Karauateri (Ills. 17 and
[192] 18). When I asked them the name of their belts, they gave me
the designation -- nyõ -- which corresponds to the Surára and
Pakidái word.

292 The Pusheweteri women gave me the same word, although
184 their belts have a somewhat different form (161). They are 60-
[192]

161. I saw them on the women of that tribe
who were married to Surára and Pakidái men.

70 centimeters long and consist solely of a thick layer of cotton
292 which has been somewhat twisted together. In other words, it is
284 a very characteristic string-belt, that is, without wrappings or
184 cross-bindings. An additional little fringed apron, however, 22-
26 centimeters long, is attached to a tie-string. To make it, 60 to
90 cotton strings, 14-18 centimeters long, are put over the tie-
string. After that, starting from the left, the end of the first
string hanging down in front is knotted with the one of the second
hanging down in back and tightly twisted with it, then the front
end of the second one with the rear end of the third, and so
forth. The fringes hanging down are 7-9 centimeters long and,
to assure firmness, are wound once more below the tie-string
292 with a thin cotton thread. When the belt is worn, the little
53

531
292
184 fringed apron rests directly over the pubic region (Ill. 15). These belts, including the little aprons, are as a rule dyed with urucú. It should
292 also be pointed out that younger Puseheweterí women usually adorn
531 the two ends of the little apron with small feathers of the toucan
239 (Rhamphastus sp.), mutum (Crax sp.), and anambé azul (Cotinga
184 cayana L.) fastened to a string. Older Puseheweterí women, on the other hand, always have hanging on the ends of the little apron eight to twelve mussel shells, 2-3 centimeters long and pierced on one side, which, when the wearers walk, beat together and make a soft jangling noise (Fig. 11).

292 Exactly the same belt with fringed apron is documented by
184 Salathé for the Karimé women, and from his statements it is to be seen further that the men also wear it, though without the pubic covering (162).

162. Salathé, 1931/32, p. 305 and Fig. 13a, b.

It should be mentioned that a few Surára women, following the example of their Puseheweterí sisters, have likewise fastened such a fringed apron to a tie-string of their plaited belts. In this the mixture of two cultural elements can be seen especially clearly.

Puseheweteri
surára

/32 cont./

531
237

Fig. 11. Fringed belt of an old Puseheweterí woman, with pierced mussel shells.

291
[462]
[237] Finally, the Surára also use a child's belt -- yaoké -- which is always made by the father /33/ out of the skin of the maracajá (Felis pardalis Neuw.) -- yaõ. These belts are 30-35 centimeters long and 2-2.5 centimeters wide. One end is pierced to receive a thin [284] tie-string of cotton or curauá fibers. The string is wound around the other end several times and then knotted (Fig. 12). This belt, too, is worn in such a way that it is open in front. Only now and then is it put on small boys and girls between 1-3 years old, who at that age, of course, do not even wear the hip cord (see p. 60), in order to promote their physical strength and growth. /34/

promote their physical strength and growth. /34/

292
171

From the above description of the cotton string-belts it may be seen that, in spite of certain differences with respect to technique and the way they are worn, they resemble the corresponding belts of the Xiriána and several Karaiben tribes of Guiana. Thus, a bundle of red-dyed cotton strings serves as a hip belt for the Xiriána men, under which they wedge the preputium of the upraised penis (163). Arekuná men often wear

163. Koch-Grünberg, 1923a, p. 306.

a plaited string-belt of cotton, which, twisted together, takes on a sausage shape. This belt, also resembling in appearance the human- and monkey-hair belts in Guiana (164) (165), is

164. Becher, 1951, pp. 99 ff. and pp. 115 ff.

165. Becher, 1955, pp. 84 ff. and pp. 97 ff.

Grünberg (168). Ule, shows in an illustration of two Arekuná men,

168. Koch-Grünberg, 1917, p. 41.

shows how it is worn (169). It can be seen there that they use the

169. Ule, 1913, p. 283, Ill. 2.

belt for fastening their pubic apron, to which Appun likewise calls attention (170). Moreover, the cotton string-belt is documented

170. Appun, 1871, II, p. 307.

for the male Makuxí /Macusi/ (171) and for the Maionkong /Maioncon/,

171. Koch-Grünberg, 1917, p. 77.

where it is worn by men (172) and women (173).

172. Rice, 1928, p. 220, illustration.

173. Stevens, 1926, p. 401, illustration.

The plaited, wide, flat women's belt of the Surára and Pakidái, however, also has its prototype among the Makuxí, where, to be sure, men wear it. Roth describes how it is made as follows: "The Makusi will plait a thick cotton cord upon two arrow thicks, and when completed will bend it twice upon itself in three equal parts and, by sewing, maintain it in this position to form what is now a broad flat belt" /cited in English/ (174).

174. Roth, 1924, p. 440.

/34 cont./
292 171 The neighboring Wapixana /Wapishana/ men (Aruak) /Arawak/, moreover, wear a very similar belt and attach to it a pubic band which is drawn between the legs (175).

175. Farabee, 1918, p. 29.

[648] [179] Since the Surára and Pakidái waged many wars with the Makuxí (the father of the Surára chief Hewemão is even supposed to have been killed by a Makuxí warrior), it would be entirely possible that they took over from this Karaiben /Carib/ tribe the form of the plaited, wide, flat belt, but then used it, not as men's, but as women's clothing.

179 [179] 184 The little fringed apron so typical for the Puseheweterí and Karimé women was also surely copied from Karaiben models, which, in turn, could have been borrowed from the Aruak, for Farabee confirms it also for Wapixana and Mapidian /Maopityan/ girls (176). According to Roth, a woven, red-dyed belt, the lower

292 171

176. Farabee, 1918, Pl. XXIX, A.

edge of which is fringed and, in addition, provided with three pendant tassels, is tied around young Makuxí and Wapixana girls on the occasion of their first menstruation. He designates this article of clothing as "apron belt" /cited in English/ (177). A

177. Roth, 1924, p. 437.

dyed belt provided with fringe is likewise documented for the Maiongkong (178) (179) and, /35/ according to Roth, resembles

178. R. H. Schomburgk, 1841, p. 215.

179. Richard Schomburgk, 1847, pp. 402/03.

000 the above-mentioned apron-belt (180). When Koch-Grünberg saw

Puseheweterí

292 /35 cont./ When Koch-Grünberg saw
174 Xiriâna women dressed in a little fringed apron (181), he had
179

181. Koch-Grünberg, 1923a, p. 305 and Plates 45, 48 (4, 5).

reason to suspect that they may have taken over and preserved the ancient dress of the Maiongkong (Yekuanâ) women. Thus, he writes: "They, too, were surely not originally peculiar to these Indians, for some of them wore the little apron up on their stomachs, on others it had slipped down halfway to the knees" (182).

182. Koch-Grünberg, 1923a, p. 305, footnote 1, and p. 306.

Comparative investigations show that the cotton belts of the Surâra, Pakidâi, and Puseheweterí reached them from the outside, that is, directly from the Karaiben or by way of the Xiriâna (183), along with cotton. With regard to the way they

183. According to Métraux, the Xiriâna took over their dress from the Karaiben (Métraux, 1948, p. 863).

291 With regard to the way they
292 were worn and the use they were put to, however, there followed
174 a transformation process, which is very informative. That is, when, on the basis of the statements in the literature, I had traced in my dissertation all the motives that might have induced the South American primitive peoples to tie on belts and hip cords, the result was as follows: "It has been possible to prove that the idea of adornment plays only a secondary role, as does the magical motive. The feeling of modesty is entirely eliminated as a cause, and also verification for a sexual stimulus is lacking. On the other hand, the investigations show that the belts and hip cords primarily have the purpose of protecting the genital organs from insects, thorns, etc. (as a holding device for the upward-placed penis, the uluri, the pubic aprons, etc.)" (184) (185).

184. Becher, 1951, p. 192.
185. Becher, 1955, p. 153.

/35 cont./

291 On the basis of my field work, however, I have reached different conclusions with respect to the Surára, Pakidái, Puseheweterf, Aramamesterf, Xiriána, and Karauaterf. Protection of the genital organs is completely eliminated for the women of these tribes, and for the men it is at most of secondary, if not tertiary importance. The thin hip-cord gives them, in fact, the same outward security that the article of clothing gives the civilized person. Though nothing is covered by it, except the glans penis, the absence of it immediately arouses a feeling of modesty in them, which, however, differs from that which has been instilled in us in that it has nothing to do with their nakedness. Clothing, shirts and trousers which I brought along as gifts, was donned by them, to be sure, as a joke, in somewhat the way we might dress up for a carnival, but they were glad when they could take it off again. Yet these Indians never showed the least shyness or embarrassment before me in their unclothed state, and when I had won their friendship and convinced them of the harmlessness of my photographic equipment, men, women, and children let themselves be photographed in relaxed and natural poses.

291 123

292 In contrast to the important hip-cord, the belts of the Surára and Pakidái are expressly ornamental objects. Since they are worn not only for festivals, however, but also on all ceremonial occasions, magical motives may likewise play a part. At the same time, they are a distinguishing mark for specific tribes and age classes. They differ from all the other belts of South American Indians, as do the men's belts of the Waiká (186) (187), in that they are open in front

186. Zerries, 1955b, colored picture on jacket and photograph on p. 663, lower left.

187. Zerries, 1954b, Pl. VI, top.

[114] and positively accentuate the pubic parts. Thus, they seem to represent striking evidence for the view of Brosse (188) and

188. Grosse, 1894, p. 96.

/35 cont./

292 114 Westermarck (189), who regard the belts as a sexual stimulus,

189. Westermarcj, 1901, pp. 195/96, 211.

by means of which the eyes are supposed to be drawn to the pubic parts. For the Surára and Pakidái, however, /36/ this hypothesis does not apply, in spite of their open belts, for the naked body does not provide any sensual stimulation for them, but rather solely the sexual act. According to Krause, among the Karajá /Caraja/ the feeling of modesty of the girls is supposed to have led to the development of the types of belts. As evidence for this, he gives the following observation: "Women never removed or changed their bands in our presence, and small girls from whom I bought belts went behind the nearest mat wall in order to put on a new one there before they brought me the worn belt" (190). My experiences among the Surára

291 123

190. Krause, 1911, pp. 208/09.

and Pakidái were the same with respect to the hip cords, among men as well as among women and children, but they always untied their belts without shyness and gave them to me in exchange for trade goods. This was also true of the Puseheweterí women, which shows that their little fringed aprons do not represent, say, a pubic covering, but merely ornamentation. Moreover, they also tie on their belts only for festive occasions.

292 184

291 171 The situation with respect to the children's belt made of the skin of the maracajá is unique. It should be noted, however, that in Guiana, one of the chief South American areas of distribution of the skin belt (191) (192), specimens made of jaguar skin have

191. Becher, 1951, I, p. 82; II, plate and Map No. 4.

192. Becher, 1955, p. 72.

291 /36 cont./
171 been documented for the men of the Makuxí (193) and Waiwai (194).

193. Farabee, 1924, p. 61.

194. Farabee, 1924, Pl. XXX.

b) Chest cords

301 The simple cord slung crosswise over chest and back --
[192] xinarîke -- and the similarly used string-bundle -- xinarí -- (195)

195. This name is identical with the word for cotton.

represent among the Surára and Pakidái characteristic articles of clothing for the girls and women. Among the latter, the cord or string-bundle runs directly below the breasts and crosses over the chest cavity, so that, at first glance, it looks like a bust support; but no lifting of the breast is connected with it, for it is quite loose (Ill. 10).

[283] Whereas the women's cord, 1.50-1.60 meters long, twisted
[824] out of two threads, and knotted at the ends, is made of curauá fibers or cotton (the length of the corresponding girls' cord is 1.20-1.40 meters), in the case of the string bundles there are layers of cotton 56-90 centimeters long, which consist of 60-80 strings and are tied together at one point. The thinner specimens are used by young women and the thicker ones by older women.
386 Both the string bundles and the cord are either dyed red all over
301 or, as in the case of the former, for example, are provided with
[531] red rings, one centimeter wide, at intervals of 6-7 centimeters
[302] (Fig. 13a and b), for which urucú dye is used. Undyed objects in time take on a dirty brown appearance, like the hammocks, for the red body-painting adheres to the cotton.

301 The chest cord, which is now and then tied around little girls
856 from four years old on, is supposed to help give them beautifully shaped breasts later on. Even the younger women, however, have

301 /36 cont./ Even the younger women, however, have
856 the idea that by occasionally wearing it they can preserve their
[824] busts, especially if the cord was made of the original material,
292 curauá fibers. On the other hand, the chest cord and the string bundle, which is worn only during festivals and on the occasion of ceremonial acts, are regarded as ornamental objects and insignia of two age classes.

301 The women of the Xiriána, Puseheweteri, Aramamesteri,
184 and Karauateri whom I met in the malokas of the Surára and Pakidái also wore such cords and string bundles, to be sure, but
[114] said that they were not used in their tribes. This also explains why Koch-Grünberg did not mention such articles when he
301 described the dress of the Xiriána (Schiriana). Among the Arekuná-
171 Taulipang, on the other hand, he saw as festival ornaments for women and men long chains /37/ /Fig. 13 appears here/ of white beads and brown seeds, which they had slung crosswise in many windings over the chest and back (196) (197). Aside from

196. Koch-Grünberg, 1923a, p. 37.

197. Koch-Grünberg, 1923b, Plates 15, 45, 62, 91, 92, 93, 98, 99, 100, 102, and 107.

the additional ornamental material used, these chains differ from the cords and string bundles described above in the way they are worn, for they reach much farther down.

301 One thus gains the impression that in the case of the chest
174 cord of curauá fibers used by the Surára and Pakidái women it is a very primitive object from which the string bundle was developed after the introduction of cotton. This, in turn, could have been borrowed by Karaiben tribes, perhaps during war contacts, and
[191] transformed by them into a long ornamental chain. The former is, to be sure, also slung crosswise, but the original meaning, the enhancement of the breast form, was lost, which may also be deduced from the fact that among the Arekuná-Taulipang even men tie such an ornamental chain around themselves.

/37 cont./

301
531

13a

13b

Fig. 13a-b. Chest string-bundle of the women (detail and diagram of the painting).

301 c) Cords for arms, wrists, and legs

From the age of four on both sexes at times wear upper-arm cords, and women and girls in addition wrist- and leg-cords, which are made of curauá fibers or cotton. It was also [283] definitely established that the two-strand curauá-fiber cords twisted to the right are the original objects, whereas the two-strand cotton cords twisted to the left are of more recent [824] date. Moreover, here, too, it was observed that a strengthening effect is attributed to the plant fiber. [856]

301 /37 cont./
856 Thus, the upper-arm cord -- xinariúnko -- is supposed to impart greater muscular and arm power (198). The wrist cord used

[192]

198. It is noteworthy that the curauá-fiber cord is also called by the word Xinariúnko, although the name for cotton -- xinarí -- is contained in it.

only by women and girls, likewise called xinariúnko, strengthens the wrists, it is believed, and the cord worn below the knees -- hukuá -- the legs.

301 171 As an ornament for the upper arms, however, besides the simple cord, bands of string -- nyõõmutimá -- the forms of which are exact miniature reproductions of the belts (199), a

[192]

199. In the word -- nyõõmutimá -- there is contained the name for belt, nyõ, to which is appended the diminutive form õmutimá.

novelty /38/ for South America, since there are as yet no parallels for this. Thus, the string-bands of the men, 20-22 centimeters long and 1.5-2 centimeters in diameter (string-bands of boys: length, 12-15 centimeters; diameter, 0.5-1 centimeter), have the same roll-shaped appearance as their belts (Fig. 14a and b; Fig. 15a and b) and are made and painted or dyed by the women in the same way (see pp. 64/65). The wide, flat shape of the women's bands (length, 18-22 centimeters; width, 1-2.5 centimeters), however, corresponds perfectly with the belts worn by them, apart from the smaller size (Fig. 16a-c; Fig. 17), so that with regard to the manufacture and painting I can refer to the making of the women's belts (see p. 66). It should also be mentioned that the upper-arm /Figs. 14-16 appear here/ bands of younger women are narrower (1-1.5 centimeters) than those of older women (2-2.5 centimeters) (200).

200. An older Pakidái woman, by the way, wore a woven upper-arm band two and a half

/38 cont./

301
[438]

200. (cont.)
centimeters wide. She likewise designated it for me with the name nyõõmutimá and added that she had obtained it from a Xiriána woman.

301
184

The four Xiriána women whom I met in the malokas of the Surára and Pakidái wore the same cords and bands on their upper arms, wrists, and legs, like all the Puseheweterí and Aramamesterí women, including the captive Karauaterí girl. The latter, however, said that they had only adopted the upper-arm bands here, for in their tribes only upper-arm cords were used.

[184]

/38 cont./

301
284

Fig. 17. Upper-arm string-band of the women.

184
301 According to Koch-Grünberg, too, among the Xiriána (Schirianá) the men wrap long, red-dyed cotton cords around their upper arms, while women use "narrow bands," which, however, they tie so tightly that the marks of them are seen even when they
301 are removed (201). The women of the Maiongkong-Yekuaná bind
171

201. Koch-Grünberg, 1923a, p. 305.

their upper arms in the same tight fashion (202). With reference

202. Koch-Grünberg, 1923b, Plates 151, 152, 170, 171, 172.

to the Arekuná-Taulipang, Koch-Grünberg writes: "Among the ornaments of the women, moreover, there are wide wrappings of strings of white beads below the knees, around the upper arms and the wrists. The men /39/ wear the same bead ornaments around the wrists, sometimes also around the ankles, but bind the legs below the knees with white cotton cords, the ends of which hang far down. Around the upper arms they usually wear only a string of white beads or a white cotton cord or, on festive days, a round disk of snail shells... The bindings around the legs are frequently pulled so tightly by young girls, out of vanity, that the calves bulge out tautly" (203) (204).

203. Koch-Grünberg, 1923a, p. 34.

204. Koch-Grünberg, 1917, Ills. 7, 8.

/39 cont./

301 171 This ancient Karaiben /Carib/ custom, which already caught the eye of the early discoverers as something unusual, is also familiar to the Surára and Pakidái, but is regarded by them as very ugly and thus not copied; for the women and girls among these Indians the leg cords are always loose.

301 789 832 d) Neck cords and chains of primitive material

It is not ornamentation, but magic that is connected with the neck cords and chains of primitive material.

Thus, young men sometimes wear around their necks an urucú-colored, two-strand curauá-fiber cord twisted to the right, [824] to which is fastened a small piece of the root of the tajá (Colocasia antiquorum and Xanthosoma violaceum Schott) -- hanrẽ. Love magic is involved here (see p. 242). In order to ward it off, married female members of the tribe use two kinds of neck chains. On their urucú-colored cord of curauá fibers, young women tie numerous small pieces of the root of the tajá -- hanrẽ -- and older ones small bits of the camarau (Cipó sp.) -- hĩ -- (see p.243).

302 e) Hair style

Men, women, and children, after the third year of life, have the same hair style -- mabéu -- cut evenly all around the head, including the tonsure -- hemõno. [462] Shaving the latter, but also cutting the hair are duties of the women, for which they use a piece of reed split and sharpened on one side (taquara -- Guadua sp. --) (see p.119). At festivals, on the occasion of magical acts, and during war expeditions the tonsure is painted with urucú.

[578] According to statements by my informants, it primarily represents a marking which, for the stick duels that the men occasionally carry out, distinguishes the safest and most resistant part of the head (205). This also explains the scars which one

205. Becher, 1959, p. 165.

302 593 sees on the tonsures of almost all the men. They are also present, however, in the case of female members of the tribe, for if a

302 /39 cont./
593 husband beats his wife for reasons of jealousy, he may likewise choose only this marked part of the head. As a further, but
302 probably secondary reason, I was told that the short haircut and
825 the tonsure made it easier to control the plague of lice. People with long hair, they thought, were certainly unable to escape head lice.

302 The tonsure is also mentioned in religion and mythology.
538 Poré, the lord of the moon, is imagined as an old man with a long white beard and a tonsure painted red (see p.197).

302 As among many other South American tribes, the tonsure
191 is also a /40/ characteristic feature of all small-sized light-
184 skinned Indians between the Rio Negro and the upper Orinoco, for the members of both sexes of the Xiriâna, Pusheweteri, Aramamesteri, and Karauateri whom I met also wore it (206).

302
191
114

206. The Brazilian country people designate all Indians with tonsures as Coroados = crowned. Baldus and Willems, however, quite rightly demand that the use of this name be avoided in Brazilian ethnology: "Coroado- Várias tribus de indios no Brasil, por examplo, os Botocudos, Kaingang, Puri, Bororo, receberam do povo o nome de Coroados, devido ao modo de cortar o cabelo, se bem que êsse modo não fosse igual entre todas elas. Causou êste têrmo grande confusão na etnografia brasileira, razão pela qual deve ser abandonada" /Coroado -- Various tribes of Indians in Brazil, for example, the Botocudo, Caingang, Puri, Bororo, are given the name of Coroado by people, owing to the manner of cutting the hair, even though this style is not the same among all of them. This term has caused great confusion in Brazilian ethnography, and for this reason it should be abandoned/ (Baldus and Willems, 1939, p. 67).

/40 cont./

302 184 Furthermore, it has been documented for the Waiká (207) (208),

207. Koch-Grünberg, 1917, p. 198.

208. Zerries, 1954b, p. 75.

Karime (209), and the Xiriána men on the Motomotó (210). With

209. Salathé, 1931/32, p. 305.

210. Koch-Grünberg, 1923a, p. 306.

regard to the latter, Koch-Grünberg points out that in this case it is a male hair style (210) /see footnote above/. In the same 302 171 work he goes on to describe the tonsure of a Karaíben woman: "The oldest woman on the Roroima had a strange hair style. Except for a narrow wreath of longer hair all around her head, which was cut in the customary fashion over the forehead, the head hair was cut short, like a monk's tonsure. (Cf. Vol. VI, Plate 86). I was unable to discover the reason for this differing hair style" (211). The remarks which Alexander von Humboldt devotes

211. Koch-Grünberg, 1923a, p. 27.

to this Indian hair style are also worthy of mention (212).

212. A. von Humboldt, 1860, IV, p. 319.

304 f) Deforming facial ornamentation

The male as well as the female sex among the Surára and Pakidái have pierced ear-lobes -- nhimekakeká -- (Surára), -- nimukakuká -- (Pakidái), a perforation of the lower lip -- husekahá --, and, in addition, the women have such in the corners of the mouth -- kaskehá.

304 301 The perforations are already made in babyhood (see p.135). The men use them primarily as a place for feather ornaments (see p. 93). They sometimes also wear as ear ornaments, however,

Surára
Pakidái

/40 cont./

304 small pieces of reed 1-2 centimeters long, from which hang, on
301 one or two short chains of beads, small triangular pieces of silver leaf, shiny silver coins, or particularly large glass beads. Women also have a special preference for these objects. The teeth of the cutia (Dasyprocta aguti L.) -- tomenáke --, which the men use as a knife (see p.115, are a typical feminine ear ornament.
[314] To prevent them from slipping out of the perforation, a small lump of tree resin is stuck on the back end. The perforations of the ear lobes are also adorned now and then with blossoms.

In the perforations of the lower lip and the corners of the mouth on either side the women now and again have delicate little reed rods -- tunhabaácre -- 15-17 and 12-15 centimeters
[184] long, respectively. Among the Xiriána women married to Surára and Pakidái men I observed that they wear, in addition, two little reed rods 30-35 centimeters long in the pierced nasal septum -- huxibéka -- (Ill. 16). This piercing I was told, is reserved for only the female members of this large, mighty tribe.
[184] This also explains why the perforations of the Pusheweterí and Aramamesterí women correspond perfectly to those of their Surára and Pakidái "sisters," that is to say, there is no piercing of the nasal septum. The same applies for Nikeromá, the little captive from the hostile tribe of the Karauaterí.

301 All the ornamental objects named are made by the male
422 and female wearers themselves and are regarded as personal property.

304 Due to Koch-Grünberg's research among the Xiriána
301 (Schirianá), Waikâ (Waíka), and various Karaiben /Carib/ tribes,
184 abundant comparative and supplementary material is available
[171] to me. Thus, the great investigator writes with regard to the Xiriána (Schirianá): "Nasal septum, /41/ ear lobes, and lower
[127] lip were pierced among the men and in many cases adorned with little reed rods almost as long as a hand. On special occasions they also wear a jaguar tooth in the lower lip.

"The women had long reed rods in the pierced ear-lobes, the lower lip, and the corners of the mouth. Three narrow strips of reed, spread out fan-shaped at both ends, adorned the nasal septum (Ill. 12)" (213).

213. Koch-Grünberg, 1923a, p. 306.

304 /41 cont./
301 This confirms the statements of my informants, who said
184 that a perforation of the nasal septum was characteristic for the Xiriâna. For the male and female Waikâ, too, there is confirmation of nose, ear, and lower-lip rods, and, in the case of women, such in the corners of the mouth (214).

214. Koch-Grünberg, 1917, pp. 198-200.

As for the use of nose-rods, it seems to be a privilege of the two hostile "great ones" (see p. 12), for their lesser allies do not use them.

The other perforations, however, are the same among all the Yanonâmi tribes mentioned, but it should be pointed out that pierced corners of the mouth are found only among women.

304 With reference to the Karaiben Arekunâ-Taulipang, Koch-
301 Grünberg writes: "Ear lobes and lower lip are pierced, and in
171 the case of some men the nasal septum as well" (215). According

215. Koch-Grünberg, 1923a, p. 28.

to that, the perforation of the nasal septum is reserved for only the men, and perforations of the corners of the mouth are en-
301 tirely absent. In the ear lobes, however, male as well as female
171 members of the tribe likewise wear little reed rods with one or two short chains of beads hanging down, to which are fastened silver coins and crescent-shaped or triangular pieces of silver leaf (216). The latter are the same type of objects that I found

216. Koch-Grünberg, 1923a, p. 28.
Plate 5 (6).

as ornaments among the Surâra and Pakidâi (see p. 85 and Ill. 9 /see p. 270/. Therefore, in this case, too, an adoption from the Karaiben, directly or indirectly, seems to be indicated. In reply to my question about the origin of these ornamental objects, the Xiriâna were mentioned, to be sure, but they for their part certainly

/41 cont./

301 M1 did not make them themselves either, for they were made, by pounding and grinding, out of Brazilian silver coins which are no longer in circulation today. Moreover, for centuries the technical skill of the Karaiben with regard to gold, silver, and copper ornaments has been acclaimed. For example, Gumilla already mentions Karaiben tribes in the vicinity of the Orinoco who wore homemade plates of gold (217), and, according to de

217. Gumilla, 1745, I, p. 139.

Rochefort, the Island Karaiben used ear pendants of gleaming copper (218). Crescent-shaped silver leaf is used by the Makuxf

218. de Rochefort, 1658, p. 289.

men, but they wear it on a nose rod (219).

219. Im Thurn, 1883, p. 198, Figs. 2 and 4.

Further comparative material is to be found in the valuable work by Brigitte Menzel, "Deformierender Gesichtschmuck südamerikanischer Naturvölker /Deforming Facial Ornaments of South American Primitive Peoples/." Here it was shown that ear ornaments of metal occur especially frequently in northwest Amazonas as well as Guiana (220), and also ear ornaments of teeth are con-

220. Menzel, 1957, p. 38 and Map 14.

firmed in considerable quantity for the highlands of Guiana (221).

221. Menzel, 1957, p. 34.

With reference to the ornamentation of the corners of the mouth, the authoress writes: "From an accumulation in the source region of the Ucayali, the evidence extends over northwest Amazonas

/41 cont./

301 as far as Guiana; the Tapuya on the eastern horn of South
171 America remain isolated. The pattern of distribution coincides
301 in essential features with the multiple perforations of the upper
304 lip (these parts also merge into each other very much anatomi-
171 cally) and clearly rests on Andean prototypes" (222). The

222. Menzel, 1957, p. 33.

characteristic mouth-corner rods of the Yanonámi women may well fit into this area of distribution, but not in connection with perforations of the upper /42/ lip, for here instead of the latter, the lower lip is pierced.

304 g) Tattooing
[881] All women and girls have pin-point tattooing over the upper lip, which extends downward on either side of the mouth (Ills. 19 and 24) and is punctured on the girls during the first menstrua-
[192] tion (see p. 66) (223). The designation for this among the Surára

[184]

223. This tattooing is also found among the female Xirišna, Puseheweterî, and Aramamesterî who are married to Surára and Pakidái men. The little captive of the Surára, Nikeromá, from the hostile tribe of the Karauaterî is an exception. She assured me, however, that in her maloka the girls are also tattooed. But she had fallen into the hands of the Surára before her first menstruation, and the tattooing was not put on her here. If later, however, she is married by a Surára man, the pin-point design must subsequently be punctured on her.

is -- uarabakoxîk -- and among the Pakidái -- uarabakoxîbe.
[824] [386] These words are derived from the name for the genipap fruit -- uarabá --, the juice of which is used for puncturing the dots.

2: Becher--90 E-5 (1955-1956) 1960 SQ18 Yanoama SQ18
Surára
Pakidái

/42 cont./

304 For the Karaiben /Carib/ and Aruak /Arawak/ women of
171 Guiana, however, a puncture-tattooing in the mouth region is also characteristic, and occasionally one finds it even among male Karaiben. In this case, too, it is regarded as a sign of maturity and usually has a magical significance. The punctured patterns, however, differ entirely from those of the Surára and Pakidái. Among the Makuxí /Macusi/ they consist of numerous short, vertical, parallel lines, and the Arekuná-Taulipang /Arecuna/ prefer dots, dashes, and fishhook patterns (224). The

224. Koch-Grünberg, 1923a, p. 45; Pl. 12 (3-16).

latter motifs have also been confirmed for the women of the Wapixana /Wapishana/ (225) (226) and other Aruak tribes in

225. Appun, 1871, p. 523.

226. Farabee, 1918, p. 82, Fig. 9.

British Guiana as well as Surinam (227) (228).

227. Richard Schomburgk, 1847, p. 226.

228. Joest, 1893, p. 83 and Ill. a and b.

304 There are also slight differences with regard to the time of
171 tattooing. The Surára and Pakidái carry it out during the first
881 menstruation, the Arekuná-Taulipang and Makuxí, on the other
(184) hand, shortly before the onset of it, and, to be sure, in connection with the ant torture (229).

229. Koch-Grünberg, 1923a, p. 128.

/42 cont./

304 824 386 412 177 The former use the juice of the genipap fruit as coloring matter, the latter the ashes of burned honey bees (229) /see footnote p. 90/. The original instrument everywhere for the puncturing of the dots was a palm thorn. Koch-Grünberg, however, also saw the use of pointed fragments of glass among the above-mentioned Karaiben (230).

230. Koch-Grünberg, 1923a, p. 45.

304 174 171 114 A decision about whether the tattooings in the mouth region developed independently among the aforementioned Yanonámi, Karaiben, and Aruak tribes or whether they were brought about by reciprocal or outside influences cannot be reached as yet, although Koch-Grünberg saw a young Xiriána woman who had the fishhook and dot tattooing of the Arekuná-Taulipang painted on her face (231). This may have been an exception, however,

231. Koch-Grünberg, 1923a, p. 305.

for, strangely enough, he did not find any further tattooing among the Xiriána.

177 The designs of the Surára and Pakidái also seem to be more primitive than the basic motifs of the Karaiben and Aruaken in the form of fishhooks, which clearly point to borrowings from civilization. Moreover, the fact that among the Karaiben tribes of Guiana individual men and boys are tattooed in the region of the mouth leads one to conclude that there has been a leveling of this custom. For probably there, too, it was formerly reserved for only the women, just as it is today among the Surára and Pakidái.

In conclusion, reference is to be made to P. Schmidt and Nordenskiöld, from whom there are already available brief, summary studies about puncture-tattooing in South America. The first-named author differentiates two groups, which are reserved for men and women or only for women, respectively, and regards a western origin as probable (232). /43/ On the other

/43 cont./

232. P. Schmidt, 1913, pp. 1083/84.

304
174
17
114

hand, Nordenskiöld represents the view that puncture-tattooing "could rather easily have been discovered in various places." His map of distribution shows a concentration of this custom in the northern and central parts of South America (233). A com-

233. Nordenskiöld, 1918, pp. 128-130 and Map 19.

prehensive study on the tattooing of South American Indians would definitely produce worthwhile and informative results.

301 h) Painting

The body painting which is applied on ceremonial occasions, war expeditions, and occasionally also hunting expeditions is [531] very simple and artless. Either it consists of constantly recurring motifs, such as serpentine lines, circles and dots (234), which

234. The implements are also painted with these motifs.

are applied sometimes singly, sometimes mixed, or the entire body is rubbed with red or black coloring matter.

[824] For the red coloring matter, there is urucú -- narã --, a [386] paste which is prepared from the red berries of Bixa orellana. Blue color is furnished by the seeds of the genipap fruit (Genipa brasiliensis) -- uarabá --, whereas for black coloring matter the soot scraped off cooking pots is used, usually mixed with a little genipap.

[413] The serpentine lines, circles, and dots are applied with the fingers or a wooden stick, and for diffused coloring a little ball of cotton is used.

/43 cont./

302 174 Since Koch-Grünberg also found only very little body painting among the Xiriâna (Schirianâ) (235), it is to be sus-

235. Koch-Grünberg, 1923a, p. 307.

pected that originally it was not peculiar to the three Yanonámi tribes named, but is to be traced back to Karaiben influences. The following account by Alexander von Humboldt also points to this: "The custom," writes the great investigator, "of painting the body is not equally old among all the peoples on the Orinoco. It has only been since the frequent invasions by the mighty nation of the Caraiben into these lands that it has become more general. Victors and vanquished alike were naked, and in order to be agreeable to the victor, one was obliged to paint oneself as he did and to wear his color. Now the might of the Caraiben is past, they are confined to the region between the Carony, Cuyuni, and Paraguamuzi rivers, but the Caraiben custom of coloring the entire body has persisted; the practice is more enduring than the conquest" (236).

236. A. von Humboldt, 1860, III, pp. 92/93.

301 562 i) Feather ornaments

Feather ornaments -- pauxí -- are worn by men only and chiefly on the upper arms, but occasionally also in the perforations of the ear lobes and the lower lip.

301 825 237 Under the upper-arm cords and bands, which serve primarily as fastening devices for the upper-arm ornaments, individual or several tail feathers of the arara vermelha (Ara Macao L.) -- pauxí aratexinâ -- as well as small bunches of feathers, are wedged in front for war expeditions and festive occasions. The latter are always tied with a string of cotton or curauá fibers to a wooden stick 7-9 centimeters long (Ills. 9 and 14). The following list shows which birds are preferred as feather-suppliers for these objects:

301 /43 cont./
237 Pauxí maraxí -- upper-arm ornament of the black-white feathers
825 of the cujubim (Pipile pipile cajubi Pelz.).
Pauxí koikoimão -- upper-arm ornament of the black-white feathers of the gavião-caipira (Hypomorphnus urubitinga urubitinga Gm.).
Pauxí parurihonomaíbe -- upper-arm ornament of white breast feathers of the mutum (Crax sp.).
Pauxí marakanã -- upper-arm ornament of feathers of the arara amarela (Ara ararauna L.).
Pauxí xeraŷeramão -- upper-arm ornament of feathers of the papagaio moleiro (Amazona sp.) and the papagaio curica (Amazona sp.).

Besides these bunches of feathers which are stuck into the arm cords or bands from the top, /44/ there are also ornaments which are knotted to them and hang down. These are usually several small feathers from different birds, the quills of which have been tied together with a string of cotton or curauá fibers:
Pauxí prukatõba -- Pendant upper-arm ornament of feathers of the mutum (Crax sp.), papagaio moleiro (Amazona sp.), and toucan (Rhamphastus sp.).
Pauxí maraxiakosíbe -- Pendant upper-arm ornament of feathers of the cujubim (Pipile pipile cajubi Pelz.) and toucan (Rhamphastus sp.).

Finally, as the most valuable ornament in this category, one should mention upper-arm bindings of mutum feathers -- pauxí parurihés -- to which are fastened hangings -- pauxí manhebéahunque -- of feathers of the mutum (Crax sp.), toucan (Rhamphastus sp.), and jacamim (Psophia crepitans L.), or even skins of these birds. In addition, there are upper-arm bindings which consist only of feathers of the jacamim -- pauxí nhapinhéssi -- with feather hangings -- pauxí pehakossíbe -- from the same bird.

[554] All the feather ornaments listed also represent marks of distinction, for only the chiefs and trusted warriors have the right to adorn both upper arms; younger men, on the other hand, only one.

/44 cont./

301 825 239 Into the pierced ear-lobes there are sometimes inserted small feathers of the anambé azul (Catinga cayana L.) -- pauxí osuemekés --, while a tail feather of the arara vermelha (Ara macao L.) -- pauxí aratexiná -- occasionally adorns the perforation of the lower lip (Ill. 11). These ornamental objects may be used by older as well as younger warriors. [554]

[962] The making of feather ornaments is incumbent upon the men, who, however, do it very superficially. As a result of the wealth of birds in their dwelling and roving areas, however, it is no trouble to renew damaged pieces very quickly.

Finally, it should be mentioned as a peculiarity that Surára and Pakidái men often glue the white down-feathers of the gavião-real (Thrasaetus harpyia L.) -- koikoimão -- in the hair with tree resin. Usually they are arranged in the form of a wreath so that they give the effect of a head circlet (Ill. 9), but sometimes they are scattered through the hair at random. The ornamental idea, however, plays only a secondary role in this case, for this feather covering is regarded as a trophy. In the opinion of these Indians, sickness and evil in general come from hostile tribes, above all from the Waiká. They are caused by magical performances of the medicine men, who for this use these birds or bats as transmitters, in whose bodies they send their own souls. Now if the Surára and Pakidái kill such an animal, they believe that a hostile medicine man has at the same time met his end (see also pp.211 and 229).

301 825 75

301 171 The feather ornaments of the Surára and Pakidái are, of course, unable to compete with the magnificent feather ornaments of the Urubu-Kaapor, Munduruku /Mundurucu/, Tapirapé, Karajá /Caraja/, Bororo, Guajajára, Tembé, Apiaká /Apiaca/, Mawé /Maue/, Arara, Tukano /Tucano/, and Xingú Indians, which were worked out in detail and classified by Darcy and Berta G. Ribeiro (237) (238), but they show how differently the individual

237. Darcy Ribeiro and Berta G. Ribeiro, 1957.

238. Berta G. Ribeiro, 1957.

/44 cont./

301 South American tribal units developed their abilities and passed
171 on their traditions over the centuries from generation to generation.

301 For the Yanonámi the simple upper-arm ornament represents
184 a further external distinction, for Xiriâna, Puseheweterî, and
114 Aramamesterî men whom I met wore it in the same manner. With regard to the Xiriâna, my observations correspond with a statement by Koch-Grünberg: "The men," he says, "wrap around the upper arms long, red-dyed cotton strings, on the ends of which hang bird skins (Pl. 46, 2 and 2a). When they go to war, they stick bunches of tail feathers of the red arara in front under the arm bindings, so that they project above the /45/ shoulders" (239).

239. Koch-Grünberg, 1923a, p. 305.

For the Waiká this upper-arm ornament is documented by photographs by Zerries (240) (241).

240. Zerries, 1955b, frontispiece.

241. Zerries, 1954b, Pl. VI, top.

301 As for ear and lip ornaments, parallels are found among
239 the Makuxî and Arekuná-Taulipang, but here the white down-
171 feathers of the king vulture or of the large hocco (mutum) are used (242).

242. Koch-Grünberg, 1923a, p. 28.

301 j) Bead ornaments
436 European glass beads, especially small ones, are to this day the favorite trade items among the Surára and Pakidái.
[822] They value most of all white, blue, and red beads (243), and

243. In this respect the Surára and Pakidái are like many other South American tribes (Menzel, 1957, p. 23 and Pl. 3).

/45 cont./

301 436 822 [171] only then come beads in the colors of orange, yellow, black, and green (244).

244. Krause also notes with regard to the Karajá that they scorn green glass beads (Krause, 1911, p. 279), and among many other tribes there is likewise an aversion to this color (Menzel, 1957, pp. 17/18 and Pl. II and III). For this reason Brigitte Menzel asks the justifiable questions: "Could this rejection of green raw material among forest peoples be traced back to the predominance of green in their physical-geographical environment? Do they prefer other colors for reasons of contrast?" (Menzel, 1957, p. 18.)

301 462 They are strung by the women on cords of cotton or curauá fibers, at which the men occasionally help, and are used as neck chains, upper-arm and wrist cords, and ear pendants.

301 822 I was able to observe the following ways of making them: On a cord are strung, for example, only white, red, or blue beads. Depending on the taste of the person making it, however, a blue or red bead may always follow three white ones; others prefer the color combination of blue, white, red, or vice versa. There are many more variations, however, also in combination with other colors.

Moreover, chains are made of two strings, though less often. In this case, for example, a white bead is strung on both strings, then a red or blue one on one string, then again a white one on both, etc.

301 Women and girls like to wear several strings of beads, one over the other, as neck chains, whereas men and boys never tie on more than one. Only men wear upper-arm strings of glass beads and only boys and girls corresponding strings around their wrists. Short chains of beads which are fastened in the perforations of the ear lobes are worn by both sexes, though only rarely. Then,

Surára
Pakidái

/45 cont./

301 in most cases, a silver triangle, a large glass bead, or a fruit pit is fastened at the bottom.

301 439 When I came to the Surára and Pakidái, a few bead chains were already in use. According to their statements, they had obtained the glass beads from the Indian protection post Ajuricaba on the Rio Demini, from rubber and palm-fiber gatherers, and from the Xiriána. The latter had presumably acquired this foreign commodity from Karaiben tribes who, for their part, had received it from the whites. This shows that the barter of glass beads is still carried on vigorously among the Indians themselves (245).

[114]

245. It was already observed by v. Martius that glass beads were traded over wide areas (von Martius, 1867, I, pp. 702 ff.), and Krause also points out that they are greatly prized as trade items (Krause, 1911, p. 279).

7. Hammocks

352 [824] The Surára and Pakidái have three different kinds of hammocks. The hammock of embira (tree bast, Malvaceae sp.) -- yâritanacík -- whose length is between 1.80-1.90 meters, may probably be regarded as the oldest and most primitive form (Ill. 26). It has no weft and consists only of ten to 14 embira strips [284] 1-2 centimeters wide. These are bent over at the ends and tied together by means of two ropes 1.30-1.40 meters long, which at the same time serve for suspension (Fig. 18a and b). Both ropes are very strong and durable, for they have been plaited in the form of a braid out of three one-centimeter-wide /46/ /Fig. 18 appears [462] here/ strands of embira. The manufacture of this hammock is [824] extracrdinarily simple and is done only by men. From the embira [284] tree they remove 10-15 bast strips two meters long and 1-2 centimeters wide, which they tie together in the manner described above, after they have first plaited two ropes. To cut the tree [412] bast they use the little cutia-tooth knife (see p. 110). Since the yâritanacík is extraordinarily light, the men like to use it on their

352 roving, hunting, and war expeditions as a travel hammock.
[482] Rolled up, it then hangs on their backs, held by a thin neck-cord
of cotton or curauá (Bromelia fiber). For sleeping they usually
[513] lie curled up in it; it takes practice and skill, however, not to
fall out.

352 Similar hammocks are also used by the Waiká, and there,
184 according to Zerries, they are supposed to fulfill certain functions
[114] in the ritual system (246) (247), whereas Schuster says that they

246. Zerries, 1955a, p. 87.

247. Zerries, 1956a, p. 184.

are made only in an emergency (248). The tree-bast hammocks

248. Schuster, 1958b, p. 16.

of the Xiriána are more highly developed, for they have a weft of cotton threads and plant fibers. Ruth Haebler describes two specimens in the ethnological museums in Berlin (VA 61119) and Leipzig (8736) (249).

249. Haebler, 1919, p. 12.

/46 cont./

352
171

Even highly civilized peoples, however, for example, the Ipurina, an Aruak /Arawak/ tribe that at present is still living on the Acre, Seruini, and Ituxf rivers in the Brazilian state of Amazonas (250), formerly used these hammocks without weft, as

250. Darcy Ribeiro, 1957, p. 75.

is confirmed by a specimen in the Berlin ethnological museum (VB 3758) (251). There were also some, however, that were bound

251. Haebler, 1919, p. 12.

[114] by means of one or two rather long cross-strips. With respect to their purpose and manufacture, my observations among the Surára and Pakidái are almost identical with Ehrenreich's statements concerning the Ipurina. Thus, the investigator named writes: "The extremely primitive, but serviceable hammocks which the Ipurina use in an emergency on journeys, hunting expeditions, etc. clearly show how this useful implement may have been invented.

"Four or five strips of bast (embira) two meters long and 3-4 centimeters wide are simply loosened from the tree and gathered together at the ends, and sometimes bound together by one or two shorter cross-strips. In any case, lying in it requires no little skill and practice" (252).

252. Ehrenreich, 1891, p. 63.

The Berlin Museum für Völkerkunde, however, owns one hammock that is still more primitive. It comes from the Nahukuá (Nahuqua), a Karaiben /Carib/ tribe of the Xingú source region, and consists only of a bundle of grass, which, tied together at top and bottom, served as a sleeping arrangement for children (VB 2624) (253).

253. Haebler, 1919, p. 12.

Surára
Pakidái

/46 cont./

352
[192] Instead of the yâritanaçík (embira hammock), the Surára and Pakidái men, on their rovings and hunting and war expeditions, also /47/ frequently use a liana hammock -- totokẽ -- (254) (255),

254. The name is derived from tototó, with which the liana (cipó-titica) is designated.

255. Except for a slight dialectal difference, the name corresponds to the Waiká word -- "toto" --, with which, however, according to statements by Zerries, they designated their tree-bast hammocks (Zerries, 1955a, p. 87).

which is likewise very light but gives the sleeper a somewhat firmer support. The lengths of these hammocks vary between
[462] 1.90 and 2.10 meters. They, too, are without cross-bindings
352 and are likewise made only by men. This is done as follows:
284 The man has a rather large bundle of long lianas lying in front of him. He splits each one with his teeth into 3-5 flat strips and places these side by side. When he has gathered as many strips as he can easily grasp with one hand, approximately 200-250, he winds a thick liana around the ends. Below the wrapping he then divides the flat strips into several bunches of equal size, each of which he winds twice with two split, twisted lianas (Fig. 19 and Fig. 20). This makes the bundle of strips wider at the ends. As tie ropes the man uses three lianas plaited like braids (Ill. 7).

352
184 Such hammocks are likewise used by the Waiká (256) and

256. Schuster, 1958b, p. 16.

Xirianá, but the latter Indians sometimes provide them with cross-bindings of cotton strings (257).

257. Koch-Grünberg, 1923a, p. 314 and Pl. 46 (1).

Surára
pakidái

/47 cont./

352 Finally, as the third and most important form, which is used constantly by men, women, and children, both in the maloka as well as during migrations of the tribe, the plaited hammock of cotton -- nyõ (258) -- is to be mentioned (Ills. 28 and 29). Aside

258. The cotton belts are also designated with the same word.

from the material, it differs from the two earlier types above all because of the weft. The lengths run between 1.60-2.20 meters, depending on whether they are meant for children or adults.
[462] Making them is again the duty of the men, though the women occasionally help a little.

352 Before they are made, two posts are rammed into the ground
286 and connected at top and bottom by cross-poles with lianas. The length of the hammock depends on the distance of the latter, for around these cross poles is /Figs. 19 and 20 appear here/ wound the continuous warp thread, the two ends of which are knotted with the warp at the start and finish. This produces front and rear layers of thread, which are united into a single layer by slipping the rear warp threads between the /48/ front ones. After that the plaiting of the double thread is begun, which is done without implements, only with the fingers, from right to left; it should also be mentioned that it is started at the top. All hammocks are plaited with very wide meshes, for the intervals between the individual cross-bindings, which are knotted at the beginning and end, are 8-12 centimeters. To fasten the hammocks ropes of
[824] Bromelia fibers (curauá) are used, which, made of four strands, braidlike, are twisted to the right.

352 When a hammock has been used for some time, it gradually takes on a dirty-brown appearance. This comes about because
[302] the urucú color with which the Indians frequently paint their bodies rubs off on it somewhat when they lie down and adheres to the cotton.

Surára Pakidái

/48 cont./

352 According to the classification by Max Schmidt,
286 who differentiates three groups for the plaiting tech-
174 nique in South America, the cotton hammocks made
171 by the Surára and Pakidái would belong to the second

(284)

Fig. 19. End fastening of a liana hammock.

Fig. 20. Diagram of the interweaving of the end fastening of a liana hammock.

group, the double-thread plaiting, which the scholar characterizes as follows: "This plaiting method, which is widespread throughout America, North and South, is simply based, as the diagram in Fig. 115 shows, on two threads that are twisted around each other and are simultaneously, at each half twist around each other, wound around one of the bundles

Surára
Pakidái

/48 cont./

352 of rushes or fibers running parallel to one another" (259). "It is
286
174
171

259. Max Schmidt, 1905, p. 228.

this double-thread technique," Ruth Haebler writes in her work, "Die geflochtenen Hängematten der Naturvölker Südamerikas /The Plaited Hammocks of the Primitive Peoples of South America/," "which is used in the manufacture of the plaited hammocks. The essence of the two-ply technique thus consists of stretching parallel threads which form a warp, so to speak, and through which the double thread is passed as a weft. As a result of the manner in which the warp is stretched, two completely different groups of plaited hammocks are produced" (260).

260. Haebler, 1919, p. 3.

The Surára and Pakidái hammocks are to be assigned to group two, which leads over to weaving (261), for here there is already

261. Haebler, 1919, pp. 9/10.

regular shed-formation. My observations among the Surára and Pakidái also agree almost exactly with the descriptions by Im Thurn (262) Ehrenreich (263), and Krause (264). This proves an

262. Im Thurn, 1883, pp. 288 ff.

263. Ehrenreich, 1891, p. 22.

264. Krause, 1911, pp. 259 ff.

adoption from the outside, most probably from the Karaiben tribes, which took place presumably by way of the Xiriána. It is noteworthy, however, that all the authors named say that the warp threads are stretched horizontally and that the weft is interlaced
000 from top to bottom or from bottom to top. From a photograph

Surára
Pakidái
Waica

352 /48 cont./ From a photograph
286 taken by Zerries (265) it may be seen that the Waikâ make their
174
184

265. Zerries, 1954b, Pl. VI, bottom.

cotton hammocks in the same way. With regard to the origin and technique, he writes in another place: "The cotton hammock of the Waika was taken over, in simplified form, from the Marikitare /Makiritare/ and, like theirs, is not woven, but merely knotted" (266). Although Zerries uses the expression

266. Zerries, 1956a, p. 184.

"knotted" /geknüpft/, this is probably the same type which I described for the Surára and Pakidái (267). This is even further

267. The names, too, are very similar, -- "nu" -- among the Waikâ (Zerries, 1955a, p. 84; 1954b, p. 71), and -- nyõ -- among the Surára and Pakidái.

elucidated by the following remarks of Schuster: "The cotton hammock, following, as a more recent form, these types made of wild material, exhibits as an essential difference, aside from the cultivated raw material, longitudinal threads held parallel and close together by cross-bindings. Apparently this hammock, whose length is determined by the bow-staff used as a crosspiece on the tying framework, is a clumsy imitation of the far more carefully worked hammock of the Karaiben Makiritare, who live in the northern and northwestern part of the Waika /49/ region" (268).

268. Schuster, 1958b, p. 16.

This cotton hammock of the Waikâ, clearly taken over from the Karaiben, thus completely corresponds in form to the one used by the Surára and Pakidái. But what induced the latter in making it to put the warp threads vertically, instead of horizontally, as among the other tribes, cannot yet be explained.

/49 cont./

8. Basketry

285 462 [824] Basketry is carried on primarily by the women. The only exceptions are temporary carrying-baskets of natural palm leaves, which are made by both sexes, and carrying-baskets of curauí, the making of which falls to the men.

[824] If the Indians need a temporary carrying-basket in the forest, they simply place two pinnate palm leaves close together on the ground (most often they use for this the leaves of the patauí, açaí, and ubim palm) and interweave the inner sides to make a firm surface. Then both leaves are bent over at the upper end, which makes the bottom, and on the outside a braidlike rim is plaited 482 (Ill. 32). By means of a carrying-band of embira, very heavy loads can then be carried with this basket, called pakokêhe, above all fruits, but also pieces of large game, for example, tapir, which the hunter alone cannot carry into the maloka. Men always slip the carrying-band over upper arms and chest, while women prefer the forehead for this.

285 191 Similar baskets are found among the Karaiben /Carib/ and Aruak /Arawak/ tribes of Guiana (269), as well as among the

269. Roth, 1924, p. 379 and Pl. 124.

Urubu in the Brazilian state of Maranhão (270). Similar specimens,

270. Lopes, 1932, p. 147 and Fig. 6.

however, are used by the Nahukuá /Nahuqua/ and Bakaïrí /Bacairi/ in the Xingú source region (271), to mention only a few more

271. Max Schmidt, 1904, pp. 500 ff. and Figs. 13 and 14.

examples, which, however, could be augmented at will. It is seen from this that many tribes were in a position to make carrying devices out of natural palm leaves.

Surára
Pakidái
Shiriana

/49 cont./

285 462 824 More highly developed is the carrying basket which consists of bast strips of the curauá plant (Ananas sativus Sch.) -- uaramá. It is made by the male members of the tribe in the following manner: Two groups of plaiting strips are laid on top of each other in different directions and then interwoven with a third group of strips running in still another direction (Ill. 33).

285 194 971 This, according to Max Schmidt's classification, is the third principal type of South American plaiting (272) (273). This type

272. Max Schmidt, 1904, pp. 490 ff.

273. Max Schmidt, 1905, pp. 330 ff.

of basket (274), which is very widespread in South America, is

274. Abundant comparative material is to be found in Roth (Roth, 1924, pp. 321 ff. and Pl. 100 B and 102) and Mason (Mason, 1904, pp. 529 ff. and Pl. 240 (1, 2).

also regarded as very old, but today is seldom used any more by the Surára and Pakidái. Nothing concerning its origin is known any more among the tribes named. An autochthonous development (179) is possible, but an adoption from Karaiben or Aruak tribes, who use similar baskets, is more probable. The same basket is (184) likewise confirmed for the related Karimé (275).

275. Salathé, 1931/32, p. 302 and Figs. 9 and 10.

285 824 192 The one most frequently used at present is the women's large carrying-basket made of liana strips (276) -- wuēka --, which "has the shape of a somewhat elongated semicircle" (Ill. 34).

276. Each individual liana is split with the teeth into several flat strips. (Cf. also p. 101).

Surára
Pakidái

/49 cont./

which "has the shape of a somewhat elongated semicircle" (Ill. 34). This description comes from Koch-Grünberg, and, to be sure, he is referring to the completely identical women's carrying-baskets of the Xirišana (Schirianá). "In this type of plaiting," says the investigator named, "which is probably peculiar to the Schirianá, the vertical strips running out radially from the common center of the bottom are wound spirally with two finer horizontal strips. A few stronger inner rings to which /50/ the vertical strips are lashed with lianas give the basket shape and support. The ends of the vertical strips are secured under a special overcasting of the rim (Pl. 23, 1). By means of tree-bast strips, to which the bark still adheres, the basket is carried by the forehead on the back" (277). The same technique is used by the

277. Koch-Grünberg, 1923a, pp. 307/08.

Surára and Pakidái, and the initial plaiting of a carrying-basket (Fig. 21) shows this particularly clearly (Ill. 35). This is /Fig. 21 appears here/ /51/ the type of plaiting which Max Schmidt designates as "double-thread plaiting," the second principal type of South American plaiting (278) (279).

278. Max Schmidt, 1904, pp. 490 ff.

279. Max Schmidt, 1905, pp. 330 ff.

By means of an external feature one can, however, easily distinguish the women's carrying-baskets of the Xirišana from those of the Surára and Pakidái. In the case of the former, the carrying band is fastened only at the edge (280), while the latter

280. Koch-Grünberg, 1923a, Pl. 23, 1.

always wind it around the bottom, then lead it through two twisted liana-loops on the lower third as well as on the upper edge, and then knot it on one side (Ill. 34). This gives the wearers a better

Surára
Pakidái
Shiriana

/51 cont./

285
184
482]
[438]

hold, which makes it possible for them to transport substantially heavier loads without chafing themselves. This slight improve-

Fig. 21. Initial plaiting of a women's carrying-basket.

ment could have been developed by the Surára and Pakidái women, but the baskets themselves, as well as the method of making them, according to the statements of my informants, represent imported goods from the Xiriána.

The same applies for the round, flat basket-bowls made by the same technique, which are found in various sizes among the Xiriána (281) as well as among the Surára and Pakidái and

/51 cont./

285
184

281. Koch-Grünberg, 1923a, p. 308.

which serve for storing manioc cakes and fruits. Among the last-named Indians I also saw women's carrying-baskets in miniature form, which are meant for small girls, and some with covers -- [531] wee. All the objects named are usually painted with serpentine [386] lines, for which urucú is used. Finally, it should be mentioned [461] that the women, like best to lie comfortably in their hammocks while making such baskets and basket-bowls.

285
191
184

The women's large carrying-baskets and basket-bowls described above are likewise used by the Waikâ, and both Zerries and Schuster point out that in the manufacture the twining plaiting-technique is used (282) (283) (284). Similar basket-bowls

282. Zerries, 1956a, p. 184.

283. Zerries, 1955b, p. 663, Ill. 2.

284. Schuster, 1958b, p. 17.

are also documented for the Karimé (285), and small hanging

285. Salathé, 1931/32, p. 302 and Fig. 11.

baskets and basket-winnowers from Aruak and Tukano /Tucano/ tribes on the upper Rio Negro, as well as from the Makú /Macu/, exhibit further parallels, which differ only slightly in the external form (286).

286. Koch-Grüngerg, 1910a, pp. 220 ff. and Ills. 142e, 143a, 144.

/51 cont./

285 [192] [824] Then there are small baskets with handles and square bottoms -- yorohfkes -- (Ill. 36), in which women keep their ornaments, arm, leg, and chest cords, the spindle and balls of cotton. To make these, split lianas are again used. The technique employed is very primitive, for the plaiting strip is merely led [184] alternately over and under a plaiting strand (287). The shape of

287. Max Schmidt includes this technique in the first principal group of South American plaiting (Max Schmidt, 1904, pp. 492/93).

these little baskets seems to be peculiar to the Surára and Pakidái, for in the literature I have not yet found a corresponding description with reference to other tribes.

285 824 302 Simple plaited fire-fans -- xuhéma -- are made of the leaf-stalk sheaths of the tucumã palm (Astrocaryum sp.). They have an elongated shape, and the ends of the strips are tied together to form a handle (Fig. 22).

285 372 174 171 Similar fans, but more evenly worked, were found by Koch-Grünberg among the Makiritare, Yekuaná /Yecuana/, and Guinaú in the catchment area of the upper Orinoco (288), from which one

288. Koch-Grünberg, 1923a, p. 345 and Pl. 24, 6.

might conclude that this object reached the Surára and Pakidái from here, probably by way of the Xiriána. The reverse route might also be possible, however, if only because most of the Karaiben and Aruak tribes of Guiana use fire-fans with a handle set crosswise (289).

289. Roth, 1924, pp. 291 ff., Pl. 78, 79, and Fig. 91.

Surára
Pakidái
Shiriana

252 /51 cont./
184
285 The tube-press -- pokunho -- has only recently gained entry
[192] among the Surára and Pakidái. Among the former I discovered only three specimens, among the latter five, all of which /52/ /Fig. 22 appears here/ were made of bast strips of the curauá plant
[438] (Ananas sativus Sch.) and were relatively small (length, 1.10-1.20 meters; diameter, 3-4 centimeters). They were in the possession of a few families who had obtained them by barter
[192] from the Xiriána. Heretofore the manioc pulp has been pressed out with the hand by means of small, square plaitings -- yorohí -- (290).

290. The name is practically identical with the one for the small basket with handle -- yorohikes -- and the plaiting technique is the same throughout.

[178] Even today this method is more common than the one with the tube-press, but the latter is gradually beginning to come in.
[426] Families who do not as yet own a tube-press sometimes borrow one, for up to now it has been made neither by the Surára nor the
114 Pakidái. The above reference to the fact that the tube-press is
252 supposed to represent an import article from the Xiriána is
174 significant, however. That is, when Koch-Grünberg stayed with
285 a Xiriána group in Motomotó, he did not find any there, but only small basket-winnowers, in which the manioc pulp was squeezed
[177] with the hand (291). Hence it is to be assumed that these Indians,

291. Koch-Grünberg, 1923a, p. 308.

too, have not known the tube-press for very long; presumably they took it over from the Karaíben. /Fig. 23 appears here./

9. Band for Carrying Children

The band for carrying children -- okomakuſ -- is made from the bast of an embira tree (Daphnopsis brasiliensis Mart.). For this purpose thin trunks are cut down by the men. Then the women remove the bark and /53/ with a bast beater -- xamotimá -- (a piece of wood 30-40 centimeters long, from the embira tree) beat on the trunk for 1-2 hours. Through this the bast -- uarimaxſke -- becomes loosened, soft, and pliable, so that finally it can be easily peeled off the trunk -- pekehſk -- (Fig. 23a-c). Then the two ends are slipped into each other and sewed double with a thread of Bromelia fibers or cotton. The holes are pierced beforehand with the little cutia-tooth knife (see p.117), and then the thread can be drawn through without effort.

The carrying-band is always slung over the right shoulder so that the right hand remains free for work, and it ends at the level of the left hip (Ill. 15), which gives the sitting child additional support if the mother puts its legs around her body.

This carrying method is very widespread in South America and is also employed by tribes that do not use the carrying-band (292). Among the Xiriſna Koch-Grünberg does not seem to

292. See, for example, Koch-Grünberg 1923a, Pl. 45.

have seen such carrying-bands, for he says nothing about them.

10. Receptacles

415 824 [192]

As receptacles, the fruits of the Bignoniaceae (Crescentia cujete Lin.) and Cucurbitaceae (Cucurbita lagenaria Lin. and Cucurbita idolatrica Lacerda = jamaru), which offer a variety of shapes (ball shape, bottle shape, cucumber shape, and others), are used principally.

These vessels in general are called -- horotokſ --, except for those of the jamaru fruit (Fig. 24), which are called -- nhapotoſma.

Surára
Pakidai
Shiriana
Waica
Karime

/53 cont./

415 Fruits cut in two furnish correspondingly shaped bowls --
824 maraká. In order to cut them, men or women tie curauá fibers
around the fresh fruit and then scratch along this with the little
[386] cutia-tooth knife (see p.117). On the inside all the bowls are
given a black coating, which is made out of the charred wood of
the pupunha palm and the oily yolk of turtle eggs or cayman fat.

415 A few families also have black, thick-walled, undecorated
323 clay vessels -- haboká -- with a round bottom, which are poorly
[438] fired and break easily. I was told that they come from the Xiriána (293).

293. The name, too, is almost the same among the latter -- "hapóga" -- (Koch-Grünberg, 1928, p. 304).

for the Surára and Pakidái do not practice pottery themselves.

323 On the other hand, this craft is also familiar to the Waiká and
184 Karimé, and, to be sure, they make vessels of the same shape as described above (294) (295). /Fig. 24 appears here./

294. Zerries, 1956a, p. 184.

295. Salathé, 1931/32, p. 302 and Fig. 12.

123 My pots and pans of aluminum, brought along as gifts, were
415 highly prized by the women of both tribes, as were empty gasoline cans and food cans.

/54/

11. Tools

412 Primitive tools, which consist of teeth, tortoise shell, bone, taquara, bamboo, and wood, are few.

[192] The most important one, and reserved exclusively for male
[237] use, is a small knife made out of the sharp tooth of the cutia (Dasyprocta aguti L.) -- tomenáke --, which every Surára and Pakidái wedges under his left upper-arm cord while traveling and on hunting and war expeditions (Ill. 31) (296). The lower part

[301] 296. The women use the cutia teeth as ear ornaments (see p. 86).

Surára
Pakidái

/54 cont./ The lower part
412 of the tooth is firmly anchored with tree resin in a tubular bone
[314] of the jacamim (Psophia crepitans L.) -- nyapín -- which at the
[723] same time serves as the handle and is called -- nyapínmatáz --,
[192] and this part of the shaft is additionally wound with a thread of cotton or cunauí (Bromelia fiber) (Fig. 25). /Fig. 25 appears here./

With this small knife the arrow cane is bored to insert the tip, a wooden shaft, or the notched hand-end. The crudely carved bamboo points are improved and sharpened with it, as

[415]
[824]

Fig. 24. Jamaru fruit.

are the points of bone and wood. It is also used, however, to bore holes in the hearth, that is, the horizontal piece of wood of the
[531] fire-making apparatus, and to cut a groove at the side. The
[593] serpentine lines and zigzag designs are put on the quiver with it, and finally it is used by the men to make deep gashes on the bodies of their wives for reasons of jealousy. Almost all the women have large and small scars from this; they always showed them to me with a certain amount of pride, however, as a sign that they are, or were, beautiful and desirable.

412 Other tribes of Guiana, too, and those that in the rest of
184 South America are part of the remnants of the original stratum
[191] use these small knives. They are documented for the Waiká by

412 /54 cont./
184 Zerries and Schuster, (297) (298), for the Karimé by Salathé (299).

297. Zerries, 1956a, p. 184.

298. Schuster, 1958b, p. 17.

299. Salathé, 1931/32, p. 306 and Fig. 16.

[237]

Fig. 25. Small knife made out of the sharp tooth of the cutia (Dasyprocta aguti L.).

Fig. 26. Knife made out of the ventral shell of the perema (water turtle).

[284] [824] and for the Xiriâna by Koch-Grünberg (300). The latter, however,

300. Koch-Grünberg, 1923a, p. 313 and Pl. 47 (9).

says that the Xiriâna lash the tooth to a wooden handle by means 000 of Bromelia fibers (301). In the same place Koch-Grünberg likewise

301. Such a knife is to be found in the Hamburg Museum für Völkerkunde und Vorgeschichte Koch-Grünberg Collection, 12.25:108).

Surara, Shiriana
Pakidai
Waica

412 /54 cont./ In the same place Koch-Grünberg likewise
171 mentions a knife with a bone handle which he acquired from an Arekuná who lived among the Guinaú on the Merewarí, but he adds: "Whether the subdivisions of the Arekuná who live deep in the interior still use such primitive tools I do not know" (302).

302. Koch-Grünberg, 1923a, p. 313 and Pl. 17 (3).

Outside Guiana this little knife is confirmed for the Guayakí (303)

303. de la Hitte, 1897, Pl. III, Figs. 4 and 6.

and Sirionó (304), among others. /Fig. 26 appears here./

304. Nordenskiöld, 1911, p. 193, Ill. 119.

412 /55/ The knife made of tortoise shell -- micí -- represents a
184 work tool for women. This is the ventral shell of the perema
[237] (small water turtle), sharpened on one long side (Fig. 26). Primarily the wild fruits of the pot tree (Lecythis longifolia) are cut with it after cooking (see p. 182).

This knife is also familiar to the Waikí and is used for the same purpose there (305).

305. Zerries, 1956b, p. 149.

For a third type of knife, which is likewise used only by women, there are the no longer serviceable lancet-shaped arrow points of bamboo -- kantaní and rahakí -- (see pp. 41/43). They are used primarily for peeling and scraping manioc tubers.

Koch-Grünberg also observed this among the Xirifna (Schirianí) (306). The investigator named also points out that the

306. Koch-Grünberg, 1923a, p. 308 and Pl. 48 (6 and 7).

/55 cont./

412 184 knives are sometimes bound to a pointed wooden handle. This strengthening, however, certainly was not added later, but rather is simply the shaft which the Xirišna, unlike the Surára and Pakidái, mount on their arrow points (see p. 43).

412 462 302 For cutting hair and shearing off the tonsure, decidedly women's work, a split piece of reed sharpened on one side (taquara -- Guadua sp.) is used.

412 191 Such "knives" are also widespread among the South American Indians; Prince zu Wied-Neuwied documents them for the Botokuden (307).

307. Prince zu Wied-Neuwied, 1821, p. 9.

412 239 Another important tool is the eyetooth from the lower jaw of the wild pig -- manacoauí --, with the inner edge of which the men smooth their bows.

[184] This tool is also used for the same purpose by the Waikí (308).

308. Schuster, 1958b, p. 17.

412 192 [184] For work in the fields the men use a digging stick somewhat flattened at the lower end and 2-2.20 centimeters long -- namunamutehí --, which they make out of the hard wood of the pupunha palm (Guilielma speciosa Mart.); as a substitute they also occasionally use an old, broken bow-staff.

[184] Zerries also observed the latter practice among the Waikí (309).

309. Zerries, 1956b, p. 153.

413 462 A piece of round wood from the trunk of the pupunha palm should also be mentioned; it is used by the women as a bast beater -- xamotimí (see also pp. 112/114).

412 197 This exhausts the use of primitive tools. Even in olden times, there were certainly not many more. During my stay among the two tribes, however, I saw them already using steel axes, as well as tercados (large bush-knives) and small knives.

Suráro
Waica
Shiriana
Pakidái

/55 cont./

412 [432] [439] The Surára acquire these articles by way of barter through their occasional contacts with the piaçabeiros (palm-fiber gatherers) on the Rio Aracá, while they are given to the Pakidái as gifts by the personnel of the Indian protection post Ajuricaba on the middle Demini. To my question as to whether their ancestors [124] had once used stone axes (I could not discover any), I was always 412 given affirmative replies. They also have a special name for the 192 ax -- hanhokomã. The blade alone is named synonymously, 437 whereas the shaft is called -- hanhokomãhitohã. Most probably 194 the stone axes were acquired by barter, as is the case, according to Schuster, for the Waikás (310). Which tribe furnished this

310. Schuster, 1958b, p. 17.

import article could no longer be determined, but this time the 412 Xirixána seem to be excluded as the intermediaries. Koch-Grünberg 194 writes: "They (the Xirixána) in former times apparently had no axes 114 at all to cut down the forest. At any rate, they did not know what to do with a stone ax that I showed them" (311a).

311a. Koch-Grünberg, 1923a, p. 307.

481

12. Equipment for Climbing

[137] [192] To climb up tall palms with a smooth trunk, such as the açaí (Euterpe oleracea Mart.), bacaba (Oenocarpus distichus or Oenocarpus /56/ bacaba Mart.), bucu (Manicaria saccifera Gaertn.), buriti (Mauritia vinifera Mart.), inaja (Maximiliana regia Mart.), paxiuba (Iriartea exorrhiza Mart.), tucumã palm (Astrocaryum sp.), and others, the Surára and Pakidái use the climbing ring -- horohoromã --, which consists of a split liana (cipó-titica) rolled up several times. The ends of the liana are wound around the ring several times and tied with a knot (Fig. 27). /Fig. 27 appears here./

/56 cont./

481 The man, sometimes also the woman, puts this ring around the feet and presses them, with the hollow between the ball of the foot and the heel, in the form of a prehensile foot, firmly against the trunk so that they are fairly sucked against the bark. He assumes a squatting position and then hoists his body upward.

Fig. 27. Climbing ring.

Although he embraces the trunk with his arms and hands, for climbing he uses only his feet, which, because of the ring, always have a firm grip. This grip becomes particularly important after the man has reached the top where he now uses both hands to cut off the fruits.

[191] Such climbing rings are known in many parts of South America and are also used by the caboclos (Brazilian country people). The invention, however, seems to be of Indian origin.

481 222 [137] The pupunha palm (Guilielma speciosa Mart.), however, which plays such an important role in the economic life of the Surára and Pakidái, cannot be climbed in this fashion, because its trunk, the diameter of which is 60-80 centimeters, is covered with long, pointed thorns. In order to be able to harvest its fruits in spite of this, these Indians use a climbing apparatus -- kanaške -- which is also familiar to the Waiká (311b).

[184]

311b. Barker, 1953, p. 446 and Fig. 1.

Surára
Pakidái

/56 cont./

481 222 The apparatus consists of two devices completely alike, which are fastened and used in the following manner: Two sticks, 1.60-1.80 meters long, whose diameter is 12-15 centimeters, are tied to the trunk scissors-like and loosely with lianas. The downward-pointing rear part of these crossed sticks is also wound with lianas. Above this first climbing apparatus a second one is attached in the same manner. The Indian who wishes to climb the pupunha palm now stands on the rear end of the lower "scissors" and pushes the one above it upward a short distance. Then he climbs on the rear end of the upper "scissors" and pulls the lower one after him. Next he shifts back to the lower climbing device and pushes the top one up a bit farther. Thus, by constantly changing his position and pushing one apparatus up and drawing the other one after him, he reaches the crown in 4-5 minutes (Ill. 39). He picks the ripe fruits and lets them down one by one on a liana, where his fellow tribesmen receive them. The descent is the reverse of the ascent.

481 222 194 I venture to doubt that this magnificent technical invention was developed by the Waikí, Surára, or Pakidái, above all because the rest of their material culture is extraordinarily poor. There is nothing to indicate an import, however. Influences of civilization are likewise out of the question, for the caboclo population (planters, rubber /57/ and palm-fiber gatherers) in the Demini-Aracá area is unfamiliar with the technique described; they knock down the pupunha fruits with long poles.

303

13. Preparation of Urucú

The red coloring urucú -- narú -- with which the Indians paint their bodies as well as their implements, is made by the women from the red seeds of the Bixa orellana which are found in thorny capsules. The seeds are cooked in a vessel until only a red sediment remains on the bottom, which is shaped into lumps and allowed to dry. With this the Indians are then able to paint themselves at any time; the color must first be moistened, however, with a little water or saliva.

/57 cont./

VII. Social Organization

1. General

619

In the case of the Surára and the Pakidái, these are sovereign tribes, who, however, live together in connubium. The same extends to the friendly Xiriána /Shiriana/, Puscheweterf, Aramamesterf, etc.

648 161 [842] [164] [165] [126]

Although the Indians investigated by me have very little contact with palm-fiber gatherers or the personnel of the Indian protection post Ajuricaba on the Demini, their population is steadily decreasing for the following reasons: birth control; high infant mortality as a result of the lack of hygiene; diseases, chiefly measles epidemics (312), but also chicken pox and grippe;

> 312. In 1952/53, for example, a measles epidemic spread like a wave from the lower Amazonas as far as the Brazilian-Colombian border area and brought death to many Indians. [115] (Statement by Herr Alipio Edmundo Lage, Inspector of Ia. Inspetoria do Serviço de Proteção aos Índios, Manaus).

and frequent wars (313).

> 313. On the occasion of an attack on a hostile maloka, an attempt is made to kill all the men, young men, and boys, insofar as possible, while the women and girls are taken along as captives.

2. Names

551 162 [160]

The exact number of Surára at the time of my stay among them amounted to only 64 (314) and consisted of the following:

[114]

> 314. In the first reports of my investigations I erroneously gave the number as 42 (Becher, 1957a, p. 118; Becher, 1958, p. 157).

/57 cont./

551
162
[802]

Estimated Age (315)

315. These Indians count only to three, so I could only estimate the ages given.

Hewemãõ (316) -- chief and medicine man — 42 years

[123]

316. I was able to learn all the names only after my adoption into the tribe, for they are kept a strict secret from outsiders. But even then the individual men and women themselves never told them to me; I learned the names only from other members of the tribe, and, to be sure, always in a whisper. If they call each other in a loud voice, they use Portuguese names which they have heard from palm-fiber gatherers. I too had to give names to several members of the tribe.

Koemtemĩ -- his first wife (from the Pakidã tribe) — 24 years
Kanikawõ -- son — 8 years
Daughter (has no name yet (317) — 1 year

[553]

317. Children are given their names only after the completion of their third year (see pp. 201 ff.).

Yaripanamĩ -- his second wife (from the Aramamesterĩ tribe) (She had a daughter who died in infancy.) — 35 years
Maximamĩ -- daughter of Hewemãõ and his former wife Tafmakĩna, who died in childbirth — 9 years

Surára

551
162

/57 cont./

	Estimated Age
Kurikayawõ -- brother of the chief and later his successor	37 years

/58/

Xomixawõ -- war chief	40 years
Uitimĩ -- his wife (from the Xamatĩri tribe)	38 years
Moramanamĩ -- daughter (married to the Surára Uaxianauwõ)	18 years
Yaxoĩma -- daughter	13 years
Ximarĩ -- his first wife (from the Pakidĩi tribe, sister of Koeatemĩ)	20 years
Inxinemĩ -- youngest brother of the chief (bachelor)	19 years
Hemahemĩ -- son of the deceased eldest brother of Hewemãõ	25 years
Hanohomĩ -- warrior	43 years
Unhamĩ -- his wife	24 years
Matuwõ -- son of Hanohomĩ and his first wife, who died. (Matuwõ is married to Maxiuamĩ, the nine-year-old daughter of Chief Hewemãõ.)	17 years
Unariwõ -- warrior	38 years
Yanauemĩ -- his wife (from the Puscheweterĩ tribe)	35 years
Komitimĩ -- daughter (second wife of the Surára Hemahemĩ)	18 years
Roioahĩma -- daughter	8 years
Cinapemĩ -- mother of Unariwõ	54 years
Toabewõ -- warrior	28 years
Uainomĩ -- his wife (mother of Unhamĩ, see above)	43 years
Raxakewõ -- warrior	32 years
Amarokomĩ -- his first wife (from the Xirihna tribe) (Two children, a boy and girl, have died.)	24 years
Yaxuramĩ -- his second wife (from the Puscheweterĩ tribe)	22 years

Surára

/58 cont./	Estimated Age
161 Daughter (has no name yet)	3 years
162 Crated -- warrior	32 years
Posioubemf -- his wife (from the Pakidái tribe)	23 years
Son (has no name yet)	3 months
Uaxianauwõ -- warrior	24 years
Morsmanamf -- his wife (daughter of the war chief)	18 years
Rarorauwõ -- warrior	36 years
Tanyakomf -- his wife (from the Pusheweterf tribe) (Three children, two boys and a girl, died.)	30 years
Rokomf -- mother of Rarorauwõ (oldest Surára woman)	63 years
Anyarawõ -- warrior	29 years
Ranomf -- his wife (from the Pakidái tribe)	20 years
Daughter (has no name yet)	2 years
Xanimf, mother of Anyarawõ	47 years
Poxewõ -- warrior	28 years
Riopemf -- his wife (from the Pakidái tribe)	21 years
Son (has no name yet)	2 years
Hunkawf -- warrior	29 years
Xororimf -- his wife	21 years
Son (has no name yet)	2 years

Olkoçimf -- his first wife (from the Xirifna tribe)	28 years
Daughter (has no name yet). The twin brother died.	3 years

Surára
Pakidái

/58 cont./

	Estimated Age
551 162 Xeramí -- his second wife (from the Aramamesterí tribe)	25 years
Xamiwõ -- son	12 years
Daughter (has no name yet)	2 years
Xutumí -- widow	59 years
Haikiamí -- her daughter (likewise a widow)	40 years
Yarikoawõ -- son of Haikiamí (bachelor)	17 years
Kasarauwõ -- solitary bachelor	17 years
/59/	
Ikoauwõ -- solitary bachelor	16 years
Jibeauwõ -- orphan boy	9 years
Mauabemí -- orphan boy	8 years
Nikeromí -- female captive (from the hostile tribe of the Karauaterí)	15 years

[161] [123] There are somewhat more Pakidái, for they numbered 89. Since my association with them was not quite as close as with the Surára, however, I was able to learn considerably fewer given names. In the following I am presenting those that became known to me:

	Estimated Age
Karenauõ -- chief and medicine man	28 years
Poroamí -- his wife (from the Surára tribe)	20 years
Son (has no name yet)	2 years
Porõhiwõ -- war chief	32 years
Ruxoyetemí -- his first wife (from the Surára tribe)	30 years
Yauetoiwõ -- son	13 years
Xamima -- daughter	7 years
Daughter (has no name yet). She was born during my stay	1 month
The second wife of Porõhiwõ left him because of ill treatment and was presumably drowned	
Kaxiribewõ -- warrior (brother of Porõhiwõ)	39 years
Monamí -- his wife	38 years

/59 cont./

	Estimated Age
551 162 Kuyaromí -- daughter	19 years
Bixewõ -- son	15 years
Son (has no name yet)	3 years
Son (has no name yet). He was born during my visit	1 month
Ironasterí (from the Xiriána tribe) -- wife of Bixewõ	22 years
Yururauwõ -- warrior	28 years
Xekoreimí -- his wife (from the Surára tribe)	28 years
Tenxoyahibewõ -- son. (He is the only Pakidái boy attending the mission school of the Salesians in Barcelos (Rio Negro) and speaks Portuguese well. A river trader took him there. Now he is ashamed of his fellow tribesmen and was not to be persuaded to give any information about them).	14 years
Mihemehumí -- son	5 years
Son (has no name yet)	1 year
Kuatoxemão -- warrior	33 years
Toreheíma -- his first wife (from the Puseheweterí tribe)	26 years
Xiahomí -- his second wife (from the Aramamesterí tribe)	21 years
Daughter of Xiahomí (has no name yet)	2 years
Karemoumí -- warrior	29 years
Xitiporimí -- his first wife	26 years
Tokorí -- son	8 years
Nyarimí -- daughter	4 years
Kirixoíma -- his second wife (from the Xiriána tribe)	20 years
Daughter (has no name yet)	6 months
Prexemí -- widow (mother of Karemoumí)	50 years
Hokotõmarimí -- bachelor (brother of Karemoumí; died as the result of an accident during my stay)	19 years
Xoromauwõ -- solitary bachelor	17 years

/59 cont./

595 From this list of families one gains the impression that monogamy predominates. But I was assured by my informants that those warriors who thus far have only one wife would be glad to take a second or even a third one, as was customary among their forefathers. The small number of persons in the tribes, however, has caused a shortage of women, so that most of the men are forced to be content with one spouse.

/60/ 3. Political Structure

619

These low population figures could, moreover, arouse the suspicion that it is not tribes, but only tribal divisions that are involved here, especially on account of the connubium in which they live, or merely groups. The chiefs and war chiefs named, however, told me emphatically that the Surára as well as the Pakidái were formerly large and mighty and distributed in many malokas. [185] They regard achieving this size again as a goal worth striving for.

622 An institutional chiefdom with a definitely established succession prevails in both tribes. If the chief dies, his next younger brother automatically takes his place. Only if the youngest brother is dead may the first-born son of the oldest brother, who by that time is usually an older man, occupy the office of chief.

624 701 In addition there is the war chief. This position is not hereditary; rather, the bravest warrior is chosen for it. During peacetimes he has no prerogatives whatever and lives like an ordinary member of the tribe. Only during military encounters does he take over the [622] leadership, while the real chief, as religious head, doctor, and teacher, is protected and does not take part; the same is true for his brothers.

622 159 The Surára chief Hewemão, very bold and intelligent, is a truly great personality; his orders are respected by all members of the tribe without opposition. When he was still a youth, his father, Xoromão, was killed with two arrow shots by Makuxí /Macusi/ Indians. Hewemão eldest brother, Xaraíma, assumed the succession, but he died of a fever about eight years ago.

/60 cont./

622 Since that time Hewemãõ has been chief and at the same time,
159 like his predecessor, a medicine man who instructs all the male
Surára in religion, mythology, magic, curing the sick, and tribal
traditions (see pp. 143f.). He also, however, assigns them to oc-
casional communal projects, supervises their activity in the roças
(forest clearings), gives instructions for the building of a maloka,
and selects the participants for curing the sick and for magic per-
[224] formances. If a large animal was killed, a tapir, for example,
he supervised the fair distribution of the meat so that every
family obtained its piece. In the case of smaller game, the
hunters usually give their chief a choice piece, and the women
bring him and his family fruits and berries or brimming calabashes
[554] of refreshing palm drinks. He is thus honored in every way.
He and his wives too, however, willingly and freely give up some
of their hunting or gathering spoils.

[342] In the large, open maloka he and his two wives and chil-
dren occupy a special hut (see pp. 24 ff.). During migrations of
622 the tribe he determines when they are to rest and to set out again.
484 Moreover, each morning he arranges for regular march-protection,
159 4-5 warriors who form the advance guard and set out two hours
484 before the departure. They have only their bows and arrows with
them and reconnoiter in both directions from the Indian path, in
order to be on the lookout for enemies. The bulk of the tribe,
which travels in single-file formation, always presented the
following picture during the time I lived among the Surára: 3-4
484 warriors armed only with bows and arrows. They carry their
482 weapons longitudinally over their heads or over one shoulder.
After them came men with my baggage, the younger brothers of
the chief, and finally the latter himself. I walked behind him,
my servant Mateus followed me, and the boys and girls with little
baskets, then the women with their large, cylindrical baskets,
which contain all the household goods. Mothers with babies
carried them, in addition, in a carrying band on their left hips.
On top of the basket there often sat a little dog, a monkey, or a
parrot. Then behind the women there marched 4-5 more warriors
as a rear guard.

Surára
Pakidái

/60 cont./

484 These safety measures are necessary, for one must always be prepared for a hostile attack. That is why the /61/ women [482] carry all the household goods, for if the men were thus burdened, they could not defend themselves. For this reason, the chief 484 and his brothers always march in the middle of the tribe, for in 622 the event of a military encounter the protection of the chief is the 554 supreme command of all the Surára. He is honored and respected, of course, not only as the head of the tribe, but also because he is the adviser in all situations of life, the medicine man who is able to make connections with the hekurá and serras /xierras/ (see pp. 200/201) and can ward off sickness and misfortune. If he were killed, the tribe would suddenly be in a terrible situation, for his successor does not yet have the same experience.

622 The next youngest brother and subsequent successor of Hewemãõ is Kurikayawõ. He will be followed by Inxinemá, who is approximately 19 years old, but has not yet completed his youth-initiation. And it is only after the latter that Hemahemá, who is approximately 25 years old and the only son of the oldest brother, Xarimá, who died eight years ago, would be able to take over the leadership.

624 The war chief of the Surára is Xomirawõ, a modest, reserved, but extraordinarily hardy and brave man.

622 Among the Pakidái the succession of chiefs is the same.
624 The following remarks, however, will show the complications that
619 arose six years ago as a result of the death of the old chief Karakarawõ, because his three younger brothers who could have taken over the succession died before him. Karakarawõ did have a son, Karenauõ, but he was still very young, so that there was nothing to do but to entrust the leadership of the tribe for the time being to the war chief Porẽhiwõ as a substitute. At the same time he and the older Pakidái men asked the chief of the friendly Surára, Hewemãõ, for advice in many things, especially serious illnesses, magic performances, etc. At this time many younger Pakidái attended the school of the Surára chief, among them the present Pakidái chief, Karenauõ, who was given a very thorough training by Hewemãõ. For this reason the Surára and Pakidái even lived

Pakidái
Surára

/61 cont./

622 together for several years, both in the sierra during the dry season
619 and at the Cachoeira dos Índios on the upper Rio Aracá during the
624 rainy season. In the long run, however, the war chief Porẽhiwõ did not like this, and there were also differences of opinion with the young chief, so he and his brother Kaxiribewõ, with their families temporarily withdrew from the tribe and remained alone in Taraquá, the Pakidái maloka on the middle Demini.

As a result of the youthful exuberance of the not yet fully mature Pakidái chief Karenauõ, the previously good relationship between the Surára and Pakidái was unfortunately slightly disturbed. Yet Karenauõ really had every reason to be grateful to Hewemãõ.

769 The discord began in March 1956 during the great festival
619 in memory of the dead, which the Surára as hosts and the Pakidái
622 as guests always celebrate together, and in which some friendly Pusheweteri and Xiriána families also took part. During this gathering it is customary for Hewemãõ to be acknowledged as the head by the guests, even by their chiefs, and for his orders to be followed. Young Karenauõ, however, refused to do this. He suddenly felt himself very strong because the member of Pakidái, of course, is considerably larger than that of the Surára. The rivalry between the chiefs increased from day to day and extended even to the members of the two tribes. It was only thanks to the magnanimous, wise attitude of Hewemãõ and the mediation of the chief of the Pakidái, Porẽhiwõ, who returned to his tribe and exerted great influence, that greater tensions or even military encounters could be avoided. This was only to be welcomed, for there is a long, traditional friendship between the two tribes, which has deepened consanguineously as a result of intermarriages.

[166] When the festival was over, at the end of March 1956, the Pakidái again moved to /62/ Taraquá on the middle Demini and the Surára to the Cachoeira dos Índos on the upper Aracá. But at this point I was to experience a great surprise. Three Pakidái men, with their families, no longer followed their chief Karenauõ, but joined Hewemãõ and thus actually emigrated to the Surára.

/62 cont./

4. Life Cycle

842 a) Birth control

862 The number of children among both the Surára and the [63] Pakidái is very small; no woman has more than three at most. [65] Aside from the high infant mortality rate as a result of the lack of hygiene, however, this is bound up with the fact that the women must observe an interval of at least three years after each birth, as long as a child is fed with mother's milk, which, in the opinion of these Indians, prevents conception to a considerable 842 extent. If a woman nevertheless becomes pregnant, the medicine 847 men know how to prepare an abortive medicine from plant juices. The reason for birth control, I was told, is that if a child were born during the period of restriction, it would not be healthy and able to cope with life, because the mother's body would still be too weak.

843 b) Food taboos during pregnancy

Before the birth the mother must observe many food taboos in order not to harm her child. Her diet then consists primarily of the tender meat of the mutum (Crax sp.), cooked bananas, manioc flat-cakes, and a drink that is made from the nourishing, very oily pupunha fruits. If she were to eat wild-pig meat, for example, the child would be born dead; the meat of the pirarucu (Osteoglossidae, the largest fresh-water fish), which carries inside it the bad breath of the river, would make it blind, and parrot meat would make it cry constantly later on.

844 c) Birth

While giving birth, the woman kneels in front of a tree and embraces the trunk with both arms. The ground has been sprinkled with water beforehand so that it is slimy and soft. Several female members of the tribe assist the woman in labor. After the birth, two women, each with a cotton thread, tie off the umbilical cord, and a third one then bites it off. The father

Surara
Pakidai

/62 cont./ the father
844 of the child later hangs it on the tip of a pupunha palm
[824] (Guilielma speciosa Mart.), which is connected with fertility
[842] magic; he buries the afterbirth in the planting. Two confine-
ments which I was able to observe were very easy and quick.
[142] On the lower part of the children's back I could see in each case
the grayish-black spots of pigment, the so-called Mongolian spots.

844 Immediately after birth, the mother with her baby took a
846 bath at the nearby riverbank and then lay down in her hammock
for one or two hours. After that, with the baby on her arm, she
already went back to her customary occupation.

845 If a complication arises during confinement, the chief, who
[622] is at the same time the witch doctor, is fetched.
[756] In contrast to most other Indian tribes, twins are reared.
845 If there should be triplets, which so far has never occurred, one
847 child would have to be killed, for, as they said, the mother has
only two breasts. Deformed children are killed and thrown into
the river.

852 There are no birth ceremonies, for up to its third year of
851 life the child belongs to the flesh and blood of its mother and
553 is not given a name before this.

854 d) Infancy and early childhood

The infant or young child is not left alone for a moment. When the mother attends to her housework or gathers fruits and berries in the forest, she carries it in a carrying band of tree bast on her left hip, so that she has the right hand free for her work.
853 Even at night it sleeps with her in the hammock. The breast is constantly at its disposal, so that it never /63/ thinks of sucking its finger. This may perhaps also explain why these Indians have such a perfect set of teeth. As soon as the teeth start coming in, the child is given tough meat to chew on, in order to facilitate teething. At the same time the long period of nursing, along with abundant sunshine, prevents rickets. After 3-4 months the baby is given supplementary food in the form of cooked, green mealy bananas (Musa paradisiaca normalis), which are prechewed by the mother, or a porridge made out of manioc flat-cakes.

/63 cont./

854 593 It is simply touching to see how lovingly and solicitously every mother treats her child. But the love of the father is no less great. He openly acknowledges the child and clearly shows his feelings of pride and fatherliness (318), though he is otherwise

[114] [191]

318. In contrast to this, Alexander von Humboldt, with reference to the Indians on the Orinoco, writes that fathers do not have any affection for their children (A. von Humboldt, 1860, III, p. 155).

very reserved in his expressions of feeling. When he comes wearily into the communal house after a strenuous hunting expedition or from his field work, he never forgets to devote himself first of all to his little child for a while. He either takes it on his arm and goes walking with it, or he lays it beside him in the hammock. Even during migrations of the tribe he sometimes [858] carries the child for hours. Moreover, he loves a daughter just as much as a son.

854 304 During the first year of life the ear lobes and the lower lips of boys and girls are pierced by the mother with a sharp palm thorn, and, in addition, the girls are given perforations in the corners of the mouth. To prevent the wounds from healing, small wooden rods are stuck in temporarily and moved back and forth 304 frequently.

854 833 When a little girl has completed the first year of life, she is deflowered by the mother with her finger. This procedure is done in preparation for sexual intercourse later on.

114 191 854 833 304 Similar procedures were observed by von Feldner among the Machacarf /Mashacali/ Indians, and he describes them as follows: "Nulla inter illas invenitur virgo, quia mater inde a tenera aetate filiae maxima cum cura omnem vaginae constrictionem ingredimentumque amovere studet hoc quidem modo: manui dextrae imponitur folium arboris in infundibuli formam redactum, et dum index, in partes genitales immissus huc et illud movetur, per infundibulum aqua tepida immittitur" (319). In this connection

319. von Feldner, 1828, II, p. 149, footnote.

2: Becher--136 E-5 (1955-1956) 1960 SQ18 Yanoama SQ18
Suvaya
Pakidai

/63 cont./

Ploss and Bartels have already observed: "These manipulations probably serve not so much the purpose of cleanliness as preparation for the later sexual functions" (320).

320. Ploss and Bartels, 1927, p. 376.

A custom which is said to prevail in Paraguay should be mentioned in this connection. When a girl is born there, the midwife inserts her finger into the vagina and says: This is a woman (321). Unfortunately, there is no account of the origin

321. Written communication from Montegazza to Ploss (Ploss, 1912, p. 219).

of this custom. It is possible that it was taken over from Indians, because in Paraguay the Indian population is, of course, numerically the largest.

Among most South American tribes for whom there is evidence of an artificial destruction of the hymen, however, chiefly those of the Tukano /Tucano/ and Pano linguistic families, but also some of the Aruaken /Arawak/ and Tupi, it is done for ritualistic purposes at the onset of puberty (322).

322. Fuchs, 1956, pp. 79-81.

Among the Totonaken /Totonac/ in Mexico it is one of the duties of two priests to destroy with their fingers the hymen of female babies 28-29 days after birth. At the same time they ordered the mothers to repeat the defloration six years later with their fingers (323). Strebel regards this procedure as a castigation rite,

323. Krickeberg, 1918-1922, p. 47.

corresponding to the circumcision of male infants, which was also carried out by the priests. "Even the child was to pay its tribute to the gods, /64/ and the fact that the sexual parts were chosen for

1171 /64 cont./
304 this is likewise understandable, considering their significance,
854 though the least possible loss of blood may also have been a consideration" (324).

324. Strebel, 1885, p. 13.

854 On the other hand, with regard to the Surára and Pakidái
304 it should be noted that there is no circumcision of boys among them
[833] and the defloration of small girls unequivocally serves for later sexual intercourse; there are no religious motives or hygienic reasons connected with it. Whether this was different in former times neither the chiefs nor older men and women were able to say (325a).

1171 325a. It is an interesting fact that among the
304 Itälmen on Kamchatka little girls are de-
854 flowered at a very tender age by their mothers in the same manner as among the Surára and Pakidái and for the same reason (Stellers, 1774, p. 346).

This type of body deformation has been documented for China and Indonesia too. It is done there, however, for hygienic purposes, in order to remove the mucus which gathers in the genitalia (Ploss, 1912, pp. 218/19).

593 It should be mentioned further that all Surára and Pakidái
839 fathers often touch the vulva of their small daughters with the mouth and gently suck on it.

854 If a man has two or more wives, they help each other in
[595] caring for a baby. The grandmother, a sister, or the eldest
[593] daughter are also loving helpers. Infant care, of course, does
854 not require much trouble, for regular baths are unknown. It is
515 only when the crust of dirt is a little too thick that the mother washes it off a bit when she goes to fetch water from the river. The infrequent washing has the advantage that the skin is more
000 nearly invulnerable to mosquito bites. If the child's nose is not

Surára
Pakidái

854 514 [123] /64 cont./ If the child's nose is not clean, the mother carefully takes it between her teeth, presses its contents into her mouth, and spits them out. The women found it most unhygienic that I blew my nose into a handkerchief and carried it with me.

856 593 The little Surára and Pakidái learn to walk and talk at the same age as the children of civilization, and they are aided by their parents, siblings, and relatives. The pleasure of the relatives is great and they are overjoyed when the child is able to stand and walk and babble its first words, nãpe=mother and hãpe=father.

862 e) Name-giving

[851] After the completion of the third year, a new, important period of life begins. The nursing period is ended, and the child, which hitherto belonged to the flesh and blood of the mother (325b), has become an independent human being.

851 846 114 171 842 325b. This idea is very unusual for South American Indians. It should be remembered, however, that among most of the tribes the so-called couvade, the men's childbed, is practiced. Karl von den Steinen, who has examined the psychological basis of this custom, says that in this case the child, whether it be a boy or girl, is "the little father," so to speak, a part of the father, that is, a bit of his body. (K. von den Steinen, 1894, pp. 334 ff.) "The activity of the mother in this connection is compared to that of the soil, which receives the seed." (von Spix and von Martius, 1831, p. 1339.)

000 553 776 [782] has become an independent human being. Now it is also given a name, which is taken from the animal or vegetable kingdom. The name is given to the father, when he offers his prayers in snuff-powder intoxication, by the gigantic animal and plant spirits living on

Surára Pakidái

/64 cont./

553 276 [782] high mountain ridges -- hekurá --, who represent the intermediaries to Poré and Perimbó, the joint Supreme Being of these Indians (see pp.197/199). The particular animal or plant whose name a child bears is regarded as a sort of "spiritus familiaris" [777] throughout its life. This is linked to the idea that the fate of the child has now become identical in essence with them; that is to say, good fortune, but also the suffering and dying of animals and plants are transferred to the like-named human beings.

553 114 191 The use of animal names corresponds to the nagualistic ideas and customs which Eduard Seler mentions in his monograph /65/ on Michuacan /Michoacán/ (326), while plant names are

326. Seler, 1908, pp. 104/05.

also included under the same aspect by the Surára and Pakidái. The name "nagual," according to Seler, is derived from the Aztec word naualli = disguise (327). In place of nagualism, however, the

327. Seler, 1904, pp. 75/76.

technical term "tonalism" may also be used (Aztec tonalli = someone's destiny, fate, soul, spirit...) (328).

328. Haekel, 1958, p. 45.

553 302 [412] [824] On the day of the name-giving the children are given a tonsure such as is worn by all adults of both sexes. It is shaved off with the sharpened side of a split piece of reed (taquara -- Guadua sp.). Simultaneously they are attired for the first time in 553 291 the hip cord of cotton or plant fibers, which they may then never remove up to the end of their lives, not even while bathing or during sleep. The cord must, of course, be renewed occasionally, but this is done in all secrecy. At the time of the donning of the hip cord by little boys, the penis is tied up, with the preputium held fast under [834] the cord by means of a loop (Ill. 22). From now on the penis must no longer hang down, for this would be an offense against good [992] form. On festive occasions a belt of cotton is also tied around children (See pp. 64ff.).

/65 cont./

000 children (see pp. 64 ff.). A thin cord of cotton or plant fibers,
301 which is occasionally worn below the knees, is supposed to
856 strengthen the legs, and corresponding upper-arm cords, the muscles (in the case of boys) and the arms (in the case of girls). Moreover, small girls wear strings crossed over their chests so that they will have well-shaped breasts later on.

f) Childhood

593 Even in boyhood and girlhood the family bears the chief
859 responsibility for all educational measures. The boy, to be sure, is now drawn to the father somewhat more and gradually begins to free himself from his mother. With his bow, which his father has made for him, he daily practices shooting small birds, for it is believed that a boy who kills many birds will later become a good hunter. They are cleaned and prepared by the girls, however, and together the children then have a meal, to which the girls often contribute cooked bananas or manioc flat-cakes. In play the children are properly prepared for their future duties and responsibilities as adults. Thus, the girls occasionally also help their mothers and fetch their water or wood, or they assume the care of their younger siblings.

861 The modest, thoughtful nature of these Indian children
[159] should be emphasized. Yet they are never beaten and they never hear a harsh word either from their parents or from other adults. Gentle admonishment suffices to reprove a child if it is really
857 naughty on occasion. Even in their play, however, there are
152 seldom such quarrels as are so frequent among civilized children. It would be quite unthinkable, for example, for a Surára or Pakidái child to run to its mother in order to complain about a playmate.

524 Boys and girls grow up together quite naturally and without constraint, as is shown by the fact that group games are preferred to solitary games. A great favorite, among others, is a game of ball which they play with a monkey bladder. It is batted upward with the palm of the hand (see also p. 246). They also play a sort of tug-of-war with lianas (see p.244). Moreover, the boys
[868] often imitate the dances of the men, while the girls are very fond of string games. It is especially popular to play "mother and

524 /65 cont./
child" or "married couple." In the latter game sexual activity
524 is already often involved. As long as the children have not yet
864 reached puberty, the adults laugh about it. It is only the mothers of girls who are a little annoyed when they hear about it. They do not regard it as tragic, however, since they themselves were reprimanded about it by their mothers when they were little girls.

/66/

582 g) Marriage

At the age of 7-8 a girl as a rule has already been given in
585 marriage. The husband is usually 8-10 years older. They do not as yet lead a regular married life, however. During the day the little girl plays with other children, and only at night does she sleep
[833] in her hammock beside her husband. Sexual intercourse, however,
[593] is strictly forbidden until after the second menstruation. She also fetches firewood and water and receives prepared food for herself
[484] and her husband from her family. When the tribe is on the march, she carries the hammock of her spouse and the few household articles. Economic reasons are connected with this marriage in childhood, for the young husband must hunt for his little wife and
606 her parents. Especially noteworthy is the reserve toward in-laws which operate in such a way that son-in-law and mother-in-law never
582 speak to each other and may not visit each other. Since the fear of incest is very great in both tribes, a marriage, which is always agreed upon by the parents, may be entered into only by partners who are not related by kinship. For this reason young wives are preferably obtained from a friendly tribe; in this case, however, the young man must live there until his wife has put her second
583 menstruation behind her. Occasionally young girls and women are abducted from hostile tribes. They are first held as captives and prostitutes for some time, however, before a man may finally marry them. I met such a little female captive among the Surára. She came from the hostile tribe of the Karauaterí and was approximately 15 or 16 years old.

595 /66 cont./

The Surára chief has two wives, a third one died, and the Pakidái chief, who is still comparatively young, has one. Vari-
587 ous other men also have two or more wives. If the husband dies, these women, without being able to decide for themselves, are taken on, along with their children, by one of his brothers, the younger one as a rule, even if he is already married.

835 Bachelors have the right to sexual intercourse with the wives of their older brothers, and thus the children of these women do not call them uncle, but likewise father.

881 b) Puberty rites for girls

At nine to ten years old, the Surára and Pakidái children have already reached maturity, which is probably related to the fact that these Indians live in the hot, humid rain forests of the equatorial zone. There are no initiation rites for boys. A girl,
[302] on the other hand, at the onset of her first period, is kept isolated in a circular pen 3-4 meters in diameter, which is erected a short distance from the maloka; her entire body is painted with urucú, a red plant pigment. Here the little one must sit motionless and receives only once a day from her mother a calabash of banana soup and a second one of water. In the evening she is brought into the communal house, so that she can lie down to sleep there, but neither parents and siblings nor other members of the tribe may
881 speak to her. The next morning she is put back in the pen. Dur-
304 ing the second day her mother or another woman applies a pin-point tattoo above her upper lip, which extends downward on either
[413] side of the mouth to the chin. The tattooing instrument is a
[824] pointed thorn of the pupunha palm. This is dipped into the dirty-
[386] gray juice of the genipap fruit, which, after the skin is punctured, leaves a dark blue dot. This procedure is extremely painful for the
[147] little girls. Yet they bear it with passive faces, suppress their tears, and do not utter a sound. With this tattooing, all the evil, mysterious forces which are in the menstrual blood, and which might bring danger to the husband, are banished for the rest of a woman's life.
881 With the second onset of the period, too, a girl is again isolated, and after that a small celebration takes place.

/66 cont./

and after that a small celebration takes place. Later the women do not make any arrangements for concealing the monthly bleeding from the eyes of the other /67/ members of the tribe, including the children. They do avoid walking about a great deal during these days, and, if the blood flows too copiously, they sit on the bank of the nearby river or brook.

i) Initiation rites for young men

All young men who have reached the age of approximately 20 years must submit to an initiation rite. It always takes place at the beginning of the dry season, between October and December, halfway between their winter quarters and the large, open maloka where the two tribes spend the summer together and celebrate the great festival in memory of the dead. In an intermediate camp of this type (for a description of the intermediate camp of the Surára, see p. 23) two young men are always trained for two months by the chief and an experienced helper (Hewemãõ and his brother Kurikayawõ among the Surára; Karenauõ and the war chief Porêhiwõ among the Pakidái) in all matters of religion, magic, mythology, curing the sick, and tribal tradition. Only after that are they regarded as full members of their community and from then on may independently undertake cures and prayers. It should be mentioned that for each sickness there are definite melodies, texts, and dance steps. The same is true of the prayers with which the individual men address the gigantic animal and plant spirits (hekurâ, see p. 200) before and after a journey, after slaying a large game animal, before planting a roça (forest clearing), after a successful harvest, etc. All these magic practices, however, may take place only in the snuff-powder intoxication (see p. 201).

During the training the candidates may not speak to any member of the tribe; during this time they are regarded as dead and after two months achieve an initiatory rebirth. Purely externally, one recognizes the two candidates by their body painting, which consists of six vertical serpentine lines drawn with urucú on abdomen and chest. These lines are a symbolic representation of the surucucu (Lachesis muta L.), the most dangerous

Surára
Pakidái

/67 cont./

poisonous snake of South America, which is over three meters long. The painting is supposed to help to banish the dangers that emanate from this and other poisonous snakes. As daily nourishment the two candidates may take only a ripe banana and half a liter of water. After two months they are very thin and appear to be nothing but skin and bones. In order to suppress their feeling of hunger and thirst, they constantly have the roll of tobacco mixed with water and ashes between their lower or upper lip and teeth (see p.190). Moreover, they must blow large pinches of the snuff-powder into each other's noses several times a day in order to make contact with the gigantic animal and plant spirits -- hekurá. Thus, they pass their training period in a regular trance-state.

It is worth noting that the initiation rites of the male members of the tribe take place comparatively late, and that in this way all the men are gradually trained as medicine-man helpers. Through this, the Surára chief Hewemão explained to me, they are able to protect themselves and their families against sickness and accidents in an emergency. If, for example, a man is threatened along the way by a poisonous snake or a jaguar, he is now in a position to banish the danger by calling upon the tutelary spirits. He must never fail to thank the hekurá after a successful hunting expedition or a good harvest, however, for otherwise he would incur their anger. Even when his wife, one of his children, or a relative falls ill, he himself must first try, by means of song and dance in which he addresses the hekurá, to hurl the sickness back to the hostile tribe from which it was sent. Only if his efforts remain unsuccessful may he appeal for the aid of the chief, who is always willing and, with the help of 8-9 assistants, carries out a great rekurá (cure). Thus, during the day /68/ or at night among the Surára and Pakidái one frequently sees one man, or often even several men, praying or attempting to cure a member of the family. Before that, however, they must take snuff-powder because contact with the hekurá can be made only in a state of intoxication. The songs are somewhat monotonous and are combined with animal sounds, animal movements, such as the beating of wings, hopping, etc.

Surára
Pakidái

/68 cont./

hopping, etc. The other members of the tribe pay no attention to such prayers and magic performances. Only the chiefs and their student helpers sometimes listen more carefully. Then it sometimes happened that Hewemãõ would shake his head and tell me that this or that man was praying all wrong, he had undoubtedly not paid sufficient attention during the lessons. If he notes such deficiencies often, it may happen that he will request the man in question to take part in another two-month training course in order to increase his knowledge.

There is evidence that this type of training, in similar form, occurs among the Jívaro, where prospective shamans receive instruction for one month, in the course of which the neophyte must also fast and drink various drugs, including tobacco juice and cayapi. The training costs, however, are very high (329).

329. Stirling, 1938, pp. 117/18.

For the young Surára and Pakidái men the instruction is free, to be sure, but mandatory.

j) Sex life

The behavior of the sexes toward each other in public is extraordinarily decent. Kisses, embraces, or other manifestations of affection are unknown to them. Physical demonstrations of love are carried out in the forest, away from the maloka, or in the dark of night when it is assumed that the other members of the tribe are sleeping. Hunting expeditions also offer a favorable opportunity, for the wife occasionally accompanies her husband. Since some men have two wives, they go hunting in turn with the first and with the second.

If a woman is pregnant, she is supposed to come together frequently with other men, for it is believed that only through this can her child become stronger. It must occur in all secrecy, however, for if her husband surprises her during coitus with a lover, he challenges the latter to a stick duel, and she herself will be abused by him (330).

330. Becher, 1959, p. 162.

Surára
Pakidái

/68 cont./

835 Younger, unmarried brothers have the right to unite physically with the wives of their older brothers. Nevertheless the jealousy of the latter often prevents the realization, which, however, is made up for on a suitable occasion, for the women are altogether in favor of this custom (331).

331. This polyandrous feature is also found in the myth about the origin of human beings (see p. 247).

727 Among the Surára I found a pretty, delicate girl about
83 15 or 16 years old, Nikeromá, from the hostile tribe of the
159 Karausterf (Ills. 17 and 18), who was held as a captive and was the common property of all the men, the unmarried as well as the married. When her maloka was raided, she fell into the hands of the Surára. She lived with the old widow Xututumf and her daughter Haikiamá, likewise widowed. During the day she occasionally took care of little children, deloused the wives of the chiefs, grated manioc or squeezed out the grated mass; she also strung beads or made a belt. When it grew dark, she always fetched wood for the night, just like the other female members of the tribe. She was the only woman who took a bath several times a day and played childish games with other small girls. Now and then she also went into the forest with other women to gather fruits. I never saw her inactive. When she works, however, she does so of her own free will. Yet at the same time she must always be ready for all the men, at any hour of the day or night. A man scarcely ever comes alone, but rather four, five, or more usually join him. They do not ask whether she has any desire for it, is sleeping, working, or is perhaps ill. One of them seizes her by the arm or the hair and sets out with her into /69/ the forest, and the others follow. Especially if the men have communal tasks to do in the forest, that is, felling trees for house construction, gathering palm leaves and lianas, Nikeromá is regularly taken along, whether or not she is willing. If she resists or raises objections, one of the men, with a big stick, will

Surára
Pakidái

/69 cont./

727 83 159 give her a blow on her tonsure, which is already full of scars, or he will scratch her body bloody with the sharp little cutia-tooth knife (see p. 117).

It is worth noting that the married men do not go furtively into the forest with Nikeromá, but quite openly. When I was wandering about with the tribe, I was often able to observe during the midday rest that a married man would suddenly go up to the little captive, take her by the arm, and go off with her a short distance, while five or six other men followed. The others present, men, women, and children, would laugh about it. The [593] wives, to be sure, were somewhat angry and would now and then throw a piece of wood after their husbands, but then they would make the best of it and likewise join in the laughter, though it was somewhat bittersweet. When the men returned with Nikeromá, after about an hour, we resumed our march. The women put up with this behavior of their spouses and, for their part, enjoy themselves with other men at a suitable opportunity. They never vent their wrath on the little captive, however. There is nothing defamatory about her actions, into which she is, of course, forced, for various wives were obliged to submit in the same way before their marriage. Little Nikeromá, however, found it hard to bear her fate; she was always grave and sad, in fact, almost melancholy, and suffered very much from homesickness. Yet one day, when other women and girls are captured from a hostile tribe, a Surára man will marry her.

It should be mentioned further that the Surára chief rigorously sees to it that Nikeromá is always supplied with plenty of meat and other food. He himself and his brothers treat the little captive very well, and I never saw them go into the forest with her.

The Pakidái had two captive Makuxí women.

727 83 171 In this connection I should like to refer to a very similar observation by Ehrenreich with regard to the Šambioa /Shambioa/ (Karajá /Caraja/), which the investigator describes as follows: "Moreover, unmarried men who wish to turn to the female sex may only have intercourse with the captive Kayapo /Cayapo/ women held in semislavery, a few of whom, at least among the Šambioa,

/69 cont./

727 are lodged in every village. They are regarded as common prop-
83 erty. Unfortunately, one also sees children used for similar pur-
171 poses. This clearly shows the dualism in the etiquette of the savages, whose moral laws apply only to members of their own tribe. This attitude, which is common to all primitive peoples, cannot, for this reason, alter our judgment concerning the morality of the Karaja in general" (332).

332. Ehrenreich, 1891, p. 28.

844 k) Death and burial customs
585
764 As the previous comments have shown, there are neither birth nor marriage ceremonies among the Surára and Pakidái. The social and religious life is therefore dominated all the more by death practices.

764 If a human being who has completed the third year of life dies, the relatives are inconsolable. There is lamenting in the loudest tones, and the flood of tears among men, women, and children seems endless. Meanwhile, however, the customary occupations are not neglected. While the woman is fetching water from the river, for example, she weeps incessantly to herself and intermittently shrieks loudly; the same is true for the men at their work in the plantings and even for the children at their play. The other members of the tribe cast only an occasional compassionate glance at the mourners, and with this their interest is exhausted.

Immediately after a death it is the duty of the male relatives and /70/ friends to fell small trees in the forest, out of which they make a cylindrical wooden frame -- praotimá. This consists of 15 to 20 poles 1.60-1.80 meters long, which are tied with lianas a handbreadth apart. The corpse is slid into this, and liana ropes are drawn over the two open ends so that it is protected from the attack of birds, especially vultures.

/70 cont./

764 Among the Pakidái I was able to be present on the sad occasion of a burial ceremony for the young, vigorous, and happy Hokotómarimá, an unmarried youth whose age was 19 years at [752] most. He had fallen from the top of a pupunha palm (Guilielma speciosa Mart.) (the liana lashing of his climbing apparatus, see p. 121, had evidently not been firm enough) and must have suffered internal injuries. All the efforts to save him, which were carried out uninterruptedly by the chief and his helpers for two days and nights, were unsuccessful.

[302] After the dead Hokotómarimá had been pushed into the wooden frame, five warriors whose bodies were painted all over with urucú carried him out of the maloka, amid loud lamentations. Two men carried the frame, one in front and one in back; now and then they were relieved by their companions. The women of his kin group, in part with children on their hips or by the hand, accompanied him, amid heart-rending, shrill tones of lament and endlessly flowing tears, on this last journey to the edge of the forest. Then the five men went on alone with the deceased. (The chief did not take part; he would do so only if the deceased were a relative.) After a walk of about 20 minutes, they suddenly stopped, set down the frame, and selected a suitable tree, in order to hang it in the crown. When they had found it, in this case a tall imbauba tree (Cecropia palmata Wild.) -- tokorí --, two men climbed up, each with two long lianas (cipó-titica) hanging around their necks. They chose a particularly thick limb, then lowered the lianas, where their companions tied them to the wooden frame, and pulled it up with the dead man lying in it. When the frame was hanging firmly and securely on the branch, they climbed down again.

Immediately thereafter the five men started back to the maloka. On the way, however, the brother of the deceased cut [551] into a tree, the name of which the deceased bore -- hokotómarimá -- matamatazeiro (Eschweilera matamata Hub.), with his terçado (large bush-knife) and in the lower part of the trunk, deep notches which had the following appearance ~~~~~~~~~~~~ and extended around the entire trunk. This was supposed to make the tree die.

/70 cont./

764 [551] If the deceased had borne, say, the name of an animal, it would have been the duty of the brother or a relative to kill such an animal. For, with the dead person, an animal or plant of the same name must also be killed or be made to die (see pp. 138/139).

While the deceased hung in the crown of the imbauba tree, the laments of his relatives in the maloka continued, and even the children did not lag behind their parents in this respect. At night one or two men were always awake, sometimes also a woman, who, at the same time, sang, wept, and intermittently uttered shrill sounds. The sleep of the other members of the tribe, however, was not disturbed by it.

765 Seventeen days after the death of Hokotőmarimá the second part of the burial ceremony began. The male relatives cut down more trees, and, under the imbauba tree in whose crown the dead man hung, they raised a funeral pyre; moreover, they cleared the forest at this spot, so that there was a rather large open area. On the afternoon of the eighteenth day all the Pakidái men then painted themselves with urucú and, under the leadership of Chief Karenauõ, singing loudly and weeping at the same time, they went to the place of the dead. All the women and children remaining behind also wept fervently, even the ones who were not related to the deceased. The /71/ men carried bows and arrows in their hands; some of them also carried snuff-powder and the tube for blowing it in. The brother, moreover, had the weapons and tools of the deceased, as well as bowls made out of the jamaru fruit -- horotő.

When the procession reached the imbauba tree, two kinsmen climbed up once more and carefully lowered the wooden frame, which was received by the other warriors and placed on the pyre in such a way that the head of the deceased was turned toward the rising moon. The dead man, however, was only a skeleton. The flesh had decayed and fallen through the slats to the ground where the vultures, ants, and other animals had devoured it. The brother put his weapons and tools on the wooden frame, so that they would be available to Hokotőmarimá in the realm of the dead. Several pieces of meat, bananas, some manioc flour, and the full calabash of a palm drink were to serve as food along the way.

/71 cont./

765 Shortly before sundown a bright, blazing fire was kindled with the help of the fire-drill, and the funeral pyre was set afire 765 with it. Then the men blew the snuff into each other's noses, 787 and after a few minutes they were in a state of intoxication, dur- 276 ing which they danced, singing and screaming, around the flames that leaped up over the dead man. This was the appeal to the hekurá who are supposed to help the soul of the dead on its journey [782] to the moon (see pp.199/201). The chief uttered his prayers of supplication in a loud voice, and all the other men joined in the chorus. Meanwhile the men kept blowing snuff into each other's noses, so that their ecstasy constantly increased and finally reached an unimaginable climax when the fire took possession of the skeleton. It no longer seemed to be human beings who, howling, stamping, and gesticulating, now stormed around the pyre. They seemed to have taken leave of their senses, and, as a result of the snuff-intoxication, they probably actually were in another world. To me, the sight was like a nightmare and made me think [794] of paintings by Hieronymus Bosch. The wandering of the soul of [795] the dead existing in the bones, accompanied by the tree-soul, had begun, and the hekurá paved the way for them. Meanwhile, night had fallen, and the moon, which I suddenly noticed in the sky in its full size between the crowns of the trees, seemed to be waiting for its new inhabitant. In spite of the heat, which was increased [123] by the fire of the funeral pyre, cold shudders ran down my spine, and an indescribable feeling of terror clutched at my heart. Though I had not taken any snuff-powder at this ceremony, I, too, was in a veritable drunken fever. Never before, neither in church nor in a theater, had I experienced a scene as grandiose as the one here in the nocturnal forest of Amazonia.

This death ceremony continued until dawn. After midnight, however, only a few men, whose duty it was at the same time to keep the funeral pyre burning, were still dancing and singing. The other warriors lay exhausted on the ground and slept. Occasionally one of the dancers was nudged. He got up immediately, had snuff blown into his nose, and danced around the pyre, singing, while another lay down to sleep. Finally, only two men were still

/71 cont./

765 dancing and singing. About an hour before sunrise, however, all
787 the sleepers were awakened; they again took snuff immediately,
276 and once more there began a wild dance with singing until day-
[821] break. The death ceremony must be kept secret from the sun (it
[715] is likewise regarded as a male creature), the worst enemy of the moon, because otherwise it would hinder the soul's wandering. Loudly sustained, shrill, joyous cries formed the conclusion and made it manifest that the soul of the deceased had found entry
765 into the moon. Then all the warriors, sobbing loudly, formed a circle around the burned-down funeral pyre, while the /72/ brother and other relatives gathered up the charred remains of the bones from the ashes. After these had been pounded in gourd vessels by means of small stone mortars, the bone ashes were emptied into two bowls made out of the jamaru fruit, which the brother of the deceased wrapped with palm leaves and a liana binding. Thereupon he handed them to the chief, who lifted up each one in the direction of the moon and, singing, blessed it, while the men standing about uttered shrill cries. With this the end of the ceremony was reached, and the exhausted warriors could again return to their maloka in order to recover in their hammocks from
[766] the strenuous night. The brother of the deceased tied the two jamaru bowls containing the bone ashes to the rafters of the roof behind his hearth, in order to keep them for the big annual festival in memory of the dead, at which the bone ashes of their dead, mixed with banana soup, are drunk by the men (see pp.231 ff.). From now on there was no more wailing and weeping in the maloka; daily life had resumed its normal course.

776 After the death of women and of children too, as soon as they have completed the third year of life, the death ceremonies are
[822] conducted in exactly the same way. For a deceased chief, on the other hand, there is dancing around the funeral pyre for three nights, for, of course, his entrance into the moon must be particularly solemn.

Surára
Pakidái

/72 cont./

766 The ceremony for an old person is entirely different. After death has set in, his head is chopped off and is hung, likewise in a little wooden rack, in the crown of a tree, again 15 or 20 minutes away from the maloka. The body, however, is buried in the ground in the jungle without ceremony, and, to be sure, in a squatting position, bound tightly with lianas. This is supposed to prevent its possible return, for it would have dire consequences for the tribe. The head, however, is burned on a small pyre, under [975] the same circumstances as described above, so that the soul may reach the moon in the ascending smoke; the remaining bone ashes are also kept.

769 888 266 The reason for the different obsequies for younger and older persons is the following: At the big annual ceremony in memory of the dead, which is held jointly with the Surára (see pp. 222 ff.), all the men drink the bone ashes of their deceased relatives, mixed with banana soup, because they believe that in this way the vigor and spirit of the dead remain within the tribes. In the case of old people, however, it is assumed that their bodies are already too leached out for their ashes to be able to transmit strength any more. Only the bone ashes of the head are still regarded as valuable.

888 If members of the tribe are very old or so seriously ill that, in spite of all efforts to cure them, they are no longer able to take part in the joint migrations, they are killed. For this purpose there takes place beforehand a gathering of the chief and older, more experienced men, at which they choose a participant who has to perform the killing. He uses a stick for this and, while the person in question is asleep, beats him hard on the head several times, until he has breathed his last (333). These tribal

[971]

333. Old and sick people are killed in similar manner among the Ipurina. "Moribund persons," writes Ehrenreich, "are said to be dispatched to the other world not infrequently by sorcerers by means of club-blows" (Ehrenreich, 1891,

Surára
Pakidái

/72 cont./

888
[191]

333. (cont.)
p. 70). Among the Piaroa Indians very weak old people are walled up alive in a cave. They are given food and drink for several more days and, when this has been used up, die of enervation (Marquis de Wavrin, 1944, pp. 197/98).

members destined for death are thus dispatched into the other world in an altogether humane manner, and even the killing itself is dictated by humane impulses. Since these old and sick persons can, of course, no longer take part in the customary seminomadic way of life, they would be obliged to remain helplessly behind when the tribe sets out on a new migration. This is to be prevented, however, /73/ and at the same time it is desired that the way to the moon, the paradise of the dead, be opened for them. After their death, they are cremated in the same way as all other deceased persons, that is to say, in the case of old people only the head is burned, and their ashes, too, are preserved and drunk at the festival in memory of the dead.

888
766

775 Greater than the fear of death among all Surára and Pakidái is the thought that they might one day die without being cremated, for example, during military actions, for then the entrance into the moon is barred for their soul (see p. 198).

766
[684]
[784] Persons who commit incest are excluded from cremation after their demise, and they are not mourned, for incest is regarded as the greatest crime. Poré (see p. 197) does not want their souls on the moon, and partaking of their bone ashes would exert unfavorable influences on the male members of the tribe. They are therefore tied up in a squatting position and buried in a hole in the ground.

766
858
774 If children die before the completion of the third year of life, they are thrown into the river without any ceremony, since they belong to the flesh and blood of the mother and do not yet have their own soul (see p. 138).

Surára
Pakidái

/73 cont./

764
171

For the types of burial of the Surára and Pakidái, which are undoubtedly very old and original, there are no parallels thus far in South America (334). This is true of the combined tree- and

[184]

334. Among the Waiká /Waica/, the corpse is cremated on the same day on the village square (Zerries, 1955b, p. 664).

fire-burial as well as of the earth burial of old people. A deceased member of the tribe, however, is only hung in a treetop for two or three weeks, so that his flesh will decay, before the bones are subsequently cremated.

765
171
175

The latter custom, albeit in the form of combined earth- and fire-burial, is, moreover, already mentioned in old sources. "Far inland," writes Barrère with regard to Guiana, "there are nations who assemble in order to dig out skeletons, when they think that the corpse is almost decayed, and after they have calcined these, they drink the ashes, which they soak in roucou, and they believe that they have thereby given their dead a more decent burial than if they left them to worms and putrefaction" (335).

335. Barrère, 1751, p. 172.

764
765
171
175

Similar reports are given by Froger about French Guiana (336)

336. "They have great respect for the old people, and when one of them dies, they inter him in the Carbet (Maloka) without any other ceremony than becoming very intoxicated: but when they believe that he is almost decayed, they assemble the Indians of the neighboring Carbets, dig out the bones, burn them, and take the ashes into their Oüicou in order to have a great feast" /translated from the French/ (Froger, 1715, p. 178).

hand, are of the opinion that the soul existing in the bones is able to travel up to the moon only if the flesh has decayed beforehand, and there is now nothing to prevent the soul's withdrawal.

The custom of hanging the corpse in the open until it decays is also documented as early as the seventeenth century, but not in connection with another form of burial. There are statements about this by Coreal concerning the Chevelus (Amaguaxe or Encabellados -- members of the Tukano /Tucano/ linguistic family) who lived on both sides of the Putumayo: "They do not bury their dead at all, but hang them in the open until the flesh decays: after that they keep the bones as Relics" /translated from the French/ (338).

338. Coreal, 1722, I, p. 292.

619

5. War -- nfanyu --

The Yanonámi /Yanoama/, as has been mentioned above (see p. 13), are split into two antagonistic camps, the Xiriána /Shiriana/ and the Waiká /Waica/, with their smaller satellite tribes. There is constant, open hostility between these two "power blocs," on the one hand, and toward outside enemies (Karaiben /Carib/ and Aruaken /Arawak/) on the other. They accuse each other of a propensity for thievery and /74/ attribute every sickness and every death to sorcery on the part of members of hostile tribes. Hence blood revenge -- noyú -- plays a very great role. The chief cause of all wars, however, is connected with the fact that they feel it necessary to abduct women and girls of hostile tribes and groups, in order to bring new blood into their own tribal unit. Since many tribes are comparatively small, increasing relationship by marriage already requires exogamy to a certain

619 /74 cont./
648 extent (339), and friendly tribal units are therefore in a connubium.
721

339. Zerries reports the same thing about the Waikâ (Zerries, 1956a, p. 186).

In time, however, strong ties of kinship again develop here, so that finally, and also as a result of the preference for polygyny, there is a real shortage of women, which is felt very painfully by the
726 men as yet unmarried (340). For this reason, as I was told by in-
[835]

340. The fact that for younger, unmarried men sexual intercourse with the wives of their older brothers is permitted may be connected with this.

formants, they now and then make raids on hostile tribes, which
[619] take place at dawn without any declaration of war (341). Surára
[171]

341. The descriptions of the war expeditions of the Karaiben /Carib/ which Richard Schomburgk (Richard Schomburgh, 1848, II, p. 321) and Appun (Appun, 1871, p. 447) write sound very similar.

and Pakidái warriors, however, must also take part in raids proposed
[624] by the Xiriána. They are always led by the war chief (the chief,
[622] his brother, and sons do not take part in military actions (see p. 129), nor do women (342)), and they set out on the day before the
[171]

342. Richard Schomburgk and Koch-Grünberg report that among a few Karaiben tribes women take part in war expeditions as porters. (Richard Schomburgk, 1848, II, p. 322; Koch-Grünberg, 1923a, p. 103).

[302] proposed raid. All the participants paint horizontal serpentine lines on their bodies and faces with urucú. This is the typical war painting, for in peacetimes the serpentine lines are always applied vertically (343). In the vicinity of the hostile maloka they

343. With reference to the Karaiben, too,

Richard Schomburgk points out that their body painting in wartime differs from that of peacetimes. (Richard Schomburgk, 1848, II, page 322).

spend the night quietly, while a few scouts reconnoiter the [276] position. At dawn the warriors blow large quantities of snuff into each other's noses and then, completely unfettered, but in all [720] silence they storm the hostile maloka. Men and boys are killed ruthlessly with arrow shots, and the women and children are dragged off as captives. But the attackers, too, often have to suffer great losses, and it is said that they are sometimes put to flight.

726 During my stay among the Surára, I heard of an attack by 727 the Xiriána and allied warriors on a maloka of the Waiká on the Rio Mapulau, a left tributary of the upper Demini (see p. 16). On this occasion, as I was told, all the Waiká men were killed, and the women and girls were brought to the Xiriána maloka as captives. The head of the Waiká chief, as the war chief of the Surára added, was then adorned with feathers by the Xiriána and left standing in front of their community house for several days 727 as a trophy; after that it was thrown away (344). The night after

344. The Hório and Ebidoso in the northeastern Chaco, who occasionally behave in a similar way, are to be referred to as a parallel (Baldus, 1931, p. 73).

the attack there was a big dance festival, in which all the men [226] took part. Before that they took snuff and prayed to the hekurá [782] (see p.199), in order to thank them for the victory.

6. Tribute payments and greeting ceremonial

619
651
576
574

Two or three times a year a Xiriâna chief and 18-20 warriors of this tribe come to the Surára as well as to the Pakidái, in order to collect tribute from their satellites (see also pp. 13 and 19). This visit is always carried out /75/ according to a regular protocol. First the chiefs squat down opposite each other, place the right hand on the left shoulder of the other, and hold the left hand in front of the mouth. They remain in this position for about two hours and, singing, exchange their news (345). The warriors of

> 345. I, too, was greeted in this fashion by the Surára chief as well as by the Pakidái chief.

the Xiriâna and Surára or Pakidái stand around in a circle and listen, their faces immobile. All the women and children remain lying in their hammocks during the ceremonial, or they sit with anxious faces by their hearths. When the greeting is ended, the Surára or the Pakidái chief makes a sign, whereupon his men run off and fetch knives, axes, pots, etc., and also bananas and pupunha fruits, which they put down in front of the Xiriâna chief. The latter picks up the objects and distributes them to his warriors, one after the other. When each is richly laden, they leave the maloka with measured step and disappear into the forest. The Xiriâna chief is now the only one left behind. For him, however, particularly valuable objects must be brought. Above all, it is now the duty of the Surára or Pakidái chief to offer precious things of his own, perhaps a woven hammock which was given him by civilized people, a large pot, a bush knife, or a particularly beautiful chain of glass beads. Along with these, he usually sets down a basket of bananas and pupunha fruits. When the Xiriâna chief, finally satisfied, nods his head, the Surára or Pakidái at last feel relieved. There is now a concluding dialogue sung by the two chiefs, whereupon the Xiriâna chief rises and, heavily loaded for his part, strides toward the forest where his warriors are

/75 cont./
already waiting for him. After such a visit, the Surára and Pakidái are thoroughly stripped, but at least the constraint under which they were put during these hours has been removed, and one soon hears them laughing and joking again (346).

346. For traveling investigators who come into contact with tribes of this region it is also very important to make sure, in offering presents and trade articles, that valuable objects are held back at first, because the chief always takes his share last. A visitor who is not familiar with this mentality and stands empty-handed at the end would incur the enmity of the chief and thus of the entire tribe from the outset.

7. Making a Living

a) General

At present the Surára and Pakidái are in a state of transition from an exploitative to a productive economy. The traditional means of acquiring food, hunting and gathering, still played a dominant role among these Indians at the time of my visit, but I could see that most of the members of the tribe, especially the men, already manifested a great interest in agriculture, which had been introduced a generation or two before. The chiefs in particular proved to be shining models, for they set a good example in all the work in the roça (forest clearing) (347). According to their

347. The myth about the origin of the banana (see p. 249) clearly shows that the Surára and Pakidái were formerly only hunters and gatherers.

Surára
Pakidái
Shiriana

/75 cont./ According to their own statements, both tribes regard the Xiriâna as their culture-bearers in this case too. The latter, however, likewise merely adopted agriculture from their higher Karaiben neighbors (348).

348. Koch-Grünberg, 1923a, p. 307.

b) Hunting

The majority of Surára and Pakidái men are excellent hunters and practice their hunting with the large bows and arrows described above (see pp. 36 ff.), which they know how to handle masterfully. In addition, they know the habits of the animals precisely. They discover every trail of a wild animal, no matter how faint, sniff it, and announce the time when it was at this place. Often they then follow it for hours through the almost impenetrable forest; sometimes they are /76/ gone for several days. Moreover, they know how to attract the animals by imitative sounds.

There are two methods of hunting, the individual hunt -- larâ -- (349) and the collective hunt -- norâ -- (350). The latter,

359. In this case, the hunter often takes his wife along (if he has two or more wives, the oldest usually accompanies him), who must carry the slain animal, or pieces of meat from it, into the maloka.

350. Among the Waikâ, too, there are these two hunting methods, and the names sound very similar there, "lama" and "henioma" (Zerries, 1956b, p. 151).

however, now takes place only before the great festival in memory of the dead (see pp. 224 ff.), in order to provide sufficient supplies of meat for it. Trained dogs are trusty helpers in hunting (see pp. 185ff.).

Of larger game the wild pig (Pecari tajacu) -- poxe -- is most often killed, and after that the tapir (Tapirus americanus Briss.) -- xâma -- and a deer species (Cervidae sp.) -- hajâ. The

Surára
Pakidái

/76 cont./ The
224 meat of all the animals mentioned is greatly prized. Smaller
[262] rodents, however, are regarded as decided delicacies: paca (Cuniculus paca L.) -- amutá -- and cutia (Dasyprocta aguti L.) -- toma --, which usually are killed with dogs or driven into a hole in the ground, as well as the armadillo (Dasypodidae sp.) -- obó. The latter is killed in the following way: When the Indian has discovered an inhabitated armadillo burrow, he examines it to see whether the animal is occupying it. If this is the case, he quickly fetches dry leaves and blocks the entrance. Then he kindles a fire with his fire apparatus, which he always carries on the quiver (see p. 53), sets fire to the leaves, and, with a palm leaf, fans the smoke into the burrow. This forces the animal to come out after a few minutes, whereupon the hunter is able to kill
[262] with an arrow or beat it to death with a stick (351). With some-

[191]

351. Caspar describes the same method for the Tuparí Indians (Caspar, 1953, p. 96 and Pl. 3).

what less relish these Indians eat the meat of the capybara (Hydrochoerus hydrochaeris Erxl.) and the various monkey species, such as, for example, the howling monkey (Alouatta sp.) -- ihró --, cuxiú-negro (Chiroptes satanas Humb.) -- uixá --, cuatá (Ateles paniscus L.) -- paxó --, and macaco-da-noite (Aotus infulatus) -- makurutamão. A great deal of skill, however, is required for monkey hunting in particular, because these animals leap from limb to limb in the crowns of tall trees and swing from one treetop to another by means of lianas. -- Feline species (352) are shot

352. Spotted jaguar (Felis onca L.) -- ihrá --, black jaguar (Panthera onca L.) -- hukumarí --, puma (Felis concolor) -- uaquearima --, maracajá (Felis pardalis Neuw.) -- yaó.

/76 cont./

224 relatively infrequently, for the most part only when they stay in the vicinity of a maloka and thus constitute a danger for human
224 beings. Only the meat of the maracajá (Felis pardalis Neuw.) is
262 eaten. For some hunters, however, pride in killing such animals plays a role, for finishing off a jaguar, especially the black one, gives him greater esteem. -- Snakes, which are very numerous here because of the considerable dampness, are killed with a stick. If a surucucu (Lachesis muta L.) -- pereíma -- (Surára word) -- peléma -- (Pakidái word), the largest and most dangerous poisonous snake of South America, is killed, then the joy is especially great. The head is cut off, and every family gets a piece of the snake's body, which is cooked with other meat. It has an agreeable taste and reminded me of eel. The Surára and Pakidái also
[751] [825] believe, however, that every person who has eaten the meat of a surucucu will never be bitten by any other poisonous snake. The sucuriju (Eunectes murinus) -- uaikonyá -- and the jibóia-vermelha (Epicrates cenchris) -- oatá -- are also eaten with relish. The jararaca (Lachesis sp.) -- karihirimá --, the papaova (Spilotes sp.) -- karimatá --, and the cobra-coral (Elaps corallinus Wied.) -- huamoxíke --, on the other hand, are never eaten. -- Now and then a cayman (Caiman sclerops Schneid.) -- ihuá -- or a lizard -- xaraimá -- are killed with a stick, and sometimes the hunter, but more often his dog, discovers in the forest a jabuti (Testudo tabulata Woelb.) -- totorí --, whose meat is also very tender and tasty; /77/ it does not come up to that of the water turtle, how-
[225] ever. Yet, of the numerous species which inhabit the Demini, Aracá, and their tributaries, the Surára and Pakidái catch only the peremã -- talmã --, and, to be sure, they seize it in shallow water with their hands.

223 Bird hunting requires special training. That is why even
[868] boys are encouraged to kill as many small birds as possible, so that later on they will be good hunters.

The following birds are most frequently hunted, on account of both their meat and their feathers: mutum (Crax sp.) -- parurí --, urumutum (Crax sp.) -- katará --, mutum cavalo (Mitu mitu L.) -- katauri --, jacamim (Psophia crepitans L.) -- nhapín --, cujubim

/77 cont./

223 (Pipile pipile cajubi Pelz.) -- maraxí --, jacu (Penelope sp.) -- kuremś --, japim (Cacicus cela L.) -- anhakoramś --, inambu (Crypturellus sp.) -- rororôme --, inambu-relógio (Crypturellus strigulosus Temm.) -- honamś --, toucan (Rhamphastus sp.) -- mahebé --, arara vermelha (Ara macao L.) arakaké -- arara amarela (Ara ararauna L.) -- maracana --, papagaio moleiro (Amazona sp.) -- xeraxeramakó --, papagaio curica (Amazona sp.) -- xeraxerś --, garça branca (Casmerodius albus egretta Gm) -- korihenś.

[825] [753] The gavião-real (Thrasaetus harpyia L.) -- nonexí -- is killed for magical reasons, because it is believed that there is concealed in it a hostile medicine man who brings sickness and [237] other disasters. Its down feathers are glued into the hair by the men as trophies (see p. 95); the meat is discarded. The gavião-caipira (Hypomorphnus urubitinga urubitinga Gm) -- nonexipéke -- is also killed only for its feathers, which serve the men as upper-arm ornaments.

[825] They never shoot at the urubus (Cathartes foetens, Cathartes aura, etc.) -- uatubś --, for they are glad that they remove the refuse.

224 In conclusion it should be mentioned that traps are unknown to the Surára and Pakidái (353).

353. There is a corresponding statement by Zerries about the Waikś (Zerries, 1956b, p. 151).

[622] If the hunter has killed a small animal, he may keep this booty for himself and his family, but he often gives the chief a roasted or boiled piece of it. A big-game animal, on the other hand, is divided up under the chief's supervision, and each family gets a piece of meat. This communal feeling is very strongly marked, and no member of the tribe would ever violate it.

Surára
Pakidái

/17 cont./

226 c) Fishing

Fishing plays a very subordinate part, and since olden times it has been carried on, with bow and arrow, only from the river-bank. Fishing by means of poison or landing nets, weirs, and [179] similar implements is unknown. Recently, however, these Indians have now and then used fishhooks of metal (354), which were

354. They fasten these to a line of cotton or Bromelia fibers.

given them by rubber and palm-fiber gatherers, as well as by 226 the Indian protection post on the Rio Demini. Nevertheless, this 262 has not substantially increased their interest in fishing, for fish simply are not among their favorite foods. Moreover, only smaller species may be eaten (355), because all the large ones have the

355. Aracu (Leporinus copelandi Steind.), piranha (Pygocentrus sp. and Serrasalmus sp.), surubim (Platystoma sp.), jandiá (Sciluridae sp.), mandi (Rhamdia sp.), curimatã (Prochilodus sp.), pescada (Gadus sp.), dourado (Salminus brevidens), tambaquí (Characinidae sp.), mandubí (Auchenipteridae sp.), anujá (Trachycoristes sp.), cuiú-cuiú (Oxidorus niger Vall.), etc.

evil breath of the river within them and thus cause sickness and other misfortune. Thus, they, of course, abhor the pirarucu (Osteoglossidae), over three meters long and the largest fresh-water fish, the dried meat of which represents practically the basic diet of the caboclo population (planters, rubber and palm-fiber gatherers), and the delicious meat of the large water-turtles is also rejected by them for this reason.

Surára
Pakidai
Waica

/78/

226 184 Among the Waikâ, too, fishing ranks last in the acquisition of food and is likewise practiced with bow and arrow there, as well as with the fishhook in more recent times. It is worth noting, however, that in addition they are familiar with a method of fishing by poisoning the water (356a) (356b) 357).

356a. Barker, 1953, pp. 464/65.

356b. Zerries, 1956b, p. 152.

357. Zerries, 1958c, p. 179.

222 [462] d) Gathering

Not only women, but also men take part in the gathering activity. The latter have the duty in particular to bring in the fruits of the many palm species (358), of which the following are

358. The general name for palms is -- petabaĉmo.

the most important: acaĉ (Euterpe oleracea Mart.) -- uaiĉma --, bacaba (Oenocarpus distichus Mart. or Oenocarpus bacaba Mart.) -- hokomakê --, bucu (Manicaria saccifera Gaertn.) -- yauetoŝk --, buriti (Mauritia vinifera Mart.) -- etewexĉ --, curua (Attalea spectabilis Mart.) -- yauatoŝ --, tucuma (Astrocaryum sp.) -- pahĉ -- (359), and pupunha (Guilielma speciosa Mart.) --

[481] 359. To climb the palms named they used the climbing ring (see pp. 119/120).

komunamĉ -- (360). The fruits of smaller palms that are easy to

[481] 360. Since the trunk of this palm is covered with sharp thorns -- miĉmicibâ --, it can be climbed only with the help of two specially constructed implements (see pp. 121/122).

/78 cont./

222 climb, such as the piaçaba (Attalea funifera Mart. and Leopoldinia piassaba Wal.) -- tanbarí -- and ubim (Geonoma sp.) -- komixí --, are gathered by men and women in the same manner.

[462] A division of labor between the sexes may be observed in the gathering of the fruits of the inga trees (Inga sp.) -- kepõ -- growing on the banks of rivers and brooks. In this case, however, they do not take the trouble to climb the tall, broad-limbed trees. They are felled by the men, and then the women and children strip off the long, dark-green, hard-shelled pods, the beans of which are embedded in a white, spongy pulp as sweet as sugar. This is sucked out and then spat out along with the seed. Men, women, and children relish it even while they are working, but the bulk of the pods are tied together with lianas and carried into the maloka by the women, where the pulp is again sucked out with great satisfaction. -- The fruits of the wild caju tree (Anacardium sp.) -- uitõ -- (361) are harvested in the same way, that is, by

361. The corresponding Waikâ name is "wido" (Zerries, 1956b, p. 150).

felling the trees. Of this, however, the Surára and Pakidái eat only the longish, dark-red, shiny receptacle, which is extraordinarily juicy and is especially prized as pleasantly refreshing. The kidney-shaped, greenish-black kernel, on the other hand, is not eaten. -- The fruits of the chestnut, castanha-do-pará (362)

362. We know them as Pará nuts.

(Bertholletia excelsa H.B.K.) -- hokoõ --, are very popular. During the rainy season, when the ouriços (ball-shaped husks with a hard shell, which weigh more than one kilogram and contain between 10-30 chestnuts) fall from the tall trees because of gusts of wind, the entire tribe often travels to the chestnut forests on the lower Aracá or the middle Demini, in order to reap a rich harvest here, in which again both sexes take part. The ouriços, wherever they are found, are cut open with a stone or, if available, with a terçado (large bush-knife), and the chestnuts are poured into the

Surára
Pakidái

/78 cont./

222 carrying baskets. -- Of the fruits of the wild cacao tree (Theobroma sp.) -- boroá --, which has many branches and whose foliage is dense and dark, only the sweet pith of the husks is sucked out, while the beans, which played such an important part among the high-culture peoples of Central America, are carelessly thrown away (363). -- The apple-like fruit of the lucuma tree

[184] [192] [114]

363. Zerries reports the same thing of the Waiká, and here the names are "loa" or "boholoa" (Zerries, 1956b, p. 150; Zerries, 1958c, p. 177).

(Lucuma macrocarpa Hub.) -- kumató -- is valued for its sweetish, gelatinous pulp that surrounds the pit; the /79/ outer meat of the fruit and the shell, on the other hand, has a very bitter, unpleasant taste. -- The fruit of the wild pineapple, which only reaches the size of a medium-sized apple, is also eaten with relish.

The pods of the pacova sororoca, a Musaceae species (Ravenala guianensis Benth.) -- mokohé -- (364), gathered espe-

364. The pacova-sororoca is often erroneously called "wild banana" because its large leaves, which resemble those of the banana trees.

cially frequently, contribute more to the everyday food. -- When there is an occasional food shortage during the rainy season, the flat brown fruits of the pot tree (Lecythia longifolia), which are called uapú by the Surára and kurupú by the Pakidái, are appreciated to this day (365).

365. The Waiká have the name "wabu" for them (Zerries, 1956b, p. 149; Zerries, 1958c, p. 177); Barker, 1953, p. 443).

Besides these most important vegetable products that are gathered, there are also a great many animal ones. To be named here above all is the honey of several species of small bees (366)

[136]

366. There are said to be more than 20 different varieties of them.

/79 cont./

222 which can be obtained easily and without danger, for the bees are stingless. Usually they have their nests in hollow trees or in the ground. Occasionally, however, one also sees nests built in tall trees; the latter are then cut down by the men, for the purpose of obtaining the honey. The honey is scooped out of the nest with the hand or with a calabash and put into a folded palm leaf which is then tied together and taken along to the maloka. -- Birds' eggs also constitute a popular addition to the diet, as does the nourishing yolk of the eggs of water turtles; the egg white, on the other hand, is discarded because it has an unpleasant, fish-oil taste. During the dry season, especially during the months December-February, the Surára and Pakidái gather these turtle eggs in great numbers on the sandbanks of the Demini and Aracá. -- [226] Also to be mentioned are crayfish and crabs, which are pulled out of the holes in the mud of the riverbanks. -- I also observed that they eat certain kinds of frogs and spiders, as well as insect larvae, caterpillars, termites, and the hind parts of the leaf-cutter ant (Atta sp.) -- aneanemá.

241 e) Agriculture

Although agriculture among the Surára and Pakidái was introduced only a comparatively short time ago, they have already developed a remarkable system with regard to the laying out of their fields. These are always laid out circularly around the maloka. The procedure is such that, first of all, at the beginning of a dry season, October-November, a rather large piece of forest is cleared, during which it is seen to that the circular shape is [313] produced. To chop down the underbrush and the lianas, the [412] men use the tercados (large bush-knives), and the trees are felled with steel axes (367). After about two months, when the felled

[439]

367. The Surára obtain these articles of civilization from the palm-fiber gatherers by barter, and the Pakidái get them from the Indian protection post Ajuricaba on the middle Demini.

Surára
Pakidái

/79 cont./

241 wood is well dried out, the clearing is set afire and the potash that remains constitutes fertilizer at the same time. Large trunks, stumps, and branches that did not burn up are simply left lying [361] and the crops are planted in between (Ill. 37). Only in the center of the clearing is a circle about 50-60 meters in diameter completely cleaned up, for here an open or closed circular maloka [622] is erected. This roça (forest clearing) -- hikarí --, which surrounds the community house, is then divided up by the chief among the individual families, so that they may plant here banana plants, pupunha palms, manioc, taioba, carâ, cotton, [462] tobacco, etc. (368). Clearing and planting, along with weeding,

[184]

368. Since an interest in agriculture has not been aroused in all families, however, it happens that some may relinquish their share, which is then worked by another family.

[134] falls to the men; the women help only with the harvest. Since the soil is very infertile, however, /80/ for it has only a thin humus layer which is constantly being leached out by the tropical rains, the cultivation of tubers is possible for at most three years (369).

[132]

369. The luxuriant growth of the forest may be explained only by the humidity and warmth of the climate, which, like hothouse air, accelerates the circulation of nutrients.

24 36 166 Then the work of clearing and burning off begins anew beyond the previous circular strip of field. This may be repeated several times, so that the maloka is finally surrounded by three, four, or more ring-shaped fields, until one day the tribe builds its maloka 245 at another place and lays out new fields. Banana trees and pupunha palms are left standing in the old clearings, but are always planted also in the new ones, since these fruit trees yield for 6-8 years or 50 years (pupunha palm); their fruits are regularly harvested, even on long-abandoned, distant fields.

Surára
Pakidái

/80 cont./

241 166 361 It is worth mentioning that at present in the course of one year the Surára as well as the Pakidái regularly carry on their field work in two places that are far apart. During the rainy season, April-September, the Surára, as is well known, live at the Cachoeira dos Índios on the upper Aracá and the Pakidái on a right tributary of the middle Demini, where they also own fields. On the other hand, they spend the summer season together in the large, open Surára maloka (between the Demini and Aracá rivers), around which was laid out a roça which was large enough to be divided among the Surára and Pakidái families. Thus, both tribes always have the benefit of abundant harvests at their permanent dwelling sites. In addition, there are the bananas and pupunha fruits of the abandoned fields, to which the entire tribe travels at the time of this harvest, or gathering expeditions are undertaken to bring in chestnuts, inga, and other kinds of wild fruits.

241 423 Since, however, on account of the seminomadic way of life of these Indians, one forest clearing or another is left untended for shorter or longer periods, there is the danger that in the meantime members of hostile tribes will break in and take possession of the produce there. Provision is made for this, however. Before the tribe leaves one of its clearings, a few men commissioned by the chief stick several wooden arrow points and thorns of the pupunha palm, coated with poison, into the ground and put leaves over them. Hostile Indians with plunder in view therefore risk the danger of running these into their legs (370).

[291] 370. All Indians of this region go barefoot.

[184] As I was told, this custom is resorted to by all Yanonámi tribes, and for this reason no Indian would ever think of setting foot on the deserted clearing of another tribe (371).

[114] 371. This hint may be of the greatest importance for research travelers who want to work in this region.

/80 cont./

245 [262] Among the vegetable foods of the Surára and Pakidái, bananas, of which I found nine different varieties, occupy first place today. Of these, in turn, the most frequently cultivated is the mealy banana (Musa paradisiaca normalis; the regional caboclo population calls it pacovinha) -- kuratá -- (372).

[174]

372. With regard to its origin, Sauer writes: "The plantains and bananas (Musa paradisiaca) originated in southeastern Asia and were there bred into a great variety of seedless cultivated forms. Their presence in the New World is considered by many as due to post-Columbian introduction" /cited in English/ (Sauer, 1950, p. 526).

192 245 Kuratá, however, is also the general designation for all bananas (373). In addition, the following special names were

[184]

373. Zerries gives the same name with regard to the Waiká (Zerries, 1956b, pp. 152, 155), and Koch-Grünberg gives the following names for the Karaiben Arekuná-Taulipang /Arecuna/: "kurá:tana," "kura:tana´," or "kuratanâ" (Koch-Grünberg, 1928, pp. 47, 268). The corresponding Xiriâna designation, namely, "kalatá:ke," is very similar (Koch-Grünberg, 1928, p. 306). This definitely proves that the banana, or at least one variety, reached the Waiká, Xiriâna, Surára, and Pakidái from Karaiben tribes. The myth concerning the origin of the banana, which the Surára chief told me (see p.249), also shows that this fruit came from the outside only in very recent times.

[174]

given me for the other eight varieties (374):

[184]

374. The Waiká, too, use very similar terms for certain varieties of bananas (Zerries, 1956b, p. 153):

/81/

Designation of the Surára and Pakidái:	Designation of the regional caboclo population:
pakatarimã	pacovão
kuratá pauximí	inajá
nakaximí	São Tomé roxa
rokojá	São Tomé branca
rokomã	banana maçã (?)
parauá	caité
roórenvökãkõ	banana bajé
xiahíma	Banana govêrno (375)

375. Unfortunately, I could not carry out a botanical classification of these varieties.

With the help of a digging stick made from the wood of the pupunha palm and 1.60-1.80 meters long, which has a flattened point at the lower end (Ill. 38), or a broken bow-staff, cuttings of banana trees are planted in the clearing, and after only a few months they are full-grown and bear fruit. The work of planting as well as the care of the plants falls to the men, while the women help only with the harvest (376).

376. Among the Waiká, the plants are cared for by men and women (Zerries, 1956b, p. 153).

Besides the banana, the pupunha palm (Guilielma speciosa Mart.) -- komunamá -- is cultivated to a considerable extent. Cuttings are used for planting, but occasionally seeds as well. These palms, which always stand between the bananas, give the clearings of the Surára and Pakidái a characteristic stamp (Ill. 37). The trunk, 18-20 meters tall, which is covered with pointed thorns -- mifmicibá -- and can therefore be climbed only

Surára
Pakidái

245
[481]

/81 cont./

with a specially constructed apparatus (see p. 120), bears very narrow, pinnate leaves that are curly at the tips and are always gently swaying in the wind. They stand around the community house like sentinels and seem to be perpetually nodding benevolently and reassuringly to the inhabitants of the large, open maloka (Ill. 6). Their fruits -- maraxá -- (377),

377. The name among the Waiká is very similar -- "lasha" (Zerries, 1956b, p. 149).

50-80 of which form a cluster, are noteworthy. They can be harvested only once a year, between September-April, but each palm has at least three, and sometimes four clusters, that is to say, approximately 200-300 fruits. At first they look yellow, but after ripening they take on a bright red color. In contrast to other palm fruits, they are characterized by especially abundant meat.

137
245
114

As to the question of whether or not the pupunha fruit has seeds, there are various opinions. Zerries did not find any seedless ones (378). On the other hand, I saw fruits with

378. Zerries, 1956b, p. 149.

seeds and without. This observation is confirmed by statements by Sauer, who writes: "In many cases it has lost the capacity to produce fertile seeds..." /cited in English/ (379).

379. Sauer, 1950 p. 525.

And even Alexander von Humboldt (380) and Vinci (381)

380. Alexander von Humboldt, 1860, III, p. 281.

245
137
114
[104]
[184]

/81 cont./
mention such seedless fruits (382).

382. Zerries, moreover, thinks it is possible that among the Waikâ the pupunha fruit was the predecessor of the mealy banana (Zerries, 1956b, p. 148).

244

The cultivation of tubers, which is always done separately from the banana plantings, has hitherto been practiced on only a very modest scale. It includes the cultivation of taioba or taro (Colocasia antiquorum and Xanthosoma violaceum Schott.) -- ohĩnâ -- (383), carâ or yams (Dioscorea

383. Among the Waikâ the corresponding name is "ohina" (Zerries, 1956b p. 153).

sp.) -- cabiromâ -- sweet manioc, known in Brazil as macaxeira aipim or mandioca doce (Manihot palmata Muell. Arg.) -- mihitarĩma -- bitter manioc (Manihot utilissima Pohl) -- kuamirimakõke --, and sweet potatoes (Ipomoea batatas Lam.) -- hikarĩ -- (384). Worth mentioning

249
243

384. The Waikâ call the sweet potato "higalĩ" (Zerries, 1956b, p. 153).

also are the sugar cane plantings (sugar cane (Saccharum officinale) -- bukâ -- (385)) and the absence of maize (386).

385. The Waikâ have the same word for sugar cane (Zerries, 1956b, p. 153).

[184]

386. Zerries, to be sure, found evidence of its cultivation by the Waikâ. But, he adds, maize "is little more than a rare delicacy" (Zerries, 1956b, p. 153).

249 /82/ Besides the cultivated plants used for food, some are raised to be used for enjoyment. These are primarily tobacco (Nicotiana tabacum) -- peenáke -- (387) and a pepper plant (Piperacea sp.) --

387. The Waiká word for this is "be" (Zerries, 1956b, p. 154).

maxarahá -- (388) which is required for making the narcotic

[184] 388. This plant is also cultivated by the Waiká and is designated by almost the same name "masho hara" (Zerries, 1956b, p. 154).

snuff-powder (see pp. 192), as well as -- perakí -- (389)

389. The Waiká call this pepper plant "blaki" (Zerries, 1956b, p. 154).

(Piper caudatum Vahl.), Portuguese pimenta-dos-índios, with which they spice their food.

249 824 Finally, the cultivation of plants yielding important required articles should be mentioned. These are arrow cane (Sagittaria montevidensis Cham. et Schl.) -- xerekaíbe --, the urucuzeiro (Bixa orellana L.), from whose seeds, found in a thorny capsule, the red coloring matter urucú -- narú -- is obtained (see p. 122), as well as a Bignoniaceae (Crescentia cujete Lin.) and Cucurbitaceae (Cucurbita lagenaria L. and Cucurbita idolatrica Lacerda), the fruits of which are used as vessels (see p. 114).

248 The cultivation of cotton (Gossypium barbadense or hirsutum) -- xinarí -- is of comparatively recent date.

252 [462] 8. Preparation of Food

The preparation of solid food is almost exclusively in the hands of the women, but the roasting of game is reserved for the men (390). There are two methods of doing this: The simplest

[171] 390. According to Baldus, this prerogative

Suráta
Pakidai

/82 cont./

252
462
171

390. (cont.)
of the men is found among most Brazilian tribes: "Entre os povos naturais do Brasil, as grandes caças são assadas ou moqueadas, em geral, pelos homens /among the primitive peoples of Brazil, big game is, in general, roasted or smoked by men/" (Baldus, 1950, p. 7).

252 and most common consists of impaling a piece of meat on a pointed stick, sticking the latter into the ground obliquely toward the fire, and turning it from time to time, so that all sides are equally exposed to the heat. There are also square [171] roasting racks (Portuguese moquém) with grates of wooden rods which, in the same shape or in triangular form, are familiar to almost all primitive peoples of tropical South America (391).

391. These roasting racks are made in the following way: Four sticks, forked at the top, are stuck into the ground so that a square is formed, cross rods are placed in the forks, and over them are laid sticks which are fastened with lianas.

The men use the roasting rack mostly if the meat of large animals, such as tapirs and wild pigs, is to be prepared, because several pieces can be roasted at once. Now and then, however, I also saw a whole monkey lying on the grate. So that no fat will be lost during roasting, the skin is not removed beforehand, but only when one sits down to eat. The entrails, however, are removed from the animals before roasting or boiling. They are not discarded, however, but wrapped in palm leaves and steamed in the hot ashes, to be consumed afterwards with great relish. When the roasting rack is used, an even fire; not too hot, is kept burning under it day and night. Before festivals, when it is desired to preserve exceptionally large quantities of meat,

Surára
Pakidái

/82 cont./

252 especially of the tapir, the pieces are left on the rack until they are black and as hard as bone.

[177] Smaller pieces of meat are cooked or boiled in clay vessels (392) and occasionally also in aluminum pots (393), often

[438] 392. These come from the Xiriâna.

[439] 393. These are trade articles of the caboclos (planters, rubber and palm-fiber gatherers) or gifts from the Indian protection post on the Rio Demini.

together with green bananas, by the women. The pot is simply set between the burning logs. The women are very enthusiastic about my empty gasoline cans, in which they often cooked a whole cutia, paca, or monkey. Snake meat is eaten only in a cooked state. Fish are wrapped in leaves and steamed in the hot ashes.

/83/ Vegetables offer a variety of possibilities in the way of preparation. Bananas are predominantly roasted in hot ashes when they are still green, after the peeling has been removed beforehand (the taste always reminded me of a fresh roll), or cut into small pieces and boiled, in the latter case usually along with meat. A soup which is made out of ripe bananas is regarded as a special delicacy (394). Bananas are seldom eaten

252
262

394. The banana in general and this soup in particular play an important role in the religious and social life of the Surára and Pakidái. Young men, during their training period as medicine-man helpers, must be satisfied with a banana as their daily diet (see p. 144). At the festival in memory of the dead such a soup, mixed with the bone ashes of deceased tribesmen, is drunk by the men (see p. 230). Young girls are permitted to eat banana soup as their sole

Surára
Pakidái

/83 cont./

252
262

394. (cont.)
nourishment during their first and second menstruation (see p. 142), and it represents the most important item of food for pregnant women, and for several months after confinement. Among the Tapirapé, on the other hand, where the banana also represents a basic part of the diet, parents must refrain from eating this fruit after a birth. "They believe that the child would die if they disregarded this rule" /cited in English/ (Baldus, 1956b, p. 601).

[171]

252 raw. -- The mealy, nourishing fruits of the pupunha palm are primarily boiled. Then the soup is allowed to cool and a refreshing drink is obtained in this way. Before festivals all the
[415] women pour it into a large, wooden trough, which is found in every maloka, so that there will be enough on hand. By means of steaming or roasting, a solid food is also prepared from them (395). --

[114]
[139]

395. Alexander von Humboldt, by the way designates the pupunha or pihiguao palm as "Pfirsich-palme" /peach palm/ and praises the delicious taste of its fruit (Alexander von Humboldt, 1860, III, pp. 281 f., 300; IV, p. 145). I cannot agree with the great scholar in this, for to me it tasted like slightly bitter potatoes. Zerries, by the way, is of the same opinion (Zerries, 1956b, p. 148).

Taioba, carâ, sweet potatoes, and sweet manioc are steamed in a pot or roasted in hot ashes without being previously washed or
252 peeled. -- Bitter manioc is scraped by the women with the
412 lancet-shaped bamboo knife (see p. 118) and then grated on a rough slab of granite, for they do not have grating boards (396) (397).

[177]
[123]

396. My servant Mateus, however, made them

Surára
Pakidái
Shiriana

/83 cont./

252
412
[177]
[123]
[192]

396. (cont.)
a few graters out of the sides of our empty gasoline cans by boring numerous holes in them with a nail. They were very happy over these and maintained that it was considerably more agreeable to grate on them. They also immediately had a name for this grater -- kabaricinamõ.

252
184
412

397. The Xiriâna, too, grate the manioc roots on rough slabs of granite (Koch-Grünberg, 1923a, p. 308).

252 The grated pulp is then pressed out by hand with the help of small, square strips of plaiting (see p. 112), which are rolled up (398).

398. The poison is removed from the manioc pulp in the same way among the Xiriâna (Koch-Grünberg, 1923a, p. 308).

Among the Surára I found three tube presses and among the Pakidái five, which they had obtained from the Xiriâna (see p. 112). With the flour the women bake, on large, flat granite stones under which a fire is kindled, manioc flat-cakes, which are consumed with pleasure. This food, which appeared among them only a comparatively short time ago, seems to become
273 more and more popular. The preparation of kaschirí is unknown (399).

[114]
[177]

399. Since, however, my servant, a pure-blooded Tukano /Tucano/ Indian, felt a great desire for a slight alcoholic intoxication at the sight of the manioc flat-cakes, he taught the Surára how to make kaschirí. At first they tried this unknown drink very critically. But after the first swallow their eyes shone, and they slapped Mateus on the shoulder enthusiastically and assured him again and again how good it tasted to them.

Surára
Pakidái

/83 cont./

262 Great popularity was also enjoyed among the Surára and Pakidái
439 by the roasted manioc flour which they occasionally obtain from the palm-fiber gatherers by barter or from the Indian protection post on the Demini as a gift. They are unable to make it themselves because they do not have the large iron pans for it.

252 Various fruits of wild plants also need special preparation. The white seeds found in the pods of the pacova-sororoca (see p. 168) must be roasted before they are eaten. The taste, by the way, corresponds exactly to roasted maize. /84/ -- The fruits of the pot-tree (see p. 168) are first boiled, for which the women particularly liked to use my empty gasoline cans, and then cut open with the knife of tortoise shell (see p. 118). They are then poured into one or more of the large plaited baskets -- uaramá -- (see p. 107) and hung for four days in the water on the bank of a stream, in order to remove the bitter substances. After that they are thoroughly rubbed by the women with their feet. These fruits, to be sure, occupy only a second-rank position in the favor of the "gourmets," but at least they fill the stomach. Moreover, I was assured that in olden times, that is, before the introduction of the banana, this fruit played a much greater role in the food economy.

263 All the foods mentioned are, as a rule, eaten without spices. Only now and then do some men and women add a little of their
[123] cultivated pepper, which is roasted beforehand. Not a single tribesman developed a taste for my salt, of which I had brought along several kilograms, assuming that the Indians would be pleased about it, and they had no interest whatsoever in acquiring any of it (400).

[146] 400. The amount of salt required by the body is supplied by the wood ashes with which the tobacco roll (see p.190) is mixed.

171 This aversion to salt is also found among many other tribes,
175 and in a report as early as the sixteenth century one can read the
263 following remark: "The forest people cannot use any salt, because it makes them ill, for they are not used to it; if they eat it, they

263
17
175

/84 cont./
almost always die within a short time" (401). Reference should

401. Taunay, 1921, p. 166.

also be made to a statement by Roquette-Pinto, in which he says that the Indians of the Serra do Norte reject all salted food (402).

402. Roquette-Pinto, 1919, p. 243.

There are, however, tribes among whom salt is valued to a certain extent. For example, Herbert Baldus reports about a Boróro who complained that he never got enough salt from the mission kitchen. Yet salt was previously unknown to these Indians (403). The Tapirapé and Karajá /Caraja/ also like salt

403. Baldus, 1937, p. 287.

very much (404), whereas among the Tuparí only the men like

404. Baldus, 1950, p. 14.

to use it; several women, on the other hand, not at all (405).

405. Caspar, 1953, pp. 133/34.

The following statement by Koch-Grünberg about the Arekuná-Taulipang is noteworthy: "In general, the Indians salt their foods little, but like salt very much and are glad to take it in payment for services rendered" (406).

406. Koch-Grünberg, 1923a, p. 49.

272 The number of beverages which are prepared from the nourishing fruit-meat of wild palms is abundant. Especially popular are the bluish acaí and bacaba fruits (see p. 166) about as large as plums, which ripen between December-March. They

/84 cont./

272 are kneaded and pulverized in calabashes filled with water. This produces a grayish-brown, greasy juice which, after the fleshy husks have been fished out and thrown away, reminds one of cacao in appearance and flavor and is extremely filling. This drink tasted even better to me when I added a little sugar. [123] [263] The Indians who tasted this, however, were not enthusiastic about the addition, since they like sugar just as little as salt. I was unable to please either children or adults with my bonbons. The fruit of the bacu buriti, curauá, piaçaba, and ubim palms (see p. 166) is made into beverages in the same way, while that of the inaja palm is cooked beforehand. The juice obtained from this tastes quite insipid, to be sure, but likewise has a high food value.

One should also mention that a drink is prepared from the [114] [184] [171] gathered honey by mixing it with water. I never saw it eaten, as has been confirmed for the Waiká (407) and various /85/ other

407. Zerries, 1956b, p. 150.

tribes of Guiana (408) (409).

408. Koch-Grünberg, 1923a, p. 55.

409. Richard Schomburgk, 1848, II, p. 169.

271 184 As the above account shows, the Surára and Pakidái do not lack variety with regard to beverages, so that only in the rarest instances need they resort to plain water, as is the case, according to Zerries' accounts, among the Waiká (410). As among

273 184

410. Zerries, 1958c, p. 177.

the latter (411), however, alcoholic beverages are completely

411. Zerries, 1958c, p. 177.

unknown to the Surára and Pakidái too.

/85 cont./

9. Meals and Eating Habits

264
262 In the morning the Surára and Pakidái eat very little, usually only one or two bananas or tubers roasted in the hot ashes. I often found that men and women set out to hunt or gather without having eaten anything. If they come across wild fruits on their wanderings, however, they help themselves generously. Small, light meals in the form of banana soup, roasted or steamed bananas, pupunha fruit, sweet potatoes, etc. are eaten at noon. Sometimes there are some leftovers from the meat of the day before. The main meal of the day does not take place until after sundown, by the light of the blazing fire. For at this time the whole family is usually assembled again, and the hunting booty which the man perhaps brought home in the afternoon or the products of the gathering by the women have been prepared. Everywhere one sees the men squatting beside the fire and waiting for food, which includes larger or smaller pieces of meat
[824] supplemented by vegetable fare. In front of them the women have spread out a few palm leaves as an underlayer for the food. The men eat first, and they also get the best pieces of meat. When they are satisfied, the women and children may start eating. Nothing is drunk during the meal, but afterwards a palm-fruit or honey drink is enjoyed.

264 Eating is done with the hands. In one hand the Indian holds a piece of roasted or boiled meat and in the other a roasted banana, a manioc flat-cake, or something similar. Intermittently one reaches into the pot and takes out another piece or cuts it off from
[415] the wooden spit or roasting rack. Soups are drunk out of gourd bowls or calabashes, just like the palm-fruit and honey drinks.

[251] If the hunters' bag was particularly good, one may observe many Indians, men, women, and children, eating all night long, for meat is preserved only before festivals. In connection with this the individual members of the family lie comfortably in their hammocks, converse, sleep a little at intervals, then fetch themselves another piece of meat from the roasting spit or rack. It is
[261] astonishing what quantities they consume during such a night. On the other hand, they are also easily able to fast for a long period of time.

Surára
Pakidái

/85 cont./

264 There is no feeling of modesty during eating, such as Karl von den Steinen, for example, describes for the Bakaïrí /Bacairi/ (412).

412. Karl von den Steinen, 1894, p. 66.

262 On the other hand, there are food taboos for sick people, pregnant women, for girls during their first and second menstruation, and for young men in connection with their two-months' training as medicine-man helpers.

10. Tame Animals

231

As the sole, true domestic animal, there is found among the Surára and Pakidái only the dog -- hiíma. In addition, for amusement and the pleasure in animals, European cocks are kept, as well as small monkeys, porpoise-like little hamsters (Cavia leucopyga), parrots, araras, and parakeets (Conuvidae).

As for the dogs, there are two barking varieties. One resembles the German shepherd dog, while the other, which is short- /86/ haired, white or spotted, looks very much like our fox terrier. Well-trained hunting dogs, with which a profitable [439] barter trade is carried on, are very lovingly cared for and are always given plenty of food, whereas the others are sometimes neglected. Basically, however, the Indians are attached to these animals also, which may be seen by the fact that every family that owns dogs, usually one or two, has made a "dog bed" behind their fire area, that is, a sleeping place for the loyal members of the household (Ill. 30) (see p. 29). Sometimes young dogs [552] are even nursed by women. If a bitch has brought forth young, all the relatives and friends ask to be given a young one later on and, upon receiving it, immediately give it a name. It may also be of interest to point out that the Indians mentioned never whistle to their dogs. Usually they call them by name or they hiss by pressing the tip of the tongue against the teeth (413).

[171] 413. Many North American Indians behave in the same way (Friederici, 1899, p. 365).

/86 cont./

231 [262] [973] Dogs are never killed; they are allowed to live until they die of old age. When I asked whether dog meat was ever eaten in former times, men and women, with horrified faces, answered in the negative. Yet this custom is supposed to have prevailed at one time among various tribes of Guiana (414). There do not

414. Alexander von Humboldt, 1860, IV, p. 189.

seem to be any myths about dogs.

123 231 [114] 231 [114] I should also like to mention that during my months-long, extremely friendly stay with the Surára and Pakidái, and in spite of great efforts, in which the Indians helped me, I never succeeded in winning the affection of their dogs. It meant a good deal that in time I was tolerated by them. I can agree perfectly with Friederici when he writes: "The Indian dog has always hated the white man, and, conversely, the dog of the European, the Indian. The odors given off by the races are so different that even a human nose can usually tell the difference, how much more a dog. If a white man walked through an Indian camp he usually had a whole pack of growling and teeth-baring dogs behind him" (415). But I also found that the opposite was

415. Friederici, 1899, p. 365.

true. The dogs kept at the Indian protection post Ajuricaba on the middle Demini, mongrels of the most diverse breeds, but among them also former Indian dogs, behaved, in their hatred, as though they were mad when Pakidái families came to visit (416).

[191] 416. Baldus, on the occasion of his Chaco expedition, also observed that Indian dogs, once they are in the hands of whites, become the bitterest enemies of their former masters (Baldus, 1931, p. 18).

Surára
Pakidái

/86 cont./

231 But their enmity was expressed to an even greater degree between each other, that is to say, between the dogs of the post personnel and those of the Pakidái, for if they merely saw each other, they were immediately at each other's throats.

174 231 With regard to the origin of these two breeds of dogs, which have probably been raised for centuries by the Surára and Pakidái, nothing definite can as yet be said. The first breed mentioned by me, which seems to resemble our shepherd dog, seems to be a quite typical Indian dog, for it corresponds exactly to the description which Friederici gives of a genuine Indian dog: "The general appearance of the pure Indian dog, so far as one can tell from descriptions and drawings, is a picture of the German shepherd dog, the so-called Thuringian strain, with somewhat more of the wild-dog character and with rough or bristly hair" (417). Friederici

417. Friederici, 1899, p. 362.

was concerned here, to be sure, with the Indian dog of North America, but, according to Alexander von Humboldt, this breed was already confirmed for Guiana in pre-Columbian times, as may be seen from the following quotation: "...nevertheless it has been confirmed that before the conquest in Peru, New Grenada and Guiana there was a breed of dog similar to our shepherd /87/ [184] dogs" (418). Among the Waikâ, Zerries, strangely enough, did not

418. Alexander von Humboldt, 1890, IV, p. 189.

come across this type of dog, but only the small, short-haired one that resembles the fox terrier, and he suspects that they are in part still descended from the dogs that came with the first immigrants from Asia by way of the Bering Strait about 15,000 years ago (419).

419. Zerries, 1956b, p. 151.

The following account by Franz Termer, however, shows that definite proof is lacking for the latter assumption. The scholar

Surára
Pakidái

/87 cont./

231 174 writes: "Whether the first hunter-gatherer hordes migrating to America from northeastern and northern Asia by way of the Bering Strait brought the dog along has, apart from the Eskimo dog, not as yet been proved with certainty, even though it is probable. Whether the dogs of the New World can be traced back to such early dogs, that is, of the late glacial to early postglacial times, migrating in with human beings, or whether they have come from autochthonous ancestors of New World origin is a zoological problem that cannot be decided here. Opinions about it differ. In most recent times there seems to be more of a tendency to favor a Neotropical origin of Indian dogs" (420). In this last statement

420. Termer, 1957, p. 2.

Termer refers to comments by Gilmore (421).

421. Gilmore, 1950, p. 377.

235 [439] [199] In contrast to the obscure origin of the two breeds of dogs, there is no doubt about that of the cocks -- cacará --, for these were acquired from the caboclos (planters, rubber and palm-fiber gatherers) by barter only a short time ago. Yet I was very much surprised when, on entering the Surára and Pakidái malokas, I found a large number of cocks but no hens (422), although they could

422. Incidentally, these are also called cacará.

obtain these as well. There is no interest in doing so, however, for they keep cocks only for their colorful plumage and their crowing at dawn (423). Most families have one or two, which they

[231] [191] 423. Ehrenreich reports of the Ipurina, an Aruak /Arawak/ tribe, that they keep only dogs and cocks as domestic animals, and that the latter were very popular in particular as sentinels (Ehrenreich, 1891, p. 61).

/87 cont./

235 also give names; they are fed by the women. During the day they
[552] run around freely, and at night they are confined in a common pen built out of thin trunks and sticks beside each maloka. When the tribe is traveling, it is the duty of the small boys to carry a rooster in the plaited carrying basket made from the bast strips of the curauá plant (see p. 106). When a temporary camp is set up in the afternoon, the cocks are set free. During the night they rest on the limbs of low trees, usually in the vicinity of their owners. Before the march is resumed the next morning, they are caught again and put in the baskets of the boys. I might also men-
[825] tion that the Surára and Pakidái never kill a cock, for it is a mem-
[262] ber of the household, and they believe furthermore that roosters and hens are unclean animals that eat any kind of filth. For this reason, eating their meat, including the eggs, would be very harmful for human beings (424).

235
171
262

424. Among various Karaiben /Carib/ and Aruak /Arawak/ tribes of Guiana, where many chickens are kept, neither the meat nor the eggs are eaten (Im Thurn, 1883, p. 265). Ehrenreich reports the same thing about the Karajá /Caraja/: "Even the domestic hen, which reached the Araguaya /Araguaia/ tribes a long time ago in the domestic state and has multiplied tremendously, is, as a member of the household, not used for food, nor are its eggs. In modern times, however, it serves as a trade item in dealings with travelers, who sell the poultry in the first settlements of the province of Para at a high profit" (Ehrenreich, 1891, pp. 13/14).

231

The tamed wild animals, such as monkeys, parrots, araras, and
[171] parakeets, also enjoy complete freedom. I never found them tied up, as is mentioned by Baldus, for example, for the Chaco tribes (425).

425. Baldus, 1931, p. 18.

/87 cont./

231 In the evening the monkeys climb the tallest trees in order to spend the night in their crowns, and the birds, too, occasionally fly away. But all the animals come back, for, of course, they were tamed when small and are very attached to the Indians, who /88/ always treat them affectionately. They take the trouble, with great patience, to train the parrots and parakeets to talk, and they are happy when the first results appear.

11. Luxuries

276

The Surára and Pakidái use only two luxuries, tobacco -- peenáke -- and a snuff powder -- epená. The former serves for profane purposes and the latter exclusively for ritual use.

Tobacco is not smoked, however. The leaves are pulverized in the green state, mixed with wood ashes and water or saliva, and twisted between the hands into small rolls. These are then inserted between the lower or upper lip and the teeth, where they are sucked. Both sexes, including children, indulge in this enjoyment, which also is connected with a very practical purpose, for, as a result, the Indians are able to walk around all day in the forest without feeling hungry or thirsty; but their attractive faces are quite distorted by the tobacco roll (Ill. 41).

[184] Tobacco is used in the same way among the Waiká, but
[824] here, according to Zerries' account, the roll is inserted only between the lower lip and the teeth (426) (427). The investigator

426. Zerries, 1956b, p. 154.

427. Zerries, 1958c, p. 180.

named also mentions the occasional use of wild plants as substitutes in case tobacco is lacking (428) (429). Among the Surára

428. Zerries, 1956b, p. 154.

429. Zerries, 1958c, p. 180.

/88 cont./

276 and Pakidái I was unable to learn anything with reference to this, although there, too, the consumption of tobacco is uncommonly
[249] great. They plant plenty of tobacco in all the forest clearings, however, and if it were entirely harvested in the fields where they were living at the time, the men fetch it from other distant rocas or in emergencies they obtain it from friendly tribes by barter.

[184] Koch-Grünberg reports that the Xiriána and Waiká hordes
[114] visited by him chew the tobacco (430). From his description, how-

430. Koch-Grünberg, 1923a, p. 311.

ever, it is to be seen that actually a sucking of the tobacco is
276 also involved. The Arekuná on the Roroima probably also did the
171 same thing, although Richard Schomburgk (431) and Appun (432)
114

431. Richard Schomburgk, 1848, II, p. 239.

432. Appun, 1871, p. 521.

agree in speaking of "tobacco chewing." It is noteworthy that Koch-Grünberg (433) did not observe this form of tobacco enjoyment

433. Koch-Grünberg, 1923a, p. 57.

among any other tribe in the Roroima region, for on the occasion of his visits the men smoked the tobacco as cigarettes or in short English pipes which were imported from British Guiana; he never saw women smoke.

123 If I offered the Surára and Pakidái cigarettes, they first
276 always removed the paper and enjoyed the tobacco in the same way as their cultivated tobacco. Yet they were not very enthusiastic about it, for in their opinion the cigarette tobacco was much too weak. In time, however, men and children became accustomed to smoking (434), but not the women.

434. As a result of this, our supply of cigarettes rapidly dwindled, and my

Surára
Pakidái

/88 cont./

123
276

434. (cont.)
servant Mateus and I were thereafter dependent on the cultivated tobacco of the Indians, which, however, was so strong that we simply could not enjoy it. Mateus, however, had the happy idea of washing the tobacco several times and then he let it dry in the sun. Since we had plenty of cigarette paper with us, we were not obliged to give up our customary enjoyment of cigarettes. We could never have become accustomed to sucking out the tobacco, for every attempt resulted in retching.

276 The narcotic snuff powder, similar to yopo or paricá, is made up of various ingredients, of which I was able to identify, besides the roasted and pulverized paricá seed (Piptadenia peregrina Benth.), the ashes of the burned bark of a wild species of mimosa (Mimosa acacioides?) -- hekurâhihenâ -- (435), as

[192]
[776]
[787]

435. This, it should be noted, contains the word with which the gigantic animal and plant spirits are called -- hekurâ -- with which the men are able to make contact only by means of the snuff powder.

well as a cultivated pepper plant /89/ (Piperacea sp.) -- maxarahâ -- (436) (437).

[192]
[184]

436. Zerries found the same combination among the Waikâ, and even the names for the pepper plant are almost identical; the Waikâ call it "masho hara." The bark of the mimosa, in which Zerries suspects there is an alkaloid, is, however, used only in the dried or roasted state (Zerries, 1956b, p. 154).

[126]

437. Herr Prof. Dr. Klaus Soehring of the

/89 cont./

276
122

437. (cont.)
Pharmakologischen Institut der Universität Hamburg is at present still analyzing the powder that I brought back. The result is to be published later in an article.

276
[463]
[415]

Exactly like the arrow poison, this powder is made only by certain men. It is stored in bamboo tubes -- tõra -- (Fig. 28a) which are closed with leaves. Before prayers, on the occasion of big festivals, and before curing the sick, in which several men take part, besides the chief, the powder is poured on a large clay plate left by the Xiriâna. From here it is then packed into the bamboo snuff-tube 60-70 centimeters long, on one end of which is glued by means of tree resin a perforated, longish palm nut (Fig. 28b). At the free end the nut is sharpened to a point so that the man wishing to take snuff can insert it into one nostril. From the other end /Fig. 28 appears here/ of the tube, a friendly fellow-tribesman, with partly bent knees, blows the powder with all of his might into the man's nose (Ill. 44).

123
276

After only a few minutes the snuff-taker falls into an inconceivable state of intoxication, in which he rages, screams, sings, dances, and leaps about (Ills. 45, 46). Since I was obliged, after my adoption into the tribe of the Surára, to submit to this usage also, I am in a position to describe the effect in detail. I should like to point out briefly here that immediately afterwards I developed a splitting headache and felt a strong desire to vomit, exactly like the youths making their first acquaintance with this drug. But shortly after that a strange reaction took place within me, for I felt myself to be a giant among giants. All the human beings near me, as well as dogs and parrots, suddenly seemed to be giants. This effect, which is caused by the alkaloids in the powder, is closely connected with the conceptions of gigantic animal and plant spirits (see pp. 201/201).

276
17
[184]

/89 cont./

Among the Waiká, this taking of snuff is done in the same way (438). The Tuparí (439) and numerous other tribes of western

438. Zerries, 1955b, p. 665.

439. Caspar, 1953, pp. 151 ff.

South America (440) also indulge in this custom, though the com-

position of the powder, except for the paricá or Piptadenia seeds,
[114] seems to differ from tribe to tribe. Cooper, moreover, in a comparative study of the taking of Piptadenia snuff, comes to the conclusion that this is a "western trait" /cited in English/ (441).

441. Cooper, 1949, pp. 536-538 and Map 10.

/89 cont./

12. Hygiene

515 Regular bathing, washing of the face and hands, and cleaning the finger and toe nails are unknown; this is also true for babies, who are often covered with a veritable crust of dirt. Nor do they /90/ brush their teeth or ever rinse their mouths. Yet I [147] [145] was never aware of an unpleasant body odor or bad breath on the Indians, and until an advanced age their teeth are dazzlingly white and sound. While hunting or gathering, however, if men and women are obliged to cross a brook or small river, they gladly utilize the opportunity to take a refreshing bath, and the same is true when female members of the tribe fetch water. A bath is greatly appreciated by children and young people, but [481] not at all by older persons. Most men can swim quite well and teach their sons also; women and girls who swim are exceptions. 177 515 As a result of occasional contacts with the palm-fiber gatherers on the Rio Aracá or with the personnel of the Indian protection post on the Demini, the Surára and Pakidái have for some time been acquainted with soap, and various Indians, predominantly children and young men and women, like to lather themselves when they take a bath. Several women had even taken to washing their hammocks now and then with soap. Thus, the cakes of soap [123] that I carried with me were very much in demand, as were perfume and hair tonic.

264 Eating is done only with the hands (see p. 184). If the meat was very greasy and the hands are smeared all over with dirt and grease, they are rubbed off somewhat against a post and then run through the hair a few times. The eating bowls and pots, with the remains of the meal, are then put down for the dogs, who at the same time take over the work of cleaning; eating utensils are seldom washed. When they are needed for the next meal, the woman passes them over her hair a few times. If there are still a few crusts of dirt present, she spits on them and rubs them with her hand.

Surára
Pakidái

/90 cont./

514
[264] There is frequent belching during and after eating, and it happens not infrequently that a member of the family breaks wind, often with a loud noise, which, however, is received with happy laughter, without any damage to the appetite. Both sexes also spit a great deal as a result of the tobacco rolls which they have in the mouth almost constantly (see p. 190).

Urination is done in the immediate vicinity of the maloka during the day and in the hearth at night. Men and boys always urinate in a squatting position, just like women and girls. For their other needs they all go a bit deeper into the forest clearing during the day, or even to the edge of the forest. When they have finished, they rub the seat back and forth a few times on the ground or against a tree trunk. The mother holds small children, in case she happens to be lying in the hammock, over the edge of it. Then she wipes her hand or lower arm across its seat a few times, or, if necessary, she uses a little stick to clean it. The little heap is covered with ashes or earth and stamped into the ground by the mother. If an adult has more important business to attend to at night, he digs a small hole beside the hammock and subsequently covers it with ashes or earth. Old or sick persons do this during the day as well. The reason that [825] [776] the Surára and Pakidái do not leave the maloka at night for the aforementioned purpose is because they are afraid of snakes and jaguars, as well as of nonexí, the evil spirit which transmits sickness (see p. 211). Persistent unpleasant odors are not noticeable even in closed malokas, however, since they are dispelled by the ascending smoke of the constantly burning fire.

841 During their menstruation the women do not use anything to absorb the blood (see pp. 142/143). Pools of blood that remain on the ground are obliterated by them with their feet.

356
123
291 In general, however, the communal house is kept quite clean. One always sees men and women sweeping with a broom made of piaçaba fibers. For this work both sexes liked to put on the shirts and trousers or clothing which I had brought them as gift articles and which were otherwise not at all appreciated.

Surára
Pakidái

VIII. Religion and Magic

1. The Religious Conception of the World

821
796 According to the view of the Surára and Pakidái, the earth is a disk over which the sky arches like a bell. All power emanates from the moon -- Perimbó -- and from Poré, the lord of the moon, who is pictured as an old man with a long white beard and a tonsure painted red. Occasionally he comes down to earth, but is then invisible to human beings.

Thus, Poré and Perimbó constitute an inseparable unity that is regarded as eternal, just, and benevolent, but is also able to punish, if necessary. To it is attributed the origin of the earth and all life, and it is assumed that the events of creation followed in direct as well as in indirect fashion (442).

> 442. The creation myth of the Yanonámi /Yanoama/ represents an example of such indirect creations (see pp. 247/248).

821
795 The moon, a large, open, circular maloka located in the midst of a planting and surrounded by forests, mountains, and rivers (443), is at the same time regarded as the place where

> 443. The picture of the surface of the moon corresponds to the open, almost circular Surára maloka (see pp. 25/27).

all the souls of human beings who were cremated after death lead a paradisiac existence under Poré. There are animals, plants, and fruits in abundance here, and no moon-dweller need ever suffer hunger and thirst.

[964]
[794] But only with the smoke rising during the cremation can a soul -- uwexík -- (identical with cloud, smoke), which exists in the bones and never leaves the body during life, reach this paradise. The souls of the dead who are not cremated become shadows -- petamúhi -- that must wander about restlessly,

/91 cont./

821 795 without food and drink, between earth, sun, and moon (444).

444. One feels reminded here of the conception of the Homeric Greeks, who also assumed that the dead, after actual life has gone, are obliged to lead a wretched shadow-existence.

All Surára and Pakidái therefore greatly fear that after their deaths they might become such shadows. That is why, after military encounters, they make an effort to recover their fallen fellow-tribesmen, in order to cremate them. The only the head of old persons is cremated (see p. 153), believed that this suffices to carry the soul up to the moon. Enemies are not cremated, however, for the shadow existence is desired for them.

821 The countless stars, which are also all inhabited by tribes, are allies of the moon (445). If a shooting star falls, it is

445. The Surára and Pakidái do not have special designations for the individual stars and constellations. There are only two general names, star -- purimá -- and big star -- purimá breu.

[192]

believed that the inhabitants of one star are visiting those of another.

The sun is of only minor importance in the religious life. It is regarded as rather weak and powerless, because it stands alone in the sky, has no strong allies, and travels around the earth-disk like a vagabond. It rules only the wandering souls of the uncremated dead and uses their shadows in order, in the protection of them, to slake its burning, unquenchable thirst on human beings, animals, and plants. In perspiration, my informants told me, one sees clearly how it draws the liquid out of bodies, and subsequently there remains for human beings and animals a feeling

[795]

/91 cont./

821 of thirst and weakness, while plants often wither. For this reason, and especially out of fear of the shadows, the sun's rays are regarded as dangerous. Therefore, tasks for which one must expose himself to the direct radiation of the sun, for example, forest clearing, cultivation of fields, and house construction, are preferably undertaken in cloudy or even rainy weather. In the latter case, there is even a direct /92/ connection with the moon. A large tree stands on this celestial body, in the middle of the open maloka. When Poré shakes it, the wind rises first, and after that rain falls. The aversion of the Surára and Pakidái to the merciless sun's rays of the equatorial zone has a further, matter-of-fact explanation, for in former times, as pure hunters and gatherers, they practically never came out of the eternal twilight of the primeval forest.

821 The awe of Poré and the moon is so great that the Indians
774 do not dare pray personally to this united Supreme Deity. Serras
774 /sierras/ -- peatíle -- as well as gigantic animal and plant
[782] spirits -- hekurá -- (446), who live on them and are characterized
[192]

446. This word is derived from hetumisse = heaven and he = head, above.

by supernatural qualities, are the mediators. The serras are well suited for this, because they are situated between the earth, on the one hand, and the moon and sun on the other. They are regarded as higher divine helpers, who, after Poré and Perimbó, are the mightiest. At the same time they are regarded as the masters of all the animal and plant spirits living on them. Their power is much greater than that of the sun because there is, of course, only one sun whereas there are innumerable serras. Their attitude toward Poré and Perimbó, however, is not always a loyal one. Usually they are on their side, to be sure, but if there is occasionally a quarrel between them, it may happen that they ally themselves with the sun for a time. The united Supreme Deity has taken precautions, however, and considered any possible

Surára
Pakidái

821 /92 cont./
796 danger. For the fact that it has chosen the serras as dwelling
794 places for the gigantic plant and animal spirits is injurious to their power if it is directed against Poré and Perimbó. In contrast to the serras, the hekurá are steadfastly faithful followers of the united moon deities and, together with the stars, protect them against any attacks on the part of the sun and its temporary allies. Sometimes, in an altercation which the serras wage with the moon or sun, an eclipse of the moon or sun appears, because the celestial body in question wishes to conceal itself from the other, so that it will not be drawn into the dispute (447). If, for example, it becomes dark before a thunderstorm and lightning begins to flash, then the sun is very thirsty, is hiding behind the serras and asking for rain. The latter relay the request to the moon. But it does not want to comply with the sun's wish, and already there is reason for the serras and the moon to quarrel. Then when it thunders, Poré has a headache out of anger, and he finally shakes the rain tree to put an end to the quarrel.

[191]

447. The relationship of moon and sun also plays a special role in the religious and mythological ideas of various other Indian tribes. In the myth of the Yurakaré /Yuracare/, for example, it is treated in the sense of the Orpheus motif (Rodrigues, 1875, pp. 252 ff.; d'Orbigny, 1835/47, III, p. 210).

794 The hekurá are gigantic prototypes of all the species of plants and animals that live on certain serras that are taboo for human beings. These nature spirits are regarded as subordinate helpers of Poré and Perimbó. They are usually favorably disposed toward human beings, permit and facilitate hunting, gathering, and agriculture for them. The men, however, must always show their gratitude to them by prayers, and they may
794 not indiscriminately destroy animals and plants. This is also
55 related to the fact that all members of the tribe, men, women,

Surára. Pakidái Waica

/92 cont./ and children, bear names of plants or animals (see pp. 138/139). This results in a symbiosis which at the same time furnishes proof of the alter-ego motif to be found here. If a person who has passed the third year of life dies, an animal or plant of the species whose name he bore must likewise be killed or its death be brought about. This is done so that, for the long journey to the moon, the soul of the deceased has a companion who leads the way and facilitates for it entrance into the paradisiac realm of the dead (see also p. 149).

/93/ If the chiefs, who, of course, are at the same time medicine men, or other male members of the tribe wish to make contact with the nature spirits, either in connection with curing the sick, before or after hunting expeditions, on the occasion of prayers of thanksgiving for a successful harvest, etc., they have another man blow narcotic powder into the nose with a bamboo tube and immediately afterwards fall into a state of intoxication in which they feel themselves to be giants among giants (see p. 193). Thus, it is understandable that in a snuff-powder intoxication they identify themselves with the hekurá and use a very similar sounding word -- rekurá -- for any magical performance.

If one compares the beliefs of the Surára and Pakidái with those of the related Waikâ /Waica/, who were studied by Otto Zerries, Meinhard Schuster, and the American Missionary James Paul Barker (448) (449a) (449b), one finds that they are largely

448. Zerries, 1958a.

449a. Zerries, 1958b.

449b. Barker, 1953.

in accord in their basic features.

All the tribes mentioned believe in a Supreme Being, Poré or "Omaua," respectively, and ascribe to it the creation of the earth and all living creatures. To be sure, there are certain differences, which may, however, be traced back to external influences. Thus, Poré is brought into relationship with the moon --

Surára
Pakidái
Waica

776
184
821 /93 cont./ Thus, Poré is brought into relationship with the moon--
Perimbó -- and with the latter forms an inseparable unity (450).

[114]
[171]

450. This conception, which seems rather strange and in which Josef Haekel therefore thinks he sees a contradiction (Haekel, 1959, p. 40), is, however, also confirmed for the Uitoto /Witoto/, for Preuss writes about it, among other things: "We thus have here the rare instance in which, through a combination of the god of the earth and a moon demon, a single deity has arisen, a sort of monotheism, alongside of which there are only very insignificant demons" (Preuss, 1922, p. 176). And elsewhere he states: "The fact that moon and Supreme Being here coincide may therefore have come about later, but not necessarily. Today we have them as an inseparable unity" (Preuss, 1922, p. 184).

whereas "Omaua," together with a helper, "Yoaua," lives in the western sky, where they too produce rain, in that they pour the water out of the two celestial rivers (451). In contrast to this

451. Zerries, 1958b, p. 280.

among the Surára and Pakidái it is believed that Poré shakes the rain-tree of the moon (see p. 199).

821 Great significance is also attached to the moon by the
184 Waiká, and, significantly enough, also in connection with the
773 creation of human beings. This may be seen from their legend of primitive times (452), which, except for minor deviations,

452. Zerries, 1958b, p. 280.

corresponds to the one which the Surára chief Hewemão told me

2: Becher--203 E-5 (1955-1956) 1960 SQ18 Yanoama SQ18

Surára
Pakidái
Waiká

821
184
773

/93 cont./

(see pp. 247-248) (453). As a further parallel, the leg-birth

453. With reference to this, however, among the Waiká there is a second conception that the first human beings came to the earth in the rain (Zerries, 1958b, p. 281). Hence they must have come out of the western sky where, to be sure, Omaua lives and produces rain. Zerries, however, thinks it possible that this rain is identical with the blood of the wounded moon and refers to a Uitoto myth as a parallel (Zerries, 1958b, p. 281). In this myth the monthly blood of the daughter of the organizer of the festival of the animals is seen as a fine, cold rain, which Preuss interprets as the flood in miniature, which appears with the dark of the moon; it corresponds to the menses (Preuss, 1921, pp. 113-115).

773
184

As a further parallel, the leg-birth should be mentioned. According to the Surára and Pakidái version, the first four men and a woman came from the leg of a small bird at definite intervals (see p. 247), while, according to the one of the Waiká, the first woman came out of the pregnant leg of a man (454) (455). Both myths, however, have

454. Zerries, 1958b, p. 280.

793
191

455. Conceptions of leg-births are confirmed also for other South American tribes. Thus, among the Tukuna /Tucuna/ the tribal heroes Dyoi and Epi, together with their two sisters, spring from the knees, swollen by wasp stings, of the male Nutapa (Nimuendajú, 1952, p. 122), and among the Umutina, who unfortunately no

Surára Pakidái Waiká

/93 cont./

773 191

455. (cont.)
longer exist as a tribal unit, it is believed that civilized people and hostile Indian tribes came out of the inflamed and swollen calves of the first man, Aipuku (Oberg, 1953, p. 108).

773 184 the polyandrous feature in common, for the woman had a boy (Surára and Pakidái) (see p. 247) or several children (Waiká)(456)

456. Zerries, 1958b, p. 280.

by the men.

776 174 184 /94/ In the religious world of thought of the Waiká one also finds ideas that are very contradictory. Thus, "Omaua" is regarded, on the one hand, as the Supreme Being and creator of the earth and of mankind, and, on the other hand, is thought of as an actual enemy of the Waiká who is closely linked with alien tribes in the west and with the whites, as well as with their pernicious influences, diseases, puzzling cultural possessions [782] (motor, gasoline, etc.) (457). Furthermore, it is noteworthy

457. Zerries, 1958b, p. 286.

that in white and black magic "Omaua" is directly invoked (458)

458. Zerries, 1958b, p. 286.

(the Surára and Pakidái communicate with Poré/Perimbó only through intermediaries), and that there lives with him a cannibalistic creature, "Omayali," which, according to Zerries, presumably represents a hypostasis of the former (459). He believes,

776 174 171

459. Zerries, 1958b, p. 280.

however, that "Omaua-Omayali" is an import from another culture

/94 cont./

194
[171]

area and cites corresponding parallels from Aruak /Arawak tribes of northwestern Brazil as well as from Karaiben /Carib/ of Guiana (460), which are augmented by Haekel (461). The last-

460. Zerries, 1958b, p. 286.

461. Haekel, 1959, p. 41.

named scholar then poses the question: "Did the Waika, prior to this foreign influence, lack the conception of a Supreme Being?" (462)

462. Haekel, 1959, p. 42.

He assumes that the idea of a Supreme Deity in the sense of the Surára and Pakidái related to them might have been familiar to them, since in the ethnic groups named the moon, or the lord of the moon, occasionally comes down to earth, and, as a further link, he mentions the idea of a heavenly paradise of the souls (463). Then Haekel points out that the Surára and Pakidái

[171]

463. Haekel, 1959, p. 42.

as well as the Waiká, in a religious-mythological respect, show remarkable similarity with the following Karaiben /Carib/ tribes (464), though it should be noted that some link the Supreme

464. Haekel, 1959, p. 43.

Being with the moon and others with the sun (465): Kachuyana

465. Haekel, 1959, p. 35.

(Kashuiéna /Cashuena/) (even the name of the Supreme Being is very similar in this case, Purá) (466) (467), Barama (468),

471. Cruxent, 1953, pp. 325 ff.

776 174 114 171 "The suggested parallels," Haekel goes on to say, "between Yanoama and Carib call attention, in any case, to a series of problems for which we are still far from a solution today. The probability of historical relationships can undoubtedly not be overlooked. But who were the 'givers,' who the 'receivers'? It is obvious that the Surara-Pakidai and Waika lie within the sphere of influence of Cariban tribes, but in my opinion there is no justification for thinking merely of influences from the Carib in connection with the similarities coming to light. One should also take into consideration the fact that Yanoama and Carib participated jointly in an older substratum" (472). On

472. Haekel, 1959, p. 43.

this point I agree with Haekel completely. I also share certain reservations that he has with regard to the avowed western orientation of the Waikâ or the Yanonâmi culture (473), which

473. Haekel, 1959, pp. 43/44.

Zerries represents (474). True, there is much in favor of it,

474. Zerries, 1955a, p. 81.

among other things a definite form of endocannibalism and the ritual taking of a narcotic snuffpowder. Further proof might be seen in the fact that among the Ipurina on the Rio Purús the

Surara
Pakidai

/94 cont./

776 174 171 114 moon -- "pati" -- is venerated as Supreme Being and "father," who causes the fruits to grow (475). In this case, however,

475. Ehrenreich, 1891, p. 72.

Ehrenreich believes that there has been Christian influence. Among the Sáliva in southern and eastern Colombia /95/ one also finds certain features in the religion and mythology which are reminiscent of those of the Yanomámi and Karaiben, and the Supreme Being worshiped by them is called "Puru" (476), a

476. H. v. Walde-Waldegg, 1936, pp. 40 ff.

name which sounds very similar to Poré and "Purá." Haekel further points out that the religion of the Sáliva shows marked agreement with the neighboring Aruak Achagua (477), which

477. Haekel, 1959, pp. 45/46.

was described by Hernandez de Alba (478). Moreover, it should

478. Hernandez de Alba, 1948, pp. 410 ff.

be mentioned that the Guahíbo Indians on the Venzuelan banks of the Orinoco, according to Zerries, have taken over their deity, Purnaminali, from the Achagua or Sáliva (479).

479. Zerries, 1956c, p. 232.

776 171 But in the eastern regions of Guiana there are also significant parallels with respect to the religious and mythological conceptions of the Yanomámi mentioned. Reference has already been made to the Kachuyana and their Supreme Being, Purá (see p. 205). They are even more strongly pronounced among the Warrau /Warao/. In their moon myth about "Aboré" and "Wowtáh" the moon has the character of a culture hero (480),

480. Brett, 1880, p. 76.

Surára
Pakidái
Waiká

/95 cont./

796 171 exactly as among the Surára and Pakidái; moreover, the correspondence between the names Aboré and Poré is especially great. The supplying of cultural possessions is also attributed to the deities in each case. In the Warrau myth it is even said that Aboré fled before Wowáh into the land of the whites, from whence he provided his fellow tribesmen with import articles (481).

481. Brett, 1880, pp. 84 ff.

794 191 The idea that there are gigantic prototypes of each animal and plant species also exists among other South American tribes. Zerries has already worked out the connections for this and has cited several investigators who confirmed identical or similar views for various Indian peoples, among them Arawak, Mura, tribes of the Chaco, Karaiben in Guiana (Arekuná-Taulipang /Arecuna/, Cavina and Tumupasa Indians of northeastern Bolivia, Cayapa in Ecuador, and Yaruro in Venezuela (482).

482. Zerries, 1951, pp. 149/50.

794 171 114 The conception of the Yaruro in particular shows corresponding parallels, according to Petrullo's description (483).

483. Petrullo, 1939, p. 237.

For the Karaiben tribe Arekuná, Koch-Grünberg, to be sure, does not find any evidence of gigantic plant spirits, but their idea of the animal spirits is very similar; here they are called "podole" = father (484).

484. Koch-Grünberg, 1923a, p. 187.

793 184 If one then compares the myths which deal with happenings on the already created earth, one is struck by the fact that among the Waiká the transformations of human beings into land animals cover a wide range (485). The same is true among the

485. Zerries, 1958b, p. 283.

Surára
Pakidai
Waica

/95 cont./

793 Surára and Pakidái, but here in addition there are also such for
184 the animals themselves, and, to be sure, smaller ones are always transformed into larger ones (see p. 251). The myth of the creation of the ant bear, in which Omaua or Porê transforms a man who has committed incest with his mother-in-law into this animal by magic, is familiar to the Waiká (486), as well as to

486. Zerries, 1958b, p. 285.

the Surára and Pakidái, in the same version (see p. 250).

794 Likewise synonymous is the system of the species-spirits
184 of animals and plants, hekurá (Surára and Pakidái), or "hekula" (Waiká) (487), which is closely connected with the medicine-man system.

487. Zerries, 1958b, pp. 286/87.

794
795 Of interest, finally, are comparisons concerning the con-
184 ception of the human soul. It can ascend to the moon (Surára
[184] and Pakidái) or to heaven (Waiká) (488) only if the corpse is

488. Zerries, 1958a, p. 105.

cremated, for its name, uwexík (Surára and Pakidái), or "nobolebe" (Waiká) (488) /see footnote above/, is identical with that of cloud, smoke. According to the view of the Surára and Pakidái, the soul exists in the bones (see p. 151) (489).

[171]

489. In this respect they correspond to many other tribes, for in his essay "Die Antropophagie der südamerikanischen Indianer /The Anthropophagy of the South American Indians/," Koch (Grünberg) writes: "All these practices show that the Indian, incapable of separating the physical from the spiritual, regards the bones, which alone remain after the corpse has decomposed, as the actual and ultimate seat of the soul" (Koch (Grünberg), 1899, p. 83).

Surára
Pakidái
Waica

774 /95 cont./
775 That is why they cremate only /96/ the skeleton of their dead,
184 for if the flesh were still present, the soul would be unable to
come out in time. The ceremonial drinking of the bone ashes,
[169] too, on the occasion of the annual festival in memory of the
[266] dead, is connected with the idea that strengthening remains
of the soul are still present in them. In this connection Zerries
writes with reference to the Waiká: "We were unable to find
the idea of a bone-soul among the Waika, if we disregard the
774 connection between bone ashes and bole" (490). Zerries also

490. Zerries, 1958a, p. 107.

points out that the soul, according to the view of the Waiká,
is peculiar only to the human being, but not to the animal (491).

491. Zerries, 1958a, p. 105.

774 According to the statements of the Surára and Pakidái chiefs,
775 however, the human soul of the dead on its journey to the
moon must be accompanied by a like-named animal or plant
soul of the dead, which serves as a guide (see pp. 149/150).
It is assumed by the Surára and Pakidái that children are
without a soul until they have completed the third year of life,
because during this time they are nursed by the mother and
thus still belong to her flesh and blood as well as to her soul
(see also pp. 138 and 154). Waiká children are said to re-
ceive their souls only after the completion of the sixth year
of life (492).

492. Zerries, 1958a, p. 106.

/96 cont./

2. Curing the Sick

754 825 [753] [171]

a) General

All sickness is attributed to hostile witch-doctors, especially those of the Waikâ (493). As carriers they use the gavião-real

493. The idea that sickness is caused by witch doctors is so widespread in South America that from the large number of examples I should like to quote only two authors for comparison: Roth, 1915, p. 346; Koch-Grünberg, 1923a, p. 192.

gavião-real (Thrasaetus harpyia L.) and the bat. Both animals are therefore designated generally as -- nonexí --, that is, evil spirit or spirit of sickness (494) (495). If such an animal is sighted,

494. Nonexí, however, is also the specific name of the gavião-real.

495. Zerries documents the same name, "noneshi" or "nonish," for the Waikâ. With it, however, they designate the shadow-soul or the alter ago (Zerries, 1958a, p. 108).

it is immediately killed, in order to prevent a misfortune. Moreover, it is assumed that with its death a hostile medicine man, who, of course, temporarily inhabits it, has breathed his last. [239] The down feathers of the gavião-real are therefore glued into the hair for a few days as a trophy (see p. 95).

755 If a member of the tribe has fallen ill, he can be cured only by having the chief, who among the Surára and Pakidái is at the same time the medicine man, and his helpers try to hurl the sickness back to the enemies. This can be done, however, only in the snuff-powder intoxication and by invoking

Surara
Pakida

/96 cont./

755 the hekurá, and best of all at night by moonlight (496). All

[174] [196]

496. The hekurá are the intermediaries between human beings and the united Supreme Being Poré/Perimbó (see pp. 199 ff.).

day long, usually one or two or sometimes even several men make preliminary attempts at healing. For all sicknesses there are very definite texts, melodies, and dance steps, which are taught the young men by their chief during a two-months' training course (see pp. 143/145). If the patient dies despite all efforts, the people yield to a certain fatalism, for in that case the power of the hostile medicine man was simply stronger (497).

[171]

497. The same thing is reported by Koch-Grünberg about the Arekuná-Taulipang (Koch-Grünberg, 1923a, p. 202), Richard Schomburgk about the Warrau (Richard Schomburgk, 1847, p. 172), and Barrère as well as Quandt about the Galibi and Arowaken (Barrère, 1743, pp. 216/17; Quandt, 1807, p. 260), to mention only a few parallels.

755 For the reasons mentioned, there is only suggestive therapy,
757 supplemented by fasting and treatment with cold water. In the latter case a patient, even with the highest fever, must drink a great deal of water and take frequent baths in the nearby river or brook. He is also often exposed to pouring /97/ rain (Ill. 49), since it is assumed that it has healing powers because it comes from the rain tree of the moon (see p. 199). Sick persons who are already too weak and are unable to leave their hammocks are doused with cold water at regular intervals (498).

[171]

498. Treatment with cold water is widespread in South America. For comparison

Surára
Pakidái

/97 cont./

755
759
171

498. (cont.)
I should like to mention the Kaskihá Indians in the northeastern Chaco, among whom the witch doctor tries to heal the sick in the same way (Baldus, 1931, p. 143).

164

During my nine-months' stay among the Surára and Pakidái the following sicknesses occurred there: grippe, pneumonia, malaria, chicken pox, and a gastric fever; fortunately, none was fatal (499). But the two Surára women who had pneumonia,

000

[165]
[752]

499. Only the Pakidái youth Hokotómarimá died after a fall from a pupunha palm, which probably caused internal injuries (see p. 149).

123
755
759
177

But the two Surára women who had pneumonia, first a young woman, Xunamí, the wife of Kurikayawõ, the younger brother of the chief, and later an older woman, Xanimá, the approximately 47-year-old mother of Anyarawõ (see pp. 123/125), and a boy, Xaniwõ (see p. 127), about 12 years old, would probably not have survived without the penicillin that I had brought along, for, in spite of untiring treatment by the chief and his helpers, their condition grew worse from day to day. In the first instance, the chief, Hewemão, and the husband, Kurikayawõ, finally permitted me to give Xunamí a penicillin injection in the upper arm on two successive days, whereupon she improved dramatically (500). In the second and third cases,

500. This cure increased my reputation tremendously, so that afterward I was properly adopted into the tribe of the Surára and, on the occasion of the great festival in memory of the dead, was also permitted to drink the banana soup mixed with the bone ashes of deceased relatives (see p. 231). If the woman had died after the injection, however, the intervention could have had grave consequences for me.

/97 cont./

755 the chief even asked me to give the patients "penicilina" after
[959] his healing efforts had again brought no success.
[123]
[179] Of the various cures at which I was allowed to be present, I should like to describe in detail the following two treatments:

b) Magic cure (rekurá) for Xunamí:

Xunamí, the young, pretty wife of Kurikayawõ, fell ill quite suddenly. She had a high fever, lay apathetically in her hammock, and complained of severe chest pains. Her husband,
[593] who, with touching devotion, remained with her throughout the
[757] first day, that is, he sat beside her or lay in his hammock, led her several times to the nearby small river, in which she always remained for some time and drank copious amounts. She was not permitted to eat anything, but she had no desire to do so. During the night, the fever seemed to climb, for she was quite delirious and unable to sleep soundly. The next day she felt
[959] even worse. Three times in the forenoon and as often in the afternoon her husband took her to the river, but there was no improvement after the baths and the drinking. At noon on the third day the husband, together with two other men, began
[302] the first special cure. First of all, Kurikayawõ and the second participant painted serpentine lines on their faces and bodies with urucú, while the third one rubbed himself all over with soot. Then they all three blew snuff-powder into each other's noses and in a few minutes they were in a state of ecstasy in which they leaped wildly about the sick woman lying in her hammock, shouted loudly, and gesticulated. Then, however, the cure followed very definite directions. The man painted completely black symbolically represented the spirit of sickness -- nonexí -- whom a hostile medicine man had conjured into the body of the sick woman, and the other two men, who now identified themselves with the hekurá (see p. 200), staged a sham battle against him. At first they were armed with large sticks and beat "nonexí" in order to kill him. But he defended himself with all his might. Then he hurled arrows at him, which, however, he threw back. After that the /98/ spirit of sickness stuck a carrying basket on his head, and this suddenly fell off. At once, the other two men

/98 cont./

755 beat quite hard upon the basket with their sticks, in order to
[535] give the sickness the finishing blow. All the movements were executed in a dance rhythm, two steps forward and one back, during which the "hekurá" uninterruptedly sang the words ho-he-hi-ha-fk, ho-he-hi-ha-fk, while "nonexí" uttered shrill sounds in between. At first the "battle" was enacted at some distance from the sick woman, but during the "argument" they drew nearer to her. "Nonexí" now danced alone at the head end of Xunamí, and the two "hekurá" stroked the body of the sick woman and sucked at it. Then they vomited, and one of them suddenly took a stone out of his mouth, and the other, a piece of wood. With shrill cries they threw these objects away, while "nonexí," who was still at the head end of the patient, crouched down and started to whimper loudly. With the stone and the piece of wood the sickness was to be hurled back to the Waiká. Then the sham battle between "nonexí" and the "hekurá" began anew, frequently interrupted by the sucking and stroking of the body of the sick woman, who suffered everything indifferently. Meanwhile the men kept blowing snuff-powder into each other's noses. For four hours the treatment went on, but there was no improvement to be seen in Xunamí; rather, she grew worse. The sick woman was then set on the ground in front of her hammock, and two other men, this time only personified hekurá, continued the treatment in snuff-powder intoxication, in that they danced around the woman, sang, and screamed loudly. In between, they stroked Xunamí's body and sucked out little stones, which they spat upon, licked, and then rubbed against their own bodies before they hurled them away with shrill cries. Now and then they also struck out with hands and feet and threatened an invisible foe. Occasionally they spat and stepped on the sputum with gestures of repugnance. Then the patient was again placed in her hammock and doused with cold water.

As a result of the high fever and long fasting, Xunamí was already very weak. But during the coming night a very great rekurá (magic cure; see also p. 211) was to be performed, and, to be sure, by Chief Hewemãõ and eight helpers. (The chief

/98 cont./

765 intervenes only if the day-cures of individual men have been unsuccessful.) Immediately after darkness set in, the men assembled, eight of whom, including the chief, had painted their faces and bodies with red serpentine lines, while the ninth was blackened with soot. A little to one side of the sick woman they formed a circle around the large clay plate standing in the center, upon which there was snuff-powder. They blew considerable amounts of this into each other's noses and then danced around in a circle, singing loudly and shouting. This, as the chief later explained to me, was to establish contact with the hekurá. These preparations lasted about half an hour. Then, dancing and singing, they drew nearer to the sick woman. This time she stood in front of her hammock, held by her husband, who had slipped his arms under hers and folded them over her chest, for she was no longer able to stand alone. Shouting loudly, the men danced around her several times and then leaped into the inner circle of the large, open maloka, where, in great rage, they hurled away invisible objects. Then they spat upon them and trampled furiously on these imaginary objects, at the same time uttering loud threats against the Waiká. After that they danced and leaped in apparent disorder back and forth between the sick woman, whose body they stroked a few times at each encounter, and the inner court of the maloka, during which they now and then shouted loudly, executed wild leaps, and at the same time turned in a circle. Whenever they came outside the dwelling part, they again tossed away invisible objects. This dancing, leaping, and shouting, the motions of /99/ casting away, the bending of the knees, the pointing forward and upward with the hands seemed to be utter confusion, and the noise that went with it was indescribable. After that the chief and his brother danced alone for about 40 minutes around the sick woman, who meanwhile was being held by another man. They blew in her direction and sucked at her body, at the same time massaging it. By turns they leaped a few meters backward and threw away imaginary objects. -- Meanwhile the eight medicine-man helpers had moved away a bit from the hearth. The man blackened with soot lay on the ground, symbolically portraying the evil

/99 cont./

755 nonexí, while the other seven, who, exactly like the chief and his brother, identified themselves with the hekurá, danced and leaped around him. They kicked at him with their feet, uttered invectives, threatened him with their fists, and beat him. Suddenly, "nonexí" tried to flee, but the other men quickly caught up with him and threw the "evil spirit of sickness" to the ground again. They tapped his body, sucked at it, and spat over him. In fact, they even beat him symbolically with sticks. Then a stone weighing two kilograms was placed on the abdomen of "nonexí," was picked up again after a short time, and was hurled away. At that the fiendish noise suddenly ceased. Chief Hewemãõ squatted before the sick woman, completely absorbed within himself. Behind him crouched his brother Kurikayawõ, who stroked his body and head and lightly tapped his back. Complete silence prevailed; only the moaning of the chief and of the sick woman was to be heard, frequently interrupted by the loud sighs of the former. The other seven "hekurá" meanwhile squatted silently around the prostrate "nonexí." The sick woman now sat between the legs of the man who had hitherto supported her. After the chief had concentrated, which lasted about 30 minutes, all the participants in the rekurá formed a circle around Xunamí. The chief crouched directly opposite her, face to face with her, and commenced to sing loudly in a wonderful baritone voice, while the other eight men, with the exception of the "nonexí," joined in chorus. It was a part song and so melodious that it sounded to me like an organ. Now and then the medicine-man helpers stood up and walked, singing, around the patient, while the chief stroked her body from head to foot, massaged her, tapped her, and sucked at her. Each time he would spit out imaginary objects, whereupon the other men always broke out in loud cries of "oh" and "ah." This choral singing and the manipulations accompanying it lasted for about three hours. Then Hewemãõ sucked especially vigorously on Xunamí's body, while his hands kept stroking her downwards. All at once there was a stone weighing about one kilogram in his right hand, and three small stones, two pieces of wood, and two fingernails in his left. He had sucked all these

/99 cont./

755 objects out of her body and now hurled them away with gestures of disgust, amid the loud shouts of "oh" and "ah" by his helpers. During this sucking and stroking, the chorus of all the "hekurá" standing in a circle swelled to tremendous power and subsided only after Hewemãõ slowly withdrew, for his work was ended for the time being. He was bathed in sweat and, completely exhausted, lay down in his hammock, where his two wives provided him with a nourishing meal consisting of roasted tapir meat, manioc flat-cakes, and a bacaba drink.

The sick woman was not released, however, even after this five-hour cure. From 11:00 to 1:00 at night the husband and the medicine-man helpers continued it in the manner described above. The main thing was the choral singing and the dancing in step, with occasional sitting, stroking the sick woman, sucking, threatening hand movements toward an invisible opponent, spitting, etc. added. At 1:00 two more men dropped out, including the husband. The latter now lifted his wife up and laid her in her /100/ hammock, then he crouched beside her and tenderly supported her head. For about another two hours the medicine-man helpers went on singing and "curing" and after that one alone until around 5:00. Only then could the sick woman surrender herself for a short time to a well-earned rest (501). Many other members of the tribe watched this magic

[761]

501. If patients have become very much worse, they are kept awake as much as possible to prevent their life from escaping. For if they fall asleep, death might take possession of them.

performance, above all women, who wept softly during it. They crouched in a semicircle at a somewhat greater distance and watched the proceedings with rapt attention, but only as long as the chief was acting. When he finished his work, the spectators gradually disappeared.

Unfortunately, all efforts remained unsuccessful in this case, and Hewemãõ confessed to me the next day, when the sick woman

/100 cont./

755 was much worse, that this time the power of the Waikâ medicine
123 men was extraordinarily great. I then proposed to him that I
179 should give Xunamî penicillin injections. After lengthy consultations with the husband and other male members of the tribe he consented, though with misgivings, and luck was with the patient as well as with me. From this moment on the name penicilina (Portuguese spelling) became a magic word, for it had helped to cast away the sickness. Hewemãõ even asked me to bring him a great deal of it on my next visit.

755 c) Magic cure (rekurâ) for Xanimâ:

Xanimâ, the approximately 47-year-old mother of
[164] Anyarawõ (see p. 126), had been ill for five days with chicken
pox and had had persistently high fever. At first she, too, was
[959] given the water cures, that is, she constantly had to take baths in the river and drink a great deal of water; as her weakness increased, she remained lying in her hammock and was doused with cold water. After that there were sham battles between two "hekurâ" and the bad, black-colored spirit of sickness, "nonexî."

When there was no improvement, Chief Hewemãõ and eight helpers again arranged a large, nocturnal rekurâ, but this time a somewhat different one, because, of course, a different
[302] sickness was involved (502). At first the men, eight with red

502. As has been mentioned above (see p. 212), every sickness has very definite texts, melodies, and dance steps.

serpentine lines painted on their faces and bodies and one colored black, in the light of the hearth, again formed a circle around the large clay plate standing in the middle, on which snuff-
[296] powder had been poured. They filled their snuff tubes with generous amounts of it and blew it into each other's noses, whereupon, after a few minutes, the state of ecstasy set in. The men hopped around their own axis several times, and, after a hissing sound on the part of the chief and with prolonged shrill

Suréra

/100 cont./

755 cries in the most diverse tones, they rushed toward the sick woman. They were like a wild horde, for the participants screamed at the top of their voices, bent their knees, leaped into the air, and shook their fists at an invisible foe. After a renewed hissing sound by Hewemão, they formed a circle around the sick woman lying in her hammock, and each man placed both hands on the shoulders of the one standing in front of him. With swaying dance steps, two forward and one back, 535 533 during which they sang ho-he-hi-ha-fk, ho-he-hi-ha-fk, they walked around the patient for some time. Then Hewemão hissed for the third time, whereupon the song ceased. Then the chief 755 struck up a melodious song which his helpers underscored with 533 humming. Meanwhile, with swaying step, they continued to 535 move around the sick woman, their hands always on the shoulders of the man in front as before. After 15 minutes Hewemão hissed again, and then they laid their hands crossed upon the shoulders of the one walking ahead. At the same time all the men joined in the song /101/ of the chief, and again they sang in parts. This choral singing, together with the dancing in step, lasted another 20 minutes. Then the chief and his brother Kurikayawõ placed themselves opposite each other at the head end of the patient and struck up an alternate song. At the foot end squatted two helpers who also faced each other and hummed softly. A short distance behind the head end two more helpers danced back and forth with faces turned toward each other; they were also humming, and occasionally they uttered bird-like sounds; they frequently ran their fingers through their hair and then always passed them downward over their seats. 755 Meanwhile the other three men, two painted red, the one black-colored, that is to say, two "hekurã" and "nonexf," were carrying on a sham battle beyond the foot end of Xanimã, in a manner similar to that already described on page 216. In the meantime the daughter-in-law of the sick woman had raised her up and had seated herself behind her in the hammock, at the same time supporting the old woman with both arms. Then when the sham combat was ended, and the bad "nonexf" lay on the

/101 cont./

755 ground and the two "hekurá" crouched beside him as "victors," a part song by all the participants began once more. At the same time the chief stroked the head and then the body of the sick woman. Then he started to suck at her, first at her head, then on the chest, on the stomach, and on the thighs. Then he uttered shrill cries and vomited. At this moment the singing ceased and all the helpers uttered loud cries of "ah" and "oh." Thereupon Hewemão hurled invisible objects to one side, which was always accompanied by ah and oh shouts of the other men. Then a chorus was struck up anew. This part of the magic performances lasted more than two hours. After the chief had sucked stones and pieces of wood out of the body of the sick woman and hurled them away amid animated cries of ah and oh by the helpers, however, the volume of the singing increased and was followed by shrill cries which ended in a general humming. -- After that there was complete silence. The men sat down in a circle around Xanimá, and each one leaned his head against his knees, for all were visibly exhausted, especially the chief and his brother. The wives of the latter, however, had seated themselves behind them and stroked their heads and shoulders and gently tapped their backs in order to give the weary ones new strength, for during the curing process they had completely spent themselves. The sick woman, too, could now lie down again. She had her eyes closed and one could see how exhausted she was from sitting up so long. After the noise that had been going on, the stillness had a very strange effect. But after only 15 minutes one of the medicine-man helpers arose; he began dancing in a circle around the sick woman, during which he softly sang. Meanwhile, however, clouds had passed before the moon and a heavy rain set in. Hewemão then decided to break off the session and continue it at dawn. "For with a [821] darkened sky," he said, "without the co-operation of the moon, it would be impossible to free the woman from her sickness." He left behind with the moaning Xanimá, shaken with fever chills, two helpers who crouched to the right and left of her head end and hummed softly, in order that, as Hewemão told

/101 cont./

755 me, contact with the hekurá would not be broken. Toward 4:30, the rain had stopped in the meantime, the nine men once more gathered around the sick woman and continued the cure for another two hours in the manner described above. By forenoon the fever was gone and the woman was on the way to recovery. She and every other member of the tribe were convinced that Hewemão had hurled the evil spirit of sickness, nonexí, back to the Waiká. Even Hewemão himself firmly believes that in the snuff-powder intoxication and with the help of the hekurá and the moon he is able to ward off sickness and accidents and to cast them out.

/102/ The two above-described magic performances for warding off two different diseases show a certain external pattern. Each cure begins with the taking of snuff-powder, which causes the chief and his helpers to fall into a state of ecstasy and to identify themselves with the hekurá. There follows the invocation of the hekurá, which is reinforced by wild gestures, then the sham struggle between two or more "hekurá" and the spirit of sickness, "nonexí." After that, very definite texts, melodies, and dances are used for each sickness. Unforgettable [533] for me are the choral part-songs which contain the requests to the hekurá and the serras, who, in turn, relay them to Poré/Perimbó (see pp. 197 ff.) (503).

[126]

503. I deeply regret that I was unable to record these songs on a sound track. Unfortunately, the tape recorder which the Deutsche Forschungsgemeinschaft had sent by courier to the German Consulate in São Paulo before the start of my expedition was damaged by an employee there. Without permission, he had unpacked it and tinkered with it. Thus, I can only hope that on a subsequent expedition I shall have an opportunity to record these songs.

Surára
Pakidái

/102 cont./

755 I was allowed to take part as a spectator in all the cures,
[123] and each rekurá was a new, great experience for me. I was
755 amazed at the devotion, passion, and fervor with which the
756 chief and his helpers interceded with all their physical and
622 psychic powers to ward off the sicknesses of their fellow-tribesmen (504). This explains why the Surára and Pakidái

[123]

504. The same care was bestowed upon me, the stranger. If I had an attack of malaria, the chief and his helpers likewise danced around me, and they sang in chorus while Hewemão stroked my body, massaged it, and sucked at it. He was of the opinion that the Waikâ had poisoned my blood because I lived in friendship with the Surára and had brought them so many beautiful gifts.

have such boundless confidence in their chiefs and are absolutely convinced of their magic powers. It is doubtless due to this unshakable faith that so many of the sick can be cured (505).

505. I never saw the chiefs demand a fee for their cures. The members of the tribe show their appreciation, however, by continuously offering their chiefs larger or smaller gifts (see p. 130).

[431]

755 In this context I should like to cite the following very re-
756 vealing description by Herbert Baldus: "The witch doctors were
114 simply called imposters by early travelers, and even today all whites who are incapable of understanding the mentality of the Indian are of the same opinion. One forgets that, as a result of the suggestibility of the primitive, the magic practices not only essentially help the sick person and rid his relatives of their fears, but also weave such a spell around the practitioner himself that it is impossible to decide to what extent he is acting in good

/102 cont./

755 faith and to what extent he is faking" (506). The fact that
756
114

506. Baldus, 1931, p. 142.

even in modern medicine great importance is now attributed to the suggestive influence of the physician on his patients is shown in the following statements by Hans Grimm: "If we emphasize that the suggestive influence of the physician's personality on the patient is often of decisive influence (Jores), if we use hypnosis, the so-called 'autogenous training,' etc., we are, in our own way, returning to what was already playing a role in shamanistic techniques" (507).

507. Grimm, 1958/59, p. 357.

769 3. Religious Festivals

Every year, toward the end of the dry season, March-April, the Surára and Pakidái jointly celebrate the festival in memory of the dead -- patapáanomão -- (508). It always takes

[192]

508. This contains the word for corpse, the male or female dead person -- anomão.

place in the large, open Surára maloka Jaracá (see pp. 25 ff.). Occasionally a few families of friendly tribes (Xiriána, Puseheweteri, Aramamesteri, etc.) also take part. The
[114] patapáanomão festival, which I witnessed in all its phases, /103/ was held during the period from the fourth to the sixth of
769 April, 1956. But even before that there were great preparations
251 for this purpose. The men set out on a joint hunting expedition in order to kill as many tapirs as possible, the meat of which was then roasted on roasting racks over an even fire, not too hot, until it was black and bone-hard, so that it could be kept for a

/103 cont./

769 25 [462] few days. This roasting belongs to the men's sphere of duties, as does the harvesting of pupunha fruits. The latter are then made into a drink by the women. Moreover, they fetched from the plantings large quantities of bananas which were put in the sun so that they could ripen, and, finally, it should be mentioned that among all the families several stacks of manioc flat-cakes were piled up little by little.

769 535 [276] On the evening of April fourth, toward 9:00, the actual festival began. Five men and five boys, who wore cotton belts over their hip cords, danced, after the former had first blown snuff-powder into each other's noses, one behind the other (two steps forward and one back, during which the more marked lifting of the knees with a slight turning outward of the legs is to be noted), on a circular path in the open circle of the maloka, and, to be sure, counterclockwise (509a). The first two men

509a. In all the dances that go around the periphery of a circle the participants dance counterclockwise.

each held two arrows in the right hand, and the rest, as well as [533] all the boys, had their hands crossed behind their heads. Occasionally one man would sing in a beautiful, full bass voice, and the others would then join in chorus. The songs were very melodious and furnished the rhythm for the dance steps (509b).

[534] 509b. The Surára and Pakidái accompany dances in part with songs, for musical instruments are unknown to them.

[276] Toward 10:00 more men, in part with arrows, in part without, and boys (all without arrows) joined the dancers, and at 11:30 all the men and boys, with the exception of the Surára chief, were gathered in the center of the maloka courtyard, where, from a large clay plate filled with snuff-powder that had been placed here along with several snuff tubes, they blew huge quantities into each other's noses. Then they sat down in a

Surára
Pakidái

769 /103 cont./Then they sat down in a
535 circle and started singing a song in chorus. Soon afterwards
[533] five warriors, holding arrows in both hands, arose and danced around the singers. Now and then they made huge leaps and shouted in a high, shrill voice. All this was enacted on a cool, cloudy, full-moon night, but the numerous hearthsadded some light. All the women and girls, as well as my servant Mateus and I, lay in the hammocks and watched the unique spectacle. Toward 1:00 in the morning the male participants in the festival arose and now danced, again one behind the other, around the outer circle of the maloka courtyard. They were arranged in such a way that a man with two arrows was always followed by one who held his hands crossed behind his head.

[622] Suddenly Chief Hewemãõ, who was sleeping in his ham-
[123] mock next to me, was tapped lightly by a warrior with an arrow. He got up at once, removed shirt and trousers (he had been given the two articles of clothing by me as gifts), took a bow without a bowstring in his hand, had snuff-powder blown into his nose, and mixed with the dancers, who, however, immediately after his entrance formed the following new formation: Ten men arranged themselves in rhombus form at the head of the dance procession, one at the very front, two behind to one side, and two more behind and to one side of these; two stood directly opposite the latter, then followed two who stood somewhat inward and finally one who was in the middle behind these (Fig. 29). The first five warriors, who had blackened themselves with soot, symbolized the nonexĩ (evil spirits or spirits of sickness, see p. 211) and were obliged to dance backwards. The five dancers following them embodied hekurã (gigantic animal and plant spirits who /104/ /Fig. 29 appears here/ Pakidái; see pp. 199, 214 ff.). Between these two groups of five, the participants of which each held two arrows in their hands, a sham battle was being carried out during the dance (see also pp. 214 ff.). Each of the men of the first group danced two steps back and one forward, and those of the second, two steps forward and one back. In between, wild leaps and turns were executed, the men threatened each other with the arrows and screamed in the highest key. The "nonexĩ" were constantly in

Surára
Pakidái

/104 cont./

769
535

Fig. 29. Arrangement of the dancers on the occasion of a ceremony of the festival in memory of the dead.

retreat and defended themselves with all their might against the advancing "hekurá." Behind these ten "fighting" dancers there followed six men in a row, each with an arrow in his hand, the advance guard of the chief. At a slight distance they were joined by the Surára [622] chief Hewemão, flanked on either side by six men forming a double row. These men were also prominent personalities; thus, among them there were the two younger brothers of the chief, the war chief of the Surára, the chief and war chief of the Pakidái, as well as especially excellent older warriors of both tribes. Following them, as a rear guard, in a double-row formation, came the rest of the men, young men, and boys. All who took part in the procession moved in the customary dance steps, two forward and one back, during which they sang in chorus. Now and then Chief Hewemão would utter a hissing sound, whereupon all the participants grouped themselves in the center of the plaza around the large clay plate with snuff-powder. Here the chief, in a singing voice, prayed to the hekurá [622] and asked them to intercede with Poré/Perimbó, so that the festival [782] would be vouchsafed a happy and successful course. Then the men [276] blew new snuff-powder into each other's noses, whereupon the dance would continue in the manner described above. This dancing and singing lasted, except for the brief interruptions at the clay plate, until 6:00 in the morning.

Surára
Pakidái

/104 cont./

769
788 Immediately after that the Surára chief squatted down at his hearth, and beside him squatted a medicine-man helper. On the opposite side of the large maloka the Pakidái chief and a helper had assumed the same position. Hewemão, the first-named chief, began to speak loudly and distinctly to the hekurá (gigantic animal and plant spirits). While doing so, he kept stroking his hair from front to back and then slapping his seat. The helper squatting beside him repeated each of his words and copied all his movements. (This was to express symbolically that the hekurá, the intermediaries between human beings and the united Supreme Being, Poré/Perimbó, actually pass on all questions, requests, and wishes). After Hewemão, the Pakidái chief spoke to the hekurá, and his helper likewise repeated each word and imitated the gestures (stroking the hair and slapping the seat). This exorcism, which the two chiefs carried out alternately, lasted an hour.

769
461 After that the two exhausted chiefs and the rest of the men, young men, and boys lay down for a well-earned rest. /105/ Meanwhile the women had been going about their accustomed activity. They fetched water, prepared food, took care of the children; some of them also plaited a basket in the meantime, or they strung glass beads on a string. Some of the men who had meanwhile awakened continued to lie idly in their hammocks, some also played with the children, while others sat together in groups and talked.

769 Toward 2:00 the festival was resumed when 20 men, young men, and boys, each of whom held an arrow in his hand, rushed into the maloka courtyard with loud shouts. They were [302] magnificently painted (510) and on the upper arms and in part [301]

510. The painting had been done with urucú color and consisted of serpentine lines, circles and dots; several men, however, had painted their whole bodies red.

/105 cont./

769 in the ear lobes were adorned with colorful feather ornaments
[302] (see pp. 93/95). Moreover, they had all glued into their hair
[301] the white down feathers of the gavião-real (Thrasaetus harpyia L.),
the dreaded carrier of sickness (see p. 211) (Ill. 43). They
769 made mighty leaps, then bent their knees, turned around
535 several times in between, threw their arrows into the air and
533 caught them again. After that they fell into a dance in step,
during which they sang. But this dance was constantly interrupted by wild charges and rousing shouts, which were supposed to drive the nonexí out of the maloka and show them how dangerous it was to come here at all. The others present were enthusiastically watching this performance from their hearths. For the
[302] occasion of the festival all the men, women, and children had
[292] likewise painted themselves and in part donned the cotton belts;
[301] moreover, the men wore their upper-arm ornaments of feathers (Ills. 9-11).

769 After this two-hour dance performance a particularly solemn ceremony took place, the blessing of the preserved bone ashes of deceased tribesmen. For this purpose two leading personalities of each of the two tribes sat down in a square formation before the chief's hut. The Surára chief Hewemão was squatting in such a way that he faced the maloka courtyard. To the right and left of him, somewhat to the side and forward, squatted the Pakidái chief, Karenauõ, and Hewemão's brother, Kurikayawõ, respectively, and opposite Hewemão, Porêhiwõ, the war chief of the Pakidái, had his place. In front of the latter were arranged ten small jamaru vessels (jamaru = Cucurbita idolatrica Lacerda) filled with bone ashes. Behind them stood one empty gourd bowl and one filled with urucú. The Pakidái chief, Karenauõ, on the other hand, had two large empty jamaru vessels standing in front of him.

Porêhiwõ now poured bone ashes from one after another of the small jamaru vessels into the empty gourd bowls, added a little urucú, mixed the two with his hands, and gave the bowl to Karenauõ, who each time poured the contents into one of the
[782] larger jamaru vessels. While the two Pakidái were silently per-
[788] forming their work, Hewemão was praying in a half-singing

Surára
Pakidái

/105 cont./

769 voice to the hekurá and constantly passed his hands from his head
[782] to his feet. His brother Kurikayawõ repeated each of his words
[788] and imitated the gestures (511). Around the four men, who were

511. This was again the symbolic transmission of the prayers from the hekurá to Porẽ/Perimbõ (see also p. 228).

now officiating as priests, crouched red-painted warriors whose head hair was completely covered with the down feathers of the gavião-real. Whenever the Pakidái chief poured a new mixture of bone ashes and urucú into a larger jamaru vessel, he always pulled a few feathers from the heads of the warriors and threw them in (512). The closest relatives of the late deceased sat

[751]

512. There is defensive magic connected with this. For if the men, in the subsequent ceremonial drinking of the banana soup mixed with bone ashes, swallow these feathers, they and their families are better protected against sickness.

behind the warriors and sobbed heart-rendingly, especially the
[782] women. Their tears /106/ flowed uninterruptedly, and at the same time they prayed in a low, singing cadence. When the bone ashes of another jamaru vessel were mixed with urucú by Porẽhiwõ, their sobbing and their prayers changed to high, shrill tones. This made no impression upon the medicine men, however, who imperturbably went on with their activity. The
[302] [301] mourners were surrounded by a circle of standing warriors painted red and adorned with upper-arm feathers, who held bows and arrows in their hands and faced outward. It was their task to shield
[522] the ceremony against harmful outside influences. Behind them stood numerous male spectators, who followed the proceedings with interest, to be sure, but without inner participation, for at times they laughed and joked.

Surára
Pakidái

/106 cont./

769 When the mixing of bone ashes, which lasted about two hours, was finished, Porĕhiwõ returned the half-empty little jamaru vessels to the relatives, who, amid lamentations, took them for further safekeeping. Then a solemn procession began, in which, however, the Surára chief did not take part. Karenauõ, the Pakidái chief, strode ahead, followed by Porĕhiwõ and Kurikayawõ, each of whom held in his hand one of the large jamaru vessels filled with bone ashes, a little urucú, and a few down-feathers of the gavião-real; all three were singing prayers. Behind them, weeping and lamenting, walked the closest relatives, who carried the small jamaru vessels. The warriors participating in the ceremony formed the end of the train.

[533] [782] This procession, which walked around the maloka courtyard several times, came to an end, after half an hour in front of the chief's hut, with a prayer sung in unison.

[517] Meanwhile night had descended and most of the members of the two tribes were lying in their hammocks, sitting around the fire, or calling on each other, singly or in family groups, in order to chat. Loud, happy laughter often resounded. Opposite the hut of the Surára chief, however, six warriors who wore the feathers of the gavião-real in their hair had kindled three blazing fires, upon which, in several black, round-bottomed clay vessels (see p. 115) they cooked banana soup until midnight. During this time a medicine-man helper who carried a bow and arrow in his hand ran around the outer circle of the maloka courtyard, singing loudly, and requested the assistance

[625] of the hekurá for the success of the soup. After that, general quiet set in; only two men made their rounds in front of the maloka, as they did every night, in order to warn the inhabitants, if necessary, of a hostile attack (513).

[624] [805] 513. The war chief divides up the watches each evening. The warriors have a feeling about when their time is up and they must waken their successors; as a rule this is done after two or three hours.

Surára
Pakidái

/106 cont./

769
266 On the next day, April 6, 1956, the festival reached its climax. Toward 9:00 the Surára chief, his brother Kurikayawõ, and the chief and war chief of the Pakidái sat down around the pots of banana soup, in front of which also stood the two jamaru vessels with the bone ashes of the deceased, and all the other [533] male members of the tribe sat around them. The Surára chief started to pray loudly, whereupon a rather long choral song was struck up. Then he poured the bone ashes into all the soup pots, mixed them thoroughly with his hands, and scooped out a calabash full for himself, which he emptied hastily and to the last drop. Thereupon the Pakidái chief, the brother of Hewemão, and the war chiefs of both tribes drank, followed by all the older and younger men, including the larger boys, who drank last (514). As a result of this ceremonial drinking of the

[123]

514. Hewemão also offered my servant and me a full calabash each, along with the war chiefs. When we had drunk them, he slapped our backs appreciatively and said that we were now true Sarára.

bone ashes, it is believed, the strength and spirit of the de-
769 ceased will remain within the tribe and contribute to its vigor.
[533] Following this drink, a prayer of thanksgiving was sung.
[782] Then the men, youths, and boys together ate large quantities
/107/ of the roasted tapir meat, as well as manioc flat-cakes,
[262] and after that the women handed them calabashes full of the refreshing drink made of pupunha fruits.

Invigorated and fortified with the powers of the deceased, the men were now able to proceed with the most strenuous part
[302] of the festival. But before this began, half of them blackened their faces and bodies with soot, which they scraped off of their
769 cooking pots. Meanwhile others had again set in the center of
276 the maloka circle the large clay plate upon which they poured the brownish snuff-powder -- epená --, out of bamboo containers, and in front of the plate they laid a large number of

Surára
Pakidái

/107 cont./

769
276 snuff-tubes. After these preparations, the chiefs, all the men, youths, and boys, light and black-colored participants, assembled outside the maloka. At a hissing sound from Hewemão they then stormed into the courtyard, screaming loudly, ran once around the periphery, and then grouped themselves around the clay plate. The snuff-tubes were filled with powder, and the men by twos blew it with all their might into each other's noses (Ill. 44). On the occasion of this festival they take even more snuff than before other magic performances, curing the sick, and prayers. The effect was extraordinary. After only a few moments all the men were in a wild state of ecstasy (Ills. 45 and 46). At first they danced and leaped, gesticulating and screaming, in wild disorder around the clay plate, and after that they stormed around the courtyard several times in the
[535] same manner. Then groups of five, ten, or more men put their arms around each other's necks and performed stamping circle-dances in this formation (Ill. 47), during which each man tried to pull another one tightly to him; now and then they also
769
526 danced with the knees bent. After half an hour, this ecstatic dancing, during which the participants were bathed in sweat, was replaced by an extremely strange type of sport -- petapóanhamũ. In the entire outer circle of the maloka courtyard there were seated everywhere two men opposite each other, chest to chest, with legs spread apart; in each case one had his on top of the thighs of the other one. The partners were always a Surára and a Pakidái; moreover, in each case one of them was blackened. They wound their arms around each other at the neck and, with vigorous arm movements, pulled each other back and forth with all their might (Ill. 48). Each tried to pull the head of his opponent quite close to him. Sometimes their arms would drop down on the back of the other one, and they would then pull at each other for a while in this position. During the struggle they constantly called out wrathful words at each other. Often the wives stood beside their husbands and spurred them on. But there were no victors and no losers in these combats. If the strength of a combatant flagged, another tribesman immediately came and continued the struggle with the opponent

/107 cont./

769 526 [622] [624] [147] in his place. The wife then massaged the head of the exhausted one, so that he would quickly be ready to resume. The chiefs and war chiefs in particular distinguished themselves in this type of sport. They also fought the longest, some of them with five, six, and more opponents; they had positively unbelievable strength and endurance.

These combats, in which one man always symbolically represented the good spirit, that is, a hekurá, and the other, who had smeared himself with soot, the evil spirit, a nonexf (see pp. 213 ff., 225 ff.), lasted almost two hours. After [262] that the men were completely exhausted and refreshed themselves with a new, joint meal of tapir meat and manioc flat- [276] cakes. Afterwards, however, many of the participants suffered from severe headaches brought on by the snuff-powder in connection with the inhuman physical exertion, so that many wives were obliged to massage their husbands' heads.

769 In the evening there was another half-hour procession in the maloka courtyard, when all the little jamaru vessels in which remains of bone ashes were stored were carried along. This retention of a certain amount of ashes is very important, so that the next festival in memory of the dead can be held, even though no member of the tribe /108/ dies up to that time. It could not take place without any bone ashes of deceased Surára or Pakidái.

769 114 184 If one compares this annual festival with that of the Waiká, which was described by Zerries in great detail (515), one finds

515. Zerries, 1955b, pp. 662-665.

extensive analogies in the most important phases. Zerries believes that among the Waiká it was originally a harvest festival to which other rites of various kinds were added (516).

516. Zerries, 1955b, p. 662.

For the Surára and Pakidái, on the other hand, it can definitely be said that here there are no features reminiscent of a harvest festival.

2: Becher--235 . E-5 (1955-1956) 1960 SQ18 Yanoama SQ18

769 182 184 789 526 [266]

festival. It is decidedly a festival in memory of the dead, which characterized by the ceremonial drinking of the bone ashes of deceased members of the tribe. At the same time, defensive magic against the nonexí is connected with it, for they, of course, are the ones who transmit sickness and thereby frequently cause death. As in all the magic cures for healing the sick, where the symbolic struggles between the "hekurá" and one or more "nonexí" are always enacted (see pp. 212 ff.), this factor is naturally also in evidence in all parts of the festival, in the dances, in the mixing of bone ashes, when the medicine man pulls down-feathers of the gavião-real out of the hair of the warriors and adds these, and in the duels performed in a sitting position. The latter are also documented for the Waiká in the same way, but Zerries writes that neither for him nor for the American missionaries was it possible to find out anything definite about the meaning of this ceremony (517). Presumably,

517. Zerries, 1955b, p. 665.

however, it is the same symbolic struggle between a good and an evil spirit as among the Surára and Pakidái. As yet nothing has been reported about this from other Indian tribes. My informants, however, told me that the Xiriána, Puseheweterí, and Aramamesterí engage in these combats on the occasion of their festivals in memory of the dead. Hence it seems to be a very special characteristic of the Yanonámi, which in former times may have been even more widespread. Herr Dr. Gerdt Kutscher, in connection with a lecture I gave in Berlin, called my attention to the fact that the position taken by the two men during this is reminiscent of the painting on a clay bowl from the Rio Ulúa, Honduras (518). According to Zerries, Barker,

114 769 526

518. This is in the Berlin Museum für Völkerkunde (No. IVa Ca 22381) and was reproduced in an article by Walter Lehmann (Lehmann, 1910, p. 737, Ill. 9).

Surára Pakidái waicá

114 /108 cont./ According to Zerries, Barker,
769 and Dupouy, there is also a similar combat among the Waiká,
769 in which the partners alternately beat each other on the chest
526 with clenched fists (519a, b, c). I did not observe this among
184

519a. Zerries, 1955b, p. 665.

519b. Barker, 1953, p. 447.

519c. Dupouy, 1953, p. 495.

114 the Surára and Pakidái. Similarly unknown there is the custom,
769 also reported by Zerries, that the men, when they run about in
296 the snuff-powder intoxication, hit each other on the back with the palm of the hand (520). The author named regards this as a

520. Zerries 1955b, p. 665.

769 fertility rite. There seems to be involved here, however, out-
179 side influences of agricultural tribes, which is indicated also by the ceremonial gathering of pupunha fruits (521).

521. Zerries, 1955b, p. 665.

769 It is further noteworthy that among the Waiká women and
184 girls actively participate in the festival in that they take part in
562 some dances and even drink some of the banana soup mixed with
[266] bone ashes (522). In contrast to this, the female members of

522. Zerries, 1955b, pp. 662 ff.

the tribe act only as spectators among the Surára and Pakidái.

769 The endocannibalism should be regarded as a very signifi-
184 cant similar trait. It is documented for the Waiká by Cruxent (523a)
266

769
266
171

Moreover,
/109/ the latter author, on the basis of contributions to the first five volumes of the Handbook of South American Indians, drew up a distribution map for the occurrence of endocannibalism, which was supplemented by numerous examples (526). Accord-

526. Zerries, 1955a, pp. 80/81.

ing to this, endocannibalism occurs in South American primarily in the western parts of the continent and among the marginal and submarginal tribes of the Tropical zone. This custom is particularly frequent among the Pano and Tukano /Tucano/. In most cases, besides the pulverized bones, which are mixed with chicha (for example, Pano and Tukano), water (for example, Tapuya), or a mash of Pará chestnuts (Moré Indians), the flesh is also eaten. The practice of the Surára, Pakidái, and Waiká, on the other hand, who consume only the cremated, pulverized bones, is very rarely found. The corresponding custom of the Sáliba, Guayupe, and Saé in Colombia is the most similar one. But in eastern Guiana, too, endocannibalism is widespread, for example, among the Karaiben /Carib/ Parukotó (527) and

527. Frikel, 1957, pp. 520 and 545.

among the Arapium, a Tupi tribe in the vicinity of Santarem (528).

528. Zerries, 1955a, p. 81.

Moreover, it is reported of the Kalina, Palikur, and Arawak that they consume cremated bones of the dead (529). Of the latter

529. de Goeje, 1943, p. 11.

Surára
Pakidái

/109 cont./

769 266 171 Ralegh also writes that they pound the bones to powder and consume them mixed with a beverage (530) (531), and the same has

530. Ralegh, 1848, p. 53.

531. Waitz, 1862, p. 388.

been attested to for the Mauhé (532).

532. von Martius, 1867, I, p. 404 A.

114 769 266 171 According to Whiffen, there is no endocannibalism at all in South America, for, according to his view, only vengeance against hostile tribes can be regarded as a motive for anthropophagy. "From all this," he continues, "it follows that intratribal cannibalism would be a criminal outrage by the tribe on itself, and therefore it could never occur that a member of the tribe was eaten, ... This disposes of any such thing as the eating of dead relatives as a sign of respect. These and similar statements are due to missapprehension /sic/ of facts by the writer, or a too hasty judgement on the part of the explorer" /cited in English/ (533). In conjunction with these devious

533. Whiffen, 1915, pp. 120/21.

statements by Whiffen with their completely unjustified criticism, I should like to cite a contribution concerning endocannibalism drawn up by Herbert Baldus and Emilio Willems (534):

534. This appeared in the eminently important, but long out of print, Dicionário de Etnologia e Sociologia /Dictionary of Ethnology and Sociology/, which came out shortly before World War II and is therefore, unfortunately, not available in most European libraries.

2: Becher--239 E-5 (1955-1956) 1960 SQ18 Yanoama SQ18

114 /109 cont./
769 /The long passage in Portuguese which follows on pp. 109-110
266 in the original source is omitted in the translation; see the
171 foreign text/ /110/ (535a).

535a. Baldus e Willems, 1939, pp. 40/41.

Most recently there appeared the commendable study by Boglár, "Ein endokannibalischer Ritus in Südamerika /An Endocannibalistic Rite in South America/," in which the author presents the material of several competent sources (535b). I

535b. Boglár, 1958, pp. 67-85.

cannot, however, agree with his interpretations in connection with them. The consumption of the bone powder of the deceased is by no means always to be associated with agricultural tribes, for, as my informants among the Surára and Pakidái explained to me, their forebears, who were pure hunters and gatherers, already practiced this custom. Also the author's view that the showing of respect, the magical transmission of good qualities, etc., can be regarded merely as secondary motives of the endocannibalistic rite (535c), do not apply to the

535c. Boglár, 1958, p. 83.

Surára and Pakidái; here they are decidedly primary. Among them the future life of the dead is assured by cremation, for with the ascending smoke the soul of the dead reaches the moon (see p. 151).

It should further be mentioned that endocannibalism is documented also for Central America, Mexico, and in one case in North America, but Beals regards it as a typical element of the South American Indians (536).

536. Beals, 1932, pp. 123/24.

Surára
Pakidái

/110 cont./

527 Between the patapáanomão festivals the Surára and Pakidái have only a few other festivities in the course of the year. These are but small celebrations, which, for example, take place after the two-months' training of two young men as medicine-man helpers, after a successful war-expedition, upon moving into a newly erected maloka, and in connection with the second menstruation of a girl. The latter has more of an intimate character, for only families of relatives and friends take part in it.

754 825 4. Magic for Sickness, Hunting, Love, and Rain

a) Magic for sickness:

[824] A magic powder is occasionally prepared from the bark ashes of a wild mimosa species (Mimosa acacioides?) -- hekuráhihená -- (see also p. 192) and the bone powder of the gavião-real (Thrasaetus harpyia L.). In the evening, shortly before twilight sets in, if a gavião-real happens to be flying by or is sitting on a tree, the chief blows this powder in the direction of the bird. The latter receives it and with it transmits sickness to a specific hostile tribe.

224 789 b) Hunting magic:

[782] The evening before a proposed hunting expedition the hunter takes snuff-powder and prays for about 2-3 hours to the hekurá (see pp. 200/201), whereby through them he requests [302] Poré and Perimbó (see p. 197) for a successful outcome. Then, before he sets out the next morning, he paints serpentine lines [825] on his face and body with urucú. If his wife accompanies him, she also applies this design, and the snout and feet of a dog that is taken along are painted with the same color. This is [751] supposed to increase the luck of the hunt and is at the same time bound up with defensive magic against possible dangers threatened by poisonous snakes and jaguars.

Surára
Pakidái

/110 cont./

224 If the hunter accompanied by his wife has slain small game or a bird, the wife carries the hunting booty into the community /111/ house. If the man was alone, he brings the animal only to the entrance of his dwelling. It is taken inside by his wife or by another man. The same is true for big game, for example, a tapir, from which a few pieces of meat are first taken along; the rest is fetched later by friendly fellow tribesmen. Thus, the hunter may always carry his booty to the entrance of the maloka, but he may never go inside with it. He must also leave the evisceration of the animal to other men. Subsequently he may roast the meat, to be sure, but after it has been prepared, he is forbidden to eat the first morsel. When
[782] he has finished his meal, he is obliged to pray anew by way of the hekurá to Poré and Perimbó, for the latter demand that one thank them for the hunting booty. If the hunter observes all these rules, the united Supreme Being and the hekurá will always be well-disposed toward him and will always provide for a successful outcome of the hunt.

224 Among many other tribes of South America there are the
191 same or similar conceptions of hunting magic. I can here refer
114 to Zerries, who has gathered together the pertinent source material and made a comparative study of it (537) (538). This

537. Zerries, 1951.

538. Zerries, 1954a.

shows that urucú is almost always used for the red coloring before the hunt. Métraux, however, mentions that the ancient Mocovi in the Gran Chaco smeared the snouts of their dogs with jaguar blood (539). From this Zerries draws the justifiable

539. Métraux, 1944, p. 283.

conclusion that urucú is a substitute for blood (540), which

540. Zerries, 1954a, p. 22.

224
191
114

/111 cont./
Métraux also documents for the Chiriguano (541).

541. Métraux, 1931, p. 154, footnote 1.

It should also be pointed out that the hunting rule so strictly observed by the Surára and Pakidái men, which says that a hunter may never carry his game into the maloka himself, can probably be traced back to Karaiben /Carib/ influences. In this connection Zerries speaks of propitiatory rites relating to the killed animal (542). According to his investigations, the

542. Zerries, 1954a, p. 359.

northern region of South America emerges as the nuclear area, where they are found primarily among Karaiben tribes of the Venezuelan coast and its hinterland (543). The author cites

543. Zerries, 1954a, pp. 136/37, 359/60.

Roth (544) and Crévaux (545) as the most important sources, as

544. Roth, 1915, p. 294.

545. Crévaux, 1883, p. 283.

well as the very old report by Rochefort (546), which shows that

546. Rochefort, 1658, p. 451.

even the Island Karaiben were acquainted with this custom.

832
[824]
c) Love magic:

For the purpose of love magic, young men sometimes wear a curauá-fiber string around the neck, to which is fastened a small piece of the root of the taja (Colocasia antiquorum and Xanthosoma violaceum Schott) -- h[illegible]rē -- (see p. 83). If the

/111 cont./

832 wearer bites on it and holds it under the nose of a girl or a woman, he gains her favor through the fragrances emanating from it. In fact, I was told that love will then be so great that the woman or the girl would follow him everywhere (547).

547. This type of love magic is reminiscent of a myth of the Aruak /Arawak/ Manao: The Aromatic Root. (Baldus, 1958, pages 32 ff.)

In order to protect themselves from this love magic, married women use two kinds of neck chains. Younger ones [824] have tied to their string of curauá fibers numerous small pieces of tajá root, and older ones, small pieces of the camarau liana (Cipó sp.) -- hií -- (see p. 83). These many pieces of root or liana then counteract the effect of the young men's single piece of root.

754 If a man is angry at a woman because she does not give him a hearing, he can avenge himself in the following manner: [824] On a rainy day he tears off a leaf of the pupunha palm (Guilielma speciosa Mart.) and goes with it into the forest. When he reaches a matamatá tree (Eschweilera matamata Hub.) from which /112/ drops are falling, he lays the palm leaf under the tree. He leaves it there until it has rotted. Out of it comes a worm which the man later fetches and then roasts. If he throws this upon the sleeping woman, she will have no more children.

789 d) Rain magic:
821 Although the Surára and Pakidái appreciate rain more than too strong a radiation from the sun (548), there are occasions when

[171]

548. In contrast to this, I should like to point out that among the Taulipang, for example, there is great fear of rain (Koch-Grünberg, 1916, pp. 130/31).

/112 cont./

789 it is not needed, for example, before hunting expeditions or
[821] during a tribal migration. In this case all the men, women,
[302] and children paint their bodies with a confusion of serpentine lines, in order by this means to command the rain to stop. If
526 this does not help, a tug of war -- toõtotõ -- with a thick liana
789 is arranged. This liana personifies the sucuriju (Eunectes murinus) --
[796] uaikonyã -- which, as a strong water-animal, has the power to induce Porê to stop shaking the rain tree (see p. 199). At first only two groups of red-painted men engage in the tug of war. But if the rain simply will not abate, red-painted women also take part in it. Their participation is supposed to increase the
[796] pressure on the sucuriju, for it is assumed that it is of the female sex and thus particularly well-disposed toward women. Such a
[857] tug of war often goes on for several hours. In most cases, besides adults, I also saw children who imitated it with a thin liana.

526 If it happens to rain while the sun is shining, the Surára
789 and Pakidái believe that a serious fight has broken out between
821 the moon, from which the rain comes, and the sun. Then all the members of the tribe feel obligated to come to the aid of their Supreme Being, the moon. They do this by again forming two mixed groups of men and women -- one symbolically represents the population of the moon and the other that of the sun -- who throw wet earth at each other; this "battle" is called xejejõ.

782 5. A Special Way of Showing Gratitude to Porê and Perimbõ

In connection with the festival in memory of the dead (see pp. 224 ff.) after the training period of the two medicine-man helpers (see pp. 143 f.), after the curing of the sick (see pp. 211 ff.), and other magic ceremonies, the people want to thank Porê and Perimbõ (see p. 197) in a special way, outside of the customary prayers which take place through the hekurá (see pp. 199/201). For this purpose a large calabash is filled with earth,
[824] into which, in a circle, are stuck red-painted twigs of the imbauba tree (Cecropia palmata Wild.), which are connected

Surára
Pakidái

/112 cont./

782 with threads of Bromelia fibers. Such threads are also drawn
[824] crisscross over the sticks, and on them are glued down-feathers
[237] of the gavião-real (Thrasaetus harpyia L.). The structure --
akuanohé --, which women and girls are not permitted to see,
gives the effect of a man's head, in the hair of which are glued
down-feathers of the gavião-real. By order of the chief, several
warriors take this calabash into the forest and set it down in a
particular spot.

825
202

6. Birds as Transmitters of Messages

On May 21, 1956, in his maloka on the Cachoeira dos Índios on the upper Rio Aracá, a Surára man, Honohomá, was engaged in a loud monologue which started about 4:00 in the morning and lasted until about 6:00; during this he was lying in
[114] his hammock. As to the meaning of this apparent monologue, my little interpreter Jibeauwõ afterwards gave me the following explanation: When Honohomá woke up, he heard the singing of the little bird kaukaumã, a japim (Cacicus cela L.), in which at the time, however, the soul of Porêhiwõ, the war chief of the Pakidái, was to be found. The latter was living with his tribe in the /113/ maloka on the middle Demini. The soul in the little bird said that the Pakidái, after the festival in memory of the dead, had arrived safely at their communal house. At the same time it reported the course of the journey in detail, the hunting successes, and the planting of new banana trees and pupunha palms. Whenever the little bird interrupted its song for a time, Honohomá would tell it about how the Surára were getting along.

According to the belief of the two tribes, the little japim is a transmitter of messages, who reports illness and death, as well as military encounters with hostile tribes.

/113 cont./

7. Types of Sports

526
[578] Aside from the stick duels -- xelekuhahé --, which are carried out for reasons of jealousy (549), all other types of sports

549. I have already described these stick duels in detail (Becher, 1959, pp. 162-167).

have a religious or magical character.

[237] Noteworthy above all is the game of ball with a monkey bladder -- yarobussí. Only male members of the tribe may take part in it, and for this purpose they always put on their cotton belts. Then they form a circle and keep hitting the bladder upward with the palm of the hand; it then represents both the sun and the moon (Ill. 50).

526
171
821 This game of ball is very similar to that of the Uitoto /Witoto/, even with respect to the lunar and solar conceptions associated with it (550a). Moreover, it should be mentioned

550a. Preuss, 1921, pp. 123, 133-136; 1923, pp. 644 to 659.

that in a myth of the Paressi both celestial bodies are thought of as feather balls (550b). Finally, reference is to be made to the

550b. Karl von den Steinen, 1894, pp. 435/36.

Aztec popular belief in which the flying ball is likewise identified with sun and moon (551).

551. Krickeberg, 1948, p. 139.

526 Three other types of sports of the Surára and Pakidái have already been described elsewhere: petapoanhamú, the fight

/113 cont./

526 between two men embracing each other, which is performed in a sitting position (see p. 233); the tug of war (see p. 244); and the throwing of wet earth at one another (see p. 244).

539 [115] IX. Myths and Legends

The following myths and legends were told me by the Surára chief Hewemãõ:

The Creation of the Yanonámi

The earth already existed and was full of plants and animals, but as yet was without human beings. But one day the first man, Uruhí, came out of the leg of the xiapó, a small bird with black and yellow feathers similar to the japim. A short time later the bird-leg gave birth to a second man, then a third, a fourth, and finally a woman, Petá. These four men and the woman lived together in perfect harmony. Petá, to be sure, was the wife of Uruhí, the first-born, but the other three brothers also had the right to have sexual intercourse with her (552).

[835] 552. Among the Surára and Pakidái, the younger, unmarried brothers likewise have the right to have sexual intercourse with the wives of their elder brothers. Moreover, the members of both tribes believe that a woman is able to have strong children only if she has frequent intercourse with other men during her pregnancy.

[843]

After a year Petá gave birth to a strong, healthy boy who grew rapidly and called all four men "father" (553). The boy's

[601] 553. The Surára and Pakidái children also call the unmarried brother of their father, not uncle, but likewise father.

Surára
Pakidái

/113 cont./

539 chief delight was to kill small birds with his little bow and arrow. But one night, for fun, /114/ he aimed at the moon and shot off his arrow. At once an eclipse of the moon set in. Blood dripped down and poured like a flood over the entire earth (554). From this blood came all the Yanonámi, that is,

[184] [821]

554. For this reason the Surára and Pakidái children are strictly forbidden to this day to shoot their arrows in the direction of the moon.

the Surára, Pakidái, Puseheweteri, Aramamesteri, Xiriána, Karauateri, Wa[illegible]á, etc. (see p. 12).

The Origin of Fire

539
392 The virgin forest with its wealth of plants and fruits was already created, and human beings, as well as all kinds of animals were living upon the earth. Only fire was still lacking. Besides their vegetable food, the human inhabitants were therefore able to eat only raw meat, and at night they shivered in their hammocks. They knew, however, that the cayman (jacaretinga) had fire in its mouth. Despite all entreaties, it would not give up any of it. So people resorted to a ruse. They asked the hummingbird to fly around the cayman and make jokes. At first the cayman was unmoved and took no notice of the little bird. But finally he could not suppress his laughter any longer, whereupon fire shot out of his opened mouth. The people were very happy about it and thanked the hummingbird extravagantly.

/114 cont./

539
245

The Origin of the Banana

In olden times the Surára men were only hunters, and the women gathered the fruits of the jungle. They were unacquainted as yet with any kind of agriculture. One morning, however, when the Surára man Horonamú had arisen especially early and stepped out in front of the maloka, he saw to his astonishment peculiar large plants full of fruits. Immediately he wanted to pick one, but the voice of Poré, the lord of the moon, who, along with the latter, represents the supreme divine power (see p. 197), caused him to stiffen. Poré, however, in a very friendly way, said that he had grown these plants for the Surára and that their name was kuratá. He then ordered him to inform all the members of the tribe that the kuratá should be cultivated, for with it they would never have to suffer hunger again and would not have to rely solely on hunting luck. When Horonamú wanted to express his gratitude, Poré had already disappeared.

The First Pupunha Palms

The Surára were already acquainted with the banana tree, and this was the first plant that they cultivated. One night a japim (Cacicus cela L.) came flying and, on orders from Poré, planted pupunha palms (Guilielma speciosa Mart.) between the banana trees. Early in the morning it wakened the Surára with a particularly loud song, and when they stepped outside their maloka in astonishment, it told them that this palm was called komunamá and its fruits -- araxá -- were good for eating as well as for making a refreshing drink.

539

The Creation of the Jibóia-vermelha

Once upon a time there lived the Surára Karemoná, who was very quarrelsome by nature. Every day he mistreated his two wives and quarreled with the other men. He never submitted to the orders of the chief and even tried to undermine the

/114 cont./

539 discipline of the tribe. Since all admonitions were of no avail, he was banished from the community.

Karemoná painted his body with urucú and left the maloka. After he had wandered about in the forest for a few hours, he lay down wearily on the ground and fell asleep. While he was asleep Poré transformed him into the jibóia-vermelha (Epicrates cenchris) -- oatá -- because of his insubordination.

539
825

The Creation of the Black Jaguar

The Surára were already acquainted with clearing by burning and cultivated banana trees and pupunha palms. One day they saw a large toad in the forest clearing. A Surára wanted to kill it, but it fled to the other /115/ side of the roça (forest clearing) and there turned into a black jaguar.

The Creation of the Tapir

A cuatá monkey fell from a tall tree and was unable to climb up again. After several unsuccessful attempts, it turned into a tapir.

The Creation of Wild Pigs

A band of cuxiú monkeys fell from a tall tree. After futile attempts at climbing up again they were transformed into wild pigs.

The Creation of the Ant Bear

539
606
862

A Surára man who had raped his mother-in-law was turned into an ant bear by Poré as punishment. Since then there has been in-law avoidance between mother-in-law and son-in-law, and the meat of the ant bear may not be eaten by members of the tribe.

/115 cont./

X. Character and Way of Thinking

157 [179] In spite of insignificant contacts with the caboclos (rubber and palm-fiber gatherers, planters, and the personnel of the Indian protection post Ajuricaba on the middle Demini), the Surára and Pakidái have preserved throughout the character of unspoiled primitive peoples who have not yet been alienated from such traditional Indian virtues as hospitality, moderation, 123 and honesty. I discovered this even on the occasion of my first 157 contact with them. When I, together with my servant Mateus, met nine Surára warriors on the Cachoeira dos Índios on the upper Rio Aracá, they gazed in wonder at our boat, the outboard motor, and the numerous gifts and trade articles in the form of knives, axes, pots, glass beads, etc., but they did not touch anything. They were also immediately willing to take us to their maloka, about 70 kilometers away, and carried the trunks, boxes and bags weighing 50-60 kilograms (555) (556), which, to

555. Becher, 1957a, p. 115.

556. Becher, 1958, p. 153.

their minds, contained tremendous treasures. During the strenuous three-day march, a definite feeling of harmony prevailed; there was constant laughing and jesting. When the Indians heard that Mateus called me "doutor" /doctor/, they burst into particularly hearty laughter and told us that totorí (jabuti /land turtle/) was a fitting name for me. The name remained with me until my departure and was brilliantly appropriate for me, for, in comparison with the free Forest Indians, anyone from civilization presents a very clumsy picture in the forest regions.

These nine warriors could easily have murdered us and departed alone with the gifts and trade articles. But not for a moment was I aware of any danger, for there could not have been more gracious or thoughtful companions. How great their honesty was I should like to document with the following example: During the march on the impassable Indian paths in the eternal

/115 cont./

123 157 twilight of the forest, a packet of cigarettes fell out of my trousers pocket. Who can describe my astonishment when in the evening at a halting place an Indian brought back to me the packet with the contents intact. Naturally, I gave the honest finder the cigarettes and a knife in addition.

Similarly, during my months-long stay with the two tribes I always had all the trunks, boxes, and bags standing open, and yet nothing was ever stolen from me. Even the barter of ethnographic objects always took place, usually under the supervision of the chiefs, in perfect peace and tranquility. When I presented knives, pots, glass beads, and other objects to men, women, or children, /116/ they always took them with impassive faces, [92] but without expressing gratitude. There is no word for "thanks" in their language, any more than there is in the other Indian languages. In their shining eyes, however, I could read that they were pleased.

152 157 Before the departure of a member of the family there are never any sentimental scenes between relatives, let alone endearments, and even at the return one can see aroused emotion only in the shining eyes.

123 In the presence of strangers, women and girls in particular are at first timid and grave, but when one has gained their confidence, they are gay and unrestrained. I very quickly gained the affection of the children and with it also that of their parents and the other adults. One's behavior, of course, plays an important part in relations with the Indians. If one approaches the Surára and Pakidái in a friendly and courteous manner, one can accomplish anything with them. On the other hand, if one expressed himself disapprovingly with regard to their customs and habits, scolded them, or beat a child, he would be inviting their antagonism. Thus, a visit to the malokas of these Indians is not to be recommended to nervous people, for one does not find any rest throughout the entire day, and it is often lacking at night as well. There were always men, women, and children standing or sitting around me. In the beginning, they tirelessly pronounced the words of their language for me, but they never laughed at me if I repeated them with the wrong accent. At first they even

Surára
Pakidái

/116 cont./

123 touched me all over my body, and they examined my spectacles with particular interest (557) and were very astonished at my

557. The Surára chief was so enthusiastic about my spectacles that he asked me to be sure to bring him a pair on my next visit.

blond hair and blue eyes. When I shaved, I was likewise surrounded by a circle of spectators (558). Even when I had to re-

558. Similar experiences were had by Chaffanjon among the Kunuaná (Chaffanjon, 1889, pp. 267/68), Koch-Grünberg among the Taulipang and Makuxí /Macusí/ (Koch-Grünberg, 1923a, p. 360), and Baldus among the Tapirapé (Baldus, 1956b, p. 606).

lieve myself, I was asked where I was going, and often I was joined by companions.

191 When the Surára and Pakidái see something new for the first time or if they like an object particularly well, they
521 manifest their approval by loud clickings. They love conversation above all else, and even at night they go on talking for
[576] hours. They never interrupt each other, however.

593 Though the man is the head of the family, the wife is
692 regarded as his partner with equal rights, without whose advice he does not undertake anything important. If he has two or
595 more wives, the youngest usually leads a princess's existence, for which even the older ones must contribute. Mistreatment
593 of women occurs only on account of adultery and for reasons of jealousy. But if a man beats his wife or draws blood on her body with the little cutia-tooth knife, several companions of her own sex immediately hasten to her aid. They try to pin down the arms of the angry man, and one woman will attempt to seize his scrotum and squeeze it with all her might, so that

/116 cont./

593 he soon loses all desire for further mistreatment. The other members of the tribe watch such a spectacle with interest. Moreover, it is worth noting that most of the women are very energetic and can scold with persistence. If a woman is angry with her husband, perhaps because he was unfaithful or did not go hunting, she will often scold loudly to herself for hours, so that all the other occupants of the maloka hear every word. [592] Meanwhile, however, the man being scolded remains lying in hammock in stoic calm, for a scolding woman may never be 578 interrupted. But between women, too, there are sometimes regular cannonades of vituperation carried on with the greatest vocal display. I always had the impression that at any moment they would come to blows. Sometimes this actually happens. Then they pull one another by the hair and strike each other in the face and on the rest of the body with the hands. /117/ In this case, other women do not interfere, nor do the men. Everybody watches calmly and waits until the scuffle is over.

855 Children are treated with special love and tenderness. In most cases, they show their gratitude to their parents by bestow-
888 ing upon them everlasting affection. I never saw old people neglected (559). If they became so weak and ill that they were

[171]

559. Baldus also reports of the Tapirapé that the old people are very well treated there (Baldus, 1956, p. 603), whereas later Giacone paints a very gloomy picture in this respect about the Tukano: "Entre os índios dêsses rios, a condição dos velhos é das mais penosas .... Poderíamos dizer, sem medo de errar, que o velho ou a velha, quando não pode mais trabalhar para a famíia, é considerado como bananeira que já deu cacho, e ninguem terá compaixão deles... /Among the Indians of these rivers the situation of the old people is most painful .... We might say, without fear of error, that the old man or old woman, when

Surára Pakidái

888 [171]

559. (cont.) no longer able to work for the family is regarded like a banana tree that has already produced the fruit, and no one pities them.../" P. Giacone, 1949, p. 25).

no longer able to take part in the general migrations, however, they were killed, in accordance with the tribal custom (see pp. 153/154).

829 [159] The friendly, open nature of all Surára and Pakidái is coupled with a very strongly marked self-assurance. Along with their allies, above all the mighty Xiriána, they feel like rulers of the world, which, in their opinion, consists only of virgin forest, mountains, rivers, and lakes. The caboclos (planters, rubber and palm-fiber gatherers), the only members of civilization whom they know, are therefore always treated with a certain compassionate condescension by them, for they are of the opinion that all civilized persons, whites, blacks, and mixed, are weak and powerless and owe their lives solely to the benevolent 000 forbearance of the Indians (560). When I told them about cities

[171]

560. Baldus found similar conceptions among tribes of the northeastern Chaco (Baldus, 1931, p. 114), as did Métraux among the Kayapó /Cayapo/. (Herr Prof. Métraux told me this during the meeting of the Deutsche Gesellschaft für Völkerkunde in Berlin, 1957.)

123 When I Told them about Cities
829 in which many white and black people live, of the sea and the big ships sailing on it, they could not grasp this at first and then became very thoughtful. Later, at my departure, they urged me not to travel too far out on the ocean so that I would not fall off the earth-disk (see p. 197).

Surára
Pakidái

/117 cont./

XI. Reasoning Abilities

153 Among the Surára and Pakidái the memory is especially keen, both with respect to the myths and songs, religion, and tribal history, as well as with respect to the flora and fauna and the peculiarities of a landscape (561). Their imitative

[114]

561. In this connection I should like to refer to a remark by Baldus: "By and large as far as the Indian's memory is concerned, he retains only what is useful on the phenominal level accessible to him. He will note each peculiarity of a landscape which he crosses, for that is necessary in order to find the way again and to be able to describe it to his companions. The much lauded 'sense of orientation' of the Indian is nothing but memory" (Baldus, 1931, p. 118)..

123 Their imitative
153 talent is also noteworthy. For example, upon my arrival, writing and drawing seemed new and mysterious to the Indians. When I handed them my fountain pen and pencils and asked them to draw something, neither the children nor men and women managed to produce anything but the customary serpentine lines, circles, and dots which they otherwise draw with urucú on their bodies, faces, and utilitarian objects. But as soon as I drew trees, houses, and animals for them, they were able to copy these figures after a few attempts. They proved indefatigable in this, and once they had started, they did not want to stop at all. Nor was it long before they /118/ were able to copy letters and finally entire words (562) (563).

153
171

562. Baldus reports the same thing about the Indian tribes in the northeastern Chaco: "Once one has taught the Indians

/118 cont./

153
191

562. (cont.)
'to see with our eyes,' they do not lag behind us in penmanship and copying" (Baldus, 1931, p. 118).

563. The experiences of two more investigators should also be cited. First Crevaux, whose following description concerns the Oyampí: "I enjoy reproducing the figures and arabesques with which the people of the village are covered. They are very similar to the carvings in the rock Timéri of the Maroni. It then gives me the idea of cutting a piece of charcoal and giving it to the captain Jean-Louis and asking him to draw in my notebook, which he calls caréta, whereas he calls the drawings that he makes coussiouar. Jean-Louis does not know how to draw very well. On the other hand, young Yami soon makes for me, no longer with charcoal, but with a pencil, drawings of a man, a dog, a tiger, finally all the animals and devils of the country.

"Another Indian reproduces all sorts of arabesques which he is in the habit of painting with genipap.

"Having given some needles to my draftsmen, the question is who will ask me for a pencil in order to blacken the paper. I see that these savages who are accused of being absolutely ignorant of the fine arts draw everything with extraordinary facility;..." /translated from the French/ (Crevaux, 1880, pp. 76/77). -- No less interesting is the statement by Karl von den

/118 cont./

153
191

563. (cont.)
Steinen about the Suya on the Xingú, in which he declares that these Indians knew how to use the pencil very well and drew beautiful motifs in his notebook, although he was the first white man they had seen (Karl von den Steinen, 1886, p. 212).

153
[171]
[191]
124
159
[191]

Younger people are distinguished by a gift for rapid comprehension and an astonishing learning capacity. Although these Indians very rarely come in contact with caboclos, and in most cases only the men, both sexes have at their command a rather large store of Portuguese words and figures of speech. One little Surára boy about nine years old, Jubeauwö, also called Mandú, who had spent almost two years in the hut of the palm-fiber gatherer Manuel Antonio Gómez on the Rio Aracá, had a nearly perfect command of the Portuguese language and performed unique service as my interpreter. I owe it to him alone that I was able to penetrate more deeply into the mental culture of the Surára and Pakidái and put together a complete vocabulary (564).

159
734
752

564. Three years ago the little boy suffered dangerous burns on the abdomen by an upset vessel containing boiling tree resin. Since the chief had given up hope that he would recover, he wanted to have

[888]

him given the deathblow. The custom of this tribe, as well as that of the Pakidái, decrees that all old and seriously ill persons who are no longer able to take part in the general migrations must be killed (see pp. 153/154). The grandmother of the little boy, who is an orphan took him secretly one night to the hut of the Spanish palm-fiber gatherer,

/118 cont./

159
734
752

564. (cont.) Manoel Antonio Gómez, who succeeded in saving his life. The chief was said to have been very angry at first over the arbitrary action of the grandmother, but then, when he saw that the little one had recovered, he calmed down.

123 Most men, after but a short time, had no difficulty handling
153 our two guns; a few were soon even operating the outboard
[177] motor, and the Surára chief Hewemão, who showed great interest in my camera, took very acceptable pictures with it.
153 The reasoning power seems to be somewhat more strongly developed among the men than among the women (565).

[114]
[171]

565. This conclusion agrees with an observation by Baldus among the Tumerehã, and the scholar adds a remark which could also be applied to the Surára and Pakidái: "The differences in the talents of the sexes are perhaps the result of their way of life and division of labor. Thus, among the Tumerehã, the man's way of acquiring food has probably developed his acuteness, for he does not merely gather fruits, like the woman, but also goes hunting..." (Baldus, 1931, p. 119).

802 /119/ XII. Counting and Conception of Time

The Surára and Pakidái count only to three:

1 -- mahõn

2 -- porokabõ

3 -- prukatabõ.

Surára
Pakidái

/119 cont./

802 Then comes much -- pruká -- and very much -- pruká, pruka. The opposite of that, little, is called -- porkotauẽ. One hand is called mahõn imẽk, and both hands, porokabõ imẽk. The fingers -- imixõk -- are never used as an aid in counting.

802 The Indians named, to be sure, can determine at a
804 glance whether a quantity has become larger or smaller, but they do not have any way of expressing it in numbers. For example, if 20 arrows are standing together and one increases or reduces the bundle by only one during the owner's absence, he will notice this change at once upon his return.

805 The day begins with the rising of the sun -- petamahujehãu --
821 (Surára), -- bemututuorelí -- (Pakidái) and ends with the setting of the sun -- peimaujaũuk -- (Surára), -- betamtíte -- (Pakidái). The place where the sun rises, however, is called peiuxomoprahomoprariekohẽ by both tribes, and the place where the sun sets, peiuximaakuimate. The rhythm of the day is determined by the position of the sun -- peniboínxi -- (Surára), -- benibeũx -- (Pakidái), the degree of light, the temperature fluctuations, and the wind -- ibokõ -- (Surára), -- yarí -- (Pakidái). In the morning, I was told, a light wind is usually felt, at noon it is almost always calm, and in the afternoon it blows somewhat stronger.

The day is called petamhâruk, the morning henahá, the evening -- petamahuwetehaũk --, and night -- petamatíti. There are no designations for noon and midnight, nor for year, month, and week. One speaks only of the dry season -- peuhaxtiũ -- and the rainy season -- peuõnk.

821 Besides the word for moon -- perimbõ --, there are also designations for new moon -- istoríbe -- and full moon -- perimbóabreu --, as well as for eclipse of the moon -- peauábe -- (Surára), -- hubári -- (Pakidái). The eclipse of the sun is called xomokã by both. There are no special names for individual stars and constellations; one merely speaks in general of stars --
000 purimá -- and big stars -- purimá breu. /The "Bibliography," pp. 120-129, is omitted in the translation; see the foreign text./

Vorwort

Diese Monographie enthält die Ergebnisse einer neunmonatigen Untersuchung, welche ich von Oktober 1955—Juni 1956 bei zwei der Wissenschaft noch unbekannten Indianerstämmen in Nordwestbrasilien durchführte.

Meine Reise und die Auswertung ihrer Ergebnisse wurden durch die großzügige Unterstützung der Deutschen Forschungsgemeinschaft ermöglicht, wofür ich derselben zu tiefstem Dank verpflichtet bin.

Meinem verehrten Lehrer, Herrn Prof. Dr. Franz Termer, möchte ich herzlich danken, daß er diese Arbeit, deren Ausführung er mit Rat und Tat unterstützte, für wert befand, in die Mitteilungsreihe des Hamburgischen Museums für Völkerkunde und Vorgeschichte aufgenommen zu werden.

Von Herrn Prof. Darcy Ribeiro, dem Leiter der Studienabteilung des Serviço de Proteção aos Índios, bekam ich die Anregung, jene noch unerforschten Stämme nördlich des mittleren Rio Negro aufzusuchen. Durch seine Vermittlung erhielt ich hierfür auch die Genehmigung des Direktors sowie jegliche Unterstützung dieser von Marschall Cândido Mariano da Silva Rondon gegründeten Organisation und eine freie Flugreise mit einem Militärflugzeug von Rio de Janeiro nach Manaus. Es ist mir daher ein aufrichtiges Bedürfnis, dem Serviço de Proteção aos Índios, besonders Herrn Prof. Darcy Ribeiro und der brasilianischen Luftwaffe, meinen ergebenen Dank abzustatten.

Der Universität São Paulo, vor allem dem Dekan, Herrn Prof. Dr. Paulo Sawaya, und dem Vizedekan, Herrn Prof. Dr. Antonio Soares Amora, danke ich für die Gewährung eines Stipendiums, Juni 1954—September 1955, wodurch es mir möglich war, unter so hervorragenden Gelehrten wie Herrn Prof. Dr. Herbert Baldus und Herrn Prof. Dr. Egon Schaden meine Kenntnisse der brasilianischen Ethnologie zu erweitern und mich gründlich auf die bevorstehende Arbeit im Felde vorzubereiten. Den beiden genannten Herren werde ich in Dankbarkeit verbunden bleiben.

Wertvolle Ratschläge, welche mir bei meiner Expedition von großem Nutzen waren, gaben mir Herr Prof. Dr. med. Henrique da Rocha Lima (†) sowie Herr Prof. Dr. José Antonio Benton, Herr Prof. Dr. Wilhelm Saake, S. V. D., Herr Harald Schultz und Frau Wilma, alle São Paulo.

Hilfreiche Unterstützung fand ich in Manaus bei Herrn Alípio Edmundo Lage, dem Chef der 1. Inspetoria Regional do Serviço de Proteção aos Índios, sowie in der dortigen kleinen deutschen Kolonie bei den Familien Prof. Dr. Harald Sioli, Kurt Polack und Gerhard Lindenberg.

Mit inniger Dankbarkeit gedenke ich aber meiner liebenswerten Freunde, der Suráro- und Pakidái-Indianer, die mich so herzlich aufnahmen und mir unermüdlich bei der Arbeit halfen; ihnen gebührt in erster Linie das Verdienst am erfolgreichen Verlauf des Unternehmens. Besondere Erwähnung verdienen hier vor allem der Suráro-Häuptling Hewemão und seine Brüder Kurikayawó und Inxiemsú, mein kleiner Dolmetscher Jibeauwó (s. S. 118) sowie der Pakidái-Häuptling Karenauã und der Kriegshäuptling Porthiwõ.

Viel verdanke ich auch meinem treuen Diener, dem Tukano-Indianer Mateus Dias, einem Angehörigen des Indianerschutzpostens Ajuricaba am mittleren Rio Demini. Er war mir ein unentbehrlicher Helfer in allen Lebenslagen dieser neun Monate.

Sehr verbunden bin ich aber ebenfalls der brasilianischen Landbevölkerung am Rio Negro und an den Flüssen Demini und Aracá sowie dem Personal des Indianerschutzpostens Ajuricaba am mittleren Demini und der Missionsstation der Salesianer in Barcelos. Wohin ich auch kam, überall wurde mir eine kaum vorstellbare Gastfreundschaft zuteil. Hervorzuheben sind hier vor allem der spanische Pflanzer Manoel Antonio Gómez vom Rio Aracá und die deutsche Ordensschwester Klara Jakob von der Salesianermission in Barcelos, welche mich während meiner Malariaanfälle in aufopfernder Weise pflegten. Der gleiche Dank gebührt den Ärzten und Schwestern in dem Hospital de Isolamento „Emilio Ribas" in São Paulo, wo mir nach meiner Rückkehr zwei Monate lang unentgeltlich eine schwere Leberinfektion ausgeheilt wurde.

Herrn Dr. Koch und Herrn Müller von der Bayer-Filiale in Rio de Janeiro danke ich für die geschenkweise überlassenen Medikamente. Dadurch war es mir möglich, vielen kranken Indianern und Cabocios zu helfen und eigene Leiden zu beheben.

Bei meinem Freund und Kollegen Dr. Dall'Igna Rodrigues bedanke ich mich für wichtige Hinweise, welche er mir anläßlich der Ausarbeitung dieser Monographie gab und für den vergleichenden sprachlichen Anhang.

Aber auch den Mitarbeitern vom Hamburgischen Museum für Völkerkunde und Vorgeschichte, die einen so großen Anteil an der Gestaltung dieser Arbeit haben, bin ich zu großem Dank verpflichtet. Es sind dies Herr Dr. Herbert Tischner, der mir bei der Drucklegung mit seinem Rat und seiner Erfahrung behilflich war, Fräulein Dascha Detering, die mit großer Sorgfalt die Zeichnungen und die Landkarte anfertigte und selbständig die in dieser Arbeit dargestellten textilen Techniken bearbeitete; ferner Herr Hans Cantzler, der mehrere Gegenstände photographierte und von meinen Aufnahmen Vergrößerungen herstellte.

Abschließend möchte ich Herrn Prof. Dr. Herbert Freudenthal und meiner Frau danken, daß sie mir unermüdlich beim Korrekturlesen halfen und der Druckerei J. J. Augustin für die gute drucktechnische Ausführung des vorliegenden Bandes.

Die ethnographischen Sammlungen sind in den Besitz des Museu Paulista, São Paulo und des Hamburgischen Museums für Völkerkunde und Vorgeschichte übergegangen. Alle im Figuren- und Abbildungsverzeichnis angeführten Inventarnummern sind diejenigen der im Hamburgischen Museum befindlichen Stücke.

Hamburg, Weihnachten 1959 Hans Becher

Lage des Siedlungsgebietes der Yanoa und Pakidai

[facing p. 1]

I. Geographische Einführung

Das Wohn- und Streifgebiet der Surára und Pakidái liegt zwischen den Flüssen Demini und Aracá — eine Terra incognita innerhalb des großen, völkerkundlich und geographisch bisher so gering erschlossenen Raumes zwischen Rio Branco, Rio Uraricuera, Serra Parima und Rio Negro.

Der Rio Demini ist ein linker Nebenfluß des mittleren Rio Negro. Seine Quelle befindet sich in der Serra Parima, im brasilianisch-venezolanischen Grenzgebiet, und die Mündung kurz oberhalb von Barcelos, jener früheren Hauptstadt der „Capitania do Rio Negro". Das Wasser dieses Flusses ist weiß, während die zahlreichen Uferseen und alle Zuflüsse, wie z. B. der Aracá, ein rechter Nebenfluß des unteren Demini, schwarzes Wasser enthalten. Die Nebenflüsse des Aracá hingegen zeichnen sich durch klares Wasser aus. Diese Merkwürdigkeit hängt mit den Bodenverhältnissen, der Bodenerosion und der Topographie in den Einzugsgebieten zusammen. So bedingt die Bodenerosion in stark hügligem Gelände eine helle Färbung, während in einer stark verflachten, sumpfigen Gegend dunkle Humusstoffe ins Wasser übertreten und dieses verdunkeln. Bemerkenswert ist weiterhin, daß schwarzes Wasser geründer und wohlschmeckender ist und beim Stehen keinen schmutzigen Satz absondert. Auch Wasserschildkröten und Fische, die in schwarzem Wasser leben, sind schmackhafter als die gleichen Tiere aus Weißwasserflüssen oder -seen. Außerdem ist hervorzuheben, daß Moskiten an schwarzem Wasser in wesentlich geringerem Maße auftreten als an weißem. Am Rio Demini kann man sich der kleinen Plums (*Simulium* sp., Tagesstechmücken) und der großen Carapanãs (*Anopheles*), letztere sind die gefährlichen Malariaüberträger, kaum erwehren. Der Unterlauf und ein Teil des Mittellaufes sind daher vollständig fieberverseucht.

Beide Arten des Wassers bewirken auch eine verschiedenartige Vegetation. Das Charakteristikum des Rio Demini sind die Igapós (Überschwemmungswälder mit hohen, dicht nebeneinanderstehenden Bäumen), zwischen denen es nur ganz selten eine Terra firme gibt. Auf den höheren Ufern des Aracá findet man dagegen vorwiegend niedrigen Buschwald. Als wichtigste Nutzpflanzen sind am Mittellauf des Demini die Seringueiras (Gummibäume — *Hevea brasiliensis* Muell. Arg.) zu erwähnen und am Aracá und seinen Nebenflüssen Piaçaba-Palmen (*Attalea funifera* Mart. e *Leopoldinia piassaba* Wal.). Eine wirtschaftliche Bedeutung haben auch die im Mündungsgebiet des Demini und am Unterlauf des Aracá auftretenden Kastanienwälder. Die Kastanie, oder genauer, die Kastanie von Pará (*Bertholletia excelsa* H.B.K. — ihre Früchte sind in Deutschland als Pará-Nüsse bekannt), gilt ihrer hohen Krone wegen, mit der sie alle anderen Bäume überragt, als die Königin der Urwälder Amazoniens. Am unteren Aracá ist der Itaúba-Baum (*Silvia itaúba* Pax.) von besonderer Wichtigkeit, da dieser das beste Nutzholz jener Gegend liefert. Schließlich sind noch einige weitere Baum- und Palmarten zu erwähnen, welche sowohl am Demini als auch am Aracá vorkommen:

a) Bäume: Imbaúba (*Cecropia palmata* Wild.), Angelim-amargoso (*Andira vermifuga* Mart.), Maçaranduba (*Mimusops* sp.), Embireira (*Anonaceae* sp.), Matamatazeiro (*Eschweilera matamata* Hub.), Taxizeiro (*Couratarieae* sp.), Inglazeiro (*Inga* sp.), Abiurana (*Lucuma* sp.), Cajuzeiro (*Anacardium* sp.), Lucuma (*Lucuma*

marocarpa Hub.), wilder Kakaobaum (*Theobroma* sp.), wilder Zitronenbaum (*Rubiacea* sp.) und Zedern (*Meliacea* sp.).

b) Palmen: Açaí (*Euterpe oleracea* Mart.), Bacaba (*Oenocarpus distichus* Mart. oder *Oenocarpus bacaba* Mart.), Buriti (*Mauritia vinifera* Mart.), Buçu (*Manicaria saccifera* Gaertn.), Carnaúba (*Attalea spectabilis* Mart.), Inajá (*Maximiliana regia* Mart.), Patauá (*Oenocarpus bataua* Mart.), Paxiúba (*Iriartea exorrhiza* Mart.), Pupunha (*Guilielma speciosa* Mart.), Tucumã (*Astrocaryum* sp.) und Ubim (*Geonoma* sp.).

Die beiden Flüsse haben viele Windungen und fließen in den Sommermonaten, Oktober—März, verhältnismäßig träge. Ihr Wasserstand ist in dieser Zeit außerordentlich niedrig, so daß zahlreiche Sandbänke hervortreten. Am Demini ist die Farbe des Sandes gelblich, leuchtend weiß dagegen am Aracá. Die Durchschnittsbreite des Demini beträgt an seinem Unter- und Mittellauf 200—300 m, die des Aracá 300—400 m. Hieran mag es liegen, daß auf alten Karten der Aracá fälschlich als Hauptfluß bezeichnet wird; doch der Lauf des Demini ist wesentlich länger. In den Mittel- und Oberläufen der genannten Flüsse treten Stromschnellen auf, deren Überquerung oft mit Lebensgefahr verbunden ist.

Der zwischen den Flüssen liegende Raum stellt eine jener Inselberglandschaften dar, die für den Bereich des mittleren und oberen Rio Negro so charakteristisch sind. Kegel-, kuppen- oder kammförmige Granitberge, die sich einzeln oder gebirgsartig auch gruppenweise in Form von kleinen Gebirgsstöcken oder kurzen Bergzügen bis zu 400 m erheben, bilden einen auffälligen Kontrast zu der mit dichtem Urwald bewachsenen Ebene. Ihre verhältnismäßig flachen Gipfel und die sanft geneigten Schuttkegel am Fuße sind ebenfalls dicht bewaldet. In mittlerer Berghöhe treten aber steile, glatte, von zahlreichen Regenfurchen wie kanneliert aussehende Granitwände zutage.

Morphologisch gehören diese Erhebungen einem Typus an, den Passarge in seinem Kalahari-Werke[7]) und an anderer Stelle[8]) behandelt und nach Bornhardt als Inselberge definiert hat. Diese Granitberge im Rio Negro-Gebiet wurden bereits von Spruce treffend beschrieben[9]). Nach Brandt, der sich eingehend mit der Morphogenese isolierter Granitberge befaßte, ist ihr kegelförmiges Aussehen auf einen „Abschälungsvorgang" von periklinal streuenden Granitfalten zurückzuführen[9]).

Infolge der Äquatornähe ist es in diesem Gebiet zwar sehr heiß, feucht und schwül, aber trotzdem nicht unerträglich. Denn wegen des hohen Feuchtigkeitsgehalts der Luft gibt es hier z. B. keinen Hitzschlag und keinen Sonnenstich. Auch nachts kann man recht gut schlafen, da die Temperatur dann stets um einige Grade sinkt und mit einer erfrischenden Brise verbunden ist. Die Temperatur der Luft beträgt tagsüber 32—36° und nachts 24—28°, während die des Wassers meist zwischen 29—32° liegt.

Auf Grund der Menschenarmut, die hier herrscht, gibt es in den Wäldern sehr viel Wild und Vögel, dazu kommt in den Flüssen der Reichtum an Wasserschildkröten, Kaimanen und Fischen, von denen nachstehend einige Species aufgezählt werden:

a) Säugetiere: Gefleckter Jaguar (*Felis onca* L.), Schwarzer Jaguar (*Panthera onca* L.), Puma (*Felis concolor*), Maracajá (*Felis pardalis* Nerw.), Tapir (*Tapirus americanus* Brün.), Reh (*Cervidae* sp.), Wildschwein (*Pecari tajacu*), Capivara (*Hydrochoerus hydrochaeris* Erxl.), Paca (*Coniculus paca* L.), Cutia (*Dasyprocta aguti* L.), Gürteltier (*Dasypodidae* sp.), Faultier (*Bradypus* sp.), Ameisenbär (*Myrmecophaga* sp.), Affen: Brüllaffe (*Alouatta* sp.), Cuxiú-negro (*Chiropotes satanas* Humb.), Cuntí (*Ateles paniscus* L.), Macaco-da-noite (*Aotus infulatus*) etc., Seekuh (*Trichechus inunguis* Desmarest) etc.

b) Vögel: Mutum (*Crax* sp.), Urumutum (*Crax* sp.), Mutum-cavalo (*Mitu mitu* L.), Jacamim (*Psophia crepitans* L.), Cujubim (*Pipile pipile cujubi* Pelz.), Jacu (*Penelope* sp.), Japim (*Cacicus cela* L.), Inambu (*Crypturellus* sp.), Inambu-relógio (*Crypturellus strigulosus* Temm.), Tucano (*Rhamphastos*

[7]) Passarge, 1904.

sp.), Arara vermelha (*Ara macao* L.), Arara amarela (*Ara ararauna* L.), Papagaio moleiro (*Amazona* sp.), Papagaio curica (*Amazona* sp.), Garça branca (*Casmerodius albus egretta* Gm.), Gavião-real (*Thrasaetus harpyia* L.), Gavião-caipira (*Hypomorphnus urubitinga urubitinga* Gm.), Urubus (*Cathartes foetens, Cathartes aura* etc.) etc.

c) Wasserschildkröten: Tracajá (*Emys* sp.), Cabeçuda (*Podocnemis dumeriliana*) etc.

d) Landschildkröten: Jabuti (*Testudo tabulata* Woelb.) etc.

e) Kaimane: Jacarétinga oder Jacaré-de-óculos (*Caiman sclerops* Schneid.) etc.

f) Fische: Aracu (*Leporinus copelandi* Steind.), Piranha (*Pygocentrus* sp. und *Serrasalmus* sp.), Pirarucu (größter Süßwasserfisch, erreicht eine Länge bis über 3 m; gehört zur Familie der Knochenzüngler (*Osteoglossidae*). Die harte Zunge dient Indianern und Weißen als Reibebrett), Piraiba (*Brachyplatystoma filamentosa*), Surubim (*Pseudoplatystoma* sp.), Jundiá (*Siluridae* sp.), Mandi (*Rhamdia* sp.), Curimatã (*Prochilodus* sp.), Pescada (*Cynoscion* sp.), Dourado (*Salminus brevidens*), Tambaqui (*Characinidae* sp.), Mandubi (*Anchenipteridae* sp.), Aimjá (*Trachycorystes* sp.), Caiácaiá (*Oxidoras niger* Val.) etc.

Auch Schlangen treten in großer Zahl auf:

a) Ungiftige Schlangen: Sucuriju (*Eunectes murinus*), Jiboia-vermelha (*Epicrates cenchris*) etc.

b) Giftschlangen: Surucucu (*Lachesis muta* L.), Cascavel (*Crotalus terrificus terrificus*), Jararaca (*Lachesis* sp.), Jararacuçu (*Bothrops jararacussu* Lacerda), Cobra-coral (*Elaps corallinus* Wied.) etc.

II. Die zivilisierten Bewohner des Demini-Aracá-Gebietes

Bei der zivilisierten Bevölkerung, welche an den Unter- und Mittelläufen lebt, handelt es sich um eine Mischung von Indianern, Weißen, Negern und Mulatten, die als Gummisammler, Palmfasersammler, Holzfäller, Fischer und Pflanzer ihr Leben fristen.

Gummisammler arbeiten ausschließlich im Flußgebiet des Demini, Palmfasersammler und Holzfäller nur in der Aracá-Region. Pflanzer, Fischer und einige ambulante Kaufleute sind an beiden Flüssen auf der Terra firme anzutreffen. Während die Gummisammler am Demini familienweise in großen Abständen voneinander leben, die Entfernungen betragen 10—20 km und mehr, haben sich die Holzfäller und Palmfasersammler am Aracá in kleinen Siedlungen zusammengeschlossen.

Am Rio Demini befindet sich kurz unterhalb der Cachoeira (Stromschnelle) Araticanga der Indianerschutzposten „Ajuricaba" (Abb. 1). Von der Mündung bis dorthin benötigt man in einem kleinen Boot mit Außenbordmotor, vier PS, sechs Tagereisen. Auf dieser langen Strecke zählt man nur zwei Dutzend Familien. Vor 50 Jahren waren die Ufer am unteren Drittel stärker besiedelt als heute. Doch Malaria und eine furchtbare Beri-Beri Epidemie, 1917/18, rafften die Mehrzahl der Bewohner dahin. Nach dem großen Urwaldbrand, der im Jahre 1926 am Demini wütete, besserte sich der Gesundheitszustand vorübergehend. In neuester Zeit fährt einmal im Jahr ein Motorboot des Nationalen Malariadienstes den Demini und Aracá hinauf, und man spritzt die Palmstrohhütten der Bewohner mit DDT aus. Aber trotzdem fordert die Malaria noch immer ihre Opfer. Häufig führt sie auch zu einem langen Leberleiden; vor allem mangelt es an jeglichen Medikamenten. Eine zweite Geißel ist die Tuberkulose, deren Ursache, außer dem feuchten, heißen Klima, wohl auf die kraftlose und einseitige Ernährung zurückzuführen ist. Diese besteht in vorwiegendem Maße aus Maniokmehl, kleinen Fischen, gesalzenem, an der Sonne getrocknetem Fleisch des Pirarucu, gesalzenem Wildschweinefleisch und in wesentlich geringerem Umfang aus Vögeln und Wild, denn zum Jagen fehlt den Männern im allgemeinen die Zeit. Hinzu kommt,

daß für die Gummi- und Palmfaserernteder Obst und Gemüse nahezu unbekannte Gemüse sind. Infolge des engen Zusammenlebens der einzelnen Familien und der mangelnden Hygiene bleiben auch die Kinder von der Tuberkulose nicht verschont. Außerdem ist eine gefährliche Augenentzündung zu erwähnen, die oft bis zur Erblindung führt. Diese entsteht dadurch, daß aus den Palmstrohdächern der Hütten, in denen sich viele Insekten befinden, ständig ein feiner Staub herniederrieselt und den in ihren Hängematten schlafenden Menschen in die Augen dringt. Auch eine infektiöse Hautkrankheit, wobei sich helle Flecke auf der Haut bilden, ist weit verbreitet. Häufig kommen Wurm- und Darmkrankheiten vor, ebenfalls Syphilis. Bemerkenswert ist schließlich noch, daß Erwachsene und Kinder sehr schlechte Zähne haben. Der Grund hierfür dürfte auch wieder in der einseitigen Ernährung zu suchen sein, denn die freien Waldindianer, welche ihre Mahlzeiten abwechslungsreicher gestalten, verfügen alle über ein vorzügliches Zahnmaterial. Die Sterblichkeit der Kinder ist am höchsten, danach kommt die der Frauen, von denen, da es ja keinerlei ärztliche Hilfe gibt, verhältnismäßig viele den Tod im Kindbett erleiden.

Eine Tagereise von dem Indianerschutzposten entfernt steht die letzte Hütte eines Gummisammlers, während der Posten selbst die äußerste Station der Zivilisation darstellt. Oberhalb desselben beginnt das Gebiet der Indianer. Zahlreiche, der Wissenschaft bisher völlig unbekannte Stämme führen hier noch ein Leben wie vor der Entdeckungszeit. Sie sind sehr kriegerisch, so daß es oft zu blutigen Auseinandersetzungen zwischen ihnen kommt. Ihre Malokas befinden sich meist weit ab vom Flußufer, tief im Inneren der Urwälder. Gelegentlich besuchen einige den Posten, um sich hier Geschenke, d. h. Messer, Beile, Töpfe, Glasperlen usw. abzuholen. Mit der zivilisierten Bevölkerung am Demini treten sie nie in Berührung.

Das Postenpersonal besteht aus 12 Männern, unter ihnen mehrere reinblütige, zivilisierte Tukano-Indianer, die hier ein entbehrungsreiches, schweres und gefährliches Leben führen. Bevor sie in den Indianerschutzdienst eintreten, müssen sie sich verpflichten, im Umgang mit den freien Indianern stets die Jolgrade, von dem Gründer dieser großartigen Organisation, Marschall Cândido Mariano da Silva Rondon, aufgestellte Devise zu beherzigen: „Morrer se preciso for, matar nunca!" („Sterben wenn nötig, töten nie!") Ihre einzigen Verbindungen zur Außenwelt sind eine Funkstation und das Motorboot der Inspetoria do Serviço de Proteção aos Índios in Manaus, welches ihnen ein- bis zweimal im Jahre Lebensmittel und Gebrauchsgegenstände bringt sowie Geschenke für die Indianer.

Neben der Betreuung indianischer Besucher hat das Postenpersonal auch dafür zu sorgen, daß die Angehörigen freier Indianerstämme nicht von unerfreulichen Elementen der Zivilisation, in Gestalt von Goldsuchern und anderen Abenteurern, ausgebeutet und schlecht behandelt werden. Der Schutz aller freien Waldindianer ist in Brasilien gesetzlich verankert. Danach darf kein Zivilisierter ohne Erlaubnis der Direktion des Serviço de Proteção aos Índios in Rio de Janeiro[*]) Indianerstämme aufsuchen. Die Posten stellen also gleichsam polizeiliche Organe im Urwald dar. Es gehört aber auch zum Aufgabenbereich des Personals, daß sie für den eigenen Lebensunterhalt Pflanzungen anlegen, wo sie Mandioka, Mais, süße Kartoffeln, Bananen, Mamão, Bohnen, Tabak, Zuckerrohr usw. anbauen. Zusätzlich betreiben sie Jagd und Fischfang.

Da am Arauá die Lebensbedingungen günstiger und die Arbeiten der Plantagenbesitzer (Palmfasersammler) einträglicher sind als die der Gummisammler, ist hier die Bevölkerung viermal so stark wie am Demini. Die Indianerregion beginnt an der Cachoeira dos Índios (Abb. 2 u. 3). Einen Indianerschutzposten gibt es am Rio Arauá aber noch nicht.

*) Der Serviço de Proteção aos Índios ist eine Abteilung des Ministério da Agricultura.

III. Die ethnische Zugehörigkeit der Surára und Pakidái

Schon seit Beginn des vorigen Jahrhunderts haben bedeutende Forscher, u. a. Alexander von Humboldt, Robert Schomburgk, Jean Chaffanjon und Theodor Koch-Grünberg, nördlich und westlich des Raumes zwischen Rio Branco, Uraricuera, Serra Parima und Rio Negro, bei einigen Gruppen der Xirianá[1]) und Waiká ethnographische und teilweise sprachliche Studien unternommen, die 1954/55 durch Otto Zerries und Meinhard Schuster eine Erweiterung und Vertiefung fanden, besonders hinsichtlich der Waiká[2]) (Waika) im Einzugsgebiet des oberen Orinoco[3]). Ihre Arbeit wurde von nordamerikanischen Missionaren unterstützt, welche schon seit mehreren Jahren mit den genannten Indianern in Verbindung stehen und diese Gelegenheit benutzen, um auch selbst völkerkundliche Untersuchungen durchzuführen[4]).

Außerdem ist der Italiener Alfonso Vinci zu erwähnen, der 1953—1955 in Südvenezuela weilte und dort mit Xirianá- und Waiká-Gruppen zusammentraf[5]).

Über Berührungen mit Eingeborenen im Inneren jener ausgedehnten Region zwischen Rio Branco und Serra Parima, die Coudreau noch für nahezu menschenleer hielt[6]), lediglich westlich vom Rio Branco, zwischen dem unteren Mucajaí und dem unteren Catrimani, lebten seiner Ansicht nach einige Indianergruppen „mal connus et redoutés"[7]), haben bislang nur George Salathé und Donald Holdridge berichtet[8]). Der erstere gibt von den am Oberlauf des Catrimani lebenden Karimé-Indianern einen kurzen Abriß ihrer materiellen Kultur, nebst einem Wörterverzeichnis[9]), während letzterer seine Besuche in der Xirianá (Shirianá)- und Waiká (Uaika) Maloka beschreibt, die sich 1932 noch am Demini, bzw. einem Nebenarm, befanden[10]).

Nach Durchsicht der Forschungsberichte von Zerries[11]) [12]) und Schuster[13]) sowie an Hand von Vergleichen mit ethnographischen Angaben und Wörterlisten, die Salathé bei den Karimé[14]), Vinci bei den Shirianá, Waika und Samatari[15]) und Koch-Grünberg bei den von den Waiká, aber auch benachbarten Indianern gegenüber eine sehr feindliche Haltung einnehmen sollen. Da die Gummisammler, Palmheuesammler usw. am Demini, Arecá und den anderen Flüssen meist nicht über den Mittellauf hinaus vordringen und schon gar nicht die theilweise Gebiete aufsuchen, fühlen sich die Indianer nur selten in ihrem Bereich gestört. Die nachstehend aufgeführten Vorfälle, welche sich noch in den letzten 30 Jahren hier ereigneten, beweisen aber, daß die Feindschaft seitens einiger Stämme weiter besteht und jederzeit zu neuen Gewaltakten führen kann:

1926: Surára-Indianer raubten während eines Überfalls auf eine Siedlung von Palmheuesammlern am Rio Arecá zwei weiße Frauen und ein Mädchen.

1942: Jaó-Indianer beschossen am oberen Demini die Brasil.-Venez. Grenzkommission und zwangen dieselbe zur Umkehr; zwei Angehörige der Kommission wurden durch Pfeilschüsse schwer verwundet.

1943: Fünf amerikanische Offiziere wurden von den Aimoré-Indianern am Rio Jauaperi durch Pfeilschüsse getötet. Sie waren mit einem Motorboot den Fluß hinaufgefahren, um hier Indianer zu filmen. Der brasilianische Begleiter, welcher als einziger entkam, gab später an, daß die Indianer das Surren der Kamera unangenehm empfunden und die Ausrüstung mehrfach zur Rückkehr aufgefordert hätten.

1946: Die Aimoré-Indianer überfielen den Indianerschutzposten am Rio Jauaperi und töteten 10 Mann des Personals.

[1]) X wird wie sch ausgesprochen.

[2]) Wenn die Surára und Pakidái den Stammesnamen der Waiká, ihrer bepaten Feinde, aussprechen, so betonen sie stets das letzte a.

ihm als isoliert-sprachig bezeichneten Xirián (Schiriana)-Gruppen und einigen Waikí (Waika) aufgenommen hatten[87] [88], konnte festgestellt werden, daß die untersuchten Verbände zu einer verhältnismäßig einheitlichen Kulturgruppe gehören und sich auch sprachlich nur leicht durch dialektische Abweichungen voneinander unterscheiden (s. Anhang.)[89]. Wie stark ihre Zusammengehörigkeit ist, sieht man bereits daran, daß sich die Surára und Pakidái als Yanomámi bezeichnen und die Waikí und Xirián nach Zerries und Schuster als Yanóama[90] [91].

Doch auch Angehörige der Aramamonteri, Karamateri, Pusiweteri und selbst der Xirián, die ich in den Malokas der Surára und Pakidái als Ehefrauen, Besucher sowie als Gefangene antraf, erklärten, daß sie Yanomámi seien. Außerdem zählte mir der Surára-Häuptling Hewemáo weitere 42 Stämme zwischen Catrimani und Rio Negro auf[92], befreundete und feindliche, wobei er darauf hinwies, daß diese ebenfalls einbezogen werden müssen.

Danach, und auf Grund der sprachlichen und kulturellen Verwandtschaft, dürfte es angebracht sein, Yanomámi bzw. Yanóama als neue Bezeichnung für die Sprach- und Kulturgruppe jener kleinwüchsigen und hellhäutigen Indianer des nördlichen Amazonien in die südamerikanische Völkerkunde einzuführen. Den bisherigen Untersuchungen zufolge bewohnen sie einen verhältnismäßig geschlossenen Raum, der im Osten und Süden vom Rio Branco bzw. dem Rio Negro begrenzt wird, sich jedoch nach Norden und Westen über den Uraricuera resp. die Parima-Kette ausdehnt.

Über die ethnische Zusammengehörigkeit dieser Bevölkerung kann kein Zweifel mehr bestehen. Auch Koch-Grünberg war schon der Ansicht, daß es sich bei den Xirián (Schiriana) und Waikí (Waika) „nicht um zwei verschiedene Stämme, sondern nur um zwei Abteilungen eines großen Volkes handelt"[93] [94]. An gleicher Stelle spricht der Forscher aber auch die Vermutung aus, worin ihn Ansichten von Nachbarstämmen bestärkten, daß die Waikí nur eine Untergliederung der Xirián darstellen, „mit denen sie entweder friedlich zusammen oder in erbitterter Feindschaft leben"[95] [96]. Ihre Abgeschlossenheit gegenüber anderen Stämmen ist nach Ourique „ein Beispiel der instinktiven Vorsicht der Rasse gegen ihre eigene Entartung und ihren Untergang"[97].

Bedeutsam ist nun in diesem Zusammenhang der Hinweis des Surára-Häuptlings, wonach es innerhalb des „Yanomámi-Volkes" zwei mächtige Stämme gibt, erstens die Xirián, deren Selbstbezeichnung „Harateri" lautet, und zweitens die Waikí, welche sich aber ständig befehden. Alle kleineren Stämme stehen entweder auf seiten des einen oder anderen, sind diesen aber gleichartig tribut- und kriegsdienstpflichtig[98]. Die Surára und Pakidái, so erklärte mir der Häuptling weiter, seien Verbündete der Xirián und erhalten im Tausch gelegentlich Tongefäße, Tontöpfe, Bogen, Pfeile, Hängematten, Körbe, Gürtel und Oberarmschmuck[99].

[88] Koch-Grünberg, 1928, S. 300—308.
[89] Schon Loukotka und Rivet wiesen die Verwandtschaft von einigen dieser Sprachen nach und faßten sie unter dem Oberbegriff „Xirianá-Sprachfamilie" zusammen, wozu sie die Xirianá, Karimá, Waika und Parakanã rechnen. (Loukotka, 1940, S. 89; Rivet et Loukotka, 1952, S. 1146).

[94] Koch-Grünberg, 1923a, S. 250.
[95] Ourique, 1916, S. 24.
[96] In bezug auf die Xirián erwähnt auch schon Koch-Grünberg diese Verallgemeinerbildnis (Koch-Grünberg, 1911, S. 126), und Métraux weist ebenfalls darauf hin. (Métraux, 1948, S. 861).
[97] Von den Surára und Pakidái wird die Töpferei überhaupt nicht ausgeübt, und ihre selbstverfertigten Bogen, Pfeile, Hängematten usw. sind von minderer Qualität als die der Xirián.

IV. Geschichtliche Daten

Gegenwärtig leben die Surára in den Wintermonaten (Regenzeit), April—September, an der Cachoeira dos Índios (Abb. 2 u. 3), am oberen Rio Aracá und die Pokidái in Tarraquá, an einem rechten Nebenarm des mittleren Demíni. Die Sommermonate (Trockenzeit), Oktober—März, verbringen dagegen beide Stämme gemeinsam in einer großen, offenen Maloka, welche den Surára gehört, in der Urwaldregion zwischen den Flüssen Demíni und Aracá. Diese Maloka liegt 70 km nordöstlich von der Cachoeira dos Índios entfernt und etwa 100 km südlich vom Quellgebiet des Orinoco.

Koch-Grünberg hat auf seiner Karte zu dem Werk „Vom Roroima zum Orinoco" weder den Rio Demíni noch den Rio Aracá eingetragen und bezeichnet diese Region als „Unbekanntes Gebiet". Auch in seinen Ausführungen bemerkt er, „das ganze große Gebiet zwischen Rio Negro, Rio Branco und Uraricuéra ist bis heute unerforscht"[98]. Desgleichen weist Baldus darauf hin, daß in diesem Raum „noch Überraschungen auf den Sucher unbekannter Stämme warten"[99].

Durch João Barbosa Rodrigues hatten Demíni und Aracá zum erstenmal Eingang in die Literatur gefunden, doch er schrieb nicht Demíni, sondern Demeene[100], und der Rio Aracá wurde von ihm als Uaraca bezeichnet[101].

Bezüglich des Namens Demíni darf angenommen werden, daß sich die Endung „ĩní", den sprachlichen Untersuchungen Koch-Grünbergs zufolge[102], von dem aruakischen Wort „eni" = Fluß, Wasser, ableitet. Diese Annahme findet eine Bestätigung durch zahlreiche, sehr alte Scherbenfunde, die ich auf der völlig unbesiedelten Terra firme an Ufern des Demíni machte. Es handelt sich dabei um gelblichgraue Scherben, die mit Spirallinien, Mäandern und anderen Geflechtmustern verziert sind und den Tongefäßen gleichen, die Koch-Grünberg von Aruakstämmen beschrieben hat[103].

Daß ich nur Scherben fand, hängt sicher mit der von Koch-Grünberg beschriebenen Sitte der Aruaken zusammen, derzufolge alle Tongefäße einer verstorbenen Person zerschlagen werden müssen, da sonst der Totengeist die Habgier der Verwandten bestrafen würde[104].

Damit wäre auch die Vermutung von Koch-Grünberg bestätigt, daß einst Aruakstämme von Westen und Südwesten her in das Gebiet zwischen Rio Branco und Orinoco eingedrungen waren, welches von einer alten, in ganz primitivem Zustand lebenden Bevölkerung bewohnt wurde. Die Aruaken sollen später von den Karaiben unterworfen worden sein, welche ihrerseits an den streitbaren Xirióna und Waiká einen kräftigen Widerstand fanden[105]. An einer anderen Stelle schreibt derselbe Forscher sodann: „Am Merewari und oberem Orinoco wohnen Karaiben zusammen mit Aruwaken, während der obere Uraricuéra und die Parimakette ganz in der Hand der alleinsässigen Schiriana und Waika sind"[106]. Auch ich traf im Demíni-Aracá Gebiet weder Karaiben-, noch Aruakstämme an.

Auf einer von Nimuendajú gezeichneten Stammeskarte jener Gegend[107] werden mit der Angabe des Jahres 1874 Xirióna als Bewohner des Rio Demíni angegeben. Auch Rodrigues berichtet, daß Angehörige dieses Stammes am Ende des 19. Jahrhunderts sowohl an den Ufern jenes Stromes, als auch an seinen Nebenflüssen Cuiúnas und Mamóndu lebten; von hier aus hätten sie ihre Streifzüge bis zum Catrimani ausgedehnt[108].

[108]) Rodrigues, 1885, S. 136.

Heute lebt nur noch eine zivilisierte Xirián-Familie als Pflanzer am unteren Demini, die jedoch mit ihren ursprünglich lebenden Stammesangehörigen keinerlei Beziehungen mehr hat. Diese Familie, deren Angehörige ausschließlich portugiesisch sprechen, erklärte mir, daß die Gegend des Demini seit alter Zeit das Land der Xirián gewesen sei. Wegen häufiger Überfälle weiter der Waikâ hätten sie sich aber in die äußersten Gebiete zurückgezogen. Ihre letzte Maloka am Demini wäre 1934 von einem Waikâstamm überrumpelt worden. Es ist dieselbe Stelle, wo sich heute der Indianerschutzposten „Ajuricaba" befindet, am rechten Ufer des mittleren Demini gelegen, kurz unterhalb der Cachoeira Austrinoso[*]) [**]). 1939 gaben aber auch die Waikâ diese Maloka auf und zogen zum Rio Mapulan, einem linken Nebenfluß des oberen Demini. Hier wurden sie Anfang des Jahres 1956, z. Z. meines Aufenthalts unter den Suriára, von einem Xiriánastamm überfallen und vernichtet. Suriára-Krieger erzählten mir, daß alle Waikâ-Männer getötet und die Frauen und Mädchen als Gefangene mitgeschleppt worden seien.

Als Bewohner des Rio Araçá hat Nimuendajú auf der schon erwähnten Stammeskarte dieser Gegend (s. S. 7), mit der Angabe des Jahres 1874, die Bahuanen, einen Arauktstamm, eingetragen. Herrn bemerkte der Suriára-Häuptling, daß jener Stamm auch den Eigennamen Pontari führt und ein Feind der Suriára, Pahâdâ, Xirián usw. wäre; gegenwärtig lebe er im Quellgebiet des Araçá.

Nach Aussagen älterer Palmfasersammler am Araçá erschienen seit Ende des vergangenen Jahrhunderts bis Ende der zwei Jahre unseres Jahrhunderts keine Indianer an diesem Fluß. Während der Monate Oktober und November des Jahres 1927 sahen Palmfasersammler auf dem Weg zu ihren Arbeitsplätzen erstmalig kleine und verhältnismäßig hellhäutige Indianer im Urwalddickicht verschwinden. Im Dezember 1927 und Januar/Februar 1928 wurden die Siedlungen mehrere Male von Indianern überfallen, doch den Palmfasersammlern gelang es stets, dieselben in die Flucht zu schlagen. Am Vormittag des 28. Juni 1928 erfolgte ein weiterer Überfall, wobei zwei Frauen von Gummisammlern und ein 12jähriges Mädchen geraubt wurden. Nach dieser Entführung erfolgte kein neuer indianischer Überfall. Erst 16 Jahre später, im Januar 1944, erschienen sechs Indianer, doch diesmal in friedlicher Absicht. Sie nannten sich Suriára und wollten Gegenstände der Zivilisation eintauschen. Später gaben sie auch zu, daß ihr Stamm die früheren Überfälle durchgeführt hätte. Auf Fragen nach den beiden geraubten Frauen und dem Mädchen erklärten sie, daß diese gestorben seien. Von den

[*]) Hier besuchte Hübsch 1932 die Xirián. (Hübsch, 1933, S. 386).

[**]) Auf Grund einer Information, welche Nimuendajú 1927 in Manaos von einem Mann namens Domingos Campos erhielt, sollen ursprünglich Indianer am Demini Xirián genannt worden sein (Nimuendajú, 1955, S. 130/31). Herrn lassen sich allerlei Fragen hinzufügen, die noch einer Lösung bedürfen. So könnte es sein, daß ein Arauktstamm diesen Namen gegeben haben, denn die Schreiber, welche ich am Demini fand, sind auch der Name dieses Flusses deuten darauf hin, daß hier einst Angehörige jener Sprachgruppe lebten. Es wäre aber auch möglich, daß sich Arauktgruppen nach ihrer Unterwerfung durch die Xirián mit letzteren zusammenten. Andererseits ist es nicht ausgeschlossen, daß einzelne Xirián die Arauktsprache angenommen haben, und schließlich bleibt auch die Vermutung offen, daß die von Domingos Campos erwähnten Indianer nicht mit den eigentlichen Xirián identisch sind, sondern nur von der Cabocle-Bevölkerung so genannt wurden.

In der Literatur haben sich die zwei Stammesbezeichnungen „Xirián" (Angehörige der Arauk-Sprachfamilie) und „Xirianá" (selbständige Sprachfamilie) (Loukotka, 1942, S. 8, 24, 32, Ribeiro, 1957, S. 90) zwar bereits eingebürgert. Trotzdem neige ich zu der Ansicht, daß es sich bei den Xirián und Xirianá um ein und denselben großen, weitverbreiteten Yanomámistamm handelt. Die materielle und geistige Kultur der Xirián, mit denen die Suriára und Pahâdâ verbändet sind (diese und die Xirián, welche ich bei diesen traf, selbst, bezeugen grundsätzlich das erste ist, stimmt nämlich vollständig mit jener überein, die Koch-Grünberg „Schiriana" nennt. Letzterer weist auch in einer Arbeit darauf hin, daß „Schiriana" die Selbstbezeichnung sei, „Schiriachiwi" dagegen ein Name, den ihnen ihre Nachbarn und Todfeinde, die „Maquiritâre", gaben. (Koch-Grünberg, 1913, S. 454). Es sei auch noch erwähnt, daß es sich bei der Bezeichnung „Shiriana" nach Vinci um ein Makuxi-Wort handeln soll. (Vinci, 1956, S. 107).

Palmkernsammlern wurde ihnen ihre bisherige feindliche Haltung nicht nachgetragen, denn diese waren froh, daß sie jetzt ohne Furcht vor den Indianern der Arbeit nachgehen konnten.

Die Surára halten fest an ihren alten Sitten und Gebräuchen und besuchen die Palmkernsammler nur dann, wenn sie Messer, Beile, Töpfe usw. eintauschen wollen. Nach Angaben des Häuptlings der Surára werden sie von den Xirianá zu dem Tauschverkehr mit den Palmkernsammlern gezwungen, denn alle erhaltenen Gegenstände müssen sie diesen abliefern (v. auch S. 74/77); die Xirianá selbst treten nie mit zivilisierten Bewohnern in Berührung.

Im August des Jahres 1949 wurde der 1940 gegründete Indianerschutzposten am Rio Demini erstmalig von einigen Pakidái aufgesucht. In größeren Abständen erfolgten bis heute weitere Besuche verschiedener Familien dieses Stammes. Aber auch sie kommen im Auftrage der Xirianá und müssen jenen alle Geschenke übergeben.

Hieraus ist zu ersehen, daß sich seit 1948 nichts geändert hat, als Métraux, basierend auf Angaben von Koch-Grünberg und anderen Forschungsreisenden dieser Gegend, mit voller Berechtigung schrieb: „The Shirianá are very warlike people who succeeded in dominating several weaker tribes"[*].

V. Körperliche Beschaffenheit

Bezüglich der körperlichen Beschaffenheit stimmen die Surára und Pakidái überein. Ihre Körperhöhe liegt unter der mittleren Rassengröße, denn die Männer sind nur 1,50—1,60 m und die Frauen 1,40—1,50 m groß. Beide Geschlechter haben weiche, aber muskulöse Körperformen, jedoch häufig einen vorgewölbten Unterleib und oft verhältnismäßig dünne Beine. Da sie immer barfuß gehen, haben ihre Füße die Fähigkeit behalten, beim Erklettern von Baumstämmen als Greiforgane zu dienen, und die Zehen sind nicht so zusammengepreßt wie bei zivilisierten Menschen, welche ständig Schuhe tragen. Auffällig ist der beträchtliche Abstand zwischen der großen Zehe und der zweiten (Abb. 14)[**]. Ihre Hautfarbe ist sehr hell, fast weiß. Die Stirn des dolichocephalen Kopfes ist oft flach. Bemerkenswert sind ihre breiten Nasen mit den gering nach oben gerichteten Nasenlöchern; die Nasenwurzel ist dagegen schmal. Der mongoloide Einschlag zeigt sich deutlich an den hervorspringenden Backenknochen und den schräg gestellten dunkelbraunen, beinahe schwarz wirkenden Augen. Zwischen den gering aufgeworfenen Lippen eines nie zu großen Mundes schimmern stets zwei Reihen gesunder Zähne. Ihre schönen, ganz glatten Haare sind von einem sehr dunklen Braun. Alle haben volles Haupthaar, verlieren es aber im Alter. Eine Glatzenbildung tritt jedoch nicht auf, das Haar wird dann so, als wäre es ganz kurz über dem Kopfe abgeschnitten. Bei einzelnen Männern sprießt eine dünne Barthebaarung beiderseits der Lippen und am Kinn; gelegentlich zupfen sie die Barthaare aus. Ihre übrige Körperbehaarung ist auf die Schamgegend beschränkt. Frauen zupfen sich die Schambaare aus, desgleichen Augenbrauen und Wimpern. Junge Mädchen haben meist schön geformte, halbkugelige, feste Brüste, die jedoch nach dem ersten Kind erschlaffen und herunterhängen, obgleich die Frauen dann oft noch nicht einmal das Alter von 18 oder 19 Jahren erreicht haben.

Diese Beobachtungen finden Parallelen durch die Beschreibungen, welche Alexander von Humboldt von den Waiká (Guaicas) und Guahariba gibt. Er bezeichnet sie auch als Stämme „von weißlicher Hautfarbe und sehr kleinem Wuchs". Er fügt aber hinzu „die Kleinheit der Guaicas und die Weiße der Guahariba.

[*] Métraux, 1948, S. 861.

[**] Hierauf hat auch schon Crevaux hingewiesen, und zwar bezüglich der Oyampi-Indianer in Französisch Guayana: „Le pouce fortement écarté regarde toujours en dedans, tandis que le troisième, le quatrième et le cinquième sont tournés en dehors." (Crevaux, 1880, S. 76 und Abb., links).

die P. Cunibo Gualinibos blancos nannt, wies im gleichen Maße übertrieben worden[99]). Die von Alexander von Humboldt gemessenen Guaicas hatten „im Durchschnitt 4 Fuß 7 Zoll bis 4 Fuß 8 Zoll (nach altem franz. Maß)"[100]), also etwa 1,52—1,55 m. Dieselbe Körperhöhe gibt auch Koch-Grünberg von den Waiká (Waika) an, die er in Mokomoká am Uraricuera traf und welche er ebenfalls als sehr hellhäutig bezeichnet[101]). An anderer Stelle schreibt Koch-Grünberg: „Die Schiriana und Waika von Mokomoká waren kleine Leute, im Durchschnitt etwa 1,52 m hoch. Bei keinem überstieg die Körperhöhe 1,55 m ..... Ältere Leute hatten aufgetriebene Bäuche und dürre Beine ..... Die von Natur fast durchweg hellhäutigen Menschen wirkten noch abstoßender durch den Mangel jeder Körperpflege"[102]). Ähnlich, aber noch abfälliger äußerte sich Chaffanjon über die Guahariben: „Petits et chétifs, des nomades grêles, au crâne démesurément gonflé, des cheveux longs et nuls, une physionomie bestiale, leur donnant un aspect repoussant. Ils vont absolument nus; deux hommes ont la barbe longue et clairsemée; leur teint est plus clair que celui de tous les Indiens que j'ai encore rencontrés; ils n'ont pour toute arme qu'un bâton"[103]). Schließlich ist noch zu erwähnen, daß nach Zerries bei etwa 40 erwachsenen Waiká einen Durchschnittswert von 151,5 cm für Männer und 141 cm für Frauen festzustellen[104]).

Aus den Vergleichen ist zu ersehen, daß die Surára und Pakidái von derselben körperlichen Beschaffenheit sind wie die Guahariben, Xirianá und Waiká[105]). Erstaunlich ist es daher, daß Chaffanjon und Koch-Grünberg die untersuchten Indianer als so auffallend hellhäutig bezeichnen. Die verwandten Surára und Pakidái sowie die Waiká im Einzugsgebiet des oberen Orinoco verkörpern zwar auch einen für uns fremden Typus (v. Abb. 9—24 und Abb. bei Zerries, 1959), aber bestimmt keinen derart abstoßenden.

VI. Technologie und materielle Kultur

1. Hausformen

Den Surára und Pakidái sind vier verschiedene Hausformen bekannt. Die einfachste und wohl ursprünglichste, welche aber gegenwärtig nur noch bei den Streifzügen im Urwald als Nachtquartier für jeweils eine Familie Verwendung findet, hat Ähnlichkeit mit einem Windschirm (Abb. 4). Sie wird folgendermaßen konstruiert: Vorn werden ein oder zwei 2—2,50 m lange Stützen, im Abstand der Länge einer Hängematte, in den Boden gesteckt, etwa drei Meter dahinter befinden sich in etwa weiterem Zwischenraum zwei 1—1,50 m lange, schwächere Stützen. Die oberen Enden werden durch Stangen miteinander verbunden; als Bindematerial dient Cipó-titica (eine Lianenart). Statt der hinteren Stützen bindet man die Stangen auch häufig an zwei ein Stück auseinanderstehenden Bäumen an. Darüber werden 12—15 dünnere Stangen in Querrichtung gelegt und darauf 4—6 in Längsrichtung. Es ergibt sich dadurch ein mehr oder weniger steiles Gerüst, welches die Form eines Pultdaches hat. (Abb. 4). Hierauf legt man Palmblätter, so daß die Hütte einen sicheren Schutz gegen den Regen gewährt; selbst die schwersten tropischen Gewitter können den schlafenden Indianern darunter nichts anhaben. Die Hängematten befestigt man in Dreiecksform um das in der Mitte brennende Feuer, bei größeren Familien hängen auch oft zwei Hängematten übereinander.

[99]) Chaffanjon, 1889, S. 308—311.
[100]) Zerries, 1959b, S. 186.
[101]) Erst kürzlich erschien von dem gleichen Verfasser eine Arbeit „Beiträge zur Anthropologie der Waika- und Schiriana-Indianer im Grenzgebiet zwischen Venezuela und Brasilien", welche durch ungenügendes Bildmaterial auffällt (Zerries, 1959a, S. 31—51).

[99]) A. von Humboldt, 1880, IV, S. 1158.
[100]) Koch-Grünberg, 1923, S. 215.
[101]) Koch-Grünberg, 1923, S. 304.

Die Hütten der einzelnen Familien werden, wenn der ganze Stamm wandert, stets im Kreis um die im Zentrum stehende Häuptlingshütte aufgestellt, nachdem vorher der Urwald schnell etwas gerodet wurde. Der Abstand von Hütte zu Hütte beträgt 5—8 m.

Genau die gleiche Konstruktion bringen auch Salathé für die Karinä[28]), Zerries für die Waiká[29]) und Koch-Grünberg für die Xirianá (Schirianá) am oberen Uraricapará; doch letzterer bezeichnet jene pultdachartige Hütte als Wetterschirm[30]). Dieser Name ist aber nicht zutreffend, denn ein echter Wetterschirm, auch Windschirm genannt, berührt auf einer Seite den Boden. Bei der geschilderten Bauweise und ebenfalls auf Koch-Grünbergs Zeichnungen ruht jedoch das Dach überall auf Stützen. Auch die kreisförmige Anordnung der Hütten wird schon von Koch-Grünberg erwähnt. Dann äußert der Gelehrte die Vermutung, daß es sich hierbei nur um ein flüchtiges Lager handelt[31]), was ich jetzt, hinsichtlich der Surára und Pakidái, bestätigen kann. Dagegen sagen Koch-Grünberg, Salathé und Zerries nichts über eine im Zentrum stehende Hütte aus. Diese fehlt aber bei den Surára und Pakidái niemals. Als Grund hierfür gaben mir die genannten Indianer an, daß der darin schlafende Häuptling gegen feindliche Überfälle geschützt werden soll. Nachts müssen außerdem jeweils zwei Krieger das Lager bewachen.

An den Wanderwegen der Surára und Pakidái im Gebiet zwischen den Flüssen Demíni und Aracá findet man zahlreiche solche verlassenen Lager. Sie werden aber nie ein zweites Mal als Nachtquartier benutzt, obgleich die Konstruktion oft noch sehr gut erhalten ist und nur die Dächer mit frischen Palmblättern bedeckt werden müßten.

Eine Ausnahme bildet das Lager Xiwarí, welches sich 35 km südlich von der Cachoeira das Índios am oberen Aracá befindet. Drei-

[28]) Salathé, 1931/32, S. 298—300 und Fig. 1 und 2.
[29]) Zerries, 1938, S. 184.
[30]) Koch-Grünberg, 1903a, S. 300 und Taf. 43 b und c.
[31]) Koch-Grünberg, 1903a, S. 300 und Taf. 43 a.

viertel des Kreises, der einen Durchmesser von 28 m hat, wird von 20 der beschriebenen kleinen Hütten eingenommen, während eine 7 m lange und 5 m hohe gleichartig konstruierte Behausung das übrige Viertel ausfüllt. In der Mitte des Kreises steht, wie üblich, die Häuptlingshütte. Um das Lager herum sind Roças (Waldrodungen) angelegt, wo Bananen, Pupunha-Palmen, Maniok, süße Kartoffelarten und Tabak angepflanzt werden. Hier halten sich die Surára in jedem Jahr zwischen den Monaten Oktober und Dezember auf. In der großen Hütte werden dann stets zwei Monate lang zwei junge Männer im Alter von etwa 20 Jahren von dem Häuptling und seinem Bruder als Medizinmannsgehilfen ausgebildet (s. S. 671.).

Die zweite Hausform ist eine große, offene, fast kreisförmige Maloka, welche in einem Tal zwischen drei kurzen Bergzügen liegt, 70 km nordöstlich von der Cachoeira das Índios und etwa 100 km südlich vom Quellgebiet des Orinoco (Abb. 5). Hierbei handelt es sich um eine Konstruktion (s. Fig. 1), die bisher noch nie für südamerikanische Indianer belegt worden ist. Sie wird in der Trockenzeit von den Surára und Pakidái gemeinsam bewohnt. Wie die weiteren Ausführungen zeigen werden, hat sich diese Hausform aus den kreisförmig angeordneten kleinen Hütten, die als Nachtquartier dienen, entwickelt. Das beschriebene Lager Xiwarí zeigt schon deutlich die Übergangsform.

Um eine Fläche von 52 m Länge und 46 m Breite sind drei ca. 6 m hohe, gebogene Windschirme aufgestellt (Abb. 6) und ein zum Inneruum hin offenes, sechseckiges Haus mit Giebeldach. Die Länge des größten Windschirmes beträgt 74,40 m und die der beiden anderen 28,60 m bzw. 25,40 m. Das rechteckige Häuptlingshaus ist 9,70 m lang. Vier Eingänge, mit einer jeweiligen Breite von 8 m; 6,60 m, 6,30 m und 2 m, führen in das große, offene Rund. Ein kleiner Eingang, der jedoch nur 1 m hoch und 50 cm breit ist, befindet sich innerhalb des größten Windschirmes. Außerdem ist zu erwähnen, daß zwischen dem Häuptlingshaus und dem 24,80 m langen Windschirm noch eine 4 m lange rechteckige, offene Giebeldachhütte steht, der Hahnenstall (Abb. 7).

c

Die drei Windschirme werden folgendermaßen errichtet: Zum Innenraum hin sind in unregelmäßigen Abständen 3,30—3,60 m hohe Pfosten aufgestellt. Dahinter, in einem Abstand von 2,60 m, stehen kleinere Pfosten, die ca. 1,20 m hoch sind. Die vorderen und hinteren Pfosten werden durch Leisten verbunden, die man ungefähr 2 m nach oben hinauswagen läßt. Zur Befestigung dient auch hier Cipó-titica, eine Lianenart. Im Abstand von 30—70 cm werden über diese Leisten 31—35 dünnere Querleisten gelegt, wodurch eine Windschirmkonstruktion entsteht. Im Gegensatz zu der oben beschriebenen pultdachartigen Hütte handelt es sich diesmal um echte, wenn auch besonders große Windschirme, denn der Boden wird auf einer Seite berührt. Die Tiefe beträgt ca. 7 m und die Höhe des Daches bis zu 6 m. Als Dachbelag verwendet man die Blätter der Ubim-Palme (*Geonoma* sp.), die „Ziegel" Amazoniens. Auch die Gummisammler, Palmfasersammler, Pflanzer und Holzfäller benutzen als Dach- und Wandbelag diese Blätter, deren Haltbarkeit 4—5 Jahre beträgt.

Die Ubim-Palme, welche im Demini-Aracá Gebiet sehr häufig auftritt, erreicht nur eine Höhe von 1,50—2 m. Die Blätter haben eine Länge von 80 cm bis 1 m und eine Breite von 25—30 cm. Das Sammeln derselben ist recht anstrengend und erfordert 4—5 Stunden schwere Arbeit. Sie werden abgeschlagen oder abgebrochen und zunächst haufenweise übereinandergelegt. Hat der Indianer genug Blätter zusammen, säubert er im Urwald einen kleinen rechteckigen Platz im Abstand von etwa 4 m. In dieser Entfernung steckt er auf beiden Seiten je drei 2 m hohe sich direkt gegenüberstehende Stöcke in den Boden. Diese werden mit Lianen verbunden. Danach werden über die drei Lianenstreifen jeweils Haufen von 8—10 Blättern nebeneinandergelegt. Ist das Ende erreicht, schichtet der Indianer auf die Zwischenräume erneut Haufen von 8—10 Blättern, doch diesmal mit dem Stiel nach der entgegengesetzten Seite. In der gleichen Weise verfährt er noch mehrmals, bis schließlich alle gesammelten Blätter schön säuberlich haufenweise übereinander liegen. Danach zieht er auf der einen Seite die drei Stöcke heraus und rollt jetzt die Blätter mit den drei Lianenstreifen, auf denen sie liegen, wie einen Teppich zusammen. Die Enden der Lianen werden dann fest angezogen und ineinandergesteckt. Um den Ballen wird noch ein Tragband aus Embira geschlungen, und hierauf trägt der Indianer die 60—70 kg schwere Last mit dem Kopf oder der Brust, im letzteren Falle verläuft das Tragband über der Brust und den beiden Oberarmen, 30—40 Minuten oder mehr durch den unwegsamen Urwald bis zu seiner Maloka. Der Schritt, den die Indianer dabei anschlagen, ist so schnell, daß ich, obgleich ohne Last, regelmäßig Mühe hatte, ihnen zu folgen.

In der Behausung angekommen, verarbeitet man nun die Blätter am gleichen oder folgenden Tag zu rechteckigen Matten, die als Dachbelag dienen sollen, wobei die Frauen helfen. Bei dieser Technik beeindruckt die Zweckmäßigkeit und der indianische Erfindergeist.

Über einen Stengel der Paxiúba-Palme (*Iriartea exorrhiza* Mart.) werden 60—100 Ubimblätter, mit der Rückseite nach oben, nebeneinandergelegt, und zwar in der Weise, daß gerade noch das Blattende oberhalb des Paxiúbastengels liegt, während der lange Stengel des Ubimblattes darüber hinausragt. Jedes Ubimblatt besteht übrigens aus 3—4 V-förmigen Seiten. Von rechts wird nun damit begonnen, die Blätter zu einem festen Bestand ineinanderzufügen. Der untere Teil der rechten V-förmigen Seite wird eingeschlagen. Danach wird der lange Ubimstengel umgeknickt, um den Paxiúbastengel geschlungen, rechts vom Blatt nach oben geführt und dann über das Blatt nach links gelegt. Mit den anschließenden Blättern wird in der gleichen Weise verfahren. Das Stengelende des letzten linken Blattes wird durch ein um den Paxiúbastengel geschlungenes Lianenstück befestigt, oder einfach dadurch, daß man diesen Stengel ausnahmsweise nach rechts umbiegt und unter die anderen Blätter schiebt. Damit ist ein Pano (rechteckige Matte) fertig, der im allgemeinen eine Länge von 5—8 m hat und eine Breite von einem halben Meter. Je nach der Länge des Windschirmes werden nun 80—100 oder mehr solcher Panos

im Abstand von 30—50 cm ziegelartig übereinander auf das Dachgerüst gelegt und mit Lianen befestigt.

Unter diesen Windschirmen leben die Familien, eine neben der anderen. Die räumliche Ausdehnung jeder Familie beträgt 3—4 m. In der Mitte brennt das Feuer, welches Tag und Nacht unterhalten wird. Rechts und links davon hängt je eine Hängematte, für den Mann und die Frau (Abb. 29). Bei größeren Familien werden die Hängematten dreieckförmig um das Feuer herum aufgehängt, und wenn nötig, auch übereinander. Im letzteren Falle schläft die Hauptfrau stets unten und der Mann oben, während die zweite Frau und die größeren Kinder, oder die Großmutter, in den Hängematten auf der gegenüberliegenden Seite des Feuers liegen. Über und hinter den Hängematten sind die Gebrauchsgegenstände, Bogen, Pfeile, Köcher, Messer, Körbe usw., am Dachgerüst befestigt. Die meisten Familien haben außerdem ganz im Hintergrunde ein etwa 1 m hohes quadratisches oder rechteckiges $^1/_2$ bis höchstens 1 m langes Holzgerüst aufgestellt, welches mit 30—50 cm hohen Seitenwänden versehen ist, in dem die jungen Hunde schlafen, das sogenannte Hundebett (Abb. 30). Ob letztere Vorrichtung eigenständig ist oder früher einmal von Karaibenstämmen übernommen wurde, konnte bisher nicht festgestellt werden. Nach Angabe des deutschen Franziskanerpaters Protasius Frikel aus Santarem sind ähnliche Hundebetten auch bei Karaibenstämmen am Rio Trombetas in Gebrauch[28]).

Die Häuptlingshütte verdankt ihre Entstehung offensichtlich dem Vorbild von Hütten der Pflanzer, Gummi- und Palmfasersammler. Sie hat einen rechteckigen Grundriß, die Breitseite ist zum Hof hin gerichtet und auf dieser Seite auch offen. Die Länge beträgt 9,70 m, die Breite 6 m und die Höhe, genau wie die der Windschirme, ca. 6 m. In der Mitte stehen vier 5 m lange Pfosten, vorn und hinten je vier kleinere, deren Höhe je 2,35 m beträgt. Durch Querbalken sind die kleinen Pfosten miteinander verbunden, außerdem führen Horizontalleisten zu den hohen Pfosten, wodurch ein Giebeldach gebildet wird. Darüber liegen wiederum kleine, dünne Querleisten, auf denen, genau wie bei den großen Windschirmen, Panos, die rechteckigen Palmblattmatten, befestigt sind. In der gleichen Weise hat man auch die hintere Wand und die beiden Seitenwände mit Panos versehen. Zwischen den beiden Enden der Vorderseite sind drei $^1/_2$ m hohe Stangen befestigt, die häufig als Sitzgelegenheit benutzt werden. An der rechten Schmalseite befindet sich der Eingang, welcher 1 m breit ist. In der Mitte der Hütte brennt das Feuer, und im Dreieck herum hat man die Hängematten befestigt, in denen der Häuptling, seine beiden Frauen und die Kinder schlafen. An den Querbalken und am Geflecht der hinteren Wand hängen alle Gebrauchsgegenstände.

Rechts neben dem Häuptlingshaus steht noch eine kleine, offene Hütte, welche 4 m lang, 2 m breit und 6 m hoch ist. Auch hier hat das Dach eine Giebelform und ist ebenfalls mit Panos aus Ubimblättern bedeckt. Unter dem Dach befindet sich ein Lattenverschlag, ca. 1,60 × 2 m, der als Hühnerstall Verwendung findet.

Vom architektonischen Standpunkt aus stellt diese offene, nahezu kreisförmige Konstruktion, in der allerdings die Häuptlingshütte und der Stall für die Hühne zwei später eingefügte Fremdkörper bilden, eine unübertreffliche Bauweise dar, gerade für dieses heiße, tropische Gebiet. Die Kreisform verhindert das Eindringen von Wind, und auch der Regen kann den im toten Winkel unter den Dächern lebenden Familien nichts anhaben. Außerdem herrscht ständig eine angenehme frische Luft, so daß auch beim Verlassen dieser Maloka keine Erkältungsgefahr besteht. Stämme oder Gruppen, die in geschlossenen Malokas leben, sind Erkältungskrankheiten viel leichter ausgesetzt, wenn sie das warme Gemeinschaftshaus verlassen und in die kühle Morgen- oder Nachtluft hinaustreten. Diese Maloka der Surára darf wohl als eine der ältesten und ursprünglichsten Bauformen südamerikanischer Indianer angesehen werden. Um das Gemeinschaftshaus herum hat man Pflanzungen angelegt (Abb. 37), die sich z. T. bis in die Mitte der Bergabhänge erstrecken.

[28]) Persönliche Angabe von P. Frikel anläßlich des XXXI. Int. Amerik. Kongr. in São Paulo, 1954.

Als dritte Hausform lernte ich an der Cachoeira dos Índios am oberen Aracá eine 10 m hohe, geschlossene, kreisförmige Maloka mit Giebeldach kennen. Die Surára erklärten mir, daß diese Bauweise bei den Xiriána üblich sei. Eine Beschreibung davon gibt es aber bisher auch noch nicht.

Der Bau wird, wie bei der offenen Maloka, von allen Männern des Stammes unter Leitung des Häuptlings in Gemeinschaftsarbeit durchgeführt. Ich hatte das Glück, diese Konstruktion in allen Phasen miterleben. Zuerst wird ein Stück des Urwaldes, auf dem die Maloka errichtet werden soll, gesäubert. Die Männer beginnen damit, die kleinen Bäume und Sträucher umzuschlagen und die Wurzeln derselben herauszuziehen. Hierauf gehen sie an das Fällen der großen Bäume. Doch bevor jeweils zwei Männer mit ihren Äxten die Arbeit an einem Baum beginnen, klettert ein Mann hinauf und befestigt dicht unterhalb der Krone eine sehr lange Liane. Ist danach der Baum soweit eingekerbt, daß er zu fallen droht, ziehen ihn drei bis vier Männer mittels der Liane zu Boden und springen, während der Baum fällt, rasch zu Seite. Sind alle Bäume geschlagen, werden die Wurzeln mit Hilfe von Terçados (große Buschmesser) und den Händen ausgegraben. Andere Männer ziehen inzwischen das auf dem Boden wachsende Gestrüpp heraus. An den folgenden 2—3 Tagen werden im Urwald Bäume gefällt, welche als Baumaterial dienen sollen. Hierauf mißt der Häuptling, unterstützt von zwei oder drei Männern, mittels einer Liane, einen kreisrunden Platz ab. Anschließend beginnt der Bau, welcher bereits nach acht Tagen die nachstehend aufgeführte Konstruktion zeigt: Beiderseits von drei 10 m hohen Mittelpfosten, die den Dachfirst bilden, stehen im Halbkreis je vier Pfosten, deren Höhe 8 m beträgt. In einem weiteren Abstand sind um die genannten Pfosten 21 kleine Pfähle, je 5 m hoch, kreisförmig in den Boden gerammt. Sowohl die hohen, als auch die mittleren und kleinen Pfosten sind jeweils durch zwei Querleisten an den oberen Enden und 2 m darunter miteinander verbunden. An den Querleisten der 21 Außenpfosten sind außerdem zahlreiche Horizontalstäbe befestigt, wodurch die Hauswand gebildet wird. Von den oberen Querleisten der kleinen Pfosten verlaufen über die der mittleren Pfosten, die als Stützen dienen, bis zu denen der großen Pfosten 69 Horizontalstangen, die das Dachgerüst tragen sollen. An den beiden Schmalseiten der drei hohen Mittelpfosten sind zwischen den aufliegenden Horizontalstangen orgelförmig je 11 dünne Stöcke angebracht und bilden die beiden Giebelfronten. Als Bindematerial wird auch hier ausschließlich Cipó-titica verwandt. Rechts an der vorderen und links an der hinteren Breitseite ist je ein kleiner nur 1 m hoher und 1 m breiter Eingang. Nach der Fertigstellung des Gerüstes (Abb. 8) werden auf das Dach die Panos (rechteckige Matten aus den Blättern der Ubimpalme) wieder schindelartig übereinandergelegt und an den Sparren befestigt. Es ist die gleiche Technik, wie sie schon bei der Konstruktion der großen, offenen Maloka beschrieben wurde. Den oberen Teil der beiden Giebelseiten läßt man offen, damit Licht in das Innere des Hauses eindringen und der Rauch abziehen kann. Auch die Wände werden vollständig mit Panos bedeckt, und vor die Eingänge werden mittels Lianen zurückschlagbare Palmblattmatten gehängt. Im Inneren des Hauses bleibt die Mitte frei, zur Veranstaltung von Festen und Tänzen, während die Familien, in der gleichen Form wie in der offenen Maloka, verhältnismäßig dicht an der Wand wohnen, eine Familie neben der anderen. Für den Häuptling und seine Angehörigen ist an der zum Fluß gelegenen Seite ein besonders großer Platz reserviert.

Erstaunlich ist an dieser Hausform die Tatsache, daß der Grundriß kreisförmig ist, während das Dach eine Giebelform hat. Für Häuser mit kreisförmigen Grundriß ist sonst das Kegeldach charakteristisch, wie es Olga Coudreau[28]) und Koch-Grünberg[29]) für Karaibenstämme belegt haben. Dabei werden ein oder höchstens zwei Mittelpfosten verwandt. Koch-Grünberg erwähnt zwar auch einen Bau mit drei und schreibt dazu: „Werden die beiden Mittelpfosten weiter auseinandergesetzt oder statt zwei Mittelpfosten drei oder mehr verwendet,

[28]) Olga Coudreau, 1903, S. 122.

[29]) Koch-Grünberg, 1923a, S. 18 und Taf. 2 (2a, 2b, 2a, 2b).

so verlängert sich der Dachfirst, und der kreisrunde Grundriß geht allmählich in einen elliptischen über"[95]).

Bei der von mir geschilderten Bauweise bleibt aber der kreisförmige Grundriß trotz der drei Mittelpfosten erhalten. Nach Koch-Grünberg verdanken die Giebeldächer und Hütten mit elliptischem Grundriß und anderen von Viereckform" offensichtlich europäischem Einfluß ihre Entstehung"[97]). Hierin stimme ich mit dem genannten Forscher vollständig überein und glaube daher, daß diese von den Surára konstruierte Maloka, die sie dem Gemeinschaftshaus der Xiriána nachbildeten, in Wirklichkeit aus der karaibischen Kegeldachhütte hervorgegangen ist, während das Dach eine Entlehnung aus dem Bereich der Zivilisation (Palmstrohhütten der Caboclos) darstellt. Darauf weist auch die Konstruktion der Häuptlingshütte innerhalb des Kreisumfanges der großen, offenen Maloka hin, welche ebenfalls ein Giebeldach enthält (s. S. 14). Bemerkenswert ist jedoch, daß die Maloka der Surára eine Höhe von 10 m hat, während die von Koch-Grünberg erwähnten Rundhütten eine Höhe zwischen 4.20—5.37 m aufweisen[98]). Meine Frage, warum die Surára in der Serra eine offene und an der Cachoeira dos Índios am oberen Aracá eine geschlossene Maloka bewohnen, wurde mir dahingehend beantwortet, daß es in der höhergelegenen, kühleren Region zwischen Demini und Aracá so gut wie keine Moskitos gibt, jedoch am Flußufer des Aracá verhältnismäßig viele. Diese Begründung ist sehr einleuchtend, denn in den geschlossenen indianischen Gemeinschaftshäusern halten sich keine Stechmücken. Sie scheuen das Halbdunkel und den Rauch der ständig brennenden Feuer.

2. Brücken

Boote werden von den Surára und Pakidái nicht verwandt. Wenn sie auf ihren schmalen Urwaldpfaden, die für unsere Augen kaum erkennbar sind, an Bäche gelangen, so waten sie einfach hindurch. Handelt es sich um breitere Bäche, die in der Regenzeit Hochwasser führen, oder sind deren Ufer steil abfallend, so wird einfach ein Baumstamm als Steg darübergelegt. Zur Überquerung kleinerer Flüsse, wie z. B. des Rio Deminisinho, eines linken Nebenflusses des oberen Aracá, der 1 km hinter der Cachoeira dos Índios in denselben mündet, bedienen sich die Surára sogar einer regelrechten Brücke. An der Übergangsstelle beträgt die Breite des Rio Deminisinho 38 m, und zu beiden Seiten befinden sich 8 m hohe Steilufer. Die Brücke, welche hier während der Sommerzeit, in der das Flußbett verhältnismäßig flach ist, gebaut wurde, besteht aus zwölf 12—14 m langen gekreuzten Baumstämmen, die in das Flußbett gerammt wurden. Über die Kreuzungsstellen hat man jeweils zwei nebeneinanderliegende dünnere Stämme gelegt und mit Lianenumwicklungen befestigt. An den überstehenden Enden der Tragpfosten bilden Lianen eine Art Geländer. Da sie aber sehr locker durchhängen, können sie kaum einen Halt geben. Zur Sicherung der Brücke hat man beide Enden noch zusätzlich mittels Lianen an dicken Bäumen verankert. Hierdurch wirkt die Konstruktion auf den ersten Blick wie eine Hängebrücke. Da sie aber 1 m höher ist als die Ufer, sind an beiden Seiten kleine 60 cm breite Sprossenleitern angebracht und mit Lianenbindungen befestigt.

Während ich beim Überqueren dieser und anderer Baumstammbrücken stets mit großen Schwierigkeiten zu kämpfen hatte, um das Gleichgewicht zu halten, schritten die Indianer, Männer, Frauen und Kinder, immer mühelos darüber hinweg, selbst dann, wenn sie viel Gepäck trugen. Dies mag wohl damit zusammenhängen, daß sie ihre Füße beinahe gar nicht auswärts stellen, so daß man dieselben fast für parallel halten kann (Abb. 17)[99]).

[95]) Koch-Grünberg, 1923a, S. 22 und Taf. 2 (4).
[97]) Koch-Grünberg, 1923a, S. 22.
[98]) Koch-Grünberg, 1923a, S. 21.

[99]) Ähnliche Angaben liegen von Crevaux bezüglich der Oiana (Rukuien, Roucouyennes) vor. Der Forscher suchte bereits nach den Ursachen und glaubte, dieselben im Becken zu finden. Auch die weißen Frauen, so sagte er, gehen mehr als die Männer mit nach innen gesetzten Füßen, weil ihr Becken breiter ist. Wegen der Fußstellung schließt er deshalb auch auf ein breiteres Becken bei den Indianern. (Crevaux, 1883, S. 255).

Diese Brücken stellen kein Novum dar, denn in ähnlicher Form werden sie bereits von Alexander von Humboldt vom Raudal de Guaharibos erwähnt[82]. Eine geradezu klassische Beschreibung dieser bei den Guaharibo beobachteten Bauweise liefert Chaffanjon: „Enfin, vers les quatre heures et demie du soir, nous trouvons une espèce de lac avec un rayol, à l'extrémité duquel quelques branches, régulièrement placées en travers du courant, attirent notre attention; plantées entre les anfractuosités des rochers, elles forment passerelle. Pour les constructions de cette espèce, les Indiens attendent que la rivière soit très basse. Ils recherchent des ramures ou de jeunes fûts, d'une seule venue, comme on en recontre beaucoup dans la forêt. La grosseur varie entre 12 à 15 centimètres de diamètre, la longueur diffère suivant la profondeur de l'eau. Les piquets que nous examinons ne dépassent pas 4 mètres de longueur, ils sont, ainsi que toutes les branches, ou cassés ou brûlés; aucun ne porte trace de hache ou de couteau. Les supports en X, disposés de distance en distance, ont les bras réunis par des traverses, tant à la partie inférieure qu'à la partie supérieure. Le tout est solidement fixé avec des lianes très résistantes. Pour mieux assujettir les supports plantés dans quelque anfractuosité ou entre les roches, on les relie aux arbres de la rive, ce qui leur donne l'aspect d'un pont suspendu. Les Indiens marchent sur les deux traverses inférieures et se servent de la supérieure comme d'une rampe"[83]. Weiterhin werden solche Brücken von Koch-Grünberg für die Tauliping belegt[84] und von Zerries für die Waiká[85].

3. *Jagd- und Kriegswaffen nebst Zubehör*

Für Jagd- und Kriegszüge verwenden die Sanŕma und Pakidái, genau wie die meisten anderen Urwaldnomaden Südamerikas, sehr große Bögen — *kdonaki* — und Pfeile — *xerika* (Abb. 11).

[82] A. von Humboldt, 1860, IV, S. 111, 113, 119.
[83] Chaffanjon, 1889, S. 311 und Abb. S. 309.
[84] Koch-Grünberg, 1923a, S. 78 und Abb. 6.
[85] Zerries, 1954b, S. 73.

Die Bögen, sogenannte einfache Bögen, da sie jeweils nur aus einem Stück bestehen, werden aus dem schweren, schwarzen Holz der Pupunha- oder Chontapalme (*Guilielma speciosa* Mart.) gearbeitet und haben Längen zwischen 2,03—2,12 m. Ihre Gewichtszugkraft beträgt 32 kg und die Spannlänge 71 cm[86]. Durch eine nicht zu starke, aber gleichmäßige Krümmung erhalten sie ein symmetrisches Aussehen. Während die äußere Seite flach ist, hat die innere eine abgerundete Form, so daß der Querschnitt, welcher in der Mitte 2—2½ cm beträgt, halbkreisförmig erscheint. Beide Enden laufen spitz aus (Fig. 21).

Bezüglich der Herstellung ist zu sagen, daß man den Bogenstab heute mittels Axt und Terçado (großes Buschmesser)[87] zunächst roh zuhaut. (Steinbeile, die man vielleicht früher einmal dazu verwandte, habe ich nicht vorgefunden). Anschließend bearbeiten ihn die Männer mit einem kleinen Messer, welches sie ebenfalls eintauschen. Zum Glätten verwendet man die innere Kante des Eckzahnes von einem Wildschweinunterkiefer und die rauhen Blätter der Curatella (*Cecropia peltata*), wodurch der Bogen ein schönes, glänzendes Aussehen erhält.

Die Sehne — *penahildhe* —, welche aus dreisträhnig nach rechts gedrehten Curauá (*Bromeliaceae*)-Faserschnüren besteht, wird jeweils mit einfacher Schlinge an den Bogenenden befestigt. Will man den Bogen nachspannen, muß die Sehne stärker zusammengedreht werden, wodurch sie sich verkürzt.

Der beschriebene Bogen läßt sich sofort in die typischen Bogenformen Guayanas einordnen, welche Métraux wie folgt charakterisiert: „Guiana bows were generally convex on the belly while the back or outer surface was concave or flat"[88]. Nach Meyers Klassifikation würde er wegen seines halbkreisförmigen Querschnitts

[86] Diesbezügliche Vergleiche mit Bögen anderer südamerikanischer Stämme sind aus Rankes Tabelle zu ersehen. (Ranke, 1903, S. 347).
[87] Sie erhalten diese Gegenstände im Tausch von Piaçabeiros (Palmfasersammlern) und als Geschenke vom Personal des Indianerschutzpostens Ajuricaba am mittleren Demini.
[88] Métraux, 1949, S. 232.

zum nordbrasilianischen Bogentypus gehören; auf Grund des Materials jedoch zur Peru-Gruppe, da es sich ja nicht um rotbraunes, glattes Leguminosenholz handelt, sondern um solches der Pupunhapalme[*]). Auch P. Schmidt widmet

*) Meyer, o. J., S. 31.

dieser „umgekehrten Form des Flachbogens" einen größeren Abschnitt und zählt schon folgende Stämme nördlich des Amazonas auf, wo sie vorkommt: „Kanamare am Rio Jurua, Trio, Ojana, Makusi, Wapisiana, Uaupe, Purohoto, Paase (Kinderbogen), Siriana am Rio

Uraricapara, Motomoto[68]). Auf Grund der Beschreibungen und Abbildungen, die Koch-Grünberg von dem Xiriána-Bogen gibt[69]), stimmt dieser mit dem der Surára und Pakidái nahezu überein, bis auf die Tatsache, daß ersterer an den Enden abgesetzt ist. Dadurch werden die Aussagen der von mir untersuchten Indianer bestätigt, welche erklärten, daß sie Bogen dieser Art und die Kenntnis, sie selbst herzustellen, von den Xiriána erhielten. Auf meine Frage, warum ihre Bögen am Ende aber nicht abgesetzt sind, gab man mir die Auskunft, daß die Xiriána diese Abweichung fordern. Im Hamburgischen Museum für Völkerkunde und Vorgeschichte befinden sich zwei Xiriána-Bögen, welche von Koch-Grünberg gesammelt wurden (12.25:29; 12.25:31). Es sind aber verhältnismäßig kleine Exemplare, denn sie haben nur eine Höhe von 1,92 bzw. 1,82 m. Ein Bogen der Xamatári vom Rio Mairi, einem linken Nebenfluß des Rio Cauaboris, der sich ebenfalls im Hamburgischen Museum für Völkerkunde und Vorgeschichte befindet (Sammlung Boeldecke, 56.15:4) und zwei Meter hoch ist, hat genau die gleiche Form wie die der Surára und Pakidái, d. h. ohne abgesetzte Enden. Das ist nicht verwunderlich, denn die Xamatári sind nach Aussage des Surára-Häuptlings Hewemão gleichfalls Trabanten der Xiriána (s. S. 6). Schließlich ist noch zu erwähnen, daß dieselbe Bogenform auch für die Waikâ in Venezuela belegt ist[70]).

Die Pfeile — *zerika* —, deren ganze Länge zwischen 2—2,12 m beträgt (Schaftlänge: 1,89—1,94 m; Gewicht: 60—90 g[71]) [72]), werden aus Pfeilrohr — *zerokahe* — hergestellt, daß von den Surára und Pakidái in der Nähe ihrer Malokas am oberen Araçá, bzw. am mittleren Demini angebaut wird. Alle fünf von ihnen verwandte Pfeilarten haben die gleiche Fiederung — *jarowakih* —, welche aus zwei halben schwarzen Schwungfedern des Mutum (*Crax* sp.) — *jaruri* — besteht. Man legt sie in der Weise an das Rohr, daß sie abwechselnd die obere und die untere Seite der Fahne zeigen. An mehreren Stellen des Handendes werden sie durch jeweils zwei Fäden der festen Umwicklung aus Bromeliafasern — *jamahassiwakama* — gehalten. Innerhalb dieser Umwicklung, die das schwache Rohr gegen den Eindruck der Bogensehne stärken soll, steckt am Rohrende außerdem ein kleiner, mit Harz befestigter Holzstift, der in seinem verdickten äußeren Teil eine Einkerbung hat, welche auf die Bogensehne aufgesetzt wird. Hierdurch soll verhindert werden, daß das Rohr beim Abschnellen des Pfeiles splittert. Das obere Ende des Federschaftes ist in eine zweite, schmälere Umwicklung eingebunden, in welcher zwischen den beiden halben Pfeilfedern häufig noch zwei schwarze Mutumfederchen als Schmuck stecken (Fig. 2 f).

Die beschriebene Fiederung gehört nach der Klassifizierung von Meyer zum Typ der Guayanafiederung[73]). Für die Xiriána bezeugt sie Koch-Grünberg[74]), und man kann sie auch an den Pfeilen erkennen, die der Forscher für das Hamburgische Museum für Völkerkunde und Vorgeschichte mitgebracht hat (Sammlung Koch Grünberg, 12.25:33—42). Daß die Xamatári diese Fiederung ebenfalls verwenden, zeigen die im gleichen Museum befindlichen Pfeile der Sammlung Alfred Boeldecke (56.15:3—7) und die Zeichnungen von Vinci[75]), außerdem ist sie nach Salathé bei den Karinyá anzutreffen[76]).

Erstaunlich groß ist die Variationsbreite der Pfeilspitzen, von denen es bei den Surára und Pakidái folgende fünf verschiedenen Typen gibt:

1. *Kenland* — Es ist eine breite, lanzettförmige Bambusspitze von 25—28 cm Länge; deren

[68]) P. Schmidt, 1913, S. 1030.

[69]) Koch-Grünberg, 1923a, S. 311 und Taf. 47 (1 und 2a, b, c, d).

[70]) Schuster, 1953b, S. 17.

[71]) Diese Maße bestätigen Woulu Feststellung, welcher sagte, daß der Pfeil nach Länge, Form und Gewicht dem Bogen entsprechen müsse, um eine gewisse Treffsicherheit zu gewährleisten. (Woulu, 1895, S. 6).

[72]) Dienenügliche Vergleiche mit anderen südamerikanischen Stämmen sind aus der Tabelle von Ranke zu ersehen. (Ranke, 1903, S. 347).

[73]) Meyer, o. J., S. 9.

[74]) Koch-Grünberg, 1923a, S. 311 und Taf. 47 (4, 7, 8).

[75]) Vinci, 1956, S. 146, Fig. 2.

[76]) Salathé, 1931/32, S. 300 und Fig. 3 und 4.

beide Enden spitz auslaufen; die Breite in der Mitte beträgt 3—4 cm. Die obere Seite ist abgerundet und die untere, griffgerechtlich etwas ausgehöhlt, manchmal auch mit schwarzen Punkten bemalt. Sie wird in den ein wenig gespaltenen und mit Bromeliafasern fest umwickelten Pfeilschaft hineingesteckt (Fig. 2a). Da die Pfeile mit dieser großen Spitze besonders durchschlagskräftig sind, werden sie vorwiegend für die Jagd auf Tapire und Jaguare verwandt; außerdem benutzt man sie bei kriegerischen Auseinandersetzungen. Jeder Surára- und Pakidái-Mann führt stets 2—3 solcher Reservespitzen in seinem Köcher bei sich.

Gleichartige Spitzen fand Salathé bei den Karimé[77]) und Vinci bei den Xamatári[78]) vor. Außerdem sind sie für letztere Indianer noch durch ein Exemplar im Hamburgischen Museum für Völkerkunde und Vorgeschichte belegt. (Sammlung Alfred Boeklecke, 56.15:5. Länge: 23 cm, Breite in der Mitte: 3 cm. An der unteren ausgehöhlten Seite ist diese Spitze mit einer schwarzen, schlangenförmigen Linie bemalt).

Die von Koch-Grünberg untersuchten lanzettförmigen Bambusspitzen der Xiriána haben dagegen eine etwas abweichende Form. Hier laufen nicht, wie bei den Surára, Pakidái, Karimé und Xamatári, beide Enden spitz aus, sondern das eine Ende ist verdickt, ausgehöhlt und wird, mit Bromeliafasern umwickelt, auf einen dem Pfeilrohr eingefügten Holzschaft aufgesetzt[79]). Drei solcher Xiriána-Pfeilspitzen der Sammlung Koch-Grünberg im Hamburgischen Museum für Völkerkunde und Vorgeschichte haben zudem die respektablen Längen von 34 cm (12.25:37) und 35 cm (12.25:34—35).

Da die Surára und Pakidái nach eigenen Angaben ihre lanzettförmige Bambusspitze von den Xiriána entlehnt haben, ist der erfolgte Wandlungsprozeß recht bedeutsam, weil ja die Spitze nicht mehr auf einen Holzschaft aufgesetzt, sondern direkt in das Pfeilrohr hineingesteckt wird.

Außerdem werden durch Zerries[80]) und Schuster[81]) lanzettförmige Bambusspitzen für die Waiká belegt, doch es ist aus dem Text nicht ersichtlich, ob es sich um die Art der Surára, Pakidái usw. handelt oder um die der Xiriána.

Wie stark Längen und Befestigungsmöglichkeiten solcher Bambusspitzen bei südamerikanischen Indianern variieren, zeigen die zusammenfassenden Untersuchungen von Meyer[82]) und Métraux[83]) sehr deutlich.

2. *Rahahé* — Hierbei handelt es sich um eine schmälere lanzettförmige Bambusspitze, welche in gleicher Weise wie die Kantaná in das mit Bromeliafasern umwickelte Pfeilrohr hineingesteckt wird (Fig. 2 b). Die einzelnen Spitzen sind 20—22 cm lang und in der Mitte 1,5—2 cm breit. Hiermit werden Wildschweine, Wasserschweine (Capivara), Rehe, Pacas und Cutias (s. S. 2) erlegt. Es ist bemerkenswert, daß solche schmalen Bambusspitzen in der Literatur bisher noch keine Erwähnung fanden.

3. *Kantarim* — Spitze mit Widerhaken, hergestellt aus einem doppelspitzigen Knochenstück vom Cuatá (*Ateles paniscus L.*). Derselbe ist am oberen Ende eines im Pfeilrohr steckenden Holzschaftes mittels einer Umwicklung aus Bromeliafasern, die zusätzlich noch mit Pech überzogen ist, parallel angeschnürt (Fig. 2 c). Mit dieser in Südamerika sehr weit verbreiteten Pfeilspitze werden von den Surára und Pakidái Vögel und Fische geschossen.

Nach der Klassifizierung von Métraux gehört sie zum zweiten Haupttyp der im tropischen Urwaldgebiet Südamerikas vorkommenden Pfeilspitzen[84]). Meyer erwähnt, daß sie in Guayana gebräuchlich ist, aber auch im westlichen Brasilien und bei den Karajá[85]). Innerhalb der Yanonámi-Gruppe sind sie noch für die Xiriána[86]), Karimé[87]), Xamatári[88]) und Waiká[89]) [90]) belegt. Im Hamburgischen Museum für Völkerkunde und Vorgeschichte befinden sich

übrigens drei Xiriána-Pfeile mit dieser Spitze (Sammlung Koch-Grünberg, 12.25: 39—41) und ein Pfeil der Xamatári (Sammlung Boelkecke, 56.15:6).

4. *Ranabá* — Gegabelte Holzspitze eines Vogelpfeils. Länge: 12—15 cm. Das Material liefert ein Baum — *paiodrimá* —, der unzählige solcher Gabelungen aufweist. Der untere Teil des Stiels ist zugespitzt und steckt in dem mit Bromeliafasern umwickelten Pfeilrohr (Fig. 2 e). Für diese Pfeilspitze gibt es bisher nur bei den Waiká eine Parallele.[82a])

5. *Unamá* — Hölzerne Pfeilspitze mit Giftüberzug. Ein dünner, zugespitzter Stab aus dem harten Holz der Pupunha-Palme, von 22—24 cm Länge, wird mit Pfeilgift überzogen, wodurch er ein schwarzes Aussehen erhält. Das hintere Ende steckt man in das mit Bromeliafasern umwickelte Pfeilrohr (Fig. 2 d). Solche Giftpfeile dienen ausschließlich der Affenjagd, da diese auf den hohen Bäumen lebenden Tiere sonst schwer zu erlegen sind. Nach den Aussagen von Gewährsleuten der Surára und Pakidái schießen sie vergiftete Pfeile niemals auf Menschen ab.

Andere Yanomámi-Stämme, die ebenfalls Giftpfeile verwenden, sind die Xiriána[82b]), Karimé[83]) und Waiká[84]) [85]). Außerdem befindet sich ein Giftpfeil der Xamatári im Besitz des Hamburgischen Museums für Völkerkunde und Vorgeschichte (Sammlung Boeldecke, 56.15:7).

Métraux schreibt bezüglich der Giftpfeile: „Poisoned arrows were not so widely used by the Indians as is commonly assumed from the exaggerated accounts of the Spanish conquistadors. Curare, which is the most deadly poison known to the Indians, is prepared by relatively few tribes though it is traded throughout wide regions"[86]). Bei Karaibenstämmen in Guayana sind Giftpfeile, die mit einem Bogen geschossen werden, nicht sehr häufig anzutreffen, denn sie sind lediglich durch Richard Schomburgk für die Makuxí belegt[87]) und durch de Goeje für die Trio[88]). Hierzu muß jedoch bemerkt werden, daß viele Karaiben, wie z. B. die Arekuná-Taulipang, kleine Giftpfeile mit einem Blasrohr schießen; diese Waffe ist den Surára und Pakidái unbekannt.

Pfeilgifte:

Wie mir meine Surára-Gewährsleute berichteten, verwenden sie drei Giftarten von verschiedener Stärke, welche sie jedoch alle mit dem generellen Namen — *mamakórimaxapö* — bezeichnen. Dieser Name ist fast gleichlautend mit dem der Waiká, welche nach Zerries das Pfeilgift — *mamakoli* — nennen[89]).

Das stärkste Gift soll aus der Milch eines Baumes gewonnen werden, welcher in der Sprache der Surára — *paiomá* — heißt. Dieser Baum wurde mir nicht gezeigt; er wüchse, so sagte man mir, nur in einer weit entfernten Gegend. Zur Herstellung eines angeblich schwächeren Giftes bedient man sich der Milch des — *totótó* — (*Strychnos toxifera*).

Gleich nach der Gewinnung läßt man die jeweilige Milchart in einem Tongefäß aufkochen. Dadurch erhält sie ein schwarzes Aussehen und wird anschließend mittels eines Holzstäbchens, welches mit Baumwolle umwickelt ist, auf die Pfeilspitzen gestrichen. Zur Aufbewahrung derselben verwendet man besondere Taschen — *hawabó* —, die aus Blättern der Açaípalme (*Euterpe oleracea* Mart.) angefertigt und mit Lianen genäht werden. Von dem Gift selbst bleibt nie etwas zurück.

Man sagte mir noch, daß von den Stämmen, die mit den Xiriána verbündet seien, nur die Surára mit der Zubereitung dieser beiden Giftarten vertraut wären. Alle befreundeten Indianer, selbst die Xiriána, würden daher ihre Giftpfeile von ihnen eintauschen. Allerdings, so betonte der Surára-Häuptling Hewemão, wüßten auch die verhaßten Waiká Pfeilgifte zu bereiten, die sie vor allem dazu benutzen, um auf Menschen zu schießen. Letztere Angabe findet durch Zerries eine Bestätigung[90]).

[90]) Zerries, 1956b, S. 131.

Die dritte Pfeilgiftart ist am schwächsten. Sie wird aus dem Schnupfpulver — *ejarud* — hergestellt (s. S. 88/89), indem man dieses mit Wasser anrührt und aufkochen läßt. Diese Methode soll auch den Pakidái und Xirióna bekannt sein.

An den Giftzubereitungen konnte ich leider nicht teilnehmen, denn außer dem Häuptling

Fig. 3 Haltung beim Bogenschießen

und seinem Bruder sind sie nur noch wenigen älteren Männern bekannt und werden sogar vor allen übrigen Stammesangehörigen streng geheimgehalten. Bei den spärlichen Angaben hierüber handelt es sich daher lediglich um mündliche Aussagen.

Knabenbogen:

Der Knabenbogen — *kasad* — ist 80—90 cm lang und besteht aus einem gebogenen Zweig des Paiodrimá-Baumes, der auch das Material für die Vogelpfeilspitzen liefert. Die Arme sind, wie bei allen Zweigbögen, verschieden lang, so daß sich eine unsymmetrische Form ergibt, was die Treffsicherheit beeinträchtigt. Dies ist aber ohne Bedeutung, da es sich ja lediglich um einen Spielbogen für kleinere Knaben handelt. An beiden Seiten ist der Bogenstab zugespitzt und abgesetzt, zur Aufnahme der Sehne — *pekelíhe* —, welche aus einer Liane (*Cipó-tábica*) hergestellt wird. (Fig. 2 g).

Knabenpfeile:

Rukumaçík lautet der Name des 80—90 cm langen, dünnen Knabenpfeils, den die Väter aus dem Holz der Inajápalme (*Maximiliana regia* Mart.) — *kawzimaçí* — herstellen. Die Federung — *jaronahík* — besteht aus zwei kleinen halben Mutumfedern, die am Schaft mit einem Baumwollfaden festgebunden sind. Statt einer besonderen, aufgesetzten Pfeilspitze ist hier der Pfeil nur etwas zugespitzt (Fig. 2 h); die Bezeichnung dafür lautet — *peimaçíhenãmo* —.

Tragweise und Handhabung von Bogen und Pfeil, Schußweite:

Im Urwald tragen die Surára und Pakidái ihre Bogen und Pfeile in der Regel mit einer oder beiden Händen in Längrichtung über dem Kopf, gelegentlich aber auch auf der rechten oder linken Schulter.

Beim Schießen wird der Bogen mit der linken Hand in senkrechter Lage gehalten. Der Pfeil liegt links vom Bogen zwischen Daumen und Zeigefinger. Das Pfeilende hält der Mann zwischen Zeige- und Mittelfinger der rechten Hand und spannt gleichzeitig mit den zweiten Gliedern dieser Finger die Sehne (Fig. 3); gelegentlich nimmt er auch noch das zweite Glied des Ringfingers hinzu, wenn der Schuß verstärkt werden soll. Hierbei handelt es sich um eine Form, welche nach Morse als „Mediterranean release" bezeichnet wird. Diese Anwendung ist auch für Eskimostämme und sibirische Völker belegt[20]), aber noch nie für Indianer Südamerikas. Von den Stämmen am Alarý gibt Koch-Grünberg an, daß hier die Männer das Pfeilende mit Daumen und Zeigefinger der

[20]) Morse, 1885, S. 12—13 und Fig. 8 und 9.

rechten Hand halten, während sich die übrigen drei Finger einfach wider die Handfläche drücken[202]). Auch die Yuruhaxe halten den Pfeil mit dem Daumen und Zeigefinger der rechten Hand, und die drei übrigen Finger dienen ihnen zum Spannen des Bogens[203]). Diese letztgenannten Formen scheinen in Südamerika am gebräuchlichsten zu sein, aber eine genaue Feststellung kann leider nicht getroffen werden, da die Angaben hierüber zu gering sind. Mit Recht klagte daher schon Friederici: „Über die Art, den Bogen zu fassen, zu spannen, zu zielen und den Pfeil zu entsenden, sind die Nachrichten leider nur sehr spärlich; die wenigen vorhandenen sind nicht von der Art, daß man Regeln aus ihnen ableiten könnte"[204]). Soll der Pfeil nach oben geschossen werden, so wird die Sehne bei gerade vorgestrecktem linken Arm mit der rechten Hand bis vor das rechte Auge gezogen (Abb. 13). Linkshändige Schützen sind mir nicht begegnet. Koch-Grünberg erwähnt einen solchen und bemerkt dazu, daß man ihm versichert hätte, es würde viele davon geben[205]). Bei den Mosquito-Indianern in Mittelamerika scheint die Linkshändigkeit sogar besonders ausgeprägt zu sein, denn Sapper beigt ihre typische Handhabung von Bogen und Pfeil mit der Photographie eines linkshändig schießenden Mosquito-Knaben[206]).

Die besten Schußleistungen, welche ich mit Männern und Knaben ausprobierte, lagen bei ersteren zwischen 40—50 m, wobei leere Benzinkanister mit der aufgesetzten großen lanzettförmigen Pfeilspitze glatt durchschossen wurden, und bei letzteren zwischen 8—10 m. Aber selbst auf eine Entfernung von 100 m trafen die meisten Männer noch das Ziel; die Durchschlagskraft war jedoch stark vermindert. Diese Zahlen decken sich nahezu mit den nach der Literatur zusammengestellten Angaben von Friderici[207]). Einige Krieger konnten auch indirekt schießen, was folgender Versuch beweist, den ich mit Hewenšo, dem Häuptling der Surára, seinem jüngeren Bruder Kurikajowë, dem Surára-Mann Brakaiwë und dem Kriegshäuptling der Pakidái, Pwëlëwë, durchführte. Ich legte drei weiße Blätter, Din-Format, hintereinander auf den Boden, deren Entfernungen zum jeweiligen Schützen 30, 28 und 26 m betrugen. Die genannten Männer schossen nun nacheinander drei Pfeile in die Luft (einen mit großer lanzettförmiger Spitze, einen mit kleiner lanzettförmiger Spitze und einen mit Knochenspitze), und jeder traf, meist sogar die Mitte des Blattes. Diese indianische Fähigkeit, auch Ziele mittels indirektem Beschuß zu erreichen, wurde schon von Friederici hervorgehoben und durch Quellenangaben belegt[208]).

Ich beobachtete aber auch, daß nicht alle Männer gleich gute Schützen sind, obwohl sie ja von Kindheit an in ständigem Umgang mit Bogen und Pfeil stehen. Desgleichen erweckte der Gebrauch unserer Gewehre, mein Diener Materu und ich führten je eine Schrotflinte, Kal. 20, bei uns, nur bei einigen Männern Interesse. Die oben genannten drei Surára und der Pakidái, außerdem noch mehrere andere Krieger wußten aber schon nach ganz kurzer Zeit genauso gut damit umzugehen wie mit Bogen und Pfeil.

Ähnliche Feststellungen traf Koch-Grünberg während seiner Reisen, denn er schreibt: „Damit soll jedoch nicht gesagt sein, daß jeder Indianer ein vollendeter Jäger sei. Auch unter diesen Menschen sind Gaben und Neigungen ungleich verteilt..."[209]).

Zu erwähnen ist noch, daß Bogen und Pfeile das wertvollste Privateigentum jedes Mannes darstellen und auch bei allen magischen und religiösen Handlungen (Krankenkuren, Festen, Tänzen usw.) eine große Rolle spielen. Weiterhin sind die Waffen beliebte Tauschobjekte und ehrende Geschenke, welche die Surára und Pakidái gelegentlich von den Xiriána erhalten oder diesen bei Besuchen überreichen (s. S. 6, 74/75). Auch jeder Jüngling, der ein Mädchen heiraten will, muß vorher für seinen Schwiegervater in spe einen Bogen und fünf verschiedene Pfeile

anfertigen. Stirbt ein Krieger, so werden seine Waffen mit ihm verbrannt, damit er sie bei seiner Reise zum Mond und dortselbst verwenden kann (s. S. 71).

Bevor die Surára und Pakidái von den Xiriána den großen umgekehrten Flachbogen übernahmen, so erklärte man mir, kannten ihre Vorfahren nur den Zweigbogen. Danach würde

a b

Fig. 4a—b
Bambusköcher und Abreibung des Ritzmusters

dieses heutige Kinderspielzeug ein „survival" darstellen. Die Waiká, so berichtet Zerries, hätten eine Überlieferung, derzufolge ihnen in alter Zeit Bogen und Pfeile sogar völlig fehlten. Die Kriege wären damals nur mit Keulen ausgetragen worden. Er fand auch einige Exemplare vor und beschreibt sie als lange, flache Schwertkeulen, „himo" genannt, die man aus dem Holz der Pupunhapalme anfertigt[109]). Außerdem erwähnt er lange Holzstangen, mit denen noch heute lokale Konflikte ausgetragen würden, was ihn an die Zweikämpfe der Botokuden erinnert[110]) [111]). Bei den von mir untersuchten Indianern habe ich zwar weder Stangen noch Keulen bemerkt[112]), wohl aber eine Zwischenform, nämlich Stöcke aus Pupunha-Holz von 1.30—1.40 m Länge, welche an einem Ende etwas verdickt sind und deren Name ebenfalls — *himo* — lautet. Hiermit führen die Männer aus bestimmten Anlässen Stockduelle durch[113]), die denen der Guayakí ähneln[114]); von den Stockkämpfen der Botokuden[115]) weichen sie jedoch stark ab. Trotzdem treten zwischen den Stangen, bzw. Keulen der Waiká und den Stöcken der Surára und Pakidái deutliche Parallelen hervor, einmal wegen des ähnlichen Verwendungszweckes und zum anderen durch die gleichlautenden Namen. Es ist daher anzunehmen, daß Stange und Stock sehr ursprüngliche Waffen darstellen, woraus bei den Waiká, vermutlich durch äußere Einflüsse, die Keule entwickelt wurde.

Köcher:

Ein wichtiges Zubehör für die Jagd- und Kriegswaffen bilden die 32—40 cm langen Bambusköcher — *kóra* —, die einen Durchmesser von 4—5 cm besitzen. Meist sind sie mit eingeritzten schlangenförmigen Linien und Zickzackmustern verziert (Fig. 4a, 4b).

Jeder Jäger und Krieger trägt den Köcher, in dem sich stets einige mit Palmblättern umwickelte vergiftete Pfeilspitzen und mehrere große sowie kleine lanzettförmige Bambusspitzen befinden, an einer Halsschnur und läßt ihn auf den Rücken herabhängen, damit er beim Spannen des Bogens nicht hindert.

[111]) Zerries, 1954b, S. 75.
[112]) Auch bei den Xiriána entdeckte Koch-Grünberg keine einheimischen Keulen. (Koch-Grünberg, 1923a, S. 313).
[113]) Becher, 1959, S. 162 ff.
[114]) Baldus, 1939, S. 113.
[115]) Prinz zu Wied-Neuwied, 1820, S. 368—370.

Köcher von gleicher Form und dieselbe Tragweise findet man auch bei den Waikâ, wie aus einer Aufnahme von Zerries zu ersehen ist[116]). Außerdem besitzt das Hamburgische Museum für Völkerkunde und Vorgeschichte solch einen Köcher, jedoch ohne Verzierung, von den Xamatári (Sammlung Boeldecke, 56.15:31).

4. Feuerzeug

An jedem Surára- und Pakidái-Köcher ist oben und unten mittels einer Schnur aus Baumwolle oder Curauá (Bromeliafaser) das Quirlfeuerzeug — *hordoshîk* — festgebunden, welches jeweils aus dem lanzettförmigen Herd — *pandíhapashîk* — und zwei Bohrstäben — *ihirupshîk* — besteht (Fig. 5). Beide Teile werden aus dem weichen Holz des wilden Kakaobaumes — *pordrod* — angefertigt, genau wie bei den Waikâ[117]). Koch-Grünberg belegt solch ein Quirlfeuerzeug für die Xiriána[118]), jedoch ohne Erwähnung des Materials. An einem Exemplar, welches er für das Hamburgische Museum für Völkerkunde und Vorgeschichte mitgebracht hat (Sammlung Koch-Grünberg, 12.25:124), kann man aber feststellen, daß es sich dabei ebenfalls um Holz des wilden Kakaobaumes handelt. Von Köchern sagt er gar nichts aus und scheint also keine vorgefunden zu haben. Auch sonst fand ich in der Literatur noch keine Parallele für die sehr praktische Verbindung von Köcher und Feuerzeug[119]). Dabei ist sie durchaus naheliegend, denn wenn die Surára- und Pakidái-Männer bei Kriegs- und Jagdzügen abends nicht mehr in die Maloka zurückkehren können, haben sie unterwegs die Möglichkeit, innerhalb von drei bis vier Minuten ein Feuer zu entfachen. Dies geschieht, indem der Mann im Hocksitz mit einem Fuß den Herd auf dem Boden festhält und mit

Fig. 5 Bambusköcher mit angebundenem Quirlfeuerzeug

den flachen Händen quirlt (Abb. 31). Die Löcher des Herdes werden mittels eines Messers aus dem scharfen Zahn des Cutia (*Dasyprocta aguti* L.) (s. S. 54) vorgebohrt und mit einer

[116]) Zerries, 1958c, S. 179, Abb. 6.
[117]) Schuster, 1958b, S. 17.
[118]) Koch-Grünberg, 1923a, S. 311.
[119]) Daß sie aber auch bei den Xamatári bekannt ist, beweisen zwei Gegenstände jenes Stammes im Hamburgischen Museum für Völkerkunde und Vorgeschichte (Sammlung Boeldecke, 56.15:32 und b), und vermutlich ist bei den Waikâ das Feuerzeug ebenfalls am Köcher befestigt. Genaue Angaben von Zerries und Schuster stehen darüber noch aus.

kleinen seitlichen Rinne verbunden. Durch das Quirlen wird das Loch erweitert. Es löst sich ein feiner Staub, der langsam zu rauchen und zu glimmen beginnt und durch die Rinne auf einen schon vorher daneben gelegten Zunder fällt (trockenes Gras, Laub oder trockne Bambusspäne), welcher rasch Feuer fängt. Vorsichtig bläst der Mann darauf, und kurze Zeit später lodert eine Flamme empor. Doch hierzu gehört sehr viel Übung und Geschicklichkeit; häufig hat er nach dem Quirlen Blasen an den Händen. Diese Art der Feuererzeugung ist in Südamerika am weitesten verbreitet[108]). In ihren Malokas wird das Feuer von den Surára und Pakidái konserviert.

5. *Zwirnen und Spinnen*

Zur Herstellung von Fäden und Bindfäden werden die Blattfasern einer Bromeliacee, Curaua[109]) und Baumwolle verwandt, letztere jedoch erst seit neuerer Zeit.

Während die Curaua-Fasern auch heute noch meist von Männern und nur gelegentlich von Frauen mit der rechten Hand gegen den rechten Schenkel, zum Knie hin, zu rechtsgedrehten Fäden verarbeitet werden[110]), wird zur Herstellung von Baumwollfäden eine Spindel verwandt, womit jedoch eine Linksdrehung verbunden ist. Die Behandlung der Baumwolle — *zinarí* —, angefangen vom Pflücken, über Trocknen und Bleichen, Entfernen der Kerne, Lockern und Auseinanderzupfen, bis zum Spinnen, ist Frauenarbeit.

Die Spindel — *zinaríhi* — besteht aus einem 30—35 cm langen, glatt bearbeiteten Stöckchen — *ruhú* —, oft wird hierfür auch eine Palmblattrippe verwandt, an deren oberem Ende ein kleiner Widerhaken — *akuhená* — aus demselben Material mit einem Baumwollfaden befestigt ist. Der scheibenförmige Wirtel — *tauhará* —, von Männern aus Knochen oder Holz angefertigt, wird von unten auf das Stöckchen gestreift und sitzt in der Mitte desselben. Damit er nicht abgleiten kann, wenn die Frau ihre Spindel in vertikaler Stellung hält, befindet sich unterhalb des Wirtels eine Baumwollumwicklung.

Aus der Beschreibung ist zu ersehen, daß es sich um eine für Guayana typische Abart der „Bakairispindel" handelt. „Nur in Guayana und am Amazonenstrom", so schreiben Frödin und Nordenskiöld in ihrer Untersuchung „Über Zwirnen und Spinnen bei den Indianern Südamerikas" „finden wir die mit Haken versehenen Spindeln, die sich übrigens von den übrigen Bakairispindeln nur dadurch unterscheiden, daß der Spinnwirtel nahe der Mitte des Stöckchens sitzt (Abb. 40)"[111]).

Doch in zwei anderen Punkten weichen die Spindeln der Surára und Pakidái etwas ab, denn bei ihnen ist das Stöckchen unten nicht verdickt, und der Wirtel wird durch eine Baumwollumwicklung gehalten.

Hierfür gibt es bisher nur eine Parallele, und zwar handelt es sich dabei um eine Quechua-Spindel[112]). Die Spindel der Karinié scheint auf Grund der Zeichnung in Salathés Aufsatz denen der Surára und Pakidái zu gleichen[113]). Leider gibt Salathé nicht an, ob der Wirtel durch eine darunter angebrachte Umwicklung oder vielleicht durch Harz oder Wachs seine Lage behält, wie es z. B. bei den Spindeln der Chama und Panserna der Fall ist[114]). Damit erschöpfen sich schon die Vergleiche hinsichtlich der Befestigung des Wirtels durch Umwicklung, Holz oder Wachs, so daß sich hierüber noch keine Schlüsse über Ursprung und Verbreitung ziehen lassen.

Während ich mit den Surára und Pakidái zusammenlebte, konnte ich feststellen, daß viele Frauen die Deckel meiner leeren Puderdosen und Hautcremeschachteln bevorzugt als Wirtel

[108]) Nordenskiöld, 1924, S. 118—125 und Karte 13.

[109]) Auch Koch-Grünberg bezeugt die Verwendung dieses Materials für nordwestbrasilianische Stämme. (Koch-Grünberg, 1910, S. 210).

[110]) Fäden, die nicht mit der Spindel gesponnen werden, sind bei den meisten südamerikanischen Stämmen rechtsgedreht. Es gibt jedoch Ausnahmen, denn bei einigen Völkerschaften des nordwestlichen Südamerika kommen überwiegend linksgedrehte Fäden vor, und in Guayana sowie im Gran Chaco treten erstere rechts- als auch linksgedrehte Fäden auf. (Frödin und Nordenskiöld, 1918, S. 30).

[111]) Frödin und Nordenskiöld, 1918, S. 24.

[112]) Frödin und Nordenskiöld, 1918, S. 26/27.

[114]) Frödin und Nordenskiöld, 1918, S. 26/27.

gebrauchten, und die Verbandwatte, welche ich bei mir führte, wurde von ihnen sofort gesponnen in ihre angebaute Baumwolle, weil die daraus gewonnenen Fäden, so sagten sie, fester und haltbarer wären.

Gesponnen wird in folgender Weise: Mit zurückgeschlagenem Unterschenkel sitzt die Frau auf einem dünnen Baumstamm. Die zur Verarbeitung vorgerollte Baumwolle hängt über ihrer linken Schulter, und von dort wird der Faden mit den Fingern der linken Hand weiterpräpariert. Die Spindel, an deren Widerhaken sie den Faden befestigt hat, rollt sie zunächst in horizontaler Lage mit der flachen rechten Hand auf dem etwas geneigten rechten Oberschenkel, wobei sie die Hand vom Knie aus schnell aufwärts bewegt. Dadurch erhält der Faden eine Linksdrehung. Hierauf läßt sie die Spindel in vertikale Lage zwischen die Beine fallen und auf dem Boden rotieren.

Diese Methode gehört zur Variation 1 des Fakultativspinnens[107]), welche für die Stämme Guayanas außerordentlich charakteristisch ist und in ähnlicher Weise von Koch-Grünberg[108]), Frédin-Nordenskiöld[109]), Im Thurn[110]) und Roth[111]) beschrieben wird.

Die gesponnenen Fäden wickelt man zu runden Knäueln zusammen, welche in dieser Form mit als Tributzahlung für die Xirianá verwendet werden (s. S. 74/75) und auch sonst beliebte Tauschobjekte darstellen, genau wie bei den Arekuná-Taulipang und ihren Nachbarn[112]).

Sowohl die Baumwolle, die Spindel als auch die Technik, links zu spinnen, ist vermutlich von Karaibenstämmen über die Xirianá zu den Surára und Pakidái gelangt. Daß Baumwolle und Spindel ein Importgut darstellen, wird durch die Technik des Linksdrehens besonders deutlich, weil ja mit dem ursprünglichen Material, den Curuá-Fasern, die Fäden stets rechts gedreht werden. Im Thurn weist schon darauf hin, daß es in Guayana vor allem Karaiben sind, welche Fäden aus Baumwolle spinnen, und er glaubt, daß sie auch die Baumwolle und die Spindel mitgebracht, als sie in Guayana einwanderten[113]). Letztere Annahme ist allerdings noch nicht bewiesen, denn am oberen Rio Negro traf Koch-Grünberg auch Karaibenstämme an, welche weder die Baumwolle, noch die Spindel kannten. Auf eine diesbezügliche Anfrage von Frédin und Nordenskiöld antwortete er in einem Briefe wie folgt: „Es ist mir vollkommen rätselhaft, warum die Indianer am oberen Rio Negro keine Baumwolle zum Spinnen anpflanzen und keine Spindeln haben. Es wäre wichtig zu untersuchen, wie weit diesen Fehlen der Spindeln Rio Negro abwärts und in seine Nebenflüsse reicht, die ja vom Curicuriary abwärts ethnographisch noch fast völlig unbekannt sind"[114]).

Innerhalb der Yanomámi-Gruppe ist die Baumwolle und das Spinnen außer den Xirianá, Surára und Pakidái aber auch den Pumbowéteri, Arutanowéteri und Karawatéteri bekannt, von denen ich Angehörige in den Malokas der Surára und Pakidái traf, desgleichen den Karimé[115]) und den Waikí, welche auch Schuster vermutlich durch die karaibischen Makiritare mit der Baumwolle bekannt wurden[116]).

6. *Tracht und Schmuck*

a) Hüftschnüre und Gürtel

Von 4. Lebensjahr ab tragen beide Geschlechter ständig eine Hüftschnur — akawaxi —, welche von Frauen, gelegentlich aber auch von Männern aus Curuá-Fasern, dem ursprünglichen Material (s. S. 26), oder aus Baumwolle angefertigt wird. Bei ersterer sind jeweils zwei Strähnen rechts- und bei letzterer linksgedreht. Die alte Technik der Rechtsdrehung bei Verarbeitung von Curuá-Fasern wurde also trotz Übernahme der Baumwolle beibehalten. Es gibt aber noch einen weiteren bedeutsamen Unterschied. Während nämlich die Hüftschnur aus Baumwolle gewissermaßen die Alltagstracht

darstellt, wird diejenige aus Curaná-Fasern gegenwärtig fast nur für zeremonielle Zwecke angelegt.

Alle männlichen Surára und Pakidái binden mittels der Hüftschnur den Penis nach oben, was in der Weise geschieht, daß sie vor dem Anlegen derselben einer Schlinge knoten und die Vorhaut hindurchziehen.

Mit der Hüftschnur fühlen sich diese Indianer bekleidet und legen dieselbe daher niemals ab, auch nicht beim Schlafen oder beim Baden. Als ich einmal mit dem Kriegshäuptling der Pakidái, Porihiwó, auf der Jagd war, passierte es ihm, daß seine Hüftschnur riß. Sofort trat er schamhaft hinter den nächsten Baum und knüpfte sie wieder zusammen. Hinterher erklärte er mir, daß es der größte Verstoß gegen die guten Sitten wäre, ohne Hüftschnur herumzulaufen. Die Frauen würden dann ihr Gesicht verhüllen und laut schreien. Nie dürfe sich daher ein Mann mit herunterhängendem Penis zeigen, und ein geradezu fluchwürdiges Verbrechen wäre es, welches durch Schläge geahndet wird, wenn er seine Glans den Augen der Frauen und Mädchen preisgibt.

Hieraus ist zu ersehen, daß bei den Surára und Pakidái die Hüftschnur im allgemeinen, denn auch die Frauen und Mädchen verwenden sie, ohne damit etwas zu verdecken, und das Hochbinden des Penis im besonderen mit Anstandsgefühlen in Verbindung gebracht wird[107]. Damit kann ich eine Ansicht bestätigen, welche schon Ehrenreich bezüglich der bedeckten Glans penis bei den Xingú-Indianern vertritt[108], die jedoch weder von Karl von den Steinen[109] noch von Koch-Grünberg[110] geteilt wird. Nach Auffassung dieser beiden Gelehrten, aber auch Nordenskiölds[111] und Krickebergs[112], soll durch das Hochbinden des Penis die Glans vor eindringenden Insekten, Dornen usw. geschützt werden. Diese Annahme ist für die Surára und Pakidái höchstens von sekundärer Bedeutung, denn die unbedeckte weibliche Vagina ist ja durch eindringende Insekten gleichermaßen bedroht. Aber auch magische Vorstellungen, womit Karsten[113] das Hochbinden des Penis begründen will, treffen für die von mir untersuchten Indianer nicht zu. Naheliegender wäre daher schon jene zweite von Karl von den Steinen geäußerte Vermutung, worin er diese Sitte in unmittelbare Beziehung zum Geschlechtsleben bringt und hervorhebt, daß sie den gleichen Zweck wie die Zirkumzision haben könnte: „Nicht daß die Oeffnung erweitert würde; es liegt vielmehr eine gymnastische Behandlung der Phimose vor anstatt einer operativen. Dehnen sie denn nicht die Haut, die die Andern ausschneiden? Schaffen sie nicht Raum innerhalb der Andern nach außen schaffen?" Um wenigsten kann dies für das Abklemmen des Präputiums mittels der Hüftschnur bezweifelt werden, was, wie bereits erwähnt, die älteste Form zu sein scheint, da sich die Hüftschnur überall erhalten hat. Mit dem Stulp wurde die Haut stark vorgezerrt. Bei Jünglingen zeigte sie sich häufig wund und abgeschürft. Der Europäer läßt zu enge Schuhe vom Schuster auf den Leisten schlagen, im innern Brasilien aber, wo man nur fertige importierte Ware kauft, findet ein Mann der guten Gesellschaft gar nichts darin, in Lackschuhen zu erscheinen, die er sich mit ein paar festen Schnitten erweitert hat. Sein Messer verhält sich zum Leisten, wie der beschneidende Späher oder Dorn zur Hüftschnur[114]. Außer dem brennenden Schamgefühl kann diese Annahme durchaus als zweiter Grund zutreffen. Man hätte dann gleichsam eine Parallele zu den Mädchen, welche ja bereits nach Vollendung des ersten Lebensjahres durch die Mutter mit dem Finger defloriert werden, wobei ausdrücklich gesagt wird, daß dies geschieht, um den späteren Geschlechtsverkehr zu erleichtern (s. S. 63).

Aber auch bei anderen Yanomámi-Stämmen wird die Hüftschnur aus Pflanzenfasern oder Baumwolle von beiden Geschlechtern verwandt,

[107]) Als Tragevorrichtung für Gebrauchsgegenstände, wie es z. B. Baldus bei den Tapirapé sah (Baldus, 1945, S. 83/88), wird die Hüftschnur niemals verwandt, weil ja dann leicht die Gefahr besteht, daß sie reißt.

und die Männer binden damit ebenfalls den Penis nach oben. Diese Feststellung konnte ich bei Angehörigen der Xirianá, Pianhewetteri und Aramamateri treffen, welche als Einbrasen, bzw. Besucher in den Häusern der Surára und Pakidái weilten. Auch das gefangene Karamatari-Mädchen Nikerumá trug stets eine Hüftschnur und erklärte mir, daß derselbe für ihren Stamm charakteristisch sei und die Männer ebenfalls das Glied darunterziehen. Desgleichen weisen Zerries[128] sowie Hübner[129] darauf hin, daß die Waiká eine Hüftschnur zum Hochbinden des Gliedes verwenden, und nach Aussage des letztgenannten Verfassers auch die Xirianá. Ein weiterer Beleg liegt sodann für die Karimé vor[130].

Im Anschluß an P. Schmidt[131] und Nordenskiöld[132] untersuchte ich diese merkwürdige Sitte schon in meiner Arbeit „Gürtel und Hüftschnüre südamerikanischer Naturvölker" und fand sie für 33 Stämme belegt, wozu jetzt noch sechs weitere kommen, die Surára, Pakidái, Pianhewetteri, Aramamateri, Karamatari und Karimé. Es ist sogar zu vermuten, daß bei allen Stämmen, bzw. Gruppen, die zur ethnischen Einheit der Yanoáma gehören, das Membrum nach oben gebunden wird. Da unter den Puno- und Tukano-Stämmen sowie unter den Mahé dieser Brauch ebenfalls verbreitet ist und drei San Agustín-Statuen das präkolumbische Vorkommen beweisen[133], hebt sich der Nordwesten Südamerikas einheitig als Kern- und wahrscheinlich Ursprungsgebiet dieser sehr alten Sitte ab. Die Karaiben- und Arawakstämme, welche den bisherigen Forschungen zufolge erst später in Guayana einwanderten, pflegen ihn dagegen, mit Ausnahme der Yanapery[134], gar nicht, und die Tupi empfanden das Hochbinden des Penis sogar als verabscheuungswürdig und lächerlich[135] [136] [137].

Bei festlichen und zeremoniellen Anlässen binden Männer, Frauen und Kinder vom 4. Lebensjahr ab über die Hüftschnur noch einen Baumwollgürtel — apé —[138], welcher vom stets ohne ist. In der Regel werden die Gürtel von Frauen hergestellt; Junggesellen müssen sie jedoch selbst anfertigen.

Es handelt sich zwar um die für Guayana typischen Schnurgürtel[139] [140], welche aber durch Umwicklungen, resp. Querbindungen sie von den bekannten Formen etwas abweichenden Aussehen erhalten.

Fig. 6a
Männergürtel, Detail

Fig. 6b
Männergürtel, Schema

Alle Männer- und Knabengürtel sind vollständig und haben eine Länge von 70—80 cm, bzw. 40—50 cm. Der Durchmesser bei ersteren beträgt 4—5 cm und bei letzteren 2—3 cm. Die Anfertigung ist sehr einfach, denn um zwei in den Boden gesteckte hölzerne Stöcke, deren Abstand die Länge des Gürtels bestimmt, wird ein langer Baumwollfaden solange herumgewickelt, bis man schließlich eine dicke Lage gewinnt. Diese wird dann einfach mit einem dünnen Faden aus Baumwolle oder Curaná-Fasern im

[138] Es ist der gleiche Name mit dem auch die baumwollenen Hängematte bezeichnet wird.

Fig. 7a
Jünglingsgürtel, Detail

Fig. 7b
Jünglingsgürtel, Schema

Abstand von 1,5—2 cm bei Männergürteln und 0,5—1 cm bei Knabengürteln fest umwickelt, wodurch Erhebungen und Rillen entstehen. Bevor der Gürtel von den Stöcken abgestreift wird, führt man durch die Öffnungen jeweils eine kleine zwei bis fünffarbig gefärbte Schnur aus Baumwolle oder Curaua-Fasern und knotet mittels der beiden 3—5 cm langen Enden eine Schlaufe. Diese zwei Schlaufen werden vom Träger vorn, über dem Unterleib, ineinandergedreht und gewölbeleistenartig durch die Knoten den Halt des Gürtels (Fig. 6 a u. b, Abb. 25). Nach der Fertigstellung werden auf diese Gürtel mit Urucu, wenn man sich eines Stäbchens bedient, schlangenförmige Linien, Kreise oder Punkte gemalt; häufig färbt man sie aber auch gänzlich rot.

Bei den Waiká fand Zerries die gleichen Männergürtel vor[107]), und aus den Photographien in anderen Publikationen dieses Verfassers ist zu ersehen, daß sie in derselben Weise wie bei den Suriára und Pakidái gefertigt werden[108]) [109]).

[107]) Zerries, 1954/b, S. 182.
[108]) Zerries, 1955/b, farbiges Umschlagbild und Photogr. auf S. 163 unten links.
[109]) Zerries, 1955/b, Taf. VI, oben.

Außer den Männer- und Knabengürteln gibt es bei den Suriára und Pakidái noch eine in Flechttechnik hergestellte spezielle Art für Jünglinge. Die Anfertigung beginnt in der oben beschriebenen Art. Doch nach Erhalt der Baumwollage wird dieselbe in zwei gleichmäßig dicke Bündel geteilt, die man abwechselnd im Abstand von 1—1,5 cm fest umwickelt. Der Gürtel besteht also aus zwei dünnen nebeneinanderliegenden Baumwollrollen von je 1 cm Durchmesser (Fig. 7 a u. b). Bindeschnüre und Tragweise entsprechen den Männer- und Knabengürteln, desgleichen die Bemalung.

Frauen- und Mädchengürtel zeichnen sich durch eine breite, flache Form aus. Die Längen bewegen sich zwischen 55—70 cm und die Breiten zwischen 6—8 cm für Frauengürtel und 35—45 cm, bzw. 4—5 cm für Mädchengürtel. Zur Herstellung benutzt man auch hierfür wieder zwei Stöcke, um welche die Baumwollfäden geschlungen werden. Die gewonnene Lage wird in 6—8 gleichmäßig dicke Bündel geteilt, von denen man jedes in der auf Fig. 8 a—c dargestellten Weise mittels eines Baumwollfadens umschlingt und so die Bündel der Kettfäden zusammenhält. Die Längsfäden werden also durch Querbindungen nebeneinander gehalten. Der Abstand zwischen diesen Einschlägen beträgt bei den Gürteln junger Frauen und Mädchen 1,5—3 cm und bei denen alter Frauen 0,5 cm. Auf diesen Unterscheidungsmerkmal wurde ich stets aufmerksam gemacht. Bindeschnüre und Tragweise stimmen auch hier mit den Männergürteln überein, ebenfalls die Bemalung mit Urucu, welche auf der äußeren Seite angebracht wird. Infolge ihrer Breite lassen sich diese Gürtel viel besser bemalen als die der Männer. Am häufigsten sieht man schlangenförmige Linien, gelegentlich werden Kreise dazwischen gesetzt, manchmal besteht die Bemalung auch nur aus Kreisen, oder aus Kreisen und Punkten (Fig. 9 a—c; Fig. 10 a—d); es gibt aber auch Gürtel, die vollständig rot gefärbt sind.

Xirianá-Frauen, die mit Suriára- und Pakidái-Männern verheiratet sind, tragen die gleichen Gürtel, ebenfalls die kleine Gebärgurte der Suriára, Hikaunná, vom häuslichen Stamme der

Karuuateri (Abb. 17 u. 18). Als ich sie nach dem Namen ihrer Gürtel fragte, gaben sie mir die mit dem Surára- und Pakidái-Wort übereinstimmende Bezeichnung — *wyö* — an.

Dasselbe Wort nannten mir die Pusheweteri-Frauen, obgleich deren Gürtel eine etwas abweichende Form haben[107]). Sie sind 60—70 cm lang und bestehen lediglich aus einer dicken Lage Baumwolle, die man etwas zusammengedreht hat. Es handelt sich also um einen ganz charakteristischen Schnurgürtel, d. h. ohne Umwicklungen oder Querbindungen. An einer Bindeschnur ist aber noch ein 22—26 cm langes Fransenschürzchen befestigt. Zur Herstellung desselben legt man sechzig bis neunzig 14—18 cm lange Baumwollschnüre über die Bindeschnur. Anschließend wird, von links beginnend, das nach vorn hängende Ende der ersten Schnur mit dem nach hinten hängenden der zweiten einmal verknotet und fest zusammengedreht, danach das vordere Ende der zweiten mit dem hinteren Ende der dritten Schnur usw. Die herabhängenden Fransen haben eine Länge von 7—9 cm und sind, damit ein fester Halt gewährleistet ist, unterhalb der Bindeschnur noch je einmal mit einem dünnen Baumwollfaden umwickelt. Beim Tragen des Gürtels sitzt dann das Fransenschürzchen direkt über der Schamgegend (Abb. 15). Diese Gürtel, einschließlich der Schürzchen, sind in der Regel mit Urucu gefärbt. Hervorzuheben ist noch, daß jüngere Pusheweteri-Frauen die beiden Enden des Schürzchens meist mit kleinen an einem Faden befestigten Federn des Tucano (*Rhamphastus* sp.), Mutum (*Crax* sp.) und Anambé azul (*Cotinga cayana* L.) schmücken. Ältere Pusheweteri-Frauen haben dagegen an den Schürzchenenden stets acht bis zwölf 2—3 cm lange und an einer Seite durchbohrte Muschelschalen hängen, die beim Laufen der Trägerinnen zusammenschlagen und ein leises klirrendes Geräusch hervorrufen (Fig. 11).

Genau den gleichen Gürtel mit Fransenschürzchen beigt Salathé für die Karimé-Frauen, und aus seinen Angaben ist weiter zu ersehen, daß ihn auch die Männer tragen, allerdings ohne Schambedeckung[108]).

Zu erwähnen ist sodann, daß einige Surára-Frauen, dem Vorbild ihrer Pusheweteri-Schwestern folgend, an einer Bindeschnur ihres geflochtenen Gürtels ebenfalls solch ein Fransenschürzchen befestigt haben. Hieran läßt sich die Vermischung zweier Kulturelemente einmal besonders deutlich erkennen.

Schließlich verwenden die Surára noch einen Kindergürtel — *yaaki* —, der jeweils vom Vater

[107]) Ich sah sie bei den Frauen jener Stämme, welche mit Surára- und Pakidái-Männern verheiratet sind.

[108]) Salathé, 1931/32, S. 303 und Fig. 130, b.

Fig. 11 Frauengürtel einer älteren Pusheweteri-Frau, mit durchbohrten Muschelschalen

aus dem Fell des Maracajá (*Felis pardalis* Neuw.) — *jaó* — angefertigt wird. Diese Gürtel haben eine Länge von 30—35 cm und eine Breite von 2—2,5 cm. Ein Ende ist durchbohrt, zur Aufnahme einer dünnen Bindeschnur aus Baumwolle oder Curauá-Fasern. Um das andere Ende wird die Schnur mehrfach herumgewickelt und dann verknotet (Fig. 12). Auch dieser Gürtel wird so getragen, daß er vorn offen ist. Nur hin und wieder legt man ihn kleinen Jungen und Mädchen zwischen 1—3 Jahren an, die ja in jenem Alter noch nicht einmal die Hüftschnur tragen (s. S. 17), um deren körperliche Kräfte und das Wachstum zu fördern.

Fig. 12 Kindergürtel aus dem Fell des Maracajá (*Felis pardalis* Neuw.)

Aus den obigen Beschreibungen der baumwollenen Schnurgürtel ist zu ersehen, daß sie trotz gewisser Abweichungen in bezug auf Technik und Tragweise den entsprechenden Gürteln der Xiriána und mehrerer Karaibenstämme Guayanas ähneln. So dient den Xiriána-Männern ein Bündel rotgefärbter Baumwollschnüre als Hüftgürtel, worunter sie das Praeputium des hochgeschlagenen Penis klemmen[169]). Arekuná-Männer tragen häufig einen geflochtenen Schnurgürtel aus Baumwolle, der zusammengedreht eine wurstförmige Gestalt annimmt. Dieser Gürtel, im Aussehen auch den Menschen- und Affenhaargürteln in Guayana gleichend[170]) [171]), wird von Martius[172]), Richard Schomburgk[173]) und Koch-Grünberg[174]) erwähnt. Ule zeigt seine Tragweise an Hand einer Abbildung von zwei Arekuná-Männern[175]). Man erkennt daran, daß ihnen der Gürtel zur Befestigung ihres Schamschurzes dient, worauf ebenfalls Appun hinweist[176]). Außerdem ist der baumwollene Schnurgürtel für die männlichen Makuxí belegt[177]) und für die Maiongkong, wo er von Männern[178]) und Frauen[179]) getragen wird.

Aber auch der geflochtene, breite, flache Frauengürtel der Surára und Pakidái findet bei den Makuxí, wo ihn allerdings Männer anlegen, ein Vorbild. Roth beschreibt die Art und Weise seiner Herstellung wie folgt: „The Makusi will plait a thick cotton cord upon two arrow thicks, and when completed will bend it twice upon itself in three equal parts and, by sewing, maintain it in this position to form what is now a broad flat belt"[180]). Die benachbarten Wapixana-Männer (Aruaken) tragen übrigens einen sehr ähnlichen Gürtel und befestigen daran eine zwischen den Beinen hindurchgezogene Schambinde[181]).

Da die Surára und Pakidái mit den Makuxí viele Kriege führten, der Vater des Surára-Häuptlings Hewemão, soll sogar von einem Makuxí-Krieger getötet worden sein, so wäre es durchaus möglich, daß sie von diesem Karaibenstamm die Form des geflochtenen, breiten, flachen Gürtels übernahmen, dann aber nicht als Männer-, sondern als Frauenkleidung verwandten.

Auch das für die Puseheweteri- und Karimé-Frauen so typische Fransenschürzchen ist sicher karaibischen Vorbildern nachgeahmt worden, die es allerdings ihrerseits von Aruaken entlehnt haben könnten, denn Farabee bezeugt dasselbe ja ebenfalls für Wapixana- und Mapidian-Mädchen[182]). Nach Roth bindet man jungen Makuxí- und Wapixana-Mädchen anläßlich ihrer ersten Menstruation einen gewebten, rotgefärbten Gürtel um, dessen unterer Rand gefranst und noch zusätzlich mit drei herabhängenden Quasten versehen ist. Er bezeichnet dieses Kleidungsstück als „apron belt"[183]). Für die Maiongkong ist gleichfalls ein gefärbter und mit Fransen versehener Gürtel belegt[184]) [185]), der

Roth zufolge dem oben erwähnten Schürzengürtel gleicht[180]). Als Koch-Grünberg Xiriána-Frauen mit einem Fransenschürzchen bekleidet sah[181]), gab ihm dies zu der Vermutung Anlaß, daß sie vielleicht die alte Tracht der Maiongkong (Yekuaná)-Frauen übernommen und bewahrt haben. So schreibt er: „Auch sie sind diesen Indianern sicherlich nicht ursprünglich eigen, denn einige trugen das Schürzchen oben am Bauch, andern war es bis halb zu den Knien herabgerutscht"[182]).

Die vergleichenden Untersuchungen lassen erkennen, daß die Baumwollgürtel der Surára, Pakidái und Puseheweteri von außen, d. h. durch Karaiben direkt, oder über die Xiriána[183]) mit der Baumwolle zu ihnen gelangten. Doch bezüglich der Tragweise und des Verwendungszweckes erfolgte ein Wandlungsprozeß, der sehr aufschlußreich ist. Als ich nämlich auf Grund von Literaturangaben in meiner Dissertation allen Beweggründen nachgegangen war, welche die südamerikanischen Naturvölker veranlaßt haben könnten, Gürtel und Hüftschnüre umzubinden, sah das Resultat folgendermaßen aus: „Es ließ sich nachweisen, daß der Schmuckgedanke nur eine sekundäre Rolle spielt ebenso wie das magische Motiv. Das Schamgefühl ist als Ursache völlig auszuschalten, und auch Belege für ein sexuelles Reizmittel fehlen. Dagegen zeigen die Untersuchungen, daß Gürtel und Hüftschnüre vorwiegend den Zweck haben, die Genitalorgane gegen Insekten, Dornen usw. zu schützen (als Haltevorrichtung für den hochgelegten Penis, das Uluri, der Schamschürze usw.)"[184]) [185]).

Auf Grund meiner Feldforschungen bin ich jedoch hinsichtlich der Surára, Pakidái, Puseheweteri, Aramamesteri, Xiriána und Karauateri zu abweichenden Schlüssen gelangt. Ein Schutz der Genitalorgane scheidet für die Frauen dieser Stämme vollständig aus, und für die Männer ist er höchstens von zweit-, wenn nicht gar drittrangiger Bedeutung. Die dünne Hüftschnur gewährt ihnen in der Tat die gleiche äußere Sicherheit wie den zivilisierten Menschen das Kleidungsstück. Obwohl damit, abgesehen von der Glans penis, nichts verhüllt wird, ruft das Fehlen derselben sofort ein Schamgefühl bei ihnen wach, welches sich allerdings von dem uns anerzogenen dadurch unterscheidet, daß es sich nicht auf die Nacktheit bezieht. Kleider, Hemden und Hosen, die ich als Geschenke mitgebracht hatte, zogen sie zum Scherz zwar einmal über, etwa so, wie wir uns für eine Karnevalsveranstaltung verkleiden; sie waren aber froh, wenn sie sich derselben wieder entledigen konnten. Doch nie zeigten diese Indianer in ihrem unverhüllten Zustand auch nur irgendwelche Scheu oder Verlegenheit vor mir, und als ich ihre Freundschaft gewonnen und sie von der Unschädlichkeit meines Photoapparates überzeugt hatte, ließen sich Männer, Frauen und Kinder in ungezwungener und natürlicher Stellung aufnehmen.

Im Gegensatz zu der bedeutungsvollen Hüftschnur sind die Gürtel der Surára und Pakidái ausgesprochene Schmuckgegenstände. Doch da man sie nicht nur zu Festen, sondern auch bei allen zeremoniellen Anlässen trägt, dürften magische Motive dabei ebenfalls eine Rolle spielen. Gleichzeitig sind sie ein Kennzeichen für bestimmte Stämme und Altersklassen. Von allen übrigen Gürteln südamerikanischer Indianer unterscheiden sie sich, gemeinsam mit den Männergürteln der Waiká[186]) [187]), dadurch, daß sie vorn offen sind und die Schamteile geradezu hervorheben. Somit scheinen sie einen eklatanten Beweis darzustellen für die Auffassung von Grosse[188]) und Westermarck[189]), welche die Gürtel als ein sexuelles Reizmittel ansehen, durch das der Blick auf die Schamteile gelenkt werden soll. Doch für die Surára und Pakidái

trifft diese Hypothese trotz ihrer offenen Gürtel nicht zu, denn der nackte Körper übt auf sie keinen sinnlichen Reiz aus, sondern einzig und allein der Geschlechtsakt. Nach Krause soll bei den Karajá das Schamgefühl der Mädchen zur Ausbildung der Gürtelarten geführt haben. Als Beweis hierfür gibt er folgende Beobachtung an: „Frauen haben nie in unserer Gegenwart ihre Binde abgelegt oder gewechselt, und kleine Mädchen, denen ich ihren Gürtel abkaufte, gingen hinter die nächste Mattenwand, um dort einen neuen anzulegen, ehe sie mir den getragenen Gürtel brachten"[100]). Meine Erfahrungen bei den Surára und Pakidái waren bezüglich der Hüftschnüre die gleichen, bei Männern wie bei Frauen und Kindern, doch ihre Gürtel banden sie stets ohne Scheu ab und überließen sie mir gegen Tauschobjekte. Dies traf auch für die Pusheweteri-Frauen zu, woraus hervorgeht, daß ihre Fransenschürzchen nicht etwa eine Schambedeckung darstellen, sondern lediglich Verzierung. Außerdem binden sie ihre Gürtel ebenfalls nur zu festlichen Anlässen um.

Bei dem Kindergürtel aus dem Fell des Maracajá handelt es sich um ein Unikum. Zu bemerken ist jedoch, daß in Guayana, einem der südamerikanischen Hauptverbreitungsgebiete des Fellgürtels[101]) [102]), für die Männer der Makuxi[103]) und Waiwai[104]) Exemplare aus Jaguarfell bezeugt sind.

b) Brustschnüre

Die kreuzweise über Brust und Rücken geschlungene einfache Schnur — *xinarîke* — und das gleichermaßen verwandte Schnurbündel — *xinari* —[105]) stellen bei den Surára und Pakidái charakteristische Kleidungsstücke der Mädchen und Frauen dar. Bei letzteren verlaufen Schnur, bzw. Schnurbündel direkt unter den Brüsten und kreuzen sich über der Brusthöhle, so daß sie auf den ersten Blick wie eine Büstenhebe wirken; doch eine Anhebung der Brust ist damit nicht verbunden, denn sie sitzen ganz locker (Abb. 10).

Während die 1,50—1,60 m lange und aus zwei Fäden zusammengedrehte Frauenschnur, welche an den Enden verknotet ist, aus Curauá-Fasern oder Baumwolle hergestellt wird (die Länge der entsprechenden Mädchenschnur beträgt 1,20—1,40 m), handelt es sich bei den Schnurbündeln um Baumwollagen von 56—90cm Länge, die aus 60—80 Fäden bestehen und an einer Stelle zusammengebunden sind. Die dünneren Exemplare werden von jungen und die dickeren von älteren Frauen verwandt. Sowohl die Schnurbündel als auch die Schnur sind entweder vollständig rot gefärbt oder, wie z. B. erstere, im Abstand von 6—7 cm mit 1 cm breiten, roten Ringen versehen (Fig. 13a u. b), wozu man sich der Urucufarbe bedient. Ungefärbte Objekte nehmen mit der Zeit ein schmutzig-braunes Aussehen an, ähnlich wie die Hängematten, denn die rote Körperbemalung bleibt an der Baumwolle haften.

Die Brustschnur, welche den kleinen Mädchen vom 4. Lebensjahr ab hin und wieder umgebunden wird, soll dazu beitragen, daß sie später eine schön geformte Brust erhalten. Aber auch die jüngeren Frauen haben die Vorstellung, daß sie durch gelegentliches Tragen derselben ihre Brust konservieren können, vor allem dann, wenn die Schnur aus ursprünglichem Material, Curauá-Fasern, hergestellt wurde. Daneben betrachtet man die Brustschnur und das Schnurbündel, welches nur während der Feste und anläßlich zeremonieller Handlungen getragen wird, als Schmuckgegenstände und Abzeichen zweier Altersklassen.

Die Frauen der Xiriána, Pusheweteri, Aramamesteri und Karauateri, welche ich in den Malokas der Surára und Pakidái antraf, trugen zwar ebenfalls solche Schnüre und Schnurbündel, bemerkten jedoch, daß sie innerhalb ihrer Stämme nicht verwandt würden. Dies erklärt auch, warum Koch-Grünberg solche Gegenstände nicht erwähnte, als er die Tracht der Xiriána (Schirianá) beschrieb. Bei den Arekuná-Taulipang sah er dagegen als Festschmuck bei Frauen und Männern lange Ketten

[100]) Krause, 1911, S. 208/09.
[101]) Becher, 1951, I, S. 82; II, Tab. und Karte Nr. 4.

Brustschnurbündel der Frauen
(Detail und Schema der Bemalung)

aus weißen Perlen und braunen Samen, die sie sich in vielen Windungen kreuzweise über Brust und Rücken geschlungen hatten[196]) [197]). Abgesehen von dem zusätzlich verwandten Schmuckmaterial unterscheiden sich diese Ketten von den oben beschriebenen Schnüren und Schnurbündeln noch durch ihre Tragweise, denn sie reichen viel weiter nach unten.

Man gewinnt daher den Eindruck, daß es sich bei der von den Surára- und Pakidái-Frauen verwandten Brustschnur aus Curauá-Fasern um einen sehr ursprünglichen Gegenstand handelt, aus dem wahrscheinlich erst nach Einführung der Baumwolle das Schnurbündel entwickelt wurde. Dieses wiederum könnten Karaibenstämme, vielleicht während kriegerischer Berührungen, entlehnt haben, und bei ihnen wandelte es sich dann in eine lange Schmuckkette. Jene ist zwar auch kreuzweise geschlungen, doch der ursprüngliche Sinngehalt, die Verschönerung der Brustform, ging verloren, was auch daraus zu entnehmen ist, daß bei den Arekuná-Taulipang selbst Männer solch eine Schmuckkette umbinden.

c) Arm-, Puls- und Beinschnüre

Vom 4. Lebensjahr ab tragen beide Geschlechter zeitweilig Oberarmschnüre, Frauen und Mädchen außerdem noch Puls- und Beinschnüre, die aus Curauá-Fasern oder Baumwolle angefertigt werden. Es ließ sich noch eindeutig feststellen, daß es sich bei den zweisträhnig nach rechts gedrehten Curauáfaserschnüren um die ursprünglichen Gegenstände handelt, während die zweisträhnig nach links gedrehten Baumwollschnüre jüngeren Datums sind. Außerdem war auch hier wieder zu beobachten, daß man der Pflanzenfaser eine kräftigende Wirkung beimißt.

So soll die Oberarmschnur — *xinarisinho* — eine größere Muskel- und Armkraft verleihen[198]). Die nur von Frauen und Mädchen verwandte Pulsschnur, ebenfalls *xinarisinho* genannt, kräftigt, so glaubt man, die Handgelenke und jene unterhalb der Knie getragene Schnur — *hukud* — die Beine.

Als Schmuck für die Oberarme verwendet man aber neben der einfachen Schnur auch Schnurbänder — *nyõõmutimd* —, bei deren Formen es sich um genaue miniaturartige Wiedergaben der Gürtel handelt[199]), ein Novum

[196]) Koch-Grünberg, 1923a, S. 37.
[197]) Koch-Grünberg, 1923b, Tafn. 15, 43, 61, 91, 92, 93, 98, 99, 100, 102 und 107.

[198]) Bemerkenswert ist es, daß die Curauáfaserschnur auch mit dem Wort *Xinarisinho* benannt wird, obgleich darin der Name für Baumwolle — *xinari* — enthalten ist.
[199]) In dem Wort — *nyõõmutimd* — ist der Name für Gürtel, *nyõ*, enthalten, dem man die Verkleinerungsform *õõmutimd* angehängt hat.

für Südamerika, denn Parallelen gibt es hierfür noch nicht. So haben die 20—22 cm langen Schnurbänder der Männer, deren Durchmesser 1,5—2 cm beträgt (Schnurbänder der Knaben: Länge: 12—15 cm; Durchmesser: 0,5—1 cm) dasselbe rollenförmige Aussehen wie ihre Gürtel (Fig. 14a u. b; Fig. 15a u. b) und werden von den Frauen in gleicher Weise angefertigt und bemalt, bzw. gefärbt (s. S. 29/30). Aber auch die breite, flache Form der Frauenbänder (Länge: 18—22 cm; Breite: 1—2,5 cm) stimmt, abgesehen von der geringeren Größe, vollständig mit den von ihnen getragenen Gürteln überein (Fig. 16a—c; Fig. 17), so daß ich hinsichtlich der Herstellung und Bemalung auf die Anfertigung der Frauengürtel verweisen kann (s. S. 30). Zu erwähnen ist noch, daß die Oberarmbänder jüngerer Frauen schmäler (1—1,5 cm) als die der älteren (2—2,5 cm) sind[880]).

Die vier Xiriána-Frauen, welchen ich in den Malokas der Surára und Pakidái begegnete, trugen die gleichen Oberarm-, Puls- und Beinschnüre sowie -bänder, desgleichen alle Pusheweteri- und Aramamesteri-Frauen, einschließlich des gefangenen Karauateri-Mädchens. Letztere sagten aber aus, daß sie die Oberarmbänder erst hier angenommen hätten, denn in ihren Stämmen würden nur Oberarmschnüre verwandt.

Auch nach Koch-Grünberg umwickeln bei den Xiriána (Schirianá) die Männer ihre Oberarme mit langen, rotgefärbten Baumwollschnüren, während Frauen „schmale Bänder" benutzen, die sie aber so fest binden, daß man die Male auch beim Ablegen derselben sieht[881]). Die Frauen der Maiongkong-Yekuaná umschnüren ihre Oberarme in der gleichen straffen Weise[882]). Bezüglich der Arekuná-Taulipang schreibt Koch-Grünberg: „Zum Schmuck der Frauen gehören ferner breite Umwicklungen aus weißen Perlenschnüren unterhalb der Knie, um die Oberarme und die Handgelenke. Die Männer

Fig. 14a—b Oberarmschnurband der Männer

Fig. 15a—b Oberarmschnurband der Jünglinge

[880]) Eine ältere Pakidái-Frau trug übrigens ein 2½ cm breites, gewebtes Oberarmband. Sie bezeichnete es mir ebenfalls mit dem Namen *wyâwutimâ* und fügte hinzu, daß sie dasselbe von einer Xiriána-Frau erhalten hätte.

[881]) Koch-Grünberg, 1923a, S. 305.

[882]) Koch-Grünberg, 1923b, Taf. 151, 152, 170, 171, 172.

Fig. 16a—c Oberarmschnurband der Frauen

Fig. 17 Oberarmschnurband der Frauen

tragen den gleichen Perlenschmuck um die Handgelenke, bisweilen auch um die Fußgelenke, umschnüren aber die Beine unter den Knien mit weißen Baumwollschnüren, deren Enden lang herabhängen. Um die Oberarme tragen sie gewöhnlich nur eine Schnur weißer Perlen oder eine weiße Baumwollschnur oder an Festtagen eine runde Scheibe aus Schneckenschalen.... Die Umschnürungen an den Beinen werden von den jungen Mädchen aus Eitelkeit häufig so straff angezogen, daß die Waden prall hervortreten"[203]) [204]).

Diese alte Karaibensitte, welche schon den ersten Entdeckern als Besonderheit ins Auge fiel, ist auch den Surára und Pakidái bekannt, wird von ihnen aber als sehr häßlich empfunden und daher nicht nachgeahmt; bei den Frauen und Mädchen dieser Indianer sitzen die Beinschnüre stets locker.

d) Halsschnüre und -ketten aus ursprünglichem Material

Mit Halsschnüren und -ketten aus ursprünglichem Material sind keine Schmuck-, sondern magische Absichten verbunden.

So tragen junge Männer gelegentlich eine mit Urucu gefärbte zweisträhnig nach rechts gedrehte Curauáfaserschnur um den Hals, an welcher ein Wurzelstückchen der Tajá (*Colocasia antiquorum* und *Xanthosoma violaceum* Schott) — *kanrí* — befestigt ist. Hierbei handelt es sich um einen Liebeszauber (s. S. 111). Um denselben abzuwehren, verwenden verheiratete weibliche Stammesangehörige zwei Arten von Halsketten. Junge Frauen haben an ihrer mit Urucu gefärbten Schnur aus Curauá-Fasern zahlreiche Wurzelstückchen der Tajá — *kanrí* — festgebunden und ältere kleine Teilchen der Camarau (*Cipó* sp.) — *hií* — (s. S. 111).

e) Haartracht

Männer, Frauen und Kinder, nach Vollendung des dritten Lebensjahres, haben die gleiche rund um den Kopf geschnittene Haartracht — *mabdu* —, einschließlich der Tonsur — *kemdno* —. Das Ausrasieren derselben, aber auch das Schneiden der Haare gehört zu den Pflichten der Frauen, wozu sie sich eines gespaltenen und auf einer Seite geschärften Rohrstückes (Taquara — *Guadua* sp. —) bedienen (s. S. 55). Bei Festen, anläßlich magischer Handlungen und während der Kriegszüge wird die Tonsur mit Urucu bemalt.

Nach Angaben meiner Gewährsleute stellt dieselbe in erster Linie eine Markierung dar, um für die Stockduelle, welche von den Männern gelegentlich ausgetragen werden, den sichersten und widerstandsfähigsten Teil des Kopfes zu kennzeichnen[205]). Dadurch erklären sich auch die Narben, welche man fast bei allen Männern auf der Tonsur sieht. Doch auch bei weiblichen Stammesangehörigen sind sie vorhanden, denn wenn ein Ehemann seine Frau aus Gründen der Eifersucht schlägt, darf er ebenfalls nur diesen markierten Teil des Kopfes auswählen. Als weiteren, aber wohl mehr sekundären Grund, gab man mir an, daß durch den kurzen Haarschnitt und die Tonsur der Läuseplage leichter Einhalt zu gebieten wäre. Menschen mit langem Haar, so meinten sie, könnten sich vor Kopfläusen sicher nicht retten.

Auch in der Religion und Mythologie wird die Tonsur erwähnt. Poré, den Herrn des Mondes, stellt man sich nämlich als alten Mann mit langem weißen Bart und mit rotbemalter Tonsur vor (s. S. 91).

Wie bei zahlreichen anderen südamerikanischen Stämmen, ist die Tonsur auch ein charak-

[203]) Koch-Grünberg, 1923a, S. 34.
[204]) Koch-Grünberg, 1917, Abb. 7, 8.
[205]) Becher, 1959, S. 165.

teristisches Merkmal aller kleinwüchsigen, hellhäutigen Indianer zwischen dem Rio Negro und dem oberen Orinoco, denn die Angehörigen beiderlei Geschlechts der Xiriána, Pusheweteri, Aramamesteri und Karauateri, denen ich begegnete, trugen sie gleichfalls[205]). Weiterhin ist sie für die Waiká[207]) [208]), Karimé[209]) und die Xiriána-Männer am Motomotó belegt[210]). Bezüglich letzterer hebt Koch-Grünberg hervor, daß es sich hierbei um eine männliche Haartracht handelt[211]). Im gleichen Werk beschreibt er dann noch die Tonsur einer Karaibenfrau: „Eine eigenartige Haartracht hatte die älteste Frau am Roroima. Bis auf einen schmalen Kranz längerer Haare rund um den Kopf, die an der Stirn in der üblichen Weise verschnitten waren, war das Haupthaar wie bei einer Mönchtonsur kurz geschoren. (Vgl. Bd. VI, Taf. 86). Den Grund für diese abweichende Haartracht konnte ich nicht in Erfahrung bringen"[212]). Erwähnenswert sind auch die Ausführungen, welche Alexander von Humboldt jener indianischen Haartracht widmet[213]).

f) Deformierender Gesichtsschmuck

Sowohl das männliche als auch das weibliche Geschlecht haben bei den Surára und Pakidái perforierte Ohrläppchen, — *nhimehakehá* — (Surára), — *nimakakuhá* — (Pakidái), eine Durchbohrung der Unterlippe — *kuzehahá* —, und die Frauen noch zusätzlich solche in den Mundwinkeln — *kashehá* —.

Die Durchbohrungen erfolgen bereits im Säuglingsalter (s. S. 63). Den Männern dienen sie in erster Linie zum Anbringen von Federzieraten (s. S. 43). Doch als Ohrschmuck tragen sie auch manchmal 1—2 cm lange Rohrstückchen, von denen an einem oder zwei kurzen Perlenkettchen kleine dreieckige Silberbleche, blanke Silbermünzen oder besonders große Glasperlen herabhängen. Frauen verwenden diese Objekte ebenfalls mit besonderer Vorliebe. Ein typisch weiblicher Ohrschmuck sind die Zähne des Cutia (*Dasyprocta aguti* L.) — *tomenáhe* —, welche den Männern als Messer dienen (s. S. 54). Damit sie nicht aus der Durchbohrung herausrutschen, klebt man an das hintere Ende ein Klümpchen Baumharz. Auch mit Blüten werden die Durchbohrungen der Ohrläppchen ab und zu geschmückt.

In den Perforationen der Unterlippe und beiderseits der Mundwinkel haben die Frauen hin und wieder feine Rohrstäbchen — *tunhabadere* — stecken von 15—17 bzw. 12—15 cm Länge. Bei Xiriána-Frauen, welche mit Surára- und Pakidái-Männern verheiratet sind, konnte ich beobachten, daß sie noch zusätzlich zwei 30—35 cm lange Rohrstäbchen im durchbohrten Nasenseptum — *kuxibéha* — tragen (Abb. 16). Diese Durchbohrung, so wurde mir gesagt, bleibe nur den weiblichen Angehörigen dieses großen, mächtigen Stammes vorbehalten. Daher erklärt sich auch, daß die Perforationen der Pusheweteri- und Aramamesteri-Frauen vollkommen denen ihrer Surára- und Pakidái-„Schwestern" entsprechen, d. h. eine Durchbohrung der Nasenscheidewand fehlt. Dieselbe Feststellung trifft für Nikeromá, die kleine Gefangene vom feindlichen Stamm der Karauateri, zu.

Alle genannten Schmuckobjekte werden von den männlichen und weiblichen Trägern selbst angefertigt und gelten als persönliches Eigentum.

Durch Koch-Grünbergs Forschungen bei den Xiriána (Schirianá), Waiká (Waika) und verschiedenen Karaibenstämmen bietet sich mir ein reichhaltiges Vergleichs- und Ergänzungsmaterial. So schreibt der große Forscher bezüglich der Xiriána (Schirianá): „Nasenseptum,

[205]) Die brasilianische Landbevölkerung bezeichnet alle Indianer mit Tonsuren als Coroados = Gekrönte. Baldus und Willems fordern jedoch mit Recht, den Gebrauch dieses Namens innerhalb der brasilianischen Völkerkunde zu vermeiden: „Coroado-Várias tribus de índios no Brasil, por exemplo, os Botocudos, Kaingang, Puri, Bororo, receberam do povo o nome de Coroados, devido ao modo de cortar o cabelo, se bem que êsse modo não fosse igual entre todas elas. Causou êste têrmo grande confusão na etnografia brasileira, razão pela qual deve ser abandonada." (Baldus e Willems, 1939, S. 67).

[207]) Koch-Grünberg, 1917, S. 198.

[208]) Zerries, 1954b, S. 73.

[209]) Salathé, 1931/32, S. 305.

[210]) Koch-Grünberg, 1923a, S. 306.

[211]) Koch-Grünberg, 1923a, S. 27.

[212]) A. von Humboldt, 1860, IV, S. 319.

Ohrläppchen und Unterlippe waren bei den Männern durchbohrt und bei vielen mit fast handlangen Rohrstäbchen verziert. Bei besonderen Gelegenheiten tragen sie auch einen Jaguarzahn in der Unterlippe.

Die Weiber hatten lange Rohrstäbchen in den durchbohrten Ohrläppchen, der Unterlippe und den Mundwinkeln. Drei schmale Rohrstreifen, nach beiden Seiten fächerförmig auseinanderstehend, zierten das Nasenseptum (Abb. 12)"[212]).

Hierdurch werden die Angaben meiner Gewährsleute bestätigt, welche besagten, daß eine Perforation des Nasenseptums charakteristisch für die Xiriána sei. Doch auch für die männlichen und weiblichen Waiká sind Nasen-, Ohr- und Unterlippenstäbchen, für die Frauen außerdem solche der Mundwinkel bezeugt[214]).

Bezüglich der Verwendung von Nasenstäbchen scheint es sich also um Vorrechte der beiden feindlichen „Großen" (s. S. 6) zu handeln, denn von den kleineren Verbündeten werden sie nicht benutzt.

Die anderen Durchbohrungen stimmen dagegen bei allen genannten Yanonámi-Stämmen überein, wobei hervorzuheben ist, daß man perforierte Mundwinkel nur bei Frauen findet.

Hinsichtlich der karaibischen Arekuná-Taulipang schreibt Koch-Grünberg: „Ohrläppchen und Unterlippe, bei manchen Männern auch das Nasenseptum sind durchbohrt"[215]). Demnach bleibt hier die Perforation der Nasenscheidewand nur Männern vorbehalten, und Durchbohrungen der Mundwinkel fehlen gänzlich. In den Ohrläppchen tragen aber männliche und weibliche Stammesangehörige ebenfalls kleine Rohrstäbchen, mit einem oder zwei herabhängenden kurzen Perlenkettchen, an denen Silbermünzen, halbmondförmige oder dreieckige Silberbleche befestigt sind[216]). Bei letzteren handelt es sich um dieselben Objekte, die ich als Schmuck bei den Surára und Pakidái vorfand (s. S. 40 und Abb. 9). Eine Übernahme von Karaiben, direkt oder indirekt, scheint in diesem Falle also wieder vorzuliegen. Auf meine Frage nach der Herkunft jener Schmuckgegenstände nannte man mir zwar die Xiriána, welche sie aber ihrerseits sicher auch nicht selbst angefertigt haben, denn sie wurden durch Klopfen und Schleifen aus brasilianischen Silbermünzen hergestellt, die heute gar nicht mehr im Umlauf sind. Außerdem wird schon seit Jahrhunderten das handwerkliche Können der Karaiben in bezug auf Gold-, Silber- und Kupferzierate gerühmt. So erwähnt bereits Gumilla Karaibenstämme in der Umgebung des Orinoco, die selbstverfertigte Platten aus Gold trugen[217]), und nach de Rochefort verwandten die Inselkaraiben Ohrgehänge aus glänzendem Kupfer[218]). Von den Makuxi-Männern werden halbmondförmige Silberbleche benutzt, diese tragen sie aber an einem Nasenstäbchen[219]).

Weiteres Vergleichsmaterial findet sich in der wertvollen Arbeit von Brigitte Menzel, „Deformierender Gesichtsschmuck südamerikanischer Naturvölker". Hierin wurde festgestellt, daß Ohrschmuck aus Metall besonders häufig in Nordwest-Amazonien sowie Guayana auftritt[220]) und auch Ohrschmuck aus Zähnen in starkem Maße für das Hochland von Guayana bezeugt ist[221]). Bezüglich des Mundwinkelschmuckes schreibt die Autorin: „Von einer Häufung im Quellgebiet des Ucayali reichen die Belege über das nordwestliche Amazonien bis nach Guayana; gesondert bleiben die Tapuya am Osthorn Südamerikas. Das Verteilungsbild deckt sich in wesentlichen Zügen mit den mehrfachen Durchbohrungen der Oberlippe (diese Teile gehen auch anatomisch sehr ineinander über) und lehnt sich deutlich an andine Vorbilder an"[222]). Die charakteristischen Mundwinkelstäbchen der Yanonámi-Frauen lassen sich zwar gut in dieses Verbreitungsgebiet einreihen, jedoch nicht im Zusammenhang mit Durchbohrungen der Ober-

lippe, denn statt dieser wird hier die Unterlippe perforiert.

g) Tatauierung

Alle Frauen und Mädchen haben eine punktförmige Tatauierung über der Oberlippe, welche beiderseits des Mundes nach unten verläuft (Abb. 19 u. 24) und den Mädchen während der ersten Menstruation eingestochen wird (s. S. 66)[223]. Die Bezeichnung hierfür lautet bei den Surára — *uarabakoxlk* — und bei den Pakidái — *uarabakoxlbe* —. Diese Worte werden von dem Namen der Genipapo-Frucht — *uarabd* — abgeleitet, deren Saft zum Einstechen der Punkte verwandt wird.

Aber auch für karaibische und aruakische Frauen Guayanas ist eine Stichtatauierung in der Mundgegend charakteristisch, und gelegentlich findet man sie sogar bei männlichen Karaiben. Sie gilt hier ebenfalls als Zeichen der Reife und hat meist eine magische Bedeutung. Die eingestochenen Muster weichen aber von denen der Surára und Pakidái vollständig ab. Bei den Makuxi bestehen sie aus zahlreichen kurzen, vertikalen Parallelstrichen, und die Arekuná-Taulipang bevorzugen Punkte, Striche und Angelhakenmuster[224]. Letztere Motive sind auch für die Frauen der Wapixana[225] [226] und weiterer Aruakstämme in Britisch Guayana sowie Surinam bezeugt[227] [228].

Auch bezüglich des Zeitpunktes der Tatauierung gibt es kleine Unterschiede. Die Surára und Pakidái führen sie während der ersten Menstruation durch, Arekuná-Taulipang und Makuxi dagegen kurz vor Eintritt derselben, und zwar in Verbindung mit der Ameisenmarter[229].

Als Farbstoff verwenden erstere den Saft der Genipapo-Frucht, letztere die Asche verbrannter Honigbienen[230]. Das ursprüngliche Instrument zum Stechen der Punkte war überall ein Palmstachel. Doch Koch-Grünberg sah bei den genannten Karaiben auch schon die Verwendung von zugespitzten Glasscherben[231].

Eine Entscheidung darüber, ob sich die Tatauierungen der Mundgegend bei den erwähnten Yanomámi-, Karaiben- und Aruak-Stämmen selbständig entwickelt haben, oder ob sie durch wechselseitige, bzw. äußere Einflüsse hervorgerufen wurden, kann noch nicht getroffen werden, obgleich Koch-Grünberg eine junge Xiriána-Frau sah, welche die Angelhaken- und Punkttatauierung der Arekuná-Taulipang in das Gesicht gemalt hatte[232]. Doch hierbei kann es sich um eine Ausnahme handeln, denn merkwürdigerweise stellte er bei den Xiriána keinerlei weiteren Tatauierungen fest.

Die Muster der Surára und Pakidái scheinen auch ursprünglicher zu sein als die Grundmotive der Karaiben und Aruaken in Gestalt von Angelhaken, welche eindeutig auf Entlehnungen seitens der Zivilisation hinweisen. Auch die Tatsache, daß bei den Karaibenstämmen Guayanas vereinzelte Männer und Knaben [illegible] der Mundgegend tatauiert sind, läßt auf eine Verflachung dieser Sitte schließen. Denn wahrscheinlich war sie ja früher auch dort nur Frauen vorbehalten, genau wie noch heute bei den Surára und Pakidái.

Abschließend ist noch auf P. Schmidt und Nordenskiöld zu verweisen, von denen bereits kurze zusammenfassende Untersuchungen über die Stichtatauierung in Südamerika vorliegen. Der erstgenannte Autor unterscheidet zwei Gruppen, welche Männern und Frauen, bzw. nur Frauen vorbehalten sind, und hält eine westliche Herkunft für wahrscheinlich[233]. Dem-

[223]) Diese Tatauierung findet sich auch bei den weiblichen Xiriána, Puseheweteri und Aramameteri, die mit Surára- und Pakidái-Männern verheiratet sind. Eine Ausnahme bildet die kleine Gefangene der Surára, Nikeromá, vom feindlichen Stamm der Karauateri. In ihrer Maloka, so versicherte sie mir, werden die Mädchen aber auch tatauiert. Doch sie war bereits vor Eintritt der ersten Regel in die Hände der Surára gefallen, und hier wurde die Tatauierung an ihr nicht vorgenommen. Falls sie aber später von einem Surára-Mann geheiratet wird, müßte ihr das punktförmige Muster noch nachträglich eingestochen werden.

gegenüber vertritt Nordenskiöld die Auffassung, daß die Stichtatauierung „ziemlich leicht an verschiedenen Orten hat erfunden werden können". Seine Verbreitungskarte zeigt eine Häufung dieser Sitte in nördlichen und zentralen Teilen Südamerikas[222]). Eine umfassende Arbeit über die Tatauierung südamerikanischer Indianer würde bestimmt gute und aufschlußreiche Ergebnisse zeitigen.

h) Bemalung

Die Körperbemalung, welche bei zeremoniellen Anlässen, Kriegs- und gelegentlich auch Jagdzügen zur Anwendung kommt, ist sehr einfach und kunstlos. Entweder sind es jene immer wiederkehrende Motive, wie schlangenförmige Linien, Kreise und Punkte[223]), welche man mal einzeln, mal vermischt aufträgt, oder der ganze Körper wird mit rotem oder schwarzem Farbstoff eingerieben.

Bei dem roten Farbstoff handelt es sich um Urucu — *narú* —, eine Paste, die aus den roten Beeren der Bixa orellana bereitet wird. Blaue Farbe liefern die Samen der Genipapo-Frucht (*Genipa brasiliensis*) — *uarabú* —, während man für die Schwarzfärbung den abgekratzten Ruß der Kochtöpfe benutzt, meist vermischt mit etwas Genipapo.

Die schlangenförmigen Linien, Kreise und Punkte werden mit den Fingern oder einem Holzstäbchen aufgetragen, und zur diffusen Färbung benutzt man ein kleines Baumwollknäuel.

Da auch Koch-Grünberg bei den Xiriána (Schirianá) nur eine ganz geringe Körperbemalung feststellte[224]), ist zu vermuten, daß dieselbe den drei genannten Yanomámi-Stämmen ursprünglich nicht eigen war, sondern auf karaibische Einflüsse zurückzuführen ist. Auch die nachstehenden Ausführungen Alexander von Humboldts deuten daraufhin: „Der Brauch", so schreibt der große Forscher, „den Körper zu bemalen, ist nicht bei allen Völkern am Orinoco gleich alt. Erst seit den häufigen Einfällen der mächtigen Nation der Caraiben in diese Länder ist derselbe allgemeiner geworden. Sieger und Besiegte waren gleich nackt, und um dem Sieger gefällig zu seyn, mußte man sich bemalen wie er und seine Farbe tragen. Jetzt ist es mit der Macht der Caraiben vorbei, sie sind auf das Gebiet zwischen den Flüssen Carony, Cuyuni und Paraguamuzi beschränkt, aber die caraibische Mode, den ganzen Körper zu färben, hat sich erhalten; der Brauch ist dauernder als die Eroberung"[225]).

i) Federschmuck

Federzierate — *pauxi* — werden nur von Männern getragen und zwar vorwiegend an den Oberarmen, doch gelegentlich auch in den Perforationen der Ohrläppchen und der Unterlippe.

Als Befestigungsvorrichtungen für den Oberarmschmuck dienen vor allem die Oberarmschnüre und -bänder, unter welche bei Kriegszügen und festlichen Anlässen vorn einzelne oder mehrere Schwanzfedern des Arara vermelha (*Ara macao* L.) — *pauxi aralexiná* — geklemmt werden sowie kleine Federbüschel. Letztere sind stets mit einer Schnur aus Baumwolle oder Curauá-Fasern an einem 7—9 cm langen Holzstäbchen festgebunden (Abb. 9 u. 14). Die nachstehende Aufzählung zeigt, welche Vögel als Federlieferanten für diese Objekte bevorzugt werden:

Pauxi maraxi — Oberarmschmuck aus den schwarz-weißen Federn des Cujubim (*Pipile pipile cujubi* Pelz.).

Pauxi koihoimdo — Oberarmschmuck aus den schwarz-weißen Federn des Gavião-caipira (*Hypomorphnus urubitinga urubitinga* Gm.)

Pauxi paruriihonomaïbo — Oberarmschmuck aus weißen Brustfedern des Mutum (*Crax* sp).

Pauxi marahanã — Oberarmschmuck aus Federn des Arara amarela (*Ara ararauna* L.)

Pauxi xerexeromãbo — Oberarmschmuck aus Federn des Papagaio moleiro (*Amazona* sp.) und des Papagaio curica (*Amazona* sp.).

Außer diesen Federbüschein, welche von oben in die Armschnüre, bzw. -bänder gesteckt

[222]) Nordenskiöld, 1918, S. 128—130 und Karte 19.
[223]) Mit diesen Motiven werden auch die Gebrauchsgegenstände bemalt.
[224]) Koch-Grünberg, 1923a, S. 307.
[225]) A. von Humboldt, 1860, III, S. 92/93.

werden, gibt es auch Zierate, die hieran geknotet sind und nach unten hängen. Es handelt sich dann meist um mehrere kleine Federn von verschiedenen Vögeln, deren Kiele man mit einer Schnur aus Baumwolle oder Curauá-Fasern zusammengebunden hat:

Pauxi prukatöha — Herabhängender Oberarmschmuck aus Federn des Mutum (*Crax* sp.), Papagaio moleiro (*Amazona* sp.) und Tucano (*Rhamphastus* sp.).

Pauxi maraxiakosíbe — Herabhängender Oberarmschmuck aus Federn des Cujubim (*Pipile pipile cujubi* Pelz.) und Tucano (*Rhamphastus* sp.).

Als wertvollster Schmuck dieser Kategorie sind schließlich noch Oberarmbinden aus Mutumfedern — *pauxi parurihís* — zu erwähnen, an denen man Gehänge — *pauxi manhebéhanque* — aus Federn des Mutum (*Crax* sp.), Tucano (*Rhamphastus* sp.) und Jacamim (*Psophia crepitans* L.) befestigt hat, oder sogar Bälge dieser Vögel. Daneben werden auch Oberarmbinden verwandt, die nur aus Federn des Jacamim — *pauxi nhapinhéssi* — bestehen, mit Federgehängen — *pauxi pchakossíbe* — des gleichen Vogels.

Alle aufgezählten Federzierate stellen gleichzeitig Abzeichen dar, denn lediglich die Häuptlinge und bewährte Krieger haben das Recht, beide Oberarme zu schmücken, jüngere Männer dagegen nur einen.

In die perforierten Ohrläppchen steckt man bisweilen kleine Federn des Anambé azul (*Cotinga cayana* L.) — *pauxi osmemchís* —, während eine Schwanzfeder des Arara vermelha (*Ara macao* L.) — *pauxi arataxind* — gelegentlich die Durchbohrung der Unterlippe ziert (Abb. 11). Diese Schmuckobjekte dürfen sowohl von älteren als auch von jüngeren Kriegern verwandt werden.

Die Herstellung von Federzierat obliegt den Männern, welche sie aber recht oberflächlich ausführen. Doch infolge des Vogelreichtums in ihren Wohn- und Streifgebieten verursacht es ja keine Mühe, schadhaft gewordene Stücke rasch zu erneuern.

Als Besonderheit ist schließlich zu erwähnen, daß Surára- und Pakidái-Männer häufig die weißen Flaumfedern vom Gavião-real (*Thrasaetus harpyia* L.) — *koikoimdo* — mittels Baumharz in die Haare kleben. Meist ordnet man sie kranzförmig an, so daß sie wie ein Kopfreif wirken (Abb. 9), verteilt sie aber gelegentlich auch wahllos über die Haare. Doch der Schmuckgedanke spielt in diesem Falle nur eine sekundäre Rolle, denn diese Federbedeckung wird als Trophäe betrachtet. Nach Ansicht jener Indianer kommen nämlich die Krankheiten und überhaupt alles Böse von feindlichen Stämmen, vor allem von den Waiká. Sie werden durch Zauberhandlungen der Medizinmänner verursacht, welche dazu als Überträger diese Vögel oder Fledermäuse verwenden und in deren Körper die eigene Seele mitschicken. Wenn nun die Surára und Pakidái solch ein Tier töten, so glauben sie, daß damit auch ein feindlicher Medizinmann sein Ende gefunden hat (s. auch S. 96 u. 105).

Mit dem großartigen Federschmuck der Urubu-Kaapor, Mundurukú, Tapirapé, Karajá, Boróro, Guajajára, Tembé, Apiaká, Mawé, Arara, Tukano und Xingú-Indianer, welcher von Darcy und Berta G. Ribeiro ausführlich bearbeitet und klassifiziert wurde[227] [228]), können die Federzierate der Surára und Pakidái natürlich nicht konkurrieren, aber man ersieht daraus, wie verschieden die einzelnen südamerikanischen Stammesverbände ihre Fähigkeiten entwickelten und ihre Traditionen über Jahrhunderte hinweg von Generation zu Generation vererbten.

Für die Yanomámi stellt der einfache Oberarmschmuck ein weiteres äußeres Kennzeichen dar, denn auch Xiriána-, Pusheweteri- und Aramamesteri-Männer, denen ich begegnete, trugen ihn in der gleichen Weise. Bezüglich der Xiriána decken sich meine Beobachtungen auch mit einer Angabe Koch-Grünbergs: „Die Männer", so führt er aus, „wickeln um die Oberarme lange, rotgefärbte Baumwollschnüre, an deren Enden Vogelbälge hängen (Taf. 46, 2 und 2a). Wenn sie in den Krieg ziehen, stecken sie vorn unter die Armbinden Büschel Schwanzfedern des roten Arára, so daß sie die Schultern über-

[227]) Darcy Ribeiro e Berta G. Ribeiro, 1957.
[228]) Berta G. Ribeiro, 1957.

ragen"[339]). Für die Waiká wird dieser Oberarmschmuck durch Photographien von Zerries belegt[340]) [341]).

Bezüglich des Ohr- und Lippenschmuckes findet man bei den Makuxí und Arekuná-Taulipang Parallelen, doch hier werden die weißen Flaumfedern des Königsgeiers oder des großen Hokko (Mutum) verwandt[342]).

j) Perlenschmuck

Europäische Glasperlen, vor allem kleine, gelten bei den Surára und Pakidái noch heute als beliebteste Tauschobjekte. Am meisten schätzt man weiße, blaue und rote Perlen[343]), und erst danach folgen solche in den Farben orange, gelb, schwarz und grün[344]).

Sie werden von den Frauen auf Schnüre aus Baumwolle oder Curauá-Fasern gezogen, wobei die Männer gelegentlich helfen, und dienen als Halsketten, Oberarm- und Pulsschnüre sowie Ohrgehänge.

Folgende Herstellungsarten konnte ich beobachten: Auf eine Schnur werden z. B. nur weiße, rote oder blaue Perlen gezogen. Je nach dem Geschmack der Hersteller kommt es aber auch vor, daß auf drei weiße Perlen stets eine blaue oder rote folgt, andere bevorzugen die Farbzusammenstellung blau, weiß, rot oder umgekehrt. Es gibt jedoch noch viele weitere Variationen, auch in Verbindung mit anderen Farben.

Daneben werden, wenn auch seltener, Ketten aus zwei Schnüren angefertigt. In diesem Falle wird z. B. eine weiße Perle über beide Schnüre gezogen, danach je eine rote oder blaue über eine Schnur, dann wieder eine weiße über beide, usw.

Frauen und Mädchen tragen gern mehrere Perlenschnüre als Halsketten übereinander, Männer und Knaben binden dagegen niemals mehr als eine um. Oberarmschnüre aus Glasperlen legen nur Männer an und entsprechende Pulsschnüre allein Knaben und Mädchen. Kurze Perlenkettchen, die in den Perforationen der Ohrläppchen befestigt werden, tragen, wenn auch nur selten, beide Geschlechter. Meist ist dann unten ein silbernes Dreieck, eine große Glasperle oder ein Fruchtkern befestigt.

Als ich zu den Surára und Pakidái kam, waren schon einige Perlenkettchen in Gebrauch. Die Glasperlen hatten sie, ihren Angaben zufolge, sowohl vom Indianerschutzposten Ajuricaba am Rio Demini, von Gummi- und Palmfasersammlern, aber auch von den Xiriána erhalten. Letztere erwarben jenes Fremdgut vermutlich von Karaibenstämmen, welche es ihrerseits ebenfalls von Weißen bekommen hatten. Daran erkennt man, daß der Tausch von Glasperlen auch unter den Indianern selbst noch stark betrieben wird[345]).

7. *Hängematten*

Die Surára und Pakidái besitzen drei verschiedene Arten von Hängematten. Als älteste und wohl ursprünglichste Form kann die Hängematte aus Embira (Baumbast, *Malvaceae* sp.) — *ydritanaçik* — betrachtet werden, deren Länge zwischen 1,80—1,90 m liegt (Abb. 26). Sie enthält keinen Einschlag und besteht lediglich aus zehn bis vierzehn 1—2 cm breiten Embirastreifen. Diese werden an den Enden umgebogen und mittels zweier 1,30—1,40 m langer Stricke, welche gleichzeitig zum Aufhängen dienen, zusammengebunden (Fig. 18a u. b). Beide Stricke sind sehr fest und haltbar, denn man hat sie in Gestalt eines Zopfes aus drei 1 cm breiten

[339]) Koch-Grünberg, 1923a, S. 303.

[340]) Zerries, 1955b, Titelbild.

[341]) Zerries, 1954b, Taf. VI, oben.

[342]) Koch-Grünberg, 1923a, S. 28.

[343]) Hierin stimmen die Surára und Pakidái mit zahlreichen anderen südamerikanischen Stämmen überein. (Menzel, 1937, S. 23 und Tab. 3).

[344]) Auch Krause bemerkt hinsichtlich der Karajá, daß sie grüne Glasperlen verachten (Krause, 1911, S. 279), und bei vielen anderen Stämmen ist gleichfalls eine Aversion gegenüber dieser Farbe zu finden (Menzel, 1937, S. 17/18 u. Tab. II und III). Deshalb stellt Brigitte Menzel auch die berechtigten Fragen: „Sollte diese Ablehnung grüner Rohstoffe bei Waldvölkern auf das Dominieren von Grün in der physisch-geographischen Umwelt zurückzuführen sein? Zieht man aus Kontrastgründen die anderen Farben vor?" (Menzel, 1937, S. 18).

[345]) Schon v. Martius beobachtete, daß Glasperlen über weite Strecken gehandelt wurden (v. Martius, 1867, I, S. 702 ff.), und auch Krause hebt hervor, daß sie als Tauschobjekte sehr geschätzt werden. (Krause, 1911, S. 279).

Fig. 18a—b
Detail der Endbefestigung an einer Hängematte aus Embira sowie Schlingen- und Knotenschema

Embirasträhnen geflochten. Die Herstellung dieser Hängematte ist außerordentlich einfach und geschieht nur durch Männer. Von dem Embirabaum lösen sie 10—15 Baststreifen von 2 m Länge und 1—2 cm Breite, die sie in der oben beschriebenen Weise zusammenbinden, nachdem sie vorher noch zwei Stricke geflochten haben. Zum Schneiden des Baumbastes benutzen sie das Cutiazahn-Messerchen (s. S. 54). Da die *Ydritanaçik* außerordentlich leicht ist, wird sie von den Männern bei Wanderungen, Jagd- und Kriegszügen gern als Reisehängematte verwandt. Zusammengerollt hängt sie dann auf dem Rücken, gehalten von einer dünnen Halsschnur aus Baumwolle oder Curauá (Bromeliafaser). Beim Schlafen legen sie sich meist gekrümmt hinein; Übung und Geschicklichkeit sind aber erforderlich, um nicht durchzufallen.

Gleichartige Hängematten sind auch bei den Waiká in Gebrauch und sollen dort, nach Zerries, besondere Aufgaben im Ritualwesen erfüllen[326]) [327]), während Schuster bemerkt, daß sie nur im Notfall angefertigt werden[328]). Schon entwickelter sind die Baumbasthängematten der Xiriána, denn sie besitzen bereits Einschläge aus Baumwollfäden und Pflanzenfasern. Ruth Haebler beschreibt zwei Exemplare aus den Völkerkundemuseen in Berlin (VA 61119) und Leipzig (8736)[329]).

Aber selbst höher kultivierte Völker, wie z. B. die Ipurina, ein Aruakstamm, der gegenwärtig noch an den Flüssen Acre, Seruini und Ituxí im brasilianischen Staat Amazonas lebt[330]), verwandten früher diese Hängematten ohne Einschlag, was durch ein im Berliner Völkerkundemuseum befindliches Exemplar (VB 3758) bestätigt wird[331]). Es gab aber auch solche, die mittels eines oder zweier längerer Querstreifen verbunden waren. Bezüglich ihres Verwendungszweckes und der Herstellung stimmen meine Beobachtungen bei den Surára und Pakidái mit Ehrenreichs Angaben von den Ipurina nahezu überein. So schreibt der genannte Forscher: „Die äußerst primitiven, aber doch zweckentsprechenden Hängematten, deren die Ipurina sich im Nothfall, auf Reisen, Jagdzügen u.s.w. bedienen, zeigen deutlich, wie dieses nützliche Geräth erfunden sein mag.

Es werden einfach vier oder fünf Baststreifen (Embira) von 2 m Länge und 3—4 cm Breite vom Baume abgelöst und an den Enden zusammengenommen, zuweilen auch noch unter einander durch ein oder zwei kürzere Querstreifen verbunden. Immerhin erfordert das Liegen darin keine geringe Geschicklichkeit und Uebung"[332]).

Das Berliner Museum für Völkerkunde besitzt aber sogar eine Hängematte, welche noch primitiver ist. Sie stammt von den Nahukuá (Nahuqua), einem Karaibenstamm des Xingúquellgebietes, und besteht lediglich aus einem Büschel Gras, welches, oben und unten zusammengebunden, als Schlafgelegenheit für Kinder diente (VB 2624)[333]).

Statt der *Ydritanaçik* (Embirahängematte) benutzen die Surára- und Pakidái-Männer bei Wanderungen, Jagd- und Kriegszügen auch

häufig eine Lianenhängematte — *totoké* —[324]) [325]), welche ebenfalls sehr leicht ist, aber dem Schlafenden schon einen etwas festeren Halt gewährt. Die Längen dieser Hängematten bewegen sich zwischen 1,90 und 2,10 m. Auch sie sind ohne Querbindungen und werden ebenfalls nur von Männern angefertigt. Dies geschieht folgendermaßen: Der Mann hat vor sich ein größeres Bündel langer Lianen liegen. Jede einzelne spaltet er mit den Zähnen in 3—5 flache Streifen und legt diese nebeneinander. Wenn er so viele Streifen zusammen hat, daß er sie gerade gut mit der Hand umfassen kann, etwa 200—250, umwickelt er die Enden mit einer dicken Liane. Unterhalb der Umwicklung teilt er dann die flachen Streifen in mehrere gleich große Bündel, die er jeweils zweimal mit zwei gespaltenen, zusammengedrehten Lianen umschlingt (Fig. 19 u. Fig. 20). Dadurch erhält das Streifenbündel an den Enden eine breitere Form. Als Bindestricke verwendet der Mann drei zopfartig geflochtene Lianen (Abb. 27).

Von den Waiká[326]) und Xiriána werden solche Hängematten ebenfalls benutzt, doch die letztgenannten Indianer versehen sie teilweise schon mit Querbindungen aus Baumwollfäden[327]).

Als dritte und wichtigste Form, die von Männern, Frauen und Kindern ständig verwandt wird, sowohl in der Maloka als auch bei Wanderungen des Stammes, ist schließlich die geflochtene Hängematte aus Baumwolle — *nyó*[328]) — zu erwähnen (Abb. 28 u. 29). Abgesehen vom Material unterscheidet sie sich von den beiden frühen Arten vor allem durch Einschläge. Die Längen betragen zwischen 1,60—2,20 m, je nachdem ob sie für Kinder oder Erwachsene bestimmt sind. Ihre Anfertigung obliegt ebenfalls den Männern, doch die Frauen helfen gelegentlich ein wenig.

[324]) Der Name ist abgeleitet von *totoló*, womit die Liane (Cipó-titica) bezeichnet wird.

[325]) Bis auf eine leichte dialektische Abweichung entspricht der Name dem Waiká-Wort — „toto" —, womit diese, den Angaben von Zerries zufolge, aber ihre Baumbasthängematten bezeichnen. (Zerries, 1953a, S. 87).

[326]) Schuster, 1958b, S. 16.

[327]) Koch-Grünberg, 1923a, S. 314 und Taf. 46 (1).

[328]) Mit dem gleichen Namen bezeichnet man auch die Baumwollgürtel.

Vor der Herstellung rammt man zwei Pfähle in die Erde und verbindet sie oben und unten mittels Lianen durch Querstangen. Nach dem Abstand der letzteren richtet sich die Länge der Hängematte. Denn um diese Querstangen wird

Fig. 19 Endbefestigung einer Lianenhängematte

Fig. 20 Durchflechtungsschema von der Endbefestigung einer Lianenhängematte

der fortlaufende Kettenfaden gewickelt, dessen beide Enden am Anfang und Schluß mit der Kette verknotet werden. Es entsteht eine vordere und eine hintere Fadenlage, die man dadurch zu einer einzigen Lage vereinigt, daß man die hinteren Kettenfäden zwischen die

vorderen schiebt. Danach wird mit dem Einflechten des Doppelfadens begonnen, was ohne Gerät, lediglich mittels der Finger von rechts nach links geschieht; dabei ist noch zu erwähnen, daß oben begonnen wird. Alle Hängematten sind sehr weitmaschig geflochten, denn die Abstände zwischen den einzelnen Querbindungen, die am Anfang und am Ende verknotet sind, betragen 8—12 cm. Zur Befestigung der Hängematte verwendet man Stricke aus Bromeliafasern (Curauá), die jeweils aus vier Strähnen zopfartig nach rechts zusammengedreht werden.

Ist eine Hängematte länger in Gebrauch, so bekommt sie allmählich ein schmutzig-braunes Aussehen. Dies wird dadurch hervorgerufen, daß sich die Urucufarbe, mit welcher die Indianer häufig ihre Körper bemalen, beim Liegen derselben etwas abscheuert und an der Baumwolle haften bleibt.

Nach der Klassifizierung von Max Schmidt, welcher in Südamerika drei Gruppen der Flechttechnik unterscheidet, würden die von den Surára und Pakidái angefertigten Baumwollhängematten zur zweiten Gruppe, dem Doppelfadengeflecht, gehören, welches der Gelehrte wie folgt charakterisiert: „Diese Flechtmethode, welche über ganz Amerika-Nord und Südverbreitet ist, beruht, wie das Schema in Fig. 115 zeigt, einfach darin, daß zwei Fäden um sich selbst geschlungen werden und gleichzeitig bei jeder halben Drehung um sich selbst eine der parallel zueinanderverlaufenden Binsen oder Faserbüschel umschlingen"[385]). „Diese Doppelfadentechnik nun ist es", so schreibt Ruth Haebler in ihrer Arbeit: „Die geflochtenen Hängematten der Naturvölker Südamerikas, die bei der Herstellung der geflochtenen Hängematten zur Anwendung kommt. Das Wesen der Doppelfadentechnik besteht also darin, daß parallel verlaufende Fäden aufgespannt werden, die gleichsam die Kette bilden und durch welche als Einschlag der Doppelfaden hindurchgeführt wird. Durch die Art und Weise wie die Kette aufgespannt wird, ergeben sich zwei völlig voneinander verschiedene Gruppen der geflochtenen Hängematten"[386]). Der Gruppe zwei, welche schon mehr zur Weberei hinüberführt[387]), denn es handelt sich ja hierbei bereits um eine regelrechte Fachbildung, sind die Surára- und Pakidái-Hängematten zuzuordnen. Auch mit den Beschreibungen von Im Thurn[388]), Ehrenreich[389]) und Krause[390]) stimmen meine Beobachtungen bei den Surára und Pakidái nahezu überein. Dies beweist eine Übernahme von außen, höchstwahrscheinlich von Karaibenstämmen, welche vermutlich über die Xiriána erfolgte. Bemerkenswert ist jedoch die Tatsache, daß alle genannten Autoren angeben, daß die Kettenfäden waagerecht gespannt und die Einschläge von oben nach unten oder von unten nach oben eingeflochten werden. Daß die Waiká ihre Baumwollhängematten in der gleichen Weise anfertigen, ist aus einer Photographie zu ersehen, welche Zerries aufgenommen hat[391]). Bezüglich des Ursprungs und der Technik schreibt er noch an anderer Stelle: „Die Hängematte der Waika aus Baumwolle ist in vereinfachter Form von den Marikitare übernommen und wird, wie diese, nicht gewebt, sondern nur geknüpft"[392]). Obgleich Zerries den Ausdruck „geknüpft" verwendet, dürfte es sich um die gleiche Form handeln, wie ich sie von den Surára und Pakidái beschrieb[393]). Durch Schusters nachstehende Angaben wird dies sogar noch verdeutlicht: „Die diesen beiden Typen aus Wildmaterial als jüngere Form folgende Baumwollhängematte zeigt als wesentlichen Unterschied, vom angebauten Rohmaterial abgesehen, daß ihre Längsschnüre durch Querbindungen parallel und dicht beieinander gehalten werden. Allen Anschein nach ist diese Hängematte, deren Länge durch den am Bindegerüst als Querleiste benutzten Bogenstab bestimmt wird, eine ungeschickte Nachahmung der weit sorgfältiger gearbeiteten Hängematten der karaibischen Makiritare, die im Norden und Nordwesten des Waikagebietes

[393]) Auch die Namen lauten sehr ähnlich, — „ne" — bei den Waiká (Zerries, 1959a, S. 84; 1954b, S. 71) und — nye — bei den Surára und Pakidái.

wohnen"[268]). Diese eindeutig von den Karaiben entlehnte Baumwollhängematte der Waiká stimmt also in ihrer Form vollständig mit der von den Surára und Pakidái benutzten überein. Was aber letztere veranlaßte, bei der Herstellung die Kettenfäden senkrecht, anstatt, wie bei den übrigen Stämmen, waagerecht zu ziehen, konnte noch nicht geklärt werden.

8. Korbflechterei

Die Korbflechterei wird vorwiegend von Frauen betrieben. Ausnahmen bilden lediglich die provisorischen Tragkörbe aus natürlichen Palmblättern, welche beide Geschlechter herstellen und Tragkörbe aus Curauá, deren Anfertigung den Männern obliegt.

Benötigen die Indianer im Urwald einen provisorischen Tragkorb, so legen sie einfach zwei gefiederte Palmblätter dicht nebeneinander auf den Boden (am häufigsten verwenden sie hierzu die Blätter der Pataúá-, Açaí- und Ubimpalme) und verflechten die Innenseiten zu einer festen Fläche. Danach werden beide Blätter am oberen Ende umgebogen, man erhält dadurch den Boden, und aus den Außenseiten wird ein zopfartiger Rand geflochten (Abb. 32). Mittels eines Tragbandes aus Embíra lassen sich dann mit diesem Korb, der *pakohíhe* genannt wird, sehr schwere Lasten transportieren, vor allem Früchte, aber auch Stücke eines erlegten Großwildes, z. B. des Tapirs, den der Jäger nicht allein in die Maloka tragen kann. Männer schlingen das Tragband stets über Oberarme und Brust, während Frauen hierfür die Stirn bevorzugen.

Gleichartige Körbe findet man bei Karaiben- und Aruakstämmen Guayanas[269]) sowie bei den Urubu im brasilianischen Staate Maranhão[270]). Ähnlich sind aber auch jene Exemplare, welche die Nahukuá und Bakairí im Xingúquellgebiet verwenden[271]), um nur noch einige Beispiele anzuführen, die jedoch beliebig vermehrt werden könnten. Man ersieht daraus, daß viele Stämme in der Lage waren, aus natürlichen Palmblättern Tragevorrichtungen anzufertigen.

Schon entwickelter ist der Tragkorb, welcher aus den Baststreifen der Curauá-Pflanze (*Ananas sativus* Sch.) besteht — *uruná* —. Von den männlichen Stammesangehörigen wird er in folgender Weise angefertigt: Zwei Gruppen von Geflechtstreifen werden in verschiedener Richtung übereinandergelegt und von einer dritten, wieder in anderer Richtung verlaufender Streifengruppe durchflochten (Abb. 33).

Hierbei handelt es sich, der Einteilung von Max Schmidt zufolge, um die dritte Hauptart der südamerikanischen Geflechte[272]) [273]). Auch diese in Südamerika weit verbreitete Korbart[274]) gilt als sehr alt, wird aber heute von den Surára und Pakidái nur noch selten benutzt. Bezüglich ihrer Herkunft ist bei den genannten Stämmen nichts mehr bekannt. Eine autochthone Entwicklung wäre möglich, doch die Übernahme von Karaiben- oder Aruak-Stämmen, welche ähnliche Körbe verwenden, ist wahrscheinlicher. Der gleiche Korb ist ebenfalls für die verwandten Karimé belegt[275]).

Am häufigsten ist gegenwärtig der große, aus Lianenstreifen[276]) verfertigte Frauentragkorb — *wuíha* — in Gebrauch, welcher „die Form einer etwas in die Länge gezogenen Halbkugel hat" (Abb. 34). Diese Beschreibung stammt von Koch-Grünberg, und zwar bezieht er sich dabei auf die völlig übereinstimmenden Frauentragkörbe der Xiriána (Schirianá). „Bei dieser Flechtart", so bemerkt der genannte Forscher, „die den Schirianá wahrscheinlich eigentümlich ist, werden die von dem gemeinschaftlichen Mittelpunkt des Bodens strahlenförmig ausgehenden Vertikalstreifen abwechselnd von zwei feineren Horizontalstreifen in Spiralen umflochten. Einige stärkere innere Ringe, auf denen

[272]) Max Schmidt, 1904, S. 490ff.
[273]) Max Schmidt, 1905, S. 330ff.
[274]) Reiches Vergleichsmaterial findet man bei Roth (Roth, 1924, S. 321 ff. und Tafn. 100 B und 101) und Mason (Mason, 1904, S. 329ff. und Taf. 240 (1, 2)).
[275]) Salathé, 1931/32, S. 302 und Figs. 9 und 10.
[276]) Mit den Zähnen wird jede einzelne Liane in mehrere flache Streifen gespalten. (Vgl. auch S. 47).

die Vertikalstreifen mit Lianen festgebunden sind, geben dem Korb Form und Halt. Unter einer besonderen Umflechtung des Randes sind die Enden der Vertikalstreifen verwahrt (Taf. 23,1). Mittels eines Bündels Baumbaststreifen, an denen noch die Rinde hängt, wird der Korb an der Stirn auf dem Rücken getragen"[227]). Die gleiche Technik wird von den Surára und Pakidái angewandt, und der Geflechtsanfang eines Tragkorbes (Fig. 21) führt dies besonders deutlich vor Augen (Abb. 35). Es handelt sich hierbei um

[227]) Koch-Grünberg, 1923a, S. 307/08.

Fig. 21 Geflechtsanfang eines Frauentragkorbes

jene Flechtart, welche Max Schmidt als „Doppelfadengeflecht" bezeichnet, die zweite Hauptart der südamerikanischen Geflechte[373]) [374]).

Durch ein äußeres Merkmal kann man aber die Frauentragkörbe der Xiriána leicht von jenen der Surára und Pakidái unterscheiden. Bei ersteren ist das Tragband nur am Rande befestigt[375]), während es letztere stets um den Boden schlingen, danach im unteren Drittel sowie am oberen Rand durch je zwei gedrehte Lianenschlaufen führen und dann an einer Seite verknoten (Abb. 34). Dies bewirkt für die Trägerinnen einen besseren Halt, wodurch es ihnen möglich ist, wesentlich schwerere Lasten zu transportieren, ohne daß sie sich dabei wundscheuern. Jene geringfügige Verbesserung könnte von den Frauen der Surára und Pakidái entwickelt worden sein, doch die Körbe an sich wie auch die Herstellungsart stellen auf Grund von Aussagen meiner Gewährsleute Importgüter der Xiriána dar.

Dasselbe trifft auch für die in gleicher Technik angefertigten runden, flachen Korbschalen zu, welche in verschiedenen Größen sowohl bei den Xiriána[376]) als auch bei den Surára und Pakidái vorhanden sind und zur Aufbewahrung von Maniokfladen und Früchten dienen. Bei den letztgenannten Indianern sah ich außerdem Frauentragkörbe in Miniaturform, die für kleine Mädchen bestimmt sind und solche mit Deckel — *unî* —. Alle genannten Gegenstände werden meist mit schlangenförmigen Linien bemalt, wozu man Uruca verwendet. Schließlich ist noch zu erwähnen, daß die Frauen während der Anfertigung solcher Körbe und Korbschalen am liebsten bequem in der Hängematte liegen.

Von den Waiká werden die beschriebenen großen Frauentragkörbe und Korbschalen ebenfalls benutzt, und Zerries sowie Schuster heben hervor, daß bei der Herstellung die zwirnende Flechttechnik angewandt wird[377]) [378]) [379]). Gleichartige Korbschalen sind auch für die Karinä belegt[380]), und weitere Parallelen, die nur in der äußeren Form etwas abweichen, zeigen Hängekörbchen und Korbwannen von Arawak- und Tukano-Stämmen am oberen Rio Negro sowie von den Makú[381]).

Sodann sind kleine Henkelkörbchen mit viereckigem Boden — *yarokîkse* — zu erwähnen (Abb. 36), worin die Frauen ihren Schmuck, Arm-, Bein- und Brustschnüre, die Spindel und Baumwollknäuel aufbewahren. Zur Herstellung derselben werden ebenfalls gespaltene Lianen benutzt. Die angewandte Technik ist sehr ursprünglich, denn der Geflechtstreifen wird abwechselnd nur über und unter einen Geflechtsstrang geführt[382]). Die Form dieser Körbchen scheint den Surára und Pakidái eigentümlich zu sein, denn in der Literatur fand ich bezüglich anderer Stämme noch keine entsprechende Beschreibung.

Einfach geflochtene Feuerfächer — *zukûna* — werden aus den Blattstielhüllen der Tucumpalme (*Astrocaryum* sp.) verfertigt. Sie haben eine längliche Form, und die Enden der Streifen sind als Griff zusammengebunden (Fig. 22).

Gleichartige Fächer, jedoch regelmäßiger gearbeitet, fand Koch-Grünberg bei den Makiritare, Yekuaná und Guinaú im Einzugsgebiet des oberen Orinoco[383]), woraus man schließen könnte, daß dieser Gegenstand von hier, eventuell über die Xiriána, zu den Surára und Pakidái gelangte. Doch auch der umgekehrte Weg wäre möglich, schon deshalb, weil die meisten Karaiben- und Arawakstämme Guayanas Feuerfächer mit quergestelltem Handgriff verwenden[384]).

Der Preßschlauch — *pokunâko* — hat bei den Surára und Pakidái erst in jüngster Zeit Eingang gefunden. Bei ersteren entdeckte ich nur drei und bei letzteren fünf Exemplare, die alle aus

Fig. 22 Geflochtener Feuerfächer

Blattstreifen der Curuápflanze (*Ananas sativus* Sch.) angefertigt und verhältnismäßig klein waren (Länge: 1,10—1,20 m; Durchmesser: 3—4 cm). Sie befanden sich im Besitz einiger Familien, welche dieselben von den Xiriána eingetauscht hatten. Bisher wurde die Maniokmasse nämlich nur mittels kleiner, viereckiger Geflechte — *yuvobi* —[288]) mit den Händen ausgepreßt. Noch heute ist diese Methode gebräuchlicher als jene mit dem Preßschlauch, doch langsam beginnt sich letztere durchzusetzen. Auch Familien, die den Preßschlauch noch nicht besitzen, leihen sich denselben gelegentlich aus, denn verfertigt wird er bisher weder von den Surára noch von den Pakidái. Bedeutsam ist aber der oben erwähnte Hinweis, daß der Preßschlauch ein Importgut der Xiriána darstellen soll. Als nämlich Koch-Grünberg unter einer Xiriána-Gruppe in Motomotó weilte, fand er dort auch keinen vor, sondern nur kleine Korbwannen, in denen die Maniokmasse mit den Händen gequetscht wurde[289]). Deshalb ist anzunehmen, daß auch diese Indianer den Preßschlauch noch nicht sehr lange kennen; vermutlich übernahmen sie ihn von Karaiben.

Fig. 23a Kindertragband aus Embira-Baumbast
Fig. 23b Teil eines Embirastammes mit beklopftem Baumbast, der bereits etwas abgezogen wurde
Fig. 23c Bastklopfer aus Embiraholz

9. *Kindertragband*

Das Kindertragband — *ehomakud* — wird aus dem Bast eines Embirabaumes (*Daphnopsis brasiliensis* Mart.) gewonnen. Zu diesem Zweck werden von den Männern dünnere Stämme gefällt. Danach entfernen Frauen die Rinde und

[288]) Der Name ist nahezu identisch mit dem des Henkelkörbchens — *yuvobidne* —, und die Geflechttechnik stimmt völlig überein.

[289]) Koch-Grünberg, 1923a, S. 308.

schlagen mittels eines Rustklopfers — *zanatimá* — (hierbei handelt es sich um ein 30—40 cm langes Holzstück des Embirabaumes) 1—2 Stunden lang auf den jeweiligen Stamm. Dadurch wird der Baumbast — *sarúmaxíke* — locker, weich und geschmeidig, so daß man ihn schließlich leicht von dem Stamm — *pakakíli* — abziehen kann (Fig. 23a—c). Hierauf werden die beiden Enden ineinandergeflochten und mit einem Faden aus Bromeliafasern oder Baumwolle doppelt vernäht. Die Löcher bohrt man mit dem Cutiaraknagerzahn (s. S. 54) vor und kann dann den Faden mühelos hindurchziehen.

Das Traghand wird stets über die rechte Schulter geschlungen, damit die rechte Hand zur Arbeit frei bleibt, und endet in der Höhe der linken Hüfte (Abb. 15), wodurch dem sitzenden Kinde, wenn die Mutter dessen Beine um ihren Körper legt, noch ein zusätzlicher Halt gewährt wird.

Diese Tragweise ist in Südamerika weit verbreitet und wird auch von Stämmen angewandt, die Traghänder nicht benutzen[887]. Bei den Xirianá scheint Koch-Grünberg keine derartigen Traghänder gesehen zu haben, denn er sagt nichts darüber aus.

20. *Gefäße*

Als Gefäße verwendet man vor allem die Früchte von Bignoniaceen (*Crescentia cujete* Lin.) und Cucurbitaceen (*Cucurbita lagenaria* Lin. und *Cucurbita idolatrica Lauxda* — Jamaru), welche mannigfaltige Formen liefern (Kugelform, Flaschenform, Gurkenform u. a.).

Diese Gefäße werden generell — *kuvutaká* — genannt, mit Ausnahme derjenigen der Jamaru-Frucht (Fig. 24), welches — *akapetaténa* — heißt.

Durchgeschnittene Früchte liefern entsprechend gestaltete Schalen — *maraká* —. Um sie zu zerteilen, werden die frischen Früchte von Männern oder Frauen mit Curauá-Fasern umschnürt, und anschließend ritzt man mit dem Cutiaraknagerzahn (s. S. 54) darum entlang. Alle Schalen werden innen mit einem schwarzen Überzug versehen, den man aus verbranntem Holz der Pupunha-Palme und dem ölhaltigen Dotter von Schildkröteneiern oder Kaimaneier gewinnt.

Einige Familien besitzen auch schwarze, dickwandige, unverzierte Tongefäße — *kakaká* — mit rundem Boden, welche schlecht gebrannt sind und leicht brechen. Sie stammen, wie man mir sagte, von den Xirianá[888], denen die Surára und Pakidái eben selbst keine Töpferei usw.

Den Waiká und Kariná dagegen ist dieses Handwerk wiederum bekannt, und zwar stellen sie die gleiche oben beschriebene Gefäßform her[889] [890].

Fig. 24 Jamaru-Frucht

Meine als Geschenke mitgebrachten Töpfe und Schüsseln aus Aluminium wurden von den Frauen beider Stämme sehr geschätzt, desgleichen leere Bonbonkanister und Konservendosen.

[887] u. a. z. B. Koch-Grünberg, 1923a, Taf. 45.

[888] Auch der Name ist bei diesen fast gleichlautend — „Jaqaiga" — (Koch-Grünberg, 1916, S. 304).

[889] Ehrenreich, 1939a, S. 184.

[890] Kakaká, 1939/40, S. 300 und Fig. 12.

11. Werkzeuge

Ursprüngliche Werkzeuge, die zum Zähnen, Schälspatt, Knochen, Taquara, Bambus und Holz bestehen, gibt es nur wenige.

Das wichtigste und ausschließlich für den rituellen Gebrauch vorbehaltene ist ein kleines Messer aus dem scharfen Zahn des Cutia (*Dasyprocta agouti L.*) — *hamradle* —, welches jeder Suriára und Pakidái bei Wanderungen, Jagd- und Kriegszügen unter seine linke Oberarmschnur klemmt (Abb. 32)[288]. Mittels Baumharz hat man den unteren Teil des Zahnes fest in einem Röhrenknochen des Jacamins (*Psophia crepitans L.*) — *nyapán* —, der gleichzeitig als Griff dient und — *nyapámatde* — genannt wird, verankert und diese Schaftstelle außerdem noch mit einem Faden aus Baumwolle oder Curuá (Bromeliafaser) umwickelt (Fig. 25).

Fig. 25 Kleines Messer aus dem scharfen Zahn des Cutia (*Dasyprocta agouti L.*)

Mit diesem Messerchen bohrt man die Pfeilrohre an, um die Spitze, einen hölzernen Schaft oder das gekerbte Handende einzufügen. Die roh angebrannten Bambuspfeile werden damit verbrannt und geschärft, desgleichen die Spitzen aus Knochen und Holz. Es wird aber auch benutzt, um in den Herd, jenen liegende Holz den Feuerzungen, Löcher vorzubohren und eine Seitenkerbe zu ziehen. Auf dem Köcher werden damit die schlangenförmigen Linien und Zickzackmuster angebracht, und schließlich dient es den Männern noch dazu, um aus Gründen der Eifersucht ihren Frauen tiefe Einschnitte am Körper beizubringen. Fast alle Frauen haben daher größere und kleinere Narben; sie zeigten sie mir aber stets mit einem gewissen Stolz, als Zeichen, daß sie schön und begehrenswert sind, oder waren.

[288] Die Frauen verwenden die Cutia-Zähne als Glättemesser (s. S. 46).

Auch andere Stämme Guayanas und solche, die im übrigen Südamerika zu den Resten der Urschicht gehören, verwenden diese Messerchen. Durch Zerries und Schuster sind sie für die Waikâ bezeugt[289] [290], durch Salathé für die Karinâ[291] und durch Koch-Grünberg für die Xirianá[292]. Letzterer gibt jedoch an, daß die Xirianá den Zahn mittels Bromeliafasern an einem Holzstiel festbinden[293]. An gleicher Stelle erwähnt Koch-Grünberg ebenfalls ein Messer mit Knochengriff, welches er von einem Arekuná erwarb, der bei den Guinaú am Merewurf lebte, fügt aber hinzu: „Ob die Unterabteilungen der Arekuná, die tief im Innern wohnen, noch solche ursprünglichen Werkzeuge gebrauchen, weiß ich nicht"[294]. Außerhalb Guayanas ist dieses Messerchen u. a. für die Guayaki[295] und Sirionó[296] belegt.

Fig. 26 Messer aus dem Bauchbeinschild der Panzerschildkröte

[294] de la Hitte, 1849, Taf. III, Figs. 4 und 6.
[295] Nordenskiöld, 1912, S. 193, Abb. 119.

Ein Arbeitsgerät für Frauen stellt das Messer aus Schildpatt — *mici* — dar. Hierbei handelt es sich um den an einer Längsseite geschärften Bauchdeckel der Perema (kleine Wasserschildkröte) (Fig. 26). Damit werden vor allem die wildwachsenden Früchte des Topfbaumes (*Lecythis longifolia*) nach dem Kochen aufgeschnitten (s. S. 84).

Dieses Messer ist auch den Waiká bekannt und hat dort denselben Verwendungszweck[286]).

Bei einer dritten Art von Messern, die ebenfalls nur von Frauen benutzt werden, handelt es sich um die unbrauchbar gewordenen lanzettförmigen Pfeilspitzen aus Bambus — *kuniand* und *rakahé* — (s. S. 19/20). Man gebraucht sie vorwiegend zum Schälen und Schaben der Maniokwurzeln.

Dies beobachtete auch Koch-Grünberg bei den Xiriána (Schiriana)[287]). Der genannte Forscher weist noch daraufhin, daß die Messer bisweilen an einen zugespitzten Holzstiel gebunden sind. Jene Befestigung erfolgte aber sicher nicht nachträglich, sondern es ist einfach der Schaft, welchen die Xiriána, abweichend von den Surára und Pakidái, ihren Pfeilspitzen aufsetzen (s. S. 20).

Zum Schneiden der Haare und für das Ausrasieren der Tonsuren, ausgesprochenen Frauenarbeiten, bedient man sich eines gespaltenen und auf einer Seite geschärften Rohrstückes (Taquara — *Gnadua* sp.).

Solche „Messer" sind unter den südamerikanischen Indianern ebenfalls weit verbreitet; für die Botokuden weist sie der Prinz zu Wied-Neuwied nach[287]).

Ein weiteres wichtiges Werkzeug ist sodann der Eckzahn eines Wildschweinunterkiefers — *nanacoand* —, mit dessen innerer Kante die Männer ihre Bogen glätten.

Zum gleichen Zweck wird dieses Arbeitsgerät auch von den Waiká verwandt[288]).

Für Feldarbeiten benutzen die Männer einen am unteren Ende etwas abgeflachten 2—2,20 m langen Grabstock — *nanuanuatshi* —, den sie aus dem harten Holz der Pupunha-Palme (*Guilielma speciosa* Mart.) anfertigen; als Ersatz verwenden sie auch gelegentlich einen alten, gebrochenen Bogenstab.

Die letztere Anwendung nahm Zerries ebenfalls bei den Waiká wahr[289]).

Auch ein Stück Rundholz vom Stamm der Pupunha-Palme ist zu erwähnen, daß von den Frauen als Bastklopfer — *xamotimá* — verwandt wird (s. auch S. 52/53).

Damit erschöpft sich der Gebrauch ursprünglicher Werkzeuge. Aber auch in alter Zeit gab es sicher nicht viel mehr. Während meines Aufenthalts unter den beiden Stämmen sah ich sie aber bereits Stahläxte benutzen, sowie Terçados (große Buschmesser) und kleine Messer. Die Surára erwerben jene Gegenstände auf dem Tauschwege durch ihre gelegentlichen Berührungen mit den Piaçabeiros (Palmfasersammler) am Rio Aracá, während sie den Pakidái vom Personal des Indianerschutzpostens Ajuricaba am mittleren Demini als Geschenke überlassen werden. Auf meine Frage, ob ihre Vorfahren einmal Steinäxte verwandten, ich konnte nämlich keine entdecken, erhielt ich stets bejahende Antworten. Sie haben auch einen besonderen Namen für die Axt — *kankokomd* —. Die Klinge allein wird synonym benannt, während der Schaft — *kankokomdhilohi* — heißt. Höchstwahrscheinlich wurden die Steinäxte im Tausch erworben, wie es ja nach Schuster für die Waiká zutrifft[290]). Welcher Stamm dieses Importgut lieferte, war nicht mehr festzustellen, doch die Xiriána scheinen diesmal als Vermittler auszuscheiden. Koch-Grünberg schreibt nämlich: „Sie (die Xiriána) hatten ehemals anscheinend gar keine Äxte, um Wald zu schlagen. Mit einer Steinaxt, die ich ihnen zeigte, wußten sie jedenfalls nichts anzufangen"[291]).

12. *Klettergerät*

Zum Erklettern hoher Palmen mit glattem Stamm, wie die Açaí-(*Euterpe oleracea* Mart.), Bacaba-(*Oenocarpus distichus* oder *Oenocarpus*

hacaba Mart.), Buçu-(*Manicaria saccifera* Gaertn.), Buriti-(*Mauritia vinifera* Mart.), Inajá-(*Maximiliana regia* Mart.), Paxiúba-(*Iriartea exorhiza* Mart.), Tucumã-Palme (*Astrocaryum* sp.) u. a. bedienen sich die Surára und Pakidái des Kletterringes — *hoeberomd* —, der aus einer gespaltenen und mehrfach zusammengerollten Liane (*Cipó-titica*) besteht. Die Lianenenden werden einige Male um den Ring gewickelt und mittels eines Knoten verbunden (Fig. 27).

Fig. 27 Kletterring

Diesen Ring legt sich der Mann, gelegentlich auch eine Frau, um die Füße und preßt dieselben mit der zwischen Ballen und Ferse gelegenen Hohlkehle, in Form eines Greiffußes, kräftig an den Stamm, so daß sie sich in der Rinde förmlich festsaugen. Er geht jeweils in den Hocksitz und schnellt dann seinen Körper nach oben. Mit den Armen und Händen umschlingt er zwar den Stamm, doch zum Erklettern bedient er sich nur der Füße, die infolge des Ringes stets einen festen Halt haben. Von besonderer Wichtigkeit wird dieser Halt, wenn der Mann den Wipfel erreicht hat, wo er nun beide Hände gebraucht, um die Früchte abzuschneiden.

Solche Kletterringe sind in vielen Teilen Südamerikas bekannt und werden ebenfalls von den Caboclos (brasilianische Landbevölkerung) benutzt. Die Erfindung scheint aber indianischen Ursprungs zu sein.

Die Pupunha-Palme (*Guilielma speciosa* Mart.) jedoch, welche im Wirtschaftsleben der Surára und Pakidái eine so große Rolle spielt, kann in dieser Weise nicht erklettert werden, da deren Stamm, dessen Durchmesser 60—80 cm beträgt, mit langen, spitzen Stacheln bedeckt ist. Um die Früchte aber trotzdem ernten zu können, benutzen diese Indianer ein Klettergerät — *hanadku* —, welches auch den Waikâ bekannt ist[218].)

Das Gerät besteht aus zwei völlig gleichen Vorrichtungen, die man in nachfolgender Weise befestigt und benutzt: Je zwei 1,60—1,80 m lange Stöcke, deren Durchmesser 12—15 cm beträgt, werden scherenartig und lose mit Lianen an den Stamm gebunden. Der hintere, nach unten geneigte Teil jener gekreuzten Stöcke ist ebenfalls mit Lianen umwickelt. Über diesem ersten Kletterapparat wird in derselben Weise ein zweiter angebracht. Der Indianer, welcher die Pupunha-Palme erklettern will, stellt sich nun auf das hintere Ende der unteren „Schere" und schiebt die obere ein Stück aufwärts. Danach steigt er auf das hintere Ende der oberen „Schere" und zieht die untere nach. Anschließend wechselt er zurück auf die untere Klettervorrichtung und schiebt die obere ein weiteres Stück aufwärts. Indem er also ständig seine Position ändert und einen Apparat hochschiebt und den anderen nachzieht, erreicht er in 4—5 Minuten den Wipfel (Abb. 39). Er pflückt die reifen Früchte und läßt sie einzeln an einer Liane herab, wo sie von Stammesangehörigen entgegengenommen werden. Das Herabsteigen geschieht in umgekehrter Weise wie der Aufstieg.

Ob diese großartige technische Erfindung von den Waikâ, Surára oder Pakidái entwickelt wurde, wage ich zu bezweifeln, vor allem deshalb, weil ja ihre sonstige materielle Kultur außerordentlich arm ist. Es gibt aber auch noch keine Hinweise, die auf einen Import schließen lassen. Einflüsse der Zivilisation sind ebenfalls auszuschalten, denn der Caboclo-Bevölkerung (Pflanzer, Gummi-

[218]) Barbot 1933, S. 446 und Fig. 1.

und Palmfasersammler) im Demini-Aracá-Gebiet ist die beschriebene Technik unbekannt; sie schlagen die Pupunha-Früchte mit langen Stangen herab.

13. Bereitung von Urucu

Die rote Farbe Urucu — *nard* —, mit der die Indianer ihren Körper sowie Gebrauchsgegenstände bemalen, wird von den Frauen aus den roten Samen der Bixa orellana hergestellt, welche sich in stacheligen Fruchtkapseln befinden. Die Körner werden in einem Gefäß so lange gekocht, bis auf dem Boden nur noch ein roter Satz übrig bleibt, den man zu Klumpen formt und trocknen läßt. Hiermit können sich die Indianer dann jederzeit bemalen; die Farbe muß allerdings vorher mit etwas Wasser oder Speichel angefeuchtet werden.

VII. Soziale Organisation

1. Allgemeines

Sowohl bei den Surára, als auch bei den Pakidái handelt es sich um souveräne Stämme, die aber untereinander im Connubium leben. Dasselbe erstreckt sich auch auf die befreundeten Xiriána, Pusheweteri, Aramamesteri u. a.

Obgleich die von mir untersuchten Indianer nur ganz geringen Kontakt mit Palmfasersammlern, bzw. dem Personal des Indianerschutzpostens Ajuricaba am Demini haben, geht ihre Bevölkerungsstärke ständig zurück, wofür folgende Gründe maßgebend sind: Geburtenregelung; hohe Kindersterblichkeit infolge mangelnder Hygiene; Krankheiten, vor allem Masernepidemien[115]), aber auch Windpocken und Grippe, sowie häufige Kriege[116]).

2. Namen

Die genaue Anzahl der Surára betrug während meines Aufenthaltes unter ihnen nur noch 64[117]) und gliederte sich wie folgt:

	Geschätztes Alter:[118])
Hewemão[119]) — Häuptling und Medizinmann	42 J.
Koentemá — seine 1. Frau (vom Stamme der Pakidái)	24 J.
Kanikawö — Sohn	8 J.
Tochter (hat noch keinen Namen[117]))	1 J.
Yaripanamá — seine 2. Frau (vom Stamme der Aramamesteri) (Sie hatte eine Tochter, die im Säuglingsalter starb)	35 J.
Maxiuamá — Tochter von Hewemão und seiner früheren Frau Taimakána, welche während der Entbindung gestorben war	9 J.
Kurikayawö — Bruder des Häuptlings und dessen späterer Nachfolger	37 J.
Xunamí — seine Frau (vom Stamme der Pakidái) (Sie hatte einen Sohn, der im Kleinkindalter starb).	18 J.

[115]) 1932/33 verbreitete sich beispielsweise eine Masernepidemie wie eine Welle vom unteren Amazonas bis zum brasilianisch-kolumbianischen Grenzgebiet und brachte vielen Indianern den Tod. (Angabe von Herrn Alipio Edmundo Lage, Inspektor der 1a. Inspetoria do Serviço de Proteção aos Índios, Manaus).

[116]) Anläßlich des Überfalls auf eine feindliche Maloka versucht man möglichst alle Männer, Jünglinge und Knaben zu töten, während die Frauen und Mädchen als Gefangene mitgeschleppt werden.

[117]) In meinen ersten Forschungsberichten hatte ich irrtümlicherweise die Zahl 42 angegeben (Becher, 1957a, S. 118; Becher, 1958, S. 137).

[118]) Diese Indianer zählen nur bis drei, so daß ich die Altersangaben lediglich schätzen konnte.

[119]) Alle Eigennamen konnte ich erst nach meiner Aufnahme in den Stamm erfahren, denn vor Außenstehenden werden sie streng geheim gehalten. Aber auch dann nannten sie mir die einzelnen Männer und Frauen nie selbst; ich erfuhr die Namen nur durch andere Stammesangehörige, und zwar regelmäßig im Flüsterton. Wenn sie sich laut rufen, werden portugiesische Namen verwandt, die sie bei Palmfasersammlern hörten; auch ich mußte mehreren Stammesangehörigen Namen geben.

[117]) Die Kinder erhalten ihre Namen erst nach Vollendung des 3. Lebensjahres (s. S. 92 f.).

	Geschätztes Alter:
Xomirawö — Kriegshäuptling	40 J.
Uitimá — seine Frau (vom Stamme der Xamatári)	38 J.
Moramanamá — Tochter (verheiratet mit dem Surára Uaxianauwö)	18 J.
Yaxoima — Tochter	13 J.
Xinari — seine 1. Frau (vom Stamme der Pakidái, Schwester von Koentemá)	20 J.
Inxinemá — jüngster Bruder des Häuptlings (Junggeselle)	19 J.
Hemahemá — Sohn des verstorbenen ältesten Bruders von Hewemão	25 J.
Hanohomá — Krieger	43 J.
Unhami — seine Frau	24 J.
Matuwö — Sohn von Hanohomá und dessen erster Frau, die gestorben ist. (Matuwö ist mit Maxiuamá, der neunjährigen Tochter des Häuptlings Hewemão verheiratet)	17 J.
Unariwö — Krieger	38 J.
Yanaucmá — seine Frau (vom Stamme der Puseheweteri)	35 J.
Komitimá — Tochter (2. Frau des Surára Hemahemá)	18 J.
Rokoahima — Tochter	8 J.
Cinapemi — Mutter von Unariwö	54 J.
Toabewö — Krieger	28 J.
Uainomi — seine Frau (Mutter von Unhami, s. oben)	43 J.
Raxakewö — Krieger	32 J.
Amarokomá — seine 1. Frau (vom Stamme der Xiriána) (Zwei Kinder, ein Junge und ein Mädchen, sind gestorben)	24 J.
Yaxuramá — seine 2. Frau (vom Stamme der Puseheweteri)	22 J.
Tochter (hat noch keinen Namen)	3 J.
Orateú — Krieger	32 J.
Posioubemi — seine Frau (vom Stamme der Pakidái)	23 J.
Sohn (hat noch keinen Namen)	3 Monate
Uaxianauwö — Krieger	24 J.

	Geschätztes Alter:
Moramanamá — seine Frau (Tochter des Kriegshäuptlings)	18 J.
Rarorauwö — Krieger	36 J.
Tanyakomi — seine Frau (vom Stamme der Puseheweteri) (Drei Kinder, zwei Jungen und ein Mädchen, sind gestorben)	30 J.
Rokomá — Mutter von Rarorauwö (älteste Surára-Frau)	63 J.
Anyarawö — Krieger	29 J.
Ranomá — seine Frau (vom Stamme der Pakidái)	20 J.
Tochter (hat noch keinen Namen)	2 J.
Xanimá, Mutter von Anyarawö	47 J.
Poxewö — Krieger	28 J.
Riopemi — seine Frau (vom Stamme der Pakidái)	21 J.
Sohn (hat noch keinen Namen)	2 J.
Hunkawá — Krieger	29 J.
Xororimá — seine Frau	21 J.
Sohn (hat noch keinen Namen)	2 J.
Koroyewö — Krieger	31 J.
Natororomá — seine Frau (vom Stamme der Puseheweteri)	23 J.
Sohn (hat noch keinen Namen)	3 J.
Werewö — Krieger	30 J.
Makanamá — seine Frau (vom Stamme der Puseheweteri)	22 J.
Tochter (hat noch keinen Namen)	1 J.
Ixobewö — Krieger	31 J.
Oikoçimá — seine 1. Frau (vom Stamme der Xiriána)	28 J.
Tochter (hat noch keinen Namen). Der Zwillingsbruder starb	3 J.
Xeramá — seine 2. Frau (vom Stamme der Aramamesteri)	25 J.
Xaniwö — Sohn	12 J.
Tochter (hat noch keinen Namen)	2 J.
Xutumi — Witwe	59 J.
Haikiamá — ihre Tochter (ebenfalls Witwe)	40 J.
Yarikoawö — Sohn von Haikiamá (Junggeselle)	17 J.
Katarauwö — alleinstehender Junggeselle	17 J.

	Geschätztes Alter:
Ikoauwö — alleinstehender Junggeselle	16 J.
Jibeauwö — Waisenknabe	9 J.
Manahemá — Waisenknabe	8 J.
Nikeromá — Gefangene (vom feindlichen Stamm der Karauateri)	15 J.

Die Pakidái sind etwas stärker, denn ihre Kopfzahl betrug 89. Da meine Verbindung mit ihnen aber nicht ganz so eng wie mit den Surára war, konnte ich auch nur bedeutend weniger Eigennamen erfahren. Diejenigen, welche mir bekannt wurden, führe ich nachstehend auf:

	Geschätztes Alter:
Karenauö — Häuptling und Medizinmann	26 J.
Poroamá — seine Frau (vom Stamme der Surára)	20 J.
Sohn (hat noch keinen Namen)	2 J.
Poréhiwö — Kriegshäuptling	32 J.
Ruxoyetemí — seine 1. Frau (vom Stamme der Surára)	30 J.
Yauetoiwö — Sohn	13 J.
Xaraíma — Tochter	7 J.
Tochter (hat noch keinen Namen). Sie wurde während meiner Anwesenheit geboren	1 Monat
Die 2. Frau von Poréhiwö lief ihm wegen schlechter Behandlung davon und ist vermutlich ertrunken	
Kaxiribewö — Krieger (Bruder von Poréhiwö)	39 J.
Monamí — seine Frau	36 J.
Kuyaromá — Tochter	19 J.
Bixewö — Sohn	15 J.
Sohn (hat noch keinen Namen)	3 J.
Sohn (hat noch keinen Namen). Er wurde während meiner Anwesenheit geboren	1 Monat
Ironasteri (vom Stamme der Xiriána) — Frau von Bixewö	22 J.
Yururauwö — Krieger	28 J.
Xekoreimá — seine Frau (vom Stamme der Surára)	28 J.

	Geschätztes Alter:
Tenxoyahibewö — Sohn. (Als einziger Pakidái-Knabe besucht er die Missionsschule der Salesianer in Barcelos (Rio Negro) und spricht gut portugiesisch. Ein Flußhändler hatte ihn dort hingebracht. Jetzt schämt er sich seiner Stammesangehörigen und war nicht zu bewegen, etwas über dieselben auszusagen).	14 J.
Mihemehumá — Sohn	5 J.
Sohn (hat noch keinen Namen)	1 J.
Kuatoxemão — Krieger	33 J.
Toreheima — seine 1. Frau (vom Stamme der Puseheweteri)	26 J.
Xiahomá — seine 2. Frau (vom Stamme der Aramamesteri)	21 J.
Tochter von Xiahomá (hat noch keinen Namen)	2 J.
Karemouá — Krieger	29 J.
Xitiporimá — seine 1. Frau	26 J.
Tokorá — Sohn	8 J.
Nyarimá — Tochter	4 J.
Kirixoíma — seine 2. Frau (vom Stamme der Xiriána)	20 J.
Tochter (hat noch keinen Namen)	6 Monate
Prexemí — Witwe (Mutter von Karemouá)	50 J.
Hokotómarimá — Junggeselle (Bruder von Karemouá; starb während meiner Anwesenheit durch einen Unglücksfall)	19 J.
Xoronauwö — alleinstehender Junggeselle	17 J.

Aus diesen listenmäßigen Familienaufstellungen gewinnt man den Eindruck, als ob Monogamie vorherrschend sei. Doch von meinen Gewährsleuten wurde mir versichert, daß auch diejenigen Krieger, welche bisher nur eine Frau haben, gern noch eine zweite oder gar dritte hinzunehmen würden, wie es bei ihren Vorfahren üblich war. Aber die niedrige Kopfzahl der Stämme führte bereits zu einem Frauenmangel, so daß sich die meisten Männer zwangsweise mit einer Ehegefährtin begnügen müssen.

3. *Politische Gliederung*

Jene geringen Bevölkerungsstärken könnten außerdem die Vermutung erwecken, daß es sich gar nicht um Stämme, sondern nur um Stammeshalbierungen handelt, besonders wegen des Connubiums, in dem sie leben, oder lediglich um Gruppen. Doch die genannten Häuptlinge und Kriegshäuptlinge erklärten mir mit Nachdruck, daß sowohl die Surára als auch die Pakidái früher groß und mächtig gewesen seien und sich jeweils auf zahlreiche Malokas verteilt hätten. Diese Größe wieder zu erreichen, sehen sie als ein erstrebenswertes Ziel an.

Bei beiden Stämmen herrscht ein institutionelles Häuptlingstum, mit genau festgelegter Erbfolge. Stirbt der Häuptling, so tritt automatisch der nächstjüngere Bruder an seine Stelle. Erst wenn der jüngste Bruder gestorben ist, kann der erstgeborene Sohn des ältesten Bruders, welcher dann jedoch meist ein betagter Mann ist, die Häuptlingswürde einnehmen. Daneben gibt es den Kriegshäuptling. Dieses Amt ist nicht erblich, sondern der tapferste Krieger wird dazu auserkoren. In Friedenszeiten hat er keinerlei Vorrechte und lebt wie ein gewöhnlicher Stammesangehöriger. Nur bei kriegerischen Auseinandersetzungen übernimmt er die Führung, während der eigentliche Häuptling als religiöses Oberhaupt, Arzt und Lehrer geschützt wird und sich nicht daran beteiligt; dasselbe gilt für seine Brüder.

Der Surára-Häuptling Hewemáo, sehr kühn und intelligent, ist eine wahrhaft große Persönlichkeit; seine Anordnungen werden von allen Stammesangehörigen widerspruchslos respektiert. Als er noch ein Jüngling war, wurde sein Vater, Xoromáo, von einem Makuxi-Indianer durch zwei Pfeilschüsse getötet. Die Nachfolgeschaft trat Hewemáos ältester Bruder, Xaraíma, an, der vor etwa 8 Jahren an einer Fiebererkrankung starb. Seit dieser Zeit ist Hewemáo Häuptling und, wie seine Vorgänger, zu gleicher Zeit Medizinmann, der alle männlichen Surára in Religion, Mythologie, Zauberwesen, Krankenheilungen und Stammestradition ausbildet (s. S. 67 f.). Er teilt sie aber auch zu gelegentlichen Gemeinschaftsarbeiten ein, beaufsichtigt ihre Tätigkeit in den Roças (Waldrodungen), gibt Anweisungen für den Bau einer Maloka und bestimmt die Teilnehmer für Krankenkuren und Zauberhandlungen. Wurde ein großes Tier erlegt, z. B. ein Tapir, so überwacht er die gerechte Verteilung des Fleisches, damit jede Familie ihr Stück bekommt. Von kleinerem Wild überreichen die Jäger ihrem Häuptling meist einen Leckerbissen, und die Frauen bringen für ihn und seine Familie Früchte und Beeren oder volle Kalebassen mit erfrischendem Palmgetränk. Man ehrt ihn also in jeder Weise. Doch auch er und seine Frauen geben gern und reichlich von ihrer Jagd- bzw. Sammelbeute ab.

In der großen, offenen Maloka bewohnt er mit seinen beiden Frauen und den Kindern eine besondere Hütte (s. S. 11 ff.). Bei Wanderungen des Stammes bestimmt er, wann gerastet und wieder aufgebrochen wird. Außerdem teilt er jeden Morgen eine regelrechte Marschsicherung ein, 4—5 Krieger, welche die Vorhut bilden und bereits zwei Stunden vor dem Abmarsch aufbrechen. Sie haben nur ihre Bogen und Pfeile bei sich und streifen nach beiden Richtungen des Indianerpfades, um nach Feinden Ausschau zu halten. Das Gros des Stammes, welches in der Formation einer Reihe wandert, ergab während meines Zusammenlebens mit den Surára stets folgendes Bild: 3—4 nur mit Bogen und Pfeilen ausgerüstete Krieger. Ihre Waffen tragen sie in Längsrichtung über dem Kopf oder über einer Schulter. Danach kamen Männer mit meinem Gepäck, die jüngeren Brüder des Häuptlings und schließlich dieser selbst. Hinter ihm ging ich, mir folgte mein Diener Mateus, die Knaben und Mädchen mit kleinen Körben, dann die Frauen mit ihren großen, zylinderförmigen Körben, welche den gesamten Hausrat enthalten. Mütter mit Säuglingen hielten diese außerdem in einem Tragband auf der linken Hüfte. Oben auf dem Korb saß dann häufig noch ein kleiner Hund, ein Affe oder ein Papagei. Hinter den Frauen marschierten dann nochmals 4—5 Krieger als Nachhut.

Diese Sicherungsmaßnahmen sind notwendig, da stets mit einem feindlichen Überfall gerechnet werden muß. Deshalb läßt man die

Frauen allen Hausrat tragen, denn wären die Männer genauso bepackt, könnten sie sich nicht verteidigen. Aus diesem Grunde marschieren der Häuptling und seine Brüder auch stets in der Mitte des Stammes, weil im Falle einer kriegerischen Auseinandersetzung der Schutz des Häuptlings das oberste Gebot aller Surára ist. Er wird ja nicht nur als Stammesoberhaupt verehrt und geachtet, sondern er ist auch der Ratgeber in allen Lebenslagen, der Medizinmann, welcher die Verbindungen mit den Hekurá und den Serras herstellen (s. S. 92/93) sowie Unglück und Krankheiten abwehren kann. Würde er getötet, so käme der Stamm zunächst in eine schreckliche Situation, da der Nachfolger ja noch nicht über die gleichen Erfahrungen verfügt.

Der nächstjüngere Bruder und spätere Nachfolger Hewemãos ist Kurikayawö. Ihm wird der ungefähr 19 Jahre alte Inxinemá folgen, welcher aber bisher noch nicht seine Jünglingsinitiation durchlaufen hat. Und erst nach dem letzten könnte der einzige Sohn des vor 8 Jahren verstorbenen ältesten Bruders, Xarimá, der etwa 25jährige Hemahemá, die Führung übernehmen.

Kriegshäuptling der Surára ist Xomirawö, ein bescheidener, zurückhaltender, aber ungemein zäher und tapferer Mann.

Bei den Pakidái ist die Häuptlingsfolge identisch. Doch die nachfolgenden Ausführungen werden zeigen, welche Komplikationen sich hier vor sechs Jahren durch den Tod des alten Häuptlings Karakarawö ergaben, weil seine drei jüngeren Brüder, welche die Nachfolgeschaft hätten übernehmen können, schon vor ihm gestorben waren. Karakarawö hatte zwar einen Sohn, Karenauö, der aber noch sehr jung war, so daß nichts anderes übrig blieb, als zunächst vertretungsweise den Kriegshäuptling, Poréhiwö, mit der Führung des Stammes zu betrauen. Gleichzeitig baten er und die älteren Pakidái-Männer den Häuptling der befreundeten Surára, Hewemão, in vielen Dingen, besonders bei schweren Erkrankungen, Zauberhandlungen usw., um Rat. Za dieser Zeit durchliefen auch zahlreiche jüngere Pakidái die Schule des Surára-Häuptlings, u. a. auch der heutige Pakidái-Häuptling, Karenauö, dem Hewemão eine sehr gründliche Ausbildung zuteil werden ließ. Aus diesem Grunde lebten die Surára und Pakidái sogar einige Jahre zusammen, sowohl während der Trockenzeit in der Serra als auch in der Regenzeit an der Cachoeira dos Índios am oberen Rio Aracá. Doch dies behagte dem Kriegshäuptling Poréhiwö auf die Dauer nicht, dazu kamen Differenzen mit dem jungen Häuptling, so daß er und sein Bruder Kaxiribewö sich mit ihren Familien zeitweilig von dem Stamm trennten und allein in Taraquá, der Pakidái-Maloka am mittleren Demini, verblieben.

Infolge des jugendlichen Überschwanges des noch nicht völlig ausgereiften Pakidái-Häuptlings Karenauö erfuhr leider auch das bisher so gute Verhältnis zwischen den Surára und Pakidái eine leichte Trübung. Dabei hatte Karenauö doch wirklich alle Ursache, Hewemão dankbar zu sein.

Der Mißklang entstand im März 1956 während des großen Totenerinnerungsfestes, welches die Surára als Gastgeber und die Pakidái als Gäste stets gemeinsam feiern, und woran auch einige befreundete Pusheweteri- und Xiriána-Familien teilnahmen. Während dieses Zusammenlebens ist es üblich, daß Hewemão von den Gästen, selbst von deren Häuptlingen, als Oberhaupt respektiert wird, und daß man seinen Anordnungen Folge leistet. Hiergegen lehnte sich aber der junge Karenauö auf. Er fühlte sich plötzlich sehr stark, da die Kopfzahl der Pakidái ja wesentlich größer ist als die der Surára. Die Rivalität der Häuptlinge wuchs von Tag zu Tag und dehnte sich auch auf die Angehörigen beider Stämme aus. Nur der großzügigen, weisen Haltung von Hewemão und der Vermittlung des Kriegshäuptlings der Pakidái, Poréhiwö, welcher wieder zu seinem Stamm zurückgekehrt war und großen Einfluß ausübte, war es zu verdanken, daß stärkere Spannungen oder gar kriegerische Auseinandersetzungen vermieden werden konnten. Dies war nur zu begrüßen, da zwischen beiden Stämmen eine lange, traditionelle Freundschaft besteht, die durch wechselseitige Heiraten auch noch blutmäßig vertieft ist. Nach Beendigung des Festes, Ende März 1956, zogen dann die Pakidái wieder nach

Taraquá am mittleren Demini und die Surára zur Cachoeira dos Índios am oberen Aracá. Doch hierbei erlebte ich nun eine große Überraschung. Drei Pakidái-Männer folgten nämlich mit ihren Familien nicht mehr ihrem Häuptling Karenauö, sondern schlossen sich Hewemáo an und emigrierten also regelrecht zu den Surára.

4. Lebenszyklus

a) Geburtenregelung

Die Kinderzahl ist sowohl bei den Surára als auch bei den Pakidái sehr gering; keine Frau hat mehr als höchstens drei. Dies hängt aber, abgesehen von der hohen Kindersterblichkeit infolge mangelnder Hygiene, damit zusammen, daß die Frauen nach jeder Geburt einen Abstand von mindestens drei Jahren einhalten müssen. Solange wird ein Kind auch mit Muttermilch genährt, wodurch, nach Ansicht dieser Indianer, die Empfängnisverhütung weitgehend gewährleistet ist. Wird eine Frau trotzdem schwanger, so verstehen es die Medizinmänner aus Pflanzensäften ein Abtreibungsmittel zu bereiten. Als Grund für die Geburtenregelung gab man mir an, daß ein Kind, käme es in der Karenzzeit zur Welt, nicht gesund und lebenstüchtig sein könne, weil ja der Körper der Mutter noch zu schwach wäre.

b) Speisetabus während der Schwangerschaft

Vor der Geburt muß die Mutter viele Speisetabus einhalten, um ihrem Kinde nicht zu schaden. Ihre Nahrung besteht dann vorwiegend aus dem zarten Fleisch des Mutum (*Crax* sp.), gekochten Bananen, Maniokfladen und einem Getränk, welches man aus den nahrhaften, stark ölhaltigen Pupunha-Früchten bereitet. Denn wenn sie z. B. Wildschweinfleisch äße, käme das Kind tot zur Welt, durch das Fleisch des Pirarucu (*Osteoglossidae*, größter Süßwasserfisch), der den bösen Atem des Flusses in sich trägt, würde es blind, und Papageienfleisch führt dazu, daß es später ständig schreit.

c) Geburt

Während der Geburt kniet die Frau vor einem Baum und umklammert mit beiden Armen den Stamm. Der Boden wird vorher mit Wasser begossen, damit er schlammig und weich ist. Mehrere weibliche Stammesangehörige unterstützen die Gebärende. Nach der Geburt binden zwei Frauen die Nabelschnur mit je einem Baumwollfaden ab, und eine dritte beißt sie dann durch. Später wird dieselbe vom Vater des Kindes auf den Gipfel einer Pupunha-Palme (*Guilielma speciosa* Mart.) gehängt, womit ein Fruchtbarkeitszauber verbunden ist; die Nachgeburt vergräbt er in der Pflanzung. Zwei Entbindungen, die ich beobachten konnte, gingen sehr leicht und schnell vonstatten. Auf dem unteren Teil des Rückens der Kinder konnte ich auch jedesmal grauschwarze Pigmentflecke wahrnehmen, die sogenannten Mongolenflecke.

Gleich nach der Geburt nahm jeweils die Mutter mit ihrem Säugling an dem nahegelegenen Flußufer ein Bad und legte sich dann für ein bis zwei Stunden in ihre Hängematte. Anschließend ging sie, mit dem Säugling auf dem Arm, bereits wieder ihrer gewohnten Beschäftigung nach.

Tritt bei der Entbindung eine Komplikation ein, so wird der Häuptling, welcher zu gleicher Zeit Zauberarzt ist, herbeigeholt.

Im Gegensatz zu den meisten anderen Indianerstämmen zieht man Zwillinge auf. Würde es sich um Drillinge handeln, was jedoch bislang nie vorkam, müßte ein Kind getötet werden, da ja die Mutter nur zwei Brüste hätte. Auch mißgestaltete Kinder tötet man und wirft sie in den Fluß.

Geburtszeremonien gibt es nicht, denn bis zu seinem dritten Lebensjahr gehört das Kind zum Fleisch und Blut der Mutter und erhält vorher auch noch keinen Namen.

d) Säuglings- und Kleinkindalter

Der Säugling und das Kleinkind werden nicht einen Augenblick lang sich selbst überlassen. Geht die Mutter ihrer Hausarbeit nach, oder sammelt sie im Urwald Früchte und Beeren, so trägt sie es in einem Tragband aus Baumbast auf der linken Hüfte, damit sie die rechte Hand zur Arbeit frei hat. Auch nachts schläft es mit ihr zusammen in der Hängematte. Die Brust steht ihm ständig zur Verfügung, so daß es gar nicht

auf die Idee kommt, jemals am Finger zu lutschen. Dadurch erklärt sich vielleicht auch, daß diese Indianer so einwandfreie Gebisse haben. Sobald die Zähne einschießen, läßt man das Kind auf zähem Fleisch herumkauen, um das Zahnen zu erleichtern. Gleichzeitig verhindert die lange Stillzeit, in Verbindung mit der reichlichen Sonnenbestrahlung, das Auftreten von Rachitis. Nach 3—4 Monaten erhält das Kleinkind Zusatzernährung in Gestalt von gekochten, grünen Mehlbananen (*Musa paradisiaca normalis*), die von der Mutter vorgekaut werden, oder einem aus Maniokfladen zubereiteten Brei.

Es ist einfach rührend, zu sehen, wie liebevoll und fürsorglich jede Mutter ihr Kind behandelt. Doch die Liebe des Vaters ist nicht minder groß. Offen bekennt er sich zu dem Kinde und läßt seine Empfindungen von Stolz und Vatergefühl deutlich erkennen[218]), obgleich er sonst in seinen Gefühläußerungen sehr zurückhaltend ist. Kommt er nach einem anstrengenden Jagdzug oder von der Feldarbeit ermüdet in das Gemeinschaftshaus, so vergißt er nie, sich zuerst für längere Zeit seinem kleinen Kinde zu widmen. Er nimmt es entweder auf den Arm und geht ein Stück mit ihm spazieren, oder er legt es neben sich in die Hängematte. Auch bei Wanderungen des Stammes trägt er das Kind oft stundenlang. Eine Tochter liebt er übrigens genauso wie den Sohn.

Innerhalb des ersten Lebensjahres werden den Knaben und Mädchen von der Mutter mittels eines scharfen Palmstachels die Ohrläppchen und die Unterlippe durchbohrt, und die Mädchen erhalten außerdem noch Durchbohrungen in den Mundwinkeln. Damit die Wunden nicht zuheilen, steckt man zeitweilig kleine Holzstäbchen hinein und bewegt sie öfter hin und her.

Hat ein kleines Mädchen dann das erste Lebensjahr vollendet, so wird es von der Mutter mit dem Finger defloriert. Dieses Verfahren dient zur Vorbereitung für den späteren Geschlechtsverkehr.

[218]) Demgegenüber schreibt Alexander von Humboldt bezüglich der Indianer am Orinoco, daß Väter ihren Kindern keine Zuneigung entgegenbringen (A. von Humboldt, 1860, III, S. 153).

Ähnliche Vorgänge beobachtete von Feldner bei den Machacarí-Indianern und beschreibt sie wie folgt: „Nulla inter illas invenitur virgo, quia mater inde a tenera aetate filiae maximam cum cura omnem vaginae constrictionem ingredimentumque amovere studet hoc quidem modo: manui dextrae imponitur folium arboris in infundibuli formam redactum, et dum index, in partes genitales immissus huc et illud movetur, per infundibulum aqua tepida immittitur"[219]. Hierzu bemerkten schon Ploss und Bartels: „Wahrscheinlich sollen diese Manipulationen weniger den Zwecken der Reinigung als der Vorbereitung für die späteren Geschlechtsfunktionen dienen"[220]).

Zu erwähnen ist in diesem Zusammenhang auch ein Brauch, der in Paraguay herrschen soll. Kommt dort ein Mädchen zur Welt, so bohrt ihm die Hebamme den Finger in die Vagina und sagt: Dies ist ein Weib[221]). Leider fehlt jede Angabe über den Ursprung dieser Sitte. Möglich, daß sie von Indianern übernommen wurde, weil ja in Paraguay der indianische Bevölkerungsteil zahlenmäßig am stärksten ist.

Doch bei den meisten südamerikanischen Stämmen, für welche eine künstliche Zerstörung des Jungfernhäutchens bezeugt ist, vorwiegend solche der Tukano- und Pano-Sprachfamilien, aber auch einige der Aruaken und Tupi, wird sie aus zeremoniellen Gründen während des Eintritts der Geschlechtsreife durchgeführt[222]).

Bei den Totonaken in México gehörte es zu den Obliegenheiten zweier Priester, mit ihren Fingern das Hymen weiblicher Säuglinge 28—29 Tage nach der Geburt zu zerstören. Gleichzeitig befahlen sie den Müttern, die Defloration sechs Jahre später mit dem Finger zu wiederholen[223]). Strebel hält diesen Vorgang für eine Kasteiungsrite, die der Beschneidung männlicher Säuglinge entsprach, welche auch von den Priestern durchgeführt wurde. „Schon das Kind sollte seinen Tribut den Göttern

[219]) von Feldner, 1928, II, S. 149, Fußnote.

bringen, und daß man dafür gerade die Geschlechtsteile wählte, ist bei der Bedeutung, den dieselben haben, ebenfalls nahe gelegt, wenn dafür vielleicht auch noch Rücksicht auf einen möglichst geringen Blutverlust mitgewirkt haben kann"[228]).

Demgegenüber ist aber hinsichtlich der Surára und Pakidái festzustellen, daß es bei ihnen keine Beschneidung der Knaben gibt und die Defloration der kleinen Mädchen eindeutig dem späteren Geschlechtsverkehr dient; religiöse Anlässe oder hygienische Gründe sind damit nicht verbunden. Ob es früher einmal anders war, darüber konnten weder die Häuptlinge, noch ältere Männer und Frauen etwas aussagen[229]).

Zu erwähnen ist noch, daß alle Surára- und Pakidái-Väter die Vulva ihrer kleinen Tochter, nach der Zerstörung des Hymens, häufig mit dem Munde berühren und behutsam daran saugen.

Wenn ein Mann zwei oder mehrere Frauen hat, so unterstützen sich diese gegenseitig bei der Betreuung eines Säuglings. Auch die Großmutter, eine Schwester oder die älteste Tochter sind liebevolle Helfer. Viel Umstände verursacht die Säuglingspflege ja nicht, denn regelmäßige Bäder sind unbekannt. Nur wenn die Schmutzkruste etwas zu stark ist, wäscht sie die Mutter beim Wasserholen am Fluß ein wenig ab. Die geringen Waschungen haben den Vorteil, daß die Haut dadurch besser gegen Moskitostiche gefeit ist. Hat das Kind eine unsaubere Nase, dann nimmt sie die Mutter vorsichtig zwischen ihre Zähne, drückt den Inhalt in ihren Mund und spuckt ihn aus. Die Frauen empfanden es im höchsten Grade als unhygienisch, daß ich in ein Taschentuch schnupfte und dasselbe bei mir führte.

Im gleichen Alter wie die Kinder der Zivilisation lernen auch die kleinen Surára und Pakidái laufen und sprechen, wobei sie von ihren Eltern, Geschwistern und Verwandten unterstützt werden. Die Freude der Angehörigen ist groß, und sie sind überglücklich, wenn das Kind stehen und laufen kann und die ersten Worte, nápe = Mutter und hápe = Vater, lallt.

e) Namengebung

Nach Vollendung des 3. Jahres beginnt ein neuer, wichtiger Lebensabschnitt. Die Nährperiode ist beendet, und das Kind, welches bisher zum Fleisch und Blut der Mutter gehörte[229a]), ist ein selbständiger Mensch geworden. Es erhält jetzt auch einen Namen, den man aus dem Tier- oder Pflanzenreich entnimmt. Er wird dem Vater anläßlich seiner im Schnupfpulverrausch durchgeführten Gebete von den auf hohen Bergzügen lebenden gigantischen Tier- und Pflanzengeistern — *hekurá* — genannt, welche die Vermittler zu Poré und Perimbó, dem vereinigten Höchsten Wesen dieser Indianer, darstellen (s. S. 91/92). Das betreffende Tier oder die Pflanze, dessen Namen ein Kind trägt, gilt als eine Art „spiritus familiaris" für das ganze Leben. Damit ist die Vorstellung verknüpft, daß das Schicksal des Kindes von nun an wesensidentisch mit ihnen geworden ist; d. h. Glück, aber auch Not und Sterben von Tieren und Pflanzen, übertragen sich auf die gleichnamigen Menschen.

Die Verwendung von Tiernamen entspricht den nagualistischen Vorstellungen und Gebräuchen, die Eduard Seler in seiner Monographie

[228]) Strebel, 1885, S. 13.

[229]) Interessant ist die Tatsache, daß bei den Itälmen auf Kamtschatka die kleinen Mädchen von ihren Müttern in der gleichen Weise wie bei den Surára und Pakidái und aus demselben Grunde in zartester Jugend defloriert werden. (Steller, 1774, S. 346).

Auch für China und Indonesien ist diese Art der Körperdeformation bezeugt. Dort wird sie jedoch aus hygienischen Gründen angewandt, um den Schleim zu beseitigen, der sich in den Genitalien sammelt. (Ploss, 1912, S. 218/19).

[229a]) Diese Vorstellung ist für südamerikanische Indianer sehr ungewöhnlich. Doch es muß berücksichtigt werden, daß bei den meisten Stämmen die sogenannte Couvade, das Männerkindbett, zur Anwendung kommt. Karl von den Steinen, der jene Sitte auf ihre psychologischen Grundlagen hin untersucht hat, erklärt, daß das Kind in diesem Falle, mag es nun ein Knabe oder ein Mädchen sein, gewissermaßen „der kleine Vater", ein Teil des Vaters ist, also ein Stück seines Leibes. (K. von den Steinen, 1894, S. 334 f.). „Die Thätigkeit der Mutter dabei wird der des Bodens, der die Saat empfängt, verglichen." (von Spix und von Martius, 1831, S. 1339).

über Michuacan erwähnt[335]), während von den Surára und Pakidái auch die Pflanzennamen unter den gleichen Aspekt einbezogen werden. Der Name Nagual wird nach Seler von dem aztekischen Wort naualli = Verkleidung abgeleitet[337]). An Stelle von Nagualismus kann aber auch der Terminus technicus Tonalismus angewandt werden (aztekisch tonalli = jemandes Bestimmung, Schicksal, Seele, Geist...)[338]).

Am Tage der Namengebung erhalten die Kinder eine Tonsur, wie sie alle Erwachsenen beiderlei Geschlechts tragen. Mit der geschärften Seite eines gespaltenen Rohrstückes (Taquara — *Guadua* sp.) wird sie ausrasiert. Gleichzeitig legt man ihnen zum erstenmal die Hüftschnur aus Baumwolle oder Pflanzenfasern an, die sie dann bis zu ihrem Lebensende nie mehr ablegen dürfen, nicht einmal beim Baden oder während des Schlafes. Die Schnur muß zwar gelegentlich erneuert werden, doch das geschieht dann stets in aller Heimlichkeit. Den kleinen Jungen wird beim Anlegen der Hüftschnur gleichzeitig der Penis nach oben gebunden, indem man das Praeputium mittels einer Schlaufe unter die Schnur klemmt (Abb. 22). Von nun an darf der Penis nicht mehr nach unten hängen, denn dies wäre ein Verstoß gegen die guten Sitten. Bei festlichen Anlässen bindet man den Kindern noch zusätzlich einen Gürtel aus Baumwolle um (s. S. 29ff.). Eine dünne Schnur aus Baumwolle oder Pflanzenfasern, welche gelegentlich unterhalb der Knie getragen wird, soll die Beine kräftigen und entsprechende Oberarmschnüre Muskeln (bei Knaben) und Arme (bei Mädchen). Außerdem verwenden kleine Mädchen kreuzförmig geschlungene Brustschnüre, um dadurch später eine schön geformte Brust zu erhalten.

f) Kindheit

Auch im Knaben- und Mädchenalter ist die Familie noch der Hauptträger aller Erziehungsmaßnahmen. Der Knabe ist jetzt zwar etwas mehr dem Vater zugewandt und beginnt sich allmählich von der Mutter zu lösen. Mit seinem Bogen, den ihm der Vater angefertigt hat, übt er sich täglich im Schießen kleiner Vögel, denn man glaubt, daß ein Junge, der viele Vögel erlegt, später ein guter Jäger sein wird. Doch ausgenommen und zubereitet werden sie von den Mädchen, und gemeinsam halten die Kinder dann ein Mahl, zu dem die Geführtinnen häufig gekochte Bananen oder Maniokfladen beisteuern. Im Spiel werden die Kinder regelrecht auf ihre künftigen Aufgaben und Pflichten als Erwachsene vorbereitet. So helfen die Mädchen auch gelegentlich der Mutter und holen ihr Holz und Wasser, oder sie übernehmen die Betreuung kleinerer Geschwister.

Hervorzuheben ist das bescheidene, zuvorkommende Wesen dieser Indianerkinder. Dabei werden sie nie geschlagen und hören weder von ihren Eltern, noch von anderen Erwachsenen jemals ein hartes Wort. Sanfte Ermahnungen genügen, um ein Kind, wenn es wirklich einmal ungezogen ist, zurechtzuweisen. Aber auch bei ihren Spielen kommt es nur selten zu Streitereien, wie sie unter zivilisierten Kindern so häufig sind. Ganz undenkbar wäre es z. B., daß ein Surára- oder Pakidái-Kind zu seiner Mutter läuft, um sich dort über einen Spielgefährten zu beklagen.

Knaben und Mädchen wachsen ganz natürlich und ungezwungen miteinander auf, was sich schon daraus erklärt, daß Alleinspiele zugunsten der Gruppenspiele zurücktreten. Außerordentlich beliebt ist u. a. ein Ballspiel, welches sie mit einer Affenblase durchführen. Mit der flachen Hand wird dieselbe nach oben geschlagen (s. auch S. 113). Mittels Lianen betreiben sie auch eine Art von Tauziehen (s. S. 112). Außerdem ahmen die Knaben oft die Tänze der Männer nach, während von den Mädchen Fadenspiele sehr geschätzt werden. Besonders gern wird „Mutter und Kind" oder „Ehepaar" gespielt. Bei letzterem Spiel kommt es dann häufig schon zu einer Sexualbetätigung. Solange die Kinder das Pubertätsalter noch nicht erreicht haben, lachen die Erwachsenen darüber. Nur die Mütter der Mädchen sind ein wenig ärgerlich, wenn sie davon hören. Doch sie finden dies nicht weiter tragisch, da sie ja als kleine Mädchen von ihren Müttern deswegen auch getadelt wurden.

[335]) Seler, 1908, S. 104/05.
[337]) Seler, 1904, S. 73/76.
[338]) Haekel, 1958, S. 45.

g) Heirat

Im Alter von 7—8 Jahren wird ein Mädchen in der Regel schon verheiratet. Der Ehemann ist meist 8—10 Jahre älter. Doch ein richtiges Eheleben wird noch nicht geführt. Tagsüber spielt die Kleine mit den anderen Kindern, und nur nachts schläft sie in ihrer Hängematte neben dem Gatten. Ein sexueller Verkehr ist aber bis zum Abschluß der zweiten Menstruation streng verboten. Sie holt auch schon Brennholz sowie Wasser und erhält die zubereiteten Speisen für sich und den Mann von ihrer Familie. Wenn der Stamm wandert, trägt sie die Hängematte des Gemahls und die wenigen Haushaltsgegenstände. Mit dieser Heirat im Kindheitsalter sind wirtschaftliche Motive verbunden, denn der junge Mann muß für seine kleine Frau und deren Eltern jagen. Besonders bemerkenswert ist die Schwiegerscheu, welche sich in der Weise auswirkt, daß Schwiegersohn und Schwiegermutter nie miteinander sprechen und sich auch nicht besuchen dürfen. Da bei beiden Stämmen die Angst vor Inzest sehr groß ist, darf eine Ehe, welche stets von den Eltern vereinbart wird, nur zwischen Partnern erfolgen, die in keinem verwandtschaftlichen Verhältnis zueinander stehen. Deshalb werden junge Frauen gern aus einem befreundeten Stamm geholt; in diesem Falle muß der Jüngling dort aber solange leben, bis seine Frau die zweite Menstruation hinter sich gebracht hat. Gelegentlich werden auch junge Mädchen und Frauen von feindlichen Stämmen geraubt. Sie werden aber erst längere Zeit als Gefangene und Prostituierte gehalten, ehe sich ein Mann endgültig mit ihnen verbinden darf. Solch eine kleine Gefangene traf ich bei den Surára an. Sie stammte von dem feindlichen Stamm der Karauateri und war schätzungsweise 15 bis 16 Jahre alt.

Der Surára-Häuptling hat zwei Frauen, eine dritte ist gestorben, und der Pakidái-Häuptling, welcher noch verhältnismäßig jung ist, eine. Auch verschiedene andere Männer haben zwei oder mehrere Frauen. Stirbt der Mann, so werden diese, ohne selbst entscheiden zu können, mit ihren Kindern von einem seiner Brüder, in der Regel von dem jüngeren, übernommen, auch wenn dieser schon verheiratet ist.

Junggesellen haben das Recht auf sexuellen Verkehr mit den Frauen ihrer älteren Brüder, und deren Kinder nennen sie daher auch nicht Onkel, sondern ebenfalls Vater.

h) Pubertätsriten für Mädchen

Mit 9—10 Jahren werden die Surára- und Pakidái-Kinder schon mannbar, was wohl damit zusammenhängt, daß diese Indianer in den heißen, feuchten Regenwäldern der Äquatorialzone leben. Für die Knaben gibt es keine Initiationsriten. Ein Mädchen wird dagegen beim Eintritt der ersten Regel in einem kreisrunden Pferch von 3—4 m Durchmesser, den man ein Stück abseits von der Maloka errichtet, isoliert gehalten; ihr ganzer Körper ist mit Urucu, einer roten Pflanzenfarbe, bemalt. Hier muß die Kleine unbeweglich sitzen und erhält nur einmal am Tage von der Mutter eine Kalebasse voll Bananensuppe und eine zweite mit Wasser. Abends wird sie in das Gemeinschaftshaus geholt, um sich dort schlafen zu legen, aber weder Eltern und Geschwister, noch andere Stammesangehörige dürfen mit ihr sprechen. Am nächsten Morgen kommt sie wieder in den Pferch. Während des zweiten Tages wird ihr von der Mutter oder einer anderen Frau eine punktförmige Tatauierung über der Oberlippe angebracht, die beiderseits des Mundes nach unten, bis zum Kinn verläuft. Das Tatauierungsgerät ist ein spitzer Stachel der Pupunha-Palme. Dieser wird jeweils in den schmutzig-grauen Saft der Genipapo-Frucht getaucht, welcher nach dem Einstich in die Haut einen schwarzblauen Punkt hinterläßt. Jene Prozedur ist für die kleinen Mädchen außerordentlich schmerzhaft. Doch sie ertragen dieselbe mit unbewegtem Gesicht, unterdrücken die Tränen und geben auch keinen Laut von sich. Mit dieser Tatauierung sollen alle bösen, geheimnisvollen Kräfte, welche sich in dem Menstrualblut befinden, und die den Männern Gefahren bringen können, für die Dauer des Lebens einer Frau gebannt werden. Auch beim zweiten Eintritt der Periode wird ein Mädchen nochmals abgesondert, und hiernach findet ein kleines Fest statt. Später treffen die Frauen keine Anstalten, um die monatliche Blutung vor den Blicken der übrigen

Stammesangehörigen, einschließlich der Kinder, zu verbergen. Sie vermeiden es jedoch, in diesen Tagen viel herumzulaufen, und wenn das Blut zu stark fließt, setzen sie sich an das Ufer des nahegelegenen Flusses oder Baches.

i) Initiationsriten junger Männer

Alle jungen Männer, die etwa das Alter von 20 Jahren erlangt haben, müssen sich einem Initiationsritus unterziehen. Derselbe findet jeweils zu Beginn der Trockenzeit statt, zwischen Oktober—Dezember, auf halbem Wege zwischen ihren Winterquartieren und der großen, offenen Maloka, wo beide Stämme gemeinsam die Sommerzeit verbringen und das große Totenerinnerungsfest feiern. In solch einem Zwischenlager (Beschreibung des Zwischenlagers der Surára s. S. 11) werden jeweils zwei junge Männer zwei Monate lang von dem Häuptling und einem erfahrenen Gehilfen (Hewemõo und sein Bruder Kurikayawõ bei den Surára; Karenauõ und der Kriegshäuptling Porõhiwõ bei den Pakidái) in allen Fragen der Religion, Magie, Mythologie, Krankenheilung und Stammestradition ausgebildet. Erst danach gelten sie als vollwertige Mitglieder ihrer Gemeinschaften und dürfen von jetzt an selbständig Krankenbehandlungen und Gebete verrichten. Dabei ist zu erwähnen, daß es für jede Krankheit bestimmte Melodien, Texte und Tanzschritte gibt. Dasselbe gilt auch für die Gebete, mit denen sich die einzelnen Männer vor und nach einer Reise, nach Erlegung eines größeren Wildes, vor der Anlage einer Roça (Waldrodung), nach erfolgreicher Ernte usw. an die gigantischen Tier- und Pflanzengeister (*hekurd*, s. S. 92) wenden. Alle diese magischen Handlungen können jedoch nur im Schnupfpulverrausch erfolgen (s. S. 93).

Während der Ausbildung dürfen die Kandidaten mit keinem Stammesangehörigen sprechen, sie gelten in dieser Zeit als tot und erlangen nach zwei Monaten eine initiatorische Wiedergeburt. Rein äußerlich erkennt man die beiden Kandidaten an ihrer Körperbemalung, welche aus sechs senkrechten schlangenförmigen Linien besteht, die mittels Urucu auf Brust und Bauch aufgetragen werden. Bei diesen Linien handelt es sich um die symbolische Darstellung der Surucucu (*Lachesis muta* L.), jener über 3 m langen, gefährlichsten Giftschlange Südamerikas. Die Bemalung soll dazu beitragen, Gefahren zu bannen, die von dieser und anderen Giftschlangen ausgehen. Als tägliche Nahrung dürfen die beiden Kandidaten nur eine reife Banane und ein halbes Liter Wasser zu sich nehmen. Nach zwei Monaten sind sie dann stark abgemagert und scheinen nur noch aus Haut und Knochen zu bestehen. Um das Hunger- und Durstgefühl zu unterdrücken, haben sie ständig die mit Wasser und Asche vermischte Tabakrolle zwischen Unter- bzw. Oberlippe und Zähnen (s. S. 88). Außerdem müssen sie sich täglich mehrmals große Prisen von Schnupfpulver in die Nase blasen, damit ihr Kontakt zu den gigantischen Tier- und Pflanzengeistern — *hekurd* — hergestellt wird. So verbringen sie ihre Schulungszeit in einem regelrechten Trancezustand.

Es ist bemerkenswert, daß die Initiationsriten der männlichen Stammesmitglieder verhältnismäßig spät erfolgen, und daß so nach und nach alle Männer als Medizinmannsgehilfen ausgebildet werden. Man will dadurch erreichen, so erklärte mir der Surára-Häuptling Hewemõo, daß sie sich und ihre Familien notfalls selbst gegen Krankheiten und Unglücksfälle schützen können. Wird ein Mann unterwegs z. B. von einer Giftschlange oder einem Jaguar bedroht, so ist er nun in der Lage, die Gefahr durch Anrufung der Schutzgeister zu bannen. Er darf es aber nie unterlassen, sich nach einem glücklich verlaufenem Jagdzug oder nach einer guten Ernte bei den *Hekurd* zu bedanken, da er sich sonst deren Zorn zuziehen würde. Auch wenn seine Frau, eines seiner Kinder oder ein Verwandter erkrankt, muß er zunächst selbst versuchen, die Krankheit durch Gesang und Tanz, wobei er die Hekurá anruft, zu dem feindlichen Stamm, von welchem sie gesandt wurde, zurückzuschleudern. Erst wenn seine Versuche erfolglos bleiben, kann er den Häuptling um Beistand bitten, der dann dann auch stets bereit ist und mit Unterstützung von 8—9 Gehilfen eine große *Rekurd* (Krankenheilung) durchführt. So sieht man bei den Surára und Pakidái während des Tages

und in der Nacht häufig eines, oft auch mehrere Männer, die gerade beten oder bei einem Familienangehörigen Heilversuche unternehmen. Vorher müssen sie jedoch Schnupfpulver zu sich genommen haben, weil ja der Kontakt zu den Hekurá nur im Rausch erfolgen kann. Die Gesänge wirken etwas monoton und sind mit Tierlauten, tierischen Bewegungen, wie Flügelschlagen, Hüpfen usw., vermischt. Die übrigen Stammesangehörigen nehmen von solchen Gebeten und Zauberhandlungen keine Notiz. Nur die Häuptlinge und ihre Ausbildungsgehilfen hören gelegentlich genauer zu. Manchmal kam es dann vor, daß Hewemäo den Kopf schüttelte und zu mir sagte, daß dieser oder jener Mann ganz falsch bete; sicher hätte er beim Unterricht nicht genügend aufgepaßt. Stellt er häufiger solche Mängel fest, kann es passieren, daß er den betreffenden Mann auffordert, erneut an einer zweimonatigen Schulung teilzunehmen, damit dieser seine Kenntnisse vertieft.

In ähnlicher Form ist jene Art von Schulung auch für die Jívaro belegt, wo angehende Schamanen eine einmonatige Instruktion erhalten, in deren Verlauf der Neophyt ebenfalls zu fasten hat und verschiedene Drogen, einschließlich der Tabakbrühe und Cayapí, trinken muß. Die Ausbildungskosten sind jedoch sehr hoch[329]). Für die jungen Surára- und Pakidái-Männer ist der Unterricht zwar kostenlos, aber eben auch obligatorisch.

j) Geschlechtsleben

Das Verhalten der Geschlechter zueinander ist in der Öffentlichkeit außerordentlich dezent. Küsse, Umarmungen oder andere Zärtlichkeitsbezeigungen sind ihnen unbekannt. Körperliche Liebesbeweise werden im Urwald vollzogen, ein Stück abseits von der Maloka, oder im Dunkel der Nacht, wenn man annimmt, daß die übrigen Stammesangehörigen schlafen. Auch Jagdzüge bieten hierzu eine günstige Gelegenheit, weil die Frau ihren Mann ja gelegentlich begleitet. Da manche Männer zwei Frauen haben, gehen sie abwechselnd mit der ersten und mit der zweiten jagen.

[329]) Stirling, 1938, S. 117/18.

Ist eine Frau schwanger, so soll sie häufig mit anderen Männern zusammenkommen, weil man annimmt, daß ihr Kind nur dadurch kräftig werden kann. Doch es muß in aller Heimlichkeit geschehen, denn wenn ihr Mann sie mit einem Buhler beim Coitus überrascht, so fordert er diesen zu einem Stockduell, und sie selbst wird von ihm mißhandelt[330]).

Jüngere, unverheiratete Brüder haben das Recht, sich mit den Frauen ihrer älteren Brüder körperlich zu vereinigen. Doch die Eifersucht der letzteren verhindert oftmals die Ausführung, welche aber bei passender Gelegenheit nachgeholt wird, denn auch die Frauen sind mit dieser Sitte durchaus einverstanden[331]).

Bei den Surára traf ich ein etwa 15—16jähriges hübsches, zartes Mädchen an, Nikeromá, vom feindlichen Stamm der Karanateri (Abb. 17 u. 18), die als Gefangene gehalten wurde und Gemeingut aller Männer war, sowohl der ledigen als auch der verheirateten. Bei einem Überfall auf ihre Maloka war sie in die Hände der Surára gefallen. Sie lebte mit der alten Witwe Xututumi und deren ebenfalls verwitweten Tochter Haikiamá zusammen. Tagsüber betreute sie gelegentlich kleine Kinder, lauste die Frauen der Häuptlinge, rieb Maniok oder preßte die geriebene Masse aus, sie zog auch Perlen auf oder fertigte einen Gürtel an. Bei Einbruch der Dunkelheit holte sie sich stets Holz für die Nacht, genau wie die übrigen weiblichen Stammesangehörigen. Als einzige Frau nahm sie mehrere Male am Tag ein Bad und führte mit den anderen kleinen Mädchen kindliche Spiele aus. Ab und zu ging sie auch mit den anderen Frauen in den Urwald, um Früchte zu sammeln. Nie habe ich sie untätig gesehen. Wenn sie arbeitet, so ist dies aber ihr freier Wille. Doch gleichzeitig muß sie stets für alle Männer bereit sein, zu jeder Stunde des Tages oder der Nacht. Dabei kommt ein Mann fast nie allein, sondern meist schließen sich ihm 4, 5 oder mehr an. Sie fragen dann nicht, ob sie Lust hat, schläft, arbeitet oder vielleicht krank ist. Einer ergreift sie am Arm oder an den Haaren und zieht mit ihr hinaus in

[330]) Bucher, 1959, S. 162.

[331]) Dieser polyandrische Zug findet sich auch in der Mythe vom Ursprung der Menschen (s. S. 113).

den Urwald, und die anderen folgen. Besonders wenn die Männer Gemeinschaftsarbeiten im Urwald zu verrichten haben, d. h. für einen Hausbau Bäume fällen, Palmblätter und Lianen sammeln, so wird Nikeromá regelmäßig mitgenommen, ob sie will oder nicht. Falls sie sich wehrt oder Einwände erhebt, so versetzt ihr ein Mann mittels seines Stockes einen Schlag auf die Tonsur, welche schon voller Narben ist, oder er ritzt ihr mit dem scharfen Cutiazahnmesserchen (s. S. 54) den Körper blutig.

Bemerkenswert ist es, daß die verheirateten Männer nicht etwa heimlich mit Nikeromá in den Urwald gehen, sondern ganz offen. Wenn ich mit dem Stamm wanderte, konnte ich bei der Mittagsrast oft beobachten, daß ein Ehemann plötzlich auf die kleine Gefangene zuging, sie am Arm faßte und mit ihr ein Stück abseits ging, während fünf bis sechs andere Männer folgten. Die übrigen Anwesenden, Männer, Frauen und Kinder, lachten darüber. Die Ehefrauen waren allerdings etwas ärgerlich und warfen ihren Männern ab und zu ein Stück Holz nach, machten dann aber eine gute Miene zum bösen Spiel und stimmten ebenfalls, wenn auch etwas süßsauer, in das Gelächter ein. Kehrten die Männer dann nach etwa einer Stunde mit Nikeromá zurück, setzten wir unseren Marsch fort. Die Frauen haben sich schon mit diesem Verhalten ihrer Ehepartner abgefunden und vergnügen sich dafür bei passender Gelegenheit mit anderen Männern. Doch an der kleinen Gefangenen lassen sie ihren Ärger niemals aus. Deren Tätigkeit, zu der sie ja gezwungen wird, hat auch nichts Ehrenrühriges an sich, denn verschiedene Ehefrauen mußten sich vor ihrer Heirat in gleicher Weise hingeben. Doch die kleine Nikeromá konnte sich nur schwer mit ihrem Geschick abfinden, immer war sie ernst und traurig, ja fast schwermütig und litt sehr unter Heimweh. Doch eines Tages, wenn man erneut Frauen und Mädchen von einem feindlichen Stamm erbeutet hat, wird sie von einem Surára-Mann geheiratet werden.

Zu erwähnen ist noch, daß der Surára-Häuptling streng darauf achtet, daß Nikeromá stets reichlich mit Fleisch u. a. Nahrungsmitteln versorgt wird. Er selbst und seine Brüder behandeln die kleine Gefangene sehr gut, und niemals habe ich sie mit ihr in den Urwald gehen sehen.

Die Pakidái hatten zwei gefangene Makuxi-Frauen.

In diesem Zusammenhang möchte ich auf eine sehr ähnliche Beobachtung von Ehrenreich bei den Sambioa (Karajá) verweisen, die der Forscher wie folgt beschreibt: „Im übrigen sind ledige Männer, welche sich dem weiblichen Geschlecht zuwenden wollen, auf den Verkehr mit den gefangenen, in Halbsklaverei gehaltenen Kayapofrauen angewiesen, deren bei den Sambioa wenigstens jedes Dorf einige beherbergt. Dieselben gelten als Allgemeingut. Leider sieht man aber auch Kinder zu ähnlichen Zwecken verwendet. Hier zeigt sich deutlich der Dualismus in der Etikette der Wilden, deren Moralgesetze nur den eigenen Stammesangehörigen gegenüber gelten. Diese allen Naturvölkern gemeinsame Anschauung vermag deshalb nicht unser Urteil über die Moralität der Karaja im Allgemeinen zu ändern"[227].

k) Tod und Bestattungsbräuche

Wie die bisherigen Ausführungen zeigten, gibt es bei den Surára und Pakidái weder Geburts-, noch Heiratszeremonien. Umsomehr wird dafür das soziale und religiöse Leben von Totenbräuchen beherrscht.

Stirbt ein Mensch, der das dritte Lebensjahr vollendet hat, so sind die Verwandten untröstlich. In den lautesten Tönen wird gejammert, und bei Männern, Frauen und Kindern will der Tränenstrom kein Ende nehmen. Trotzdem vernachlässigt man dabei nicht die gewohnte Beschäftigung. Während z. B. die Frau das Wasser vom Fluß holt, weint sie ununterbrochen vor sich hin und schreit zwischendurch laut auf, dasselbe trifft für die Männer bei ihren Arbeiten in der Pflanzung zu und selbst für die Kinder natürlich ihrer Spiele. Die übrigen Stammesangehörigen werfen nur ab und zu einen mitleidigen Blick auf die Trauernden, womit sich ihre Anteilnahme erschöpft.

Unmittelbar nach dem Todesfall ist es die Aufgabe der männlichen Verwandten und

[227] Ehrenreich, 1891, S. 56.

Freunde im Urwald kleine Bäume zu fällen, aus denen sie ein zylinderförmiges Holzgerüst — *frontimá* — anfertigen. Dasselbe besteht aus fünfzehn bis zwanzig 1,60—1,80 m langen Stangen, die, in Handbreite voneinander entfernt, mittels Lianen verbunden werden. Hierhinein wird die Leiche geschoben, und über die beiden offenen Enden zieht man Lianenschnüre, damit sie vor Zugriffen von Vögeln, besonders Geiern, geschützt ist.

Bei den Pakidái bot sich mir der traurige Anlaß, eine Bestattungszeremonie mitzuerleben, die dem blühenden, kräftigen und lebensfrohen Hokotómarimá galt, einem unverheirateten Jüngling, dessen Alter höchstens 19 Jahre betrug. Er war vom Gipfel einer Pupunha-Palme (*Guilielma speciosa* Mart.) gestürzt (die Lianenumwicklung seines Kletterapparates, s. S. 56, war offenbar nicht fest genug gewesen) und muß sich innerliche Verletzungen zugezogen haben. Alle Heilversuche des Häuptlings und seiner Gehilfen, welche zwei Tage und Nächte ununterbrochen durchgeführt wurden, blieben erfolglos.

Nachdem man den toten Hokotómarimá in das Holzgerüst geschoben hatte, schafften ihn fünf Krieger, deren Körper vollständig mit Urucu bemalt waren, unter lauten Klagen aus der Maloka. Jeweils zwei Männer trugen das Gestell, einer vorn und einer hinten; ab und zu wurden sie von den Begleitern abgelöst. Die Frauen seiner Verwandtschaft, teilweise mit den Kindern auf der Hüfte oder an der Hand, gaben ihm, unter herzzerreißenden, schrillen Jammertönen und endlos fließenden Tränen, das letzte Geleit bis zum Rande des Urwaldes. Dann gingen die fünf Männer mit dem Toten allein weiter. (Der Häuptling nahm nicht teil, er würde es nur dann tun, wenn es sich um einen verstorbenen Verwandten handelt). Nach einem Marsch von etwa 20 Minuten hielten sie plötzlich an, setzten das Gestell ab und suchten einen geeigneten Baum aus, um es in dessen Wipfel aufzuhängen. Als sie ihn gefunden hatten, in diesem Falle einen hohen Imbaúbabaum (*Cecropia palmata* Wild.) — *tohori* —, kletterten zwei Mann hinauf, um deren Hals je zwei lange Lianen (*Cipó-titica*) hingen. Sie wählten einen besonders dicken Ast, ließen dann die Lianen hinunter, wo ihre Begleiter sie an dem Holzgerüst anbanden, und zogen dasselbe mit dem darin liegenden Toten nach oben. Als das Gerüst fest und sicher an dem Ast hing, kletterten sie wieder herab.

Gleich darauf traten die fünf Männer den Rückweg in die Maloka an. Doch unterwegs schlug der Bruder des Toten in einen Baum, dessen Namen der Verstorbene trug — *hokotómarimá* —, Matamataziro (*Eschweilera matamata* Hub.), mit seinem Terçado (großes Buschmesser) am unteren Teil des Stammes tiefe Kerben ein, die folgendes Aussehen hatten ..... und sich um den ganzen Stamm herumzogen. Dadurch sollte der Baum zum Absterben gebracht werden. Hätte der Tote z. B. einen Tiernamen getragen, wäre es die Aufgabe des Bruders oder eines Verwandten gewesen, solch ein Tier zu erlegen. Denn mit dem Toten muß auch ein Tier oder eine Pflanze gleichen Namens getötet, bzw. zum Absterben gebracht werden (s. S. 64/65).

Während der Tote im Wipfel des Imbaúbabaumes hing, gingen die Klagen seiner Verwandten in der Maloka weiter, und selbst die Kinder standen ihren Eltern darin nicht nach. Nachts wachten stets ein oder zwei Männer, manchmal auch eine Frau, die zu gleicher Zeit sangen, weinten und zwischendurch schrille Laute ausstießen. Die übrigen Stammesangehörigen ließen sich aber dadurch nicht in ihrem Schlaf stören.

Siebzehn Tage nach dem Tode von Hokotómarimá begann der zweite Teil der Bestattungszeremonie. Die männlichen Verwandten fällten erneut Bäume und errichteten unter dem Imbaúbabaum, in dessen Wipfel der Tote hing, einen Scheiterhaufen; außerdem säuberten sie an dieser Stelle den Urwald, so daß ein größerer freier Platz gewonnen wurde. Am Nachmittag des achtzehnten Tages bemalten sich dann alle Pakidái-Männer mit Urucu und zogen unter Führung des Häuptlings Karonauó laut singend und gleichzeitig weinend zum Ort des Toten. Alle zurückbleibenden Frauen und Kinder weinten ebenfalls inbrünstig, auch die, welche nicht mit dem Toten verwandt waren. Die

Männer trugen Bogen und Pfeile in den Händen, einige führten daneben Schnupfpulver mit sich und die Rohre zum Einblasen desselben. Der Bruder hatte außerdem noch die Waffen und Werkzeuge des Toten sowie Schalen der Jamaru-Frucht — *kuutú* —.

Als der Zug den Imbaúbabaum erreicht hatte, kletterten wieder zwei Verwandte hinauf und ließen das Holzgerüst vorsichtig hinunter, wo es von den übrigen Kriegern in Empfang genommen und so auf den Scheiterhaufen gestellt wurde, daß der Kopf des Verstorbenen dem aufgehenden Mond zugewandt war. Bei dem toten Mann handelte es sich aber nur noch um ein Skelett. Das Fleisch war inzwischen verfault und durch die Stäbe nach unten gefallen, wo es Geier, Ameisen u. a. Tiere aufgefressen hatten. Seine Waffen und Geräte legte der Bruder auf das Holzgerüst, damit sie Hokotónarimá im Totenreich zur Verfügung ständen. Mehrere Fleischstücke, Bananen, etwas Maniokmehl und die volle Kalebasse eines Palmgetränkes sollten als Wegzehrung dienen.

Kurz vor dem Untergang der Sonne wurde mit Hilfe des Feuerbohrers ein hell loderndes Feuer entfacht, womit man den Scheiterhaufen anzündete. Danach bliesen sich die Männer gegenseitig das Schnupfpulver in die Nase, gerieten nach wenigen Minuten in einen Rauschzustand, in dem sie singend und schreiend um die Flammen, welche zum Toten emporzüngelten, herumtanzten. Dies war die Anrufung der *Hekurá*, die der Totenseele bei ihrer Wanderung zum Monde beistehen sollten (s. S. 92/93). Der Häuptling stieß laut seine Bittgebete aus, und alle übrigen Männer fielen im Chor ein. Zwischendurch bliesen sich die Männer immer wieder neues Schnupfpulver in die Nase, so daß sich ihre Ekstase ständig steigerte und schließlich einen unvorstellbaren Höhepunkt erreichte, als das Feuer Besitz von dem Skelett ergriff. Es schienen keine menschlichen Wesen mehr zu sein, die jetzt brüllend, stampfend und gestikulierend um den Scheiterhaufen herumtobten. Es hatte den Anschein, als ob sie ihrer Sinne nicht mehr mächtig waren, und infolge des Schnupfpulverrausches befanden sie sich wohl auch tatsächlich in einer anderen Welt. Der Anblick wirkte auf mich wie ein Alptraum und erweckte in mir Erinnerungen an Gemälde von Hieronymus Bosch. Die Wanderung der in den Knochen befindlichen Seele des Toten, in Begleitung der Baumseele, hatte begonnen, und die Hekurá ebneten ihnen den Weg. Währenddessen war die Nacht hereingebrochen, und der Mond, welchen ich plötzlich in seiner ganzen Größe zwischen den Wipfeln der Bäume am Himmel wahrnahm, schien seinen neuen Bewohner zu erwarten. Trotz der Hitze, die noch durch das Feuer des Scheiterhaufens verstärkt wurde, liefen mir kalte Schauer über den Rücken, und ein unbeschreibliches Angstgefühl zog mir das Herz zusammen. Obgleich ich bei dieser Zeremonie kein Pulver geschnupft hatte, befand ich mich selbst in einem wahren Fieberrausch. Denn nie zuvor erlebte ich eine so grandiose Szenerie, weder in einer Kirche, noch in einem Theater, wie hier, im nächtlichen Urwald Amazoniens.

Bis zum Morgengrauen dehnte sich diese Totenfeier aus. Doch nach Mitternacht tanzten und sangen nur noch wenige Männer, welche gleichzeitig die Aufgabe hatten, den Scheiterhaufen im Gange zu halten. Die anderen Krieger lagen vor Erschöpfung auf dem Boden und schliefen. Gelegentlich wurde einer von den Tanzenden angestoßen. Er erhob sich sofort, ließ sich Schnupfpulver in die Nase blasen und tanzte singend um den Scheiterhaufen herum, während sich ein anderer zum Schlafen niederlegte. Schließlich tanzten und sangen nur noch zwei Männer. Doch etwa eine Stunde vor Sonnenaufgang wurden alle Schläfer geweckt, die sogleich wieder Pulver schnupften, und erneut begann ein wilder Tanz mit Gesang, bis zum Einbruch der Morgendämmerung. Vor der Sonne (sie wird ebenfalls als männliches Wesen betrachtet), dem ärgsten Feind des Mondes, muß die Totenzeremonie ähnlich geheimgehalten werden, weil diese sonst die Wanderung der Seele behindern würde. Laut anhaltende, schrille, freudige Schreie bildeten den Abschluß und gaben zu erkennen, daß die Totenseele Eingang in den Mond gefunden hatte. Dann stellten sich alle Krieger laut schluchzend im Kreis um den niedergebrannten Scheiterhaufen, während der

Bruder und andere Verwandte die verkohlten Knochenreste aus der Asche aufsammelten. Nachdem man dieselben dann mittels kleiner Steinmörser in Cujen zerstampft hatte, wurde die Knochenasche in zwei Schalen der Jamaru-Frucht geschüttet, welche der Bruder des Toten mit Palmblättern und einer Lianenbindung verschloß. Hierauf überreichte er sie dem Häuptling, der jede einzelne in Richtung des Mondes emporhob und sie singend segnete, wobei die umstehenden Männer schrille Schreie ausstießen. Damit war das Ende der Zeremonie erreicht, und die erschöpften Krieger konnten wieder in ihre Maloka zurückkehren, um sich in den Hängematten von der anstrengenden Nacht zu erholen. Der Bruder des Verstorbenen band die beiden Jamaru-Schalen mit der darin befindlichen Knochenasche im Hintergrund seiner Feuerstelle an das Sparrenwerk des Daches, um sie für das jährlich einmal stattfindende große Totenerinnerungsfest aufzubewahren, bei welchem von den Männern die Knochenasche ihrer Toten, vermischt mit Bananensuppe, getrunken wird (s. S. 106ff.). Von jetzt ab wurde in der Maloka nicht mehr geklagt und geweint; das tägliche Leben hatte wieder seinen normalen Verlauf angenommen.

Auch nach dem Tode von Frauen und Kindern, sobald sie das dritte Lebensjahr vollendet haben, verlaufen die Totenfeiern genau in der gleichen Weise. Für einen verstorbenen Häuptling wird dagegen drei Nächte lang um den Scheiterhaufen getanzt, weil dessen Eintritt in den Mond natürlich besonders feierlich gestaltet werden muß.

Ganz anders verläuft die Zeremonie für einen alten Menschen. Ihm schlägt man nach dem Eintritt des Todes den Kopf ab und hängt denselben, ebenfalls in einem kleinen Holzgestell, in den Wipfel eines Baumes, auch wieder 15—20 Minuten von der Maloka entfernt. Der Körper wird dagegen ohne Zeremoniell im Urwald erdbestattet, und zwar im Hockstz, wobei man ihn fest mit Lianen umschnürt. Hierdurch soll seine eventuelle Rückkehr verhindert werden, weil diese schreckliche Folgen für den Stamm hätte. Der Kopf wird jedoch unter gleichen Umständen, wie oben geschildert, auf einem kleinen Scheiterhaufen verbrannt, damit die Seele im aufsteigenden Rauch zum Monde gelangt; die zurückbleibende Knochenasche bewahrt man ebenfalls auf.

Der Grund für die verschiedenartige Bestattung von jüngeren und älteren Menschen ist folgender: Bei der jährlich stattfindenden großen Totenerinnerungsfeier, die gemeinsam mit den Surára durchgeführt wird (s. S. 102ff.), trinken alle Männer die mit Bananensuppe vermischte Knochenasche ihrer verstorbenen Angehörigen, weil sie glauben, daß dadurch Kraft und Geist dieser Toten innerhalb der Stämme verbleiben. Von alten Personen nimmt man dagegen an, daß ihre Körper schon zu ausgelaugt seien, so daß deren Asche keine Kräfte mehr übertragen kann. Nur die Knochenasche des Kopfes gilt noch als wertvoll.

Wenn Stammesangehörige sehr alt oder so schwer erkrankt sind, daß sie trotz aller Heilversuche nicht mehr an den gemeinsamen Wanderungen teilnehmen können, werden sie getötet. Zu diesem Zweck findet vorher eine Versammlung des Häuptlings und älterer, erfahrener Männer statt, wobei ein Teilnehmer bestimmt wird, der die Tötung vorzunehmen hat. Er verwendet dazu einen Stock und schlägt die betreffende Person, wenn sie gerade schläft, mehrere Male so stark auf den Kopf, bis sie ihr Leben ausgehaucht hat[***]). Diese dem Tode geweihten Stammesangehörigen werden also in durchaus humaner Weise in das Jenseits befördert, und selbst die Tötung an sich wird von menschenfreundlichen Regungen diktiert. Da solche Alten und Kranken ja nicht mehr an der gewohnten halbnomadischen Lebensweise teilnehmen können, müßten sie hilflos zurückbleiben, wenn der Stamm zu einer neuen Wanderung aufbricht. Doch das soll vermieden

[***]) In ähnlicher Weise werden alte und kranke Personen bei den Iparina getötet. „Man'fasuale Louis," so schreibt Ehrenreich, „sollen nicht selten von den Zauberern durch Keulenschläge ins Jenseits befördert werden." (Ehrenreich, 1891, S. 70). Bei den Pianoa-Indianern werden sehr schwache Alte lebend in eine Hütte eingemauert. Sie bekommen noch für mehrere Tage Speisen und Getränke und sterben, wenn diese aufgebraucht sind, an Entkräftung. (Marquis de Wavrin, 1944, S. 197/98).

werden, und gleichzeitig will man ihnen den Weg zum Monde, dem Paradies der Toten, eröffnen. Nach ihrem Tode werden sie in der gleichen Weise verbrannt wie alle anderen Verstorbenen, d. h. von alten Menschen wird ebenfalls nur der Kopf verbrannt, und auch ihre Knochenasche wird aufbewahrt und beim Totenerinnerungsfest getrunken.

Größer als die Furcht vor dem Tode ist bei allen Surára und Pakidái der Gedanke, daß sie einmal sterben müssen, z. B. bei kriegerischen Handlungen, ohne verbrannt zu werden, denn dann ist ihrer Seele der Eingang in den Mond versperrt (s. S. 91).

Blutschänder werden nach ihrem Ableben von der Verbrennung ausgeschlossen, und man trauert auch nicht um sie, weil Inzest als schwerstes Verbrechen angesehen wird. Poré (s. S. 91) will deren Seelen nicht auf dem Mond haben, und der Genuß ihrer Knochenasche würde ungünstige Einflüsse auf die männlichen Stammesangehörigen ausüben. Sie werden deshalb im Hocksitz zusammengebunden und in einem Erdloch verscharrt.

Sterben Kinder vor Vollendung des dritten Lebensjahres, so werden sie ohne jegliche Feierlichkeit in den Fluß geworfen, da sie ja zum Fleisch und Blut der Mutter gehören und noch keine eigene Seele haben (s. S. 64).

Für die Bestattungsarten der Surára und Pakidái, welche sicher sehr alt und ursprünglich sind, gibt es in Südamerika noch keine Parallelen[324]). Dies betrifft sowohl die kombinierte Baum- und Brandbestattung als auch die Erdbestattung alter Leute. Ein toter Stammesangehöriger wird aber nur deshalb für zwei bis drei Wochen in eine Baumkrone gehängt, damit sein Fleisch verfault, bevor die Knochen anschließend verbrannt werden.

Letztere Sitte, jedoch in Form einer kombinierten Erd- und Brandbestattung, wird übrigens schon in alten Quellen erwähnt. „Weit in dem Lande," schreibt Barrère bezüglich Guayanas, „sind Nationen, welche sich versammeln, um die Gebeine auszugraben, wenn sie glauben, daß der Leichnam bey nahe verfault sey, und nachdem sie solche calcinirt haben, trinken sie die Asche, welche sie in Roucou einweichen, und glauben, daß sie den Todten dadurch ein anständigeres Begräbniß geben, als wenn sie dieselben den Würmern und der Fäulniß überließen"[325]). Ähnliches berichten Froger von Französisch Guayana[326]) und de la Neuville und Biet von einem Teil der Festlandkaraiben[327]). Die Surára und Pakidái sind dagegen der Ansicht, daß die in den Knochen befindliche Seele nur dann zum Monde emporfahren könne, wenn vorher das Fleisch verfault sei und nunmehr dem Austritt nicht mehr hindernd im Wege steht.

Auch die Gewohnheit, den Leichnam solange im Freien aufzuhängen, bis er in Fäulnis übergeht, ist, jedoch nicht in Verbindung mit einer anderen Bestattungsart, bereits für das 17. Jahrhundert bezeugt. Hierüber liegen Angaben von Coreal vor, welche die Chevelus (Amaguaxe oder Encabellados — Angehörige der Tukano-Sprachfamilie) betreffen, die zu beiden Seiten des Putumayo lebten: „Ils n'enseveliissent point leurs morts, mais ils les pendent à l'air jusqu'à ce que la chair se pourrisse: aprés cela ils gardent les os comme des Reliques"[328]).

5. Krieg — ulanyu —

Die Yanomámi sind, wie schon oben erwähnt (s. S. 6), in zwei antagonistische Lager aufgespalten, die Xiriána und Waiká, mit ihren kleineren Trabantenstämmen. Zwischen diesen beiden „Machtblöcken" einerseits und gegenüber den äußeren Feinden (Karaiben und Aruaken) anderseits, besteht eine immerwährende, offene Feindschaft. Man beschäftigt sich gegenseitig der Neigung zu Diebstahl und

[324]) Bei den Waiká wird der Leichnam noch am gleichen Tage auf dem Dorfplatz verbrannt. (Ferrin, 1955b, S. 664).

[325]) Barrère, 1731, S. 132.

[326]) „Ils ont beaucoup de respect pour les vieillards, & lorsqu'il meurt quelqu'un d'eux, ils l'enterrent dans la Carbet (Maloka) avec notre ceremonie que de se bien en yvrer: mais lorsqu'ils croyent à peu prés qu'il est pourry, ils assemblent les Indiens des Carbets voisins, deterrent les os, les brûlent, & en mettent la cendre dans leur Ollieve pour en faire un grand regal." (Froger, 1715, S. 178).

[327]) Laët, 1924, II, S. 444 ff.

[328]) Coreal, 1722, I, S. 292.

führt jede Krankheit und jeden Todesfall auf die Zauberei seiner Angehöriger feindlicher Stämme zurück. Daher spielt auch die Blut-rache — *warfa* — [illegible] Haupturache aller Kriege häufig damit zusammen, daß man es für notwendig erachtet, Frauen und Mädchen feindlicher Stämme und Gruppen zu rauben, damit dem eigenen Stammesverband frisches Blut zugeführt wird. Da viele Stämme verhältnismäßig klein sind, erfordert eine zunehmende Verschwägerung zwar schon bis zu einem gewissen Grade die Exogamie[288]) und bedeutendere Stammesverbände stehen deshalb in einem Connubium. Mit der Zeit ergeben sich aber auch hier wieder starke verwandtschaftliche Bindungen, daß schließlich, auch infolge der bevorzugten Polygynie, ein regelrechter Frauenmangel herrscht, der besonders von den jüngeren, bisher noch unverheirateten Männern sehr schmerzlich empfunden wird[289]). So berichtet man deshalb, wie mir von Gewährsleuten berichtet wurde, ab und zu Überfälle auf feindliche Stämme vor, die im Morgengrauen, ohne jegliche Kriegserklärung, erfolgen[290]). Aber auch an geplanten Überfällen der Xirúna nehmen sich Surára- und Pakidái-Krieger beteiligen. Sie werden stets von dem Kriegshäuptling angeführt (der Häuptling, seine Brüder und Söhne nehmen nicht an kriegerischen Handlungen teil (s. S. 60), ebensowenig die Frauen[291]) und brechen bereits am Vortage des beabsichtigten Überfalls auf. Alle Teilnehmer malen sich mit Urucu waagerechte schlangenförmige Linien auf Körper und Gesicht. Dies ist die typische Kriegsbemalung, denn in Friedenszeiten werden die schlangenförmigen Linien stets senkrecht aufgetragen[292]). In der Nähe der feindlichen Maloka verbringen sie ruhig die [illegible] Stunden, schlafen, ruhen, [illegible] Im Morgengrauen blasen sich die Krieger gegenseitig große Mengen von Schnupfpulver in die Nase und stürmen dann, völlig entblößt, doch in aller Stille, auf die feindliche Maloka zu. Rücksichtslos werden Männer und Knaben durch Pfeilschüsse getötet, und die Frauen und Mädchen schleppt man als Gefangene mit. Aber auch die Angreifer haben oft große Verluste zu verzeichnen, und es soll vorkommen, daß sie in die Flucht geschlagen werden.

Während meines Aufenthalts unter den Surára hörte ich von einem Überfall seitens der Xirúna und verbündeter Krieger auf eine Maloka der Waikó am Rio Mapulon, einem linken Nebenfluß des oberen Demini (s. S. 8). Hierbei, so berichtete man mir, wären alle Waikó-Männer getötet worden, und die Frauen und Mädchen hätte man als Gefangene in die Xirúna-Maloka gebracht. Den Kopf des Waikó-Häuptlings, so fügte der Kriegshäuptling der Surára hinzu, schmückten die Xirúna dann mit Federn und Ästen ihn mehrere Tage vor ihrem Gemeinschaftshaus als Trophäe stehen; danach wurde er fortgeworfen[293]). In der Nacht nach dem Überfall fand ein großes Tanzfest statt, an dem alle Männer teilnahmen. Vorher schmückten sie und bemalten sie den Häuptling (s. S. 92), um ihnen für den Sieg zu danken.

6. *Teilnahmelosigkeit und Begräbnisgemeinschaft*

Zwei- bis dreimal im Jahr kommen ein Xirúna-Häuptling und 18—20 Krieger dieses Stammes sowohl zu den Surára als auch zu den Pakidái, um den Tribut ihrer Tributären abzuholen (s. auch S. 62 u. 93). Dieser Besuch verläuft

[288]) Gleichen berichtet Zerries von den Waikó. (Zerries, 1950a, S. 180).

[289]) Damit dürfte es zusammenhängen, daß den jüngeren, unverheirateten Männern der geschlechtliche Verkehr mit den Frauen ihrer älteren Brüder gestattet ist.

[290]) Sehr ähnlich lauten die Schilderungen von Kriegszügen der Karaiben, die Richard Schomburgk (Richard Schomburgk, 1848, II, S. 321) und Appun (Appun, 1871, S. 447) beschreiben.

[291]) Richard Schomburgk und Koch-Grünberg berichten, daß bei einigen Karaibenstämmen die Frauen als Träger an Kriegszügen teilnehmen. (Richard Schomburgk, 1848, II, S. 321; Koch-Grünberg, 1923a, S. 109).

[292]) Auch bezüglich der Karaiben hebt Richard Schomburgk hervor, daß die Bemalung in Kriegszeiten anders ist als im Frieden. (Richard Schomburgk, 1848, II, S. 302).

[293]) Als Parallele ist auf die Hitóto und Ebidoxa im nordöstlichen Chaco zu verweisen, die gelegentlich in ähnlicher Weise verfahren. (Ibidem, 1950, S. 75).

stets nach einem regelrechten Protokoll. Zuerst setzen sich die Häuptlinge im Hockstil einander gegenüber, legen die rechte Hand auf die linke Schulter des anderen und halten die linke Hand vor den Mund. In dieser Stellung verharren sie etwa zwei Stunden und tauschen eingend ihre Neuigkeiten aus[xxx]). Die Arauá- und Suriára-, resp. Pakidái-Krieger stehen mit unbeweglichen Gesichtern im Kreis herum und hören zu. Alle Frauen und Kinder bleiben während des Zeremoniells in den Hängematten liegen oder sitzen mit ängstlichen Gesichtern an ihren Feuerstellen. Ist die Begrüßung beendet, gibt der Suriára- bzw. Pakidái-Häuptling ein Zeichen, worauf seine Männer davonlaufen und Messer, Beile, Töpfe usw., aber auch Bananen und Pupunha-Früchte holen, die sie vor dem Xiriána-Häuptling niederlegen. Dieser nimmt die Gegenstände auf und verteilt sie der Reihe nach an seine Krieger. Wenn jeder reichlich beladen ist, verlassen sie gemessenen Schrittes die Maloka und verschwinden im Urwald. Der Xiriána-Häuptling ist jetzt allein zurückgeblieben. Doch für ihn müssen ganz besonders wertvolle Objekte gebracht werden. Vor allem ist es nun die Aufgabe des Suriára- oder Pakidái-Häuptlings, ihm Kostbarkeiten seines eigenen Besitzes zu überlassen, vielleicht eine gewebte Hängematte, die er von Zivilisierten erhalten hat, einen großen Topf, ein Buschmesser, oder eine besonders schöne Kette aus Glasperlen. Dann stellt er meist auch einen Korb voll Bananen und Pupunha-Früchte. Wenn der Xiriána-Häuptling schließlich befriedigt mit dem Kopfe nickt, fühlen sich die Suriára oder Pakidái endlich erleichtert. Es gibt auch ein abschließendes gemeinsames Zwiegespräch der beiden Oberhäupter, worauf sich der Xiriána-Häuptling erhebt und mürrisch schwer bepackt dem Urwald entgegenstrebt, wo seine Krieger schon auf ihn warten. Nach solch einem Besuch sind die Suriára und Pakidái zwar regelrecht empfindet, aber der Baum, dem sie während dieser Stunden unterlagen, ist gebrochen, und bald hört man sie wieder hacken und scharren[xxxi]).

[xxx]) Auch ich wurde zuweilen von dem Suriára-, als auch von dem Pakidái-Häuptling in dieser Weise begrüßt.

7. Erwerb des Lebensunterhalts

a) Allgemeines

Gegenwärtig befinden sich die Suriára und Pakidái in einem Übergangsstadium von ausgesprochener zu produzierender Wirtschaft. Der [illegible] Nahrungserwerb, Jagen und Sammeln, spielte zwar während meines Aufenthalts unter diesen Indianern noch eine beherrschende Rolle, ich konnte aber beobachten, daß die meisten Stammesangehörigen, vor allem die männlichen, schon ein großes Interesse für den vor etwa ein bis zwei Generationen eingeführten Feldbau bekundeten. Als leuchtende Vorbilder erwiesen sich besonders die Häuptlinge, welche bei allen Arbeiten in der Roça (Waldrodung) mit gutem Beispiel vorangingen[xxxii]). Nach eigenen Aussagen betrachten beide Stämme auch in diesem Falle die Xiriána als ihre Kulturbringer. Doch letztere haben den Feldbau ebenfalls erst von ihren höherstehenden karibischen Nachbarn angenommen[xxxiii]).

b) Jagd

Die Mehrzahl der Suriára- und Pakidái-Männer sind vorzügliche Jäger und führen ihr Waidwerk mit den oben beschriebenen großen Bögen und Pfeilen durch (s. S. 178f.), welche sie meisterhaft zu handhaben wissen. Hinzu kommt, daß sie die Lebensgewohnheiten der Tiere genau kennen. Sie entdecken jede, wenn auch noch so schwache Fährte des Wildes, berechnen sie und geben die Zeit an, wann es an dieser Stelle war. Oft folgen sie ihm dann stundenlang im nahen undurchdringlichen Urwald, manchmal sind sie

[xxxii]) Auch für Forschungsreisende, die mit Stämmen dieses Gebietes in Berührung kommen, ist es von großer Wichtigkeit, bei der Übergabe von Geschenken und Tauschartikeln darauf zu achten, daß wertvolle Gegenstände zunächst zurückgehalten werden, weil sich der Häuptling seinen Anteil stets zuletzt nimmt. Ein Besucher, der diese Gepflogenheit nicht kennt und schließlich mit leeren Händen dasteht, erlebt sich von vornherein die Feindschaft des Häuptlings und damit des ganzen Stammes zuziehen.

[xxxiii]) Die Ursprungssagen der Stämme (s. S. 114) zeigt übrigens deutlich, daß die Suriára und Pakidái früher nur Jäger und Sammler waren.

[xxxiv]) Koch-Grünberg, 1909/10, S. 309.

auch mehrere Tage unterwegs. Außerdem verstehen sie es, die Tiere durch nachgeahmte Laute anzulocken.

Es gibt zwei Jagdmethoden, die Einzeljagd — *kará* —[388], auch die Gemeinschaftsjagd — *axwé* —[389]. Letztere findet aber nur noch vor dem großen Totenerinnerungsfest (s. S. 102ff.) statt, um dafür genügend Fleischvorräte heranzuschaffen. Bewährte Jagdhelfer sind abgerichtete Hunde (s. S. 85ff.).

Von größerem Wild werden am häufigsten das Wildschwein (*Pecari tajacu*) — *paxe* — erlegt, danach der Tapir (*Tapirus americanus* Brss.) — *xéma* — und eine Rehart (*Cervidae* sp.) — *hajá* —. Das Fleisch aller genannten Tiere schätzt man sehr. Doch als ausgesprochene Leckerbissen gelten kleinere Nager: Paca (*Cuniculus paca* L.) — *amatá* — und Cutia (*Dasyprocta agouti* L.) — *tamá* —, die meist mit Hunden gestellt oder in ein Erdloch getrieben werden, sowie das Gürteltier (*Dasypodidae* sp.) — *obó* —. Letzteres erlegt man auf folgende Weise: Hat der Indianer einen bewohnten Gürteltierbau entdeckt, so untersucht er ihn, ob sich das Tier darin aufhält. Wenn das der Fall ist, holt er rasch trockene Blätter und verstopft damit den Eingang. Anschließend entfacht er mit seinem Feuerzeug, welches er ja stets am Köcher trägt (s. S. 23), ein Feuer, zündet die Blätter an und fächelt mittels eines Palmblattes den Rauch in die Höhle. Dadurch wird das Tier gezwungen, schon nach wenigen Minuten herauszukommen, wo es der Jäger dann mit einem Pfeil erlegen oder mittels eines Stockes erschlagen kann[390]. Mit etwas geringerem Appetit essen diese Indianer das Fleisch des Capivara (*Hydrochoerus hydrochaeris* Erxl.) und der verschiedenen Affenarten, wie z. B. der Brüllaffen (*Alouatta* sp.) — *ikré* —, Cuxiú-negro (*Chiropotes satanas* Humb.) — *wixá* —, Cuxiú (*Ateles paniscus* L.) — *paxá* — und Macaco-de-noite (*Aotus infulatus*) — *makarumako* —. Aber gerade zur Affenjagd gehört recht viel Geschick, weil diese Tiere in den Wipfeln der hohen Bäume von Ast zu Ast springen und sich mittels Umwinden von einer Baumkrone zur anderen schwingen. — Katzenarten[391] werden verhältnismäßig selten geschossen, meist nur dann, wenn sie sich in der Nähe einer Maloka aufhalten und hierdurch eine Gefahr für die Menschen darstellen. Gegessen wird übrigens nur das Fleisch des Maracajá (*Felis pardalis Nouv.*). Bei manchem Jäger spielt aber auch der Ehrgeiz eine Rolle, solche Tiere zu erlegen, denn der Abschluß eines Jaguars, vor allem des schwarzen, erhöht sein Ansehen. — Schlangen, die, infolge der großen Feuchtigkeit, hier sehr zahlreich auftreten, erschlägt man mit einem Stock. Wird eine Surucucu (*Lachesis muta* L.) — *pereima* — (Surára-Wort) — *pekéma* — (Pakidái-Wort), die größte und gefährlichste Giftschlange Südamerikas, getötet, dann ist die Freude besonders groß. Der Kopf wird abgeschlagen, und jede Familie bekommt ein Stück des Schlangenkörpers, welches mit anderem Fleisch zusammen gekocht wird. Der Geschmack ist angenehm und erinnerte mich an Aal. Doch die Surára und Pakidái glauben außerdem, daß jede Person, welche das Fleisch einer Surucucu gegessen hat, niemals mehr von anderen Giftschlangen gebissen wird. Auch die Sucuriju (*Eunectes murinus*) — *xaikonyá* — und die Jibóia-vermelha (*Epicrates cenchris*) — *oatá* — werden mit Genuß verzehrt. Die Jararaca (*Lachesis* sp.) — *kurihirimá* —, die Papo-eva (*Spilotes* sp.) — *karimatá* — und die Cobra-coral (*Elaps corallinus* Wied.) — *kuamoxíke* — verspeist man dagegen nie. — Hin und wieder werden auch ein Kaiman (*Caiman sclerops* Schneid.) — *ikuá* — oder eine Eidechse — *xaruámá* — mittels eines Stockes erschlagen, und manchmal entdeckt der Jäger, aber noch häufiger sein Hund, im Urwald eine Jabuti (*Testudo tabulata* Walb.) — *tabaré* —, deren Fleisch auch recht zart und schmackhaft ist;

[388]) Hierzu nimmt der Jäger oft seine Frau mit (hat er zwei oder mehrere Frauen, so begleitet ihn meist die älteste), welche das erlegte Tier, oder Fleischstücke davon, in die Maloka tragen muß.

[389]) Auch bei den Waiká gibt es diese zwei Jagdmethoden, und die Namen lauten dort sehr ähnlich „kare" und „axwéwa". (Zerries, 1956b, S. 131).

[390]) Die gleiche Methode beschreibt Cooper von den Tapajó-Indianern. (Cooper, 1933, S. 96 und Taf. 3).

[391]) Gefleckter Jaguar (*Felis onca* L.) — *tikoé* —, Schwarzer Jaguar (*Panthera onca* L.) — *kaikuaxé* —, Puma (*Felis concolor*) — *xapuxerimá* —, Maracajá (*Felis pardalis Nouv.*) — *yaxé* —.

an diejenige der Wasserschildkröte reicht es allerdings nicht heran. Doch von deren zahlreichen Arten, welche den Demini, Aracá und ihre Nebenflüsse bevölkern, fangen die Surára und Pakidái nur die Perema — *taimã* —, und zwar greifen sie diese im seichten Wasser mit den Händen.

Besondere Übung ist für die Vogeljagd erforderlich. Deshalb hält man schon die Knaben an, möglichst viele kleine Vögel zu erlegen, damit sie später einmal gute Jäger werden.

Folgende Vögel werden am häufigsten gejagt, und zwar sowohl des Fleisches als auch der Federn wegen: Mutum (*Crax* sp.) — *paruri* —, Urumutum (*Crax* sp.) — *kalard* —, Mutum cavalo (*Milu mitu* L.) — *kalauri* —, Jacamim (*Psophia crepitans* L.) — *nhapin* —, Cujubim (*Pipile pipile cujubi* Pelz.) — *maraxi* —, Jacu (*Penelope* sp.) — *kuremã* —, Japim (*Cacicus cela* L.) — *anhakoramã* —, Inambu (*Crypturellus* sp.) — *rororóme* —, Inambu-relógio (*Crypturellus strigulosus* Temm.) — *konamã* —, Tucano (*Rhamphastus* sp.) — *mahebé* —, Arara vermelha (*Ara macao* L.) — *arahahé* —, *Arara amarela* (*Ara ararauna* L.) — *maracanã* —, Papagaio moleiro (*Amazona* sp.) — *xerazeramahé* —, Papagaio curica (*Amazona* sp.) — *xerazerã* —, Garça branca (*Casmerodius albus egretta* Gm.) — *korihemã* —.

Der Gavião-real (*Thrasaetus harpyia* L.) — *sonaxi* — wird aus magischen Gründen erlegt, weil man glaubt, daß sich in ihm ein feindlicher Medizinmann verbirgt, der Krankheiten und anderes Unheil bringt. Seine Flaumfedern werden von den Männern als Trophäen in das Haar geklebt (s. S. 44); das Fleisch wird fortgeworfen. Auch den Gavião-caipira (*Hypomorphnus urubitinga urubitinga* Gm.) — *sonaxiſõhe* — tötet man nur seiner Federn wegen, die den Männern als Oberarmschmuck dienen.

Auf die Urubus (*Catharies foetens, Catharies aura*, etc.) — *nahahã* — wird nie geschossen, denn man freut sich, daß sie den Unrat beseitigen.

Abschließend ist noch zu erwähnen, daß den Surára und Pakidái Fallen unbekannt sind[203].

[203]) Entsprechend lautet eine dienstägliche Aussage von Zerries über die Waiká. (Zerries, 1956b, S. 131).

Hat der Jäger ein kleines Tier erlegt, so kann er diese Jagdbeute für sich und seine Angehörigen behalten; doch dem Häuptling gibt er oft ein gebratenes oder gekochtes Stück davon ab. Handelt es sich dagegen um ein Großwild, so wird dasselbe, unter Aufsicht des Häuptlings, aufgeteilt, und jede Familie bekommt ein Fleischstück. Dieser Gemeinschaftssinn ist sehr stark ausgeprägt, und nie würde ein Stammesangehöriger dagegen verstoßen.

c) Fischfang

Der Fischfang spielt eine ganz untergeordnete Rolle und wird seit alter Zeit nur vom Ufer aus mit Bogen und Pfeil betrieben. Fangmethoden mittels Gift oder Käscher, Reusen und ähnlicher Geräte sind nicht bekannt. Neuerdings verwenden diese Indianer jedoch hin und wieder Angelhaken aus Metall[204], die ihnen von Gummi- und Palmfasersammlern sowie vom Indianerschutzposten am Rio Demini überlassen wurden. Trotzdem hat sich ihr Interesse am Fischfang dadurch nicht wesentlich verstärkt, denn die Fische gehören nun einmal nicht zu ihren bevorzugten Nahrungsmitteln. Hinzu kommt, daß nur kleinere Arten gegessen werden dürfen[205], weil alle großen den bösen Atem des Flusses in sich haben und daher Krankheiten sowie anderes Unheil hervorrufen. So verabscheuen sie natürlich besonders den Pirarucu *(Osteoglossidae)*, diesen über 3 m langen, größten Süßwasserfisch, dessen getrocknetes Fleisch für die Caboclo-Bevölkerung (Pflanzer, Gummi- und Palmfasersammler) geradezu eine Basis der Ernährung darstellt, und auch das köstliche Fleisch der großen Wasserschildkröten wird aus diesem Grunde von ihnen verschmäht.

[204]) Sie befestigen diese an einer Schnur aus Baumwolle oder Bromeliafasern.

[205]) Aracu (*Leporinus copelandi* Steind.), Piranha (*Pygocentrus* sp. und *Serrasalmus* sp.), Surubim (*Platystoma* sp.), Jandiá (*Soiluridae* sp.), Mandi (*Rhamdia* sp.), Curimatã (*Prochilodus* sp.), Pescada (*Gadus* sp.), Dourado (*Salminus brevidens*), Tamboqui (*Characinidae* sp.), Mandubi (*Anchenipteridae* sp.), Anujá (*Trachycoristes* sp.), Cuiú-cuiú (*Oxidoras niger Val.*), etc.

Auch bei den Waiká rangiert der Fischfang im Rahmen des Nahrungserwerbes an letzter Stelle und wird dort ebenfalls mit Bogen und Pfeil sowie seit neuerer Zeit mit Angelhaken durchgeführt. Doch es ist bemerkenswert, daß sie außerdem eine Fischfangmethode durch Vergiften des Wassers kennen[380a]) [380b]) [381]).

d) Sammeln

An der Sammeltätigkeit sind nicht nur Frauen, sondern auch Männer beteiligt. Letzteren obliegt vor allem das Einbringen von Früchten der zahlreichen Palmenarten[382]), von denen nachstehend die wichtigsten aufgezählt werden: Açaí (*Euterpe oleracea* Mart.) — *uaiima* —, Bacaba (*Oenocarpus distichus* Mart. oder *Oenocarpus bacaba* Mart.) — *hokomahé* —, Buçu (*Manicaria saccifera* Gaertn.) — *yauetoshi* —, Buriti (*Mauritia vinifera* Mart.) — *ciewexi* —, Caruá (*Attalea spectabilis* Mart.) — *yanaiod* —, Tucumã (*Astrocaryum* sp.) — *pahá* —[383]) und Pupunha (*Guilielma speciosa* Mart.) — *komunamá* —[384]). Die Früchte von kleineren, sehr leicht zu ersteigenden Palmen, wie Piaçaba (*Attalea funifera* Mart. e *Leopoldinia piassaba* Wal.) — *tanhari* — und Ubim (*Geonoma* sp.) — *homixi* —, werden von Männern und Frauen in gleicher Weise gesammelt.

Eine Arbeitsteilung beider Geschlechter ist beim Einbringen von Früchten der an den Ufern von Flüssen und Bächen wachsenden Ingá-Bäumen (*Inga* sp.) — *kepó* — zu beobachten. Man unterzieht sich hier aber nicht der Mühe, die hohen, breitästigen Bäume zu erklettern. Sie werden von den Männern gefällt, und Frauen sowie Kinder reißen danach die langen, dunkelgrünen, hartschaligen Schoten ab, deren Bohnen in einem weißen, schwammigen, zuckersüßen Fruchtfleisch sitzen. Dasselbe wird ausgesaugt und dann mit dem Kern fortgespuckt. Jenem Genuß geben sich Männer, Frauen und Kinder schon während der Arbeit hin, doch die Masse der Schoten wird mittels Lianen zusammengebunden und von den Frauen in die Maloka getragen, wo man das Fruchtfleisch weiter mit großem Behagen auslutscht. — Auch die Früchte des wilden Cajú-Baumes (*Anacardium* sp.) — *uitó* — [381]) werden in der gleichen Weise, d. h. durch Fällen der Bäume, geerntet. Hiervon essen die Surára und Pakidái aber nur den länglichen dunkelrot glänzenden Fruchtboden, der außerordentlich saftig ist und besonders als angenehme Erfrischung geschätzt wird. Den nierenförmigen, grünlich-schwarzen Kern ißt man dagegen nicht. — Sehr beliebt sind die Früchte der Kastanie, Castanha-do-pará[385]) (*Bertholletia excelsa H.B.K.*) — *hokoó* —. Wenn in der Regenzeit die Ouriços (kugelförmige Hülsen mit harter Schale, die mehr als 1 kg wiegen und zwischen 10—30 Kastanien enthalten) durch Windstöße von den hohen Bäumen fallen, zieht oft der ganze Stamm in die Kastanienwälder am unteren Aracá, resp. mittleren Demini, um hier eine reiche Ernte zu halten, woran sich auch wiederum beide Geschlechter beteiligen. Die Ouriços werden dort, wo man sie findet, mit einem Stein oder, falls schon vorhanden, mittels des Terçado (großes Buschmesser) aufgeschlagen, und die Kastanien schüttet man in die Tragkörbe. — Von den Früchten des wilden Kakaobaumes (*Theobroma* sp.) — *boroó* —, der viele Äste hat und dessen Laub dicht und dunkel ist, wird nur das süße Hülsenmark ausgesaugt, während man die Bohnen, welche bei den mittelamerikanischen Hochkulturvölkern solch große Rolle spielten, achtlos fortwirft[386]). — Die apfelähnliche Frucht des Lucumabaumes (*Lucuma macrocarpa* Hub.) — *kumatá* — schätzt man wegen ihrer süßlichen gallertartigen Masse, die den Kern umgibt; das

[380a]) Barker, 1953, S. 464/65
[380b]) Zerries, 1956b, S. 152.
[381]) Zerries, 1958c, S. 179.
[382]) Der generelle Name für Palmen lautet — *petahadno* —.
[383]) Zum Ersteigen der genannten Palmen benutzen sie den Kletterring (s. S. 35/36).
[384]) Da der Stamm dieser Palme mit spitzen Stacheln — *milmiçihá* — bedeckt ist, kann er nur mittels zweier besonders konstruierter Geräte erstiegen werden (s. S. 36/37).

[385]) Der entsprechende Waikáname lautet „widó" (Zerries, 1956b, S. 150).
[386]) Bei uns sind sie als Pará-Nüsse bekannt.
[387]) Gleiches berichtet Zerries von den Waiká, und hier lauten die Namen „loa" oder „boholoa". (Zerries, 1956b, S. 150; Zerries, 1958c, S. 177).

äußere Fruchtfleisch und die Schale haben dagegen einen sehr bitteren, unangenehmen Geschmack. — Auch wildwachsende Ananasfrüchte, welche nur die Größe eines mittelgroßen Apfels erreichen, werden mit Genuß verzehrt.

Mehr zur alltäglichen Kost tragen die besonders häufig gesammelten Schoten der Pacova sororoca bei, einer Musaceenart (*Ravenala guianensis* Benth.) — *mokohd* —[306]). — Bei gelegentlich auftretendem Nahrungsmittelmangel in der Regenzeit schätzt man auch heute noch die flachen, braunen Früchte des Topfbaumes (*Lecythis longifolia*), welche von den Surára *sapá* und von den Pakidái *kurupá* genannt werden[307]).

Neben diesen wichtigsten pflanzlichen Sammelprodukten gibt es auch eine große Zahl von tierischen. Hier ist vor allem der Honig mehrerer kleiner Bienenarten zu nennen[308]), der leicht und gefahrlos zu gewinnen ist, da die Bienen stachellos sind. Meist haben sie ihre Nester in hohlen Bäumen oder im Erdboden. Gelegentlich sieht man aber auch angebaute Nester an hohen Bäumen; letztere werden dann zum Zwecke des Honigerwerbs von den Männern gefällt. Der Honig wird mit der Hand oder mittels einer Kalebasse aus dem Nest geschöpft und in ein gefaltetes Palmblatt gefüllt, welches man dann zusammenwickelt und mit in die Maloka nimmt. — Auch Vogeleier bilden eine beliebte Bereicherung der Ernährung, desgleichen das nahrhafte Dotter der Eier von Wasserschildkröten; das Eiweiß wirft man dagegen fort, weil es einen unangenehmen, tranigen Geschmack hat. Während der Trockenzeit, besonders in den Monaten Dezember—Februar, sammeln die Surára und Pakidái diese Schildkröteneier in großen Mengen auf den Sandbänken des Demini und Aracá. — Weiterhin sind Krebse und Krabben zu erwähnen, die aus den Löchern im Uferschlamm gezogen werden. — Außerdem beobachtete ich, daß sie bestimmte Frosch- und Spinnenarten essen sowie Insektenlarven, Raupen, Termiten und die Hinterteile der Blattschneiderameise (*Atta* sp.) — *anaenend* —.

c) Feldbau

Obgleich der Feldbau bei den Surára und Pakidái erst vor verhältnismäßig kurzer Zeit eingeführt wurde, haben sie doch schon eine bemerkenswerte Methodik hinsichtlich der Anlage ihrer Felder entwickelt. Diese sind nämlich stets kreisförmig um die Maloka herum angelegt. Man verfährt in der Weise, daß zunächst bei Beginn einer Trockenzeit, Oktober—November, ein größeres Stück Urwald gerodet wird, wobei man schon darauf achtet, daß die Kreisform entsteht. Zum Abhauen des Unterholzes und der Lianen bedienen sich die Männer der Terçados (große Buschmesser), und die Bäume werden mit Stahläxten gefällt[309]). Nach etwa zwei Monaten, wenn das umgeschlagene Holz gut angetrocknet ist, wird die Rodung angezündet, und die zurückgebliebenen Aschensalze bilden gleichzeitig den Dünger. Große Stämme, Baumstümpfe und Äste, die nicht verbrannten, läßt man einfach liegen und pflanzt dazwischen die Gewächse an (Abb. 37). Nur in der Mitte der Rodung wird ein Kreis von etwa 50—60 m Durchmesser vollständig gesäubert, denn hier errichtet man eine offene oder geschlossene kreisförmige Maloka. Jene Roça (Waldrodung) — *kihari* —, welche das Gemeinschaftshaus umgibt, wird dann durch den Häuptling an die einzelnen Familien aufgeteilt, damit diese hier Bananenstauden, Pupunha-Palmen, Maniok, Taioba, Caré, Baumwolle, Tabak usw. anpflanzen können[310]). Roden und Feldbau, einschließlich des Jätens, obliegt den Männern; die Frauen helfen nur bei der Ernte. Da der Boden aber sehr unfruchtbar ist,

[306]) Die Pacova-sororoca wird wegen ihrer großen Blätter, die denen der Bananenstauden ähneln, oft fälschlich „wilde Banane" genannt.

[307]) Die Waiká haben hierfür den Namen „wahe". (Zerries, 1956b, S. 149; Zerries, 1958c, S. 177); Ihering, 1953, S. 443).

[308]) Es soll mehr als 20 verschiedene Arten davon geben.

[309]) Diese Gegenstände der Zivilisation tauschen die Surára von Palmfruchtsammlern ein, und die Pakidái erhalten sie vom Indianerschutzposten Ajuricaba am mittleren Demini.

[310]) Da aber noch nicht in allen Familien das Interesse für den Feldbau geweckt ist, kommt es vor, daß manche auf ihren Anteil verzichten, der dann von einer anderen Familie mit bearbeitet wird.

denn er besitzt nur eine dünne Humusschicht, welche durch die tropischen Regenfälle zudem noch ständig ausgelaugt wird, ist ein Anbau von Knollenfrüchten höchstens drei Jahre lang möglich[369]). Danach beginnt außerhalb des bisherigen kreisförmigen Feldstreifens erneut die Arbeit des Rodens und Abbrennens. Dies kann sich mehrmals wiederholen, so daß die Maloka schließlich von drei, vier und mehr ringförmigen Feldern umgeben ist, bis der Stamm eines Tages an einer anderen Stelle seine Maloka erbaut und neue Felder anlegt. Doch Bananenstauden und Pupunha-Palmen läßt man in den alten Rodungen stehen, pflanzt solche aber auch stets in den neuen mit an, da diese Fruchtbäume ja 6—8, bzw. 50 Jahre (Pupunha-Palme) Erträgnisse liefern; ihre Früchte werden regelmäßig geerntet, selbst auf längst verlassenen, weit entfernten Feldern.

Erwähnenswert ist noch die Tatsache, daß sowohl die Surára als auch die Pakidái gegenwärtig in einem Jahr jeweils an zwei weit auseinanderliegenden Orten regelmäßig ihren Feldarbeiten nachgehen. In der Regenzeit, April—September, leben die Surára bekanntlich an der Cachoeira dos Índios am oberen Aracá und die Pakidái an einem rechten Nebenarm des mittleren Demini, wo sie auch Felder besitzen. Die Sommerzeit verbringen sie dagegen gemeinsam in der großen, offenen Surára-Maloka (zwischen den Flüssen Demini und Aracá), um die herum man eine so große Roça angelegt hat, daß sie auf die Surára- und Pakidái-Familien aufgeteilt werden konnte. So verfügen beide Stämme an ihren festen Wohnsitzen stets über reichliche Ernteerträge. Dazu kommen noch die Bananen und Pupunha-Früchte von verlassenen Feldern, wohin der ganze Stamm zur Zeit dieser Ernte zieht, oder es werden Sammelzüge unternommen, um Kastanien, Ingá- u. a. Wildfruchtarten einzubringen.

Da nun aber wegen der halbnomadischen Lebensweise jener Indianer die eine oder andere Waldrodung für kürzere oder längere Zeit unbeaufsichtigt bleibt, besteht die Gefahr, daß in der Zwischenzeit Angehörige feindlicher Stämme hier eindringen und sich der Früchte bemächtigen. Doch für diesen Fall wird Vorsorge getroffen. Bevor der Stamm eine seiner Rodungen verläßt, stecken einzelne vom Häuptling beauftragte Männer mehrere mit Gift überzogene hölzerne Pfeilspitzen und Stacheln der Pupunha-Palme in den Boden und legen Blätter darüber. Feindliche Indianer laufen also bei einer beabsichtigten Plünderung Gefahr, sich dieselben in die Beine zu treten[370]). Wie man mir sagte, würde jene Sitte von allen Yanomámi-Stämmen angewandt, und aus diesem Grunde ließe es sich auch kein Indianer einfallen, jemals die verlassene Rodung eines anderen Stammes zu betreten[371]).

Unter den pflanzlichen Nahrungsmitteln der Surára und Pakidái nehmen heute die Bananen, von denen ich neun verschiedene Arten vorfand, die erste Stelle ein. Hiervon wiederum wird am häufigsten die Mehlbanane (*Musa paradisiaca normalis*; die regionale Caboclo-Bevölkerung nennt sie pacovinha) — *kurá* — kultiviert[372]). *Kurá* ist aber auch die generelle Bezeichnung für alle Bananen[373]). Außerdem nannte man mir für die übrigen acht Arten noch folgende spezielle Namen[374]):

[369]) Das üppige Wachstum des Urwaldes erklärt sich nur durch die Feuchtigkeit und Wärme des Klimas, welches wie Treibhausluft den Kreislauf der Nährstoffe beschleunigt.

[370]) Alle Indianer dieser Region laufen barfuß.

[371]) Auch für Forschungsreisende, die einmal in diesem Gebiet arbeiten wollen, dürfte dieser Hinweis von größter Bedeutung sein.

[372]) Bezüglich ihrer Herkunft schreibt Sauer: „The plantains and bananas (Musa paradisiaca) originated in southeastern Asia and were there bred into a great variety of seedless cultivated forms. Their presence in the New World is considered by many as due to post-Columbian introduction." (Sauer, 1950, S. 526).

[373]) Zerries belegt den gleichen Namen für die Waiká (Zerries, 1956b, S. 132, 155), und Koch-Grünberg gibt von den karaibischen Arekuná-Taulipang folgende Namen an: „kurá:tana", „kura:taná", bzw. „kuratanâ" (Koch-Grünberg, 1928, S. 47, 268). Sehr ähnlich lautet die entsprechende Xiriána-Bezeichnung, nämlich „kalatá:ha" (Koch-Grünberg, 1928, S. 360). Dadurch wird eindeutig bewiesen, daß die Banane, oder zumindest eine Art, von karaibischen Stämmen zu den Waiká, Xiriána, Surára und Pakidái gelangten. Auch die Ursprungsmythe der Banane, welche mir der Surára-Häuptling erzählte (s. S. 114), läßt erkennen, daß diese Frucht erst in jüngster Zeit von außen kam.

[374]) Sehr ähnliche Bezeichnungen verwenden auch die Waiká für bestimmte Bananenarten. (Zerries, 1956b, S. 153).

Bezeichnung der Surára und Pakidái:	Bezeichnung der regionalen Caboclo-Bevölkerung:
pakatarimã	pacovão
kuratá pauxiní	inajá
nahaxiní	São Tomé roxa
rohojá	São Tomé branca
rohomã	banana maçã(?)
paraud	caité
rodrewöhdhö	banana bajé
xiahima	Banana govêrno[228])

Mittels eines 1,60—1,80 m langen Grabstockes aus dem Holz der Pupunha-Palme, welcher unten eine abgeflachte Spitze hat (Abb. 38), oder eines abgebrochenen Bogenstabes werden Setzlinge von Bananenstauden in der Rodung gepflanzt, und schon nach wenigen Monaten sind sie herangewachsen und tragen Früchte. Sowohl die Arbeit des Pflanzens als auch die Betreuung der Stauden obliegt den Männern, während die Frauen nur bei der Ernte helfen[229]).

Neben den Bananen wird im besonderen Maße die Pupunha-Palme (*Guilielma speciosa* Mart.) — *homunamã* — kultiviert. Zur Anpflanzung verwendet man Setzlinge, doch gelegentlich auch Kerne. Diese Palmen, welche stets zwischen den Bananen stehen, verleihen den Rodungen der Surára und Pakidái ein charakteristisches Gepräge (Abb. 37). Ihr 18—20 m hoher Stamm, der mit spitzen Stacheln — *mitmiçihõ* — bedeckt ist und daher nur mit einem besonders konstruierten Gerät erstiegen werden kann (s. S. 56), trägt sehr schmale, gefiederte Blätter, die an den Spitzen gekräuselt sind und sich immer leicht im Winde wiegen. Wie Wächter stehen sie im Umkreis des Gemeinschaftshauses und scheinen den Bewohnern der großen, offenen Maloka beständig huldvoll und beruhigend zuzunicken (Abb. 6). Bemerkenswert sind ihre Früchte — *marazã* —[230]), von denen jeweils 50—80 eine Traube bilden. Nur einmal im Jahr, zwischen September—April, können sie geerntet werden, doch jede Palme hat mindestens drei, manchmal auch vier Trauben, d. h. rund 200—300 Früchte. Anfangs sehen diese gelb aus, doch nach dem Reifen nehmen sie eine leuchtend rote Farbe an. Gegenüber anderen Palmfrüchten zeichnen sie sich durch besonders reichliches Fruchtfleisch aus.

Hinsichtlich der Frage, ob die Pupunha-Frucht Kerne hat oder nicht, gibt es verschiedene Auffassungen. Zerries fand keine kernlosen[231]). Dagegen sah ich sowohl Früchte mit als auch ohne Kerne. Diese Beobachtung findet eine Bestätigung durch die Angaben von Sauer, welcher schreibt: „In many cases it has lost the capacity to produce fertil seeds..."[232]). Doch auch Alexander von Humboldt[233]) und Vinci[234]) erwähnen solche kernlosen Früchte[235]).

Die Kultivierung von Knollenfrüchten, welche man stets abseits der Bananenpflanzungen durchführt, wird bisher nur in einem sehr bescheidenen Maße betrieben. Es handelt sich dabei um den Anbau von Taioba oder Taro (*Colocasia antiquorum* und *Xanthosoma violaceum* Schott.) — *ohtad* —[236]); Cará oder Yams (*Dioscorea* sp.) — *cabiromã* —; süßen Maniok, in Brasilien Macaxeira, Aipim oder Mandioca doce genannt, (*Manihot palmata* Muell. Arg.) — *mihitarima* —; bitteren Maniok (*Manihot utilissima* Pohl) — *kumirimakhi* — und Süßkartoffeln (*Ipomoea batatas Lam.*) — *hikori* —[237]). Erwähnenswert sind dann noch die Zuckerrohrpflanzungen (Zuckerrohr (*Saccharum officinale*) — *bukis* —[238])) und das Fehlen von Mais[239]).

[228]) Eine botanische Klassifizierung jener Arten konnte ich leider nicht durchführen.

[229]) Bei den Waiká werden die Stauden von Männern und Frauen betreut. (Zerries, 1956b, S. 153).

[230]) Sehr ähnlich lautet der Name bei den Waiká — „bahe". (Zerries, 1956b, S. 149).

[231]) Zerries, 1956b, S. 149.

[232]) Sauer, 1950, S. 525.

[233]) Alexander von Humboldt, 1860, III, S. 281.

[234]) Vinci, 1956, S. 370—375.

[235]) Zerries hält es übrigens für möglich, daß bei den Waiká die Pupunha-Frucht die Vorgängerin der Mehlbanane war. (Zerries, 1956b, S. 149).

[236]) Bei den Waiká lautet der entsprechende Name „ohime". (Zerries, 1956b, S. 153).

[237]) Die Waiká nennen die Süßkartoffel „higuli". (Zerries, 1956b, S. 153).

[238]) Die Waiká haben für Zuckerrohr das gleiche Wort. (Zerries, 1956b, S. 153).

[239]) Für die Waiká ist der Anbau erst durch Zerries belegt. Doch der Mais, so fügt er hinzu, „ist wenig mehr als eine exotische Delikatesse." (Zerries, 1956b, S. 153).

Neben den für die Ernährung bestimmten Kulturpflanzen werden auch solche gezogen, die als Genußmittel Verwendung finden. Hierbei handelt es sich vor allem um Tabak (*Nicotiana tabacum*) — *pesudhe* —[287]) und um ein Pfeffergewächs (*Piperacea* sp.) — *maxarahd* —[288]), das zur Herstellung des narkotischen Schnupfpulvers benötigt wird (s. S. 88f.), sowie um —*perahi* —[289]) (*Piper caudatum* Vahl.), portugiesisch pimenta-dos-Indios, womit sie die Speisen würzen.

Schließlich ist noch der Anbau von Pflanzen zu erwähnen, welche wichtige Bedarfsartikel liefern. Es sind Pfeilrohr (*Sagittaria montevidensis* Cham. et Schl.) — *zarekabe* —, der Urucuzeiro (*Bixa orellana* L.), aus dessen Samen, die sich in einer stachligen Fruchtkapsel befinden, man den roten Farbstoff Urucu — *nard* — gewinnt (s. S. 57), sowie eine Bignoniacee (*Crescentia cujete Lin.*) und Cucurbitaceen (*Cucurbita lagenaria* L. und *Cucurbita idolatrica* Lacerda), deren Früchte als Gefäße verwendet werden (s. S. 53).

Verhältnismäßig jungen Datums ist der Anbau von Baumwolle (*Gossypium barbadense* oder *hirsutum*) — *xinarl* —.

8. Nahrungsbereitung

Die Bereitung fester Nahrung liegt fast ausschließlich in den Händen der Frauen, doch den Männern bleibt das Braten von Wildbret vorbehalten[290]). Hierbei gibt es zwei Methoden: Die einfachste und gebräuchlichste besteht darin, daß man ein Fleischstück auf einen zugespitzten Stock spießt, diesen schräg gegen das Feuer in die Erde steckt und von Zeit zu Zeit dreht, damit alle Seiten gleichmäßig der Hitze ausgesetzt werden. Daneben gibt es viereckige Bratständer (portug. Moquém) mit Rosten aus Holzstäben, welche in der gleichen oder dreieckigen Form bei fast allen Naturvölkern des tropischen Südamerika bekannt sind[291]). Des Bratständers bedienen sich die Männer meist dann, wenn das Fleisch von großen Tieren, wie Tapiren und Wildschweinen, zubereitet werden soll, da man so gleich mehrere Stücke auf einmal braten kann. Hin und wieder sah ich aber auch einen ganzen Affen auf dem Rost liegen. Damit beim Braten kein Fett verloren geht, zieht man die Haut vorher nicht ab, sondern erst dann, wenn man sich zum Essen niedersetzt. Doch die Eingeweide werden den Tieren vor dem Braten oder Kochen herausgenommen. Diese wirft man aber nicht fort, sondern hüllt sie in Palmblätter und läßt dieselben in der heißen Asche dünsten, um sie danach mit großem Genuß zu verspeisen. Wird der Bratständer benutzt, so läßt man Tag und Nacht ein gleichmäßiges, nicht zu starkes Feuer darunter brennen. Vor Festen, wenn man ausnahmsweise größere Fleischmengen, besonders vom Tapir, konservieren will, läßt man die Stücke solange auf dem Rost liegen, bis sie schwarz und knochenhart sind.

Von den Frauen werden kleinere Fleischstücke in Tongefäßen[292]) und gelegentlich auch schon in Aluminiumtöpfen[293]) gekocht oder gesotten, und zwar häufig zusammen mit grünen Bananen. Der Topf wird einfach zwischen die brennenden Holzscheite gestellt. Ganz begeistert waren die Frauen von meinen leeren Benzinkanistern, in welchen sie oftmals einen ganzen Cutia, Paca oder Affen kochten. Schlangenfleisch wird nur im gekochten Zustand gegessen. Fische wickelt man in Blätter und läßt sie in der heißen Asche dünsten.

[287]) Das Waikâ-Wort hierfür lautet „be". (Zerries, 1956b, S. 154).

[288]) Diesen Gewächs wird auch von den Waikâ angebaut und mit nahezu demselben Namen bezeichnet „mashe hara" (Zerries, 1956b, S. 154).

[289]) Die Waikâ nennen jene Pfefferpflanze „blaki". (Zerries, 1956b, S. 154).

[290]) Nach Baldus findet man dieses Vorrecht der Männer bei den meisten brasilianischen Stämmen: „Entre os povos naturais do Brasil, as grandes caças são assadas ou moqueadas, em geral, pelos homens." (Baldus, 1950, S. 7).

[291]) Diese Bratständer werden in folgender Weise angefertigt: Man steckt vier oben gegabelte Stöcke in den Boden, so daß ein Viereck gebildet wird, legt Querstäbe in die Gabeln und Stöcke darüber, welche man mit Lianen befestigt.

[292]) Diese stammen von den Xirianá.

[293]) Hierbei handelt es sich um Tauschartikel der Caboclos (Pflanzer, Gummi- und Palmfasersammler), bzw. Geschenke des Indianerschutzpostens am Rio Demini.

Vielseitige Zubereitungsmöglichkeiten bieten die Vegetabilien. Bananen werden vorwiegend im noch grünen Zustand, nachdem man vorher die Schale abgezogen hat, in der heißen Asche geröstet (der Geschmack erinnerte mich stets an ein frisches Brötchen) oder, in kleine Stücke geschnitten, gekocht, im letzteren Falle meist zusammen mit Fleisch. Als besondere Delikatesse gilt eine Suppe, welche man aus reifen Bananen bereitet[284]). Im rohen Zustand werden Bananen nur selten gegessen. — Die mehligen, nahrhaften Früchte der Pupunha-Palme werden in erster Linie gekocht. Danach läßt man die Suppe erkalten und gewinnt so ein erfrischendes Getränk. Vor Festen gießen es alle Frauen in einen großen, hölzernen Trog, der sich in jeder Maloka befindet, damit genügend Vorrat vorhanden ist. Durch Dünsten oder Rösten bereitet man aus ihnen aber auch eine feste Nahrung[285]). — Taioba, Cará, süße Kartoffeln und süßer Maniok werden ungewaschen und ohne vorherige Entfernung der Schale in einem Topf gedünstet oder in der heißen Asche geröstet. — Bitterer Maniok wird von den Frauen mittels des lanzettförmigen Bambusmessers (s. S. 55) geschabt und danach auf einer rauhen Granitplatte gerieben, denn Reibebretter besitzen sie nicht[286]) [287]). Die geriebene Masse wird anschließend mittels kleiner rechteckiger Geflechtsstreifen (s. S. 52), welche man zusammenrollt, mit den Händen ausgepreßt[288]). Bei den Surára fand ich auch drei und bei den Pakidái fünf Preßschläuche vor, die sie von den Xiriána erhalten hatten (s. S. 51/52). Aus dem Mehl backen die Frauen auf großen, flachen Granitsteinen, unter denen man ein Feuer entzündet, Maniokfladen, die gern verzehrt werden. Dieses Nahrungsmittel, welches erst vor verhältnismäßig kurzer Zeit bei ihnen Eingang fand, scheint sich immer mehr durchzusetzen. Die Bereitung von Kaschiri ist unbekannt[289]). Großer Beliebtheit erfreut sich bei den Surára und Pakidái auch das geröstete Maniokmehl, welches sie gelegentlich von Palmfasersammlern eintauschen, bzw. vom Indianerschutzposten am Demini als Geschenk erhalten. Sie selbst können es noch nicht herstellen, weil ihnen ja hierzu große, eiserne Pfannen fehlen.

Auch verschiedene Früchte wildwachsender Pflanzen bedürfen einer besonderen Zubereitung. Die weißen Kerne, welche sich in den Schoten der Pacova-sororoca (s. S. 79) befinden, muß man vor dem Genuß rösten. Der Geschmack stimmt übrigens völlig mit geröstetem Mais

[284]) Die Banane im allgemeinen und diese Suppe im besonderen spielen im religiösen und sozialen Leben der Surára und Pakidái eine große Rolle. Junge Männer müssen sich anläßlich ihrer Ausbildungszeit als Medizinmannsgehilfen mit einer Banane als täglicher Nahrung begnügen (s. S. 67). Beim Totenerinnerungsfest wird solch eine Suppe, vermischt mit der Knochenasche verstorbener Stammesangehöriger, von den Männern getrunken (s. S. 106). Kleine Mädchen dürfen Bananensuppe während ihrer ersten und zweiten Menstruation als einzige Ernährung zu sich nehmen (s. S. 66), und für schwangere Frauen stellt sie das wichtigste Nahrungsmittel dar, auch noch mehrere Monate nach der Entbindung. Bei den Tapirapé dagegen, wo ja die Banane auch eine Basis der Ernährung darstellt, müssen sich die Eltern nach einer Geburt des Genusses dieser Frucht enthalten. „They believe that the child would die if they disregarded this rule." (Baldus, 1956b, S. 601).

[285]) Alexander von Humboldt bezeichnet die Pupunha- oder Pihiguao-Palme übrigens als „Pfirsichpalme" und rühmt den köstlichen Geschmack ihrer Früchte. (Alexander von Humboldt, 1860, III, S. 281f., 300; IV, S. 145). Hierin kann ich dem großen Gelehrten allerdings nicht beistimmen, denn wir schmeckten sie wie etwas bittere Kartoffeln. Der gleichen Ansicht ist übrigens auch Zerries. (Zerries, 1956b, S. 148).

[286]) Mein Diener Mateus hatte ihnen jedoch aus Seiten unserer leeren Benzinkanister einige Reibebretter angefertigt, indem er mit einem Nagel zahlreiche Löcher hindurchbohrte. Sie waren darüber sehr glücklich und sagten aus, daß es sich hierauf wesentlich angenehmer reiben ließe. Sie hatten auch gleich einen Namen für dieses Reibebrett bereit — *Aduripimund* —.

[287]) Auch die Xiriána reiben die Maniokwurzeln auf rauhen Granitplatten. (Koch-Grünberg, 1923a, S. 306).

[288]) In derselben Weise wird die Maniokmasse bei den Xiriána entgiftet. (Koch-Grünberg, 1923a, S. 306).

[289]) Doch da mein Diener, ein ruhebedürftiger Tukuna-Indianer, beim Anblick der Maniokfladen ein großes Gelüst nach einem leichten Alkoholrausch verspürte, brachte er den Surára bei, wie man Kaschiri herstellt. Erst probierten sie recht kritisch diesen unbekannten Getränk. Doch schon nach dem ersten Schluck leuchteten ihre Augen, und sie schlugen Hatemo begeistert auf die Schultern und versicherten immer wieder, wie gut es ihnen schmeckte.

überein. — Die Früchte des Topfbaumes (s. S. 79) werden zunächst gekocht, wozu sich die Frauen besonders gern meiner leeren Benzinkanister bedienten, und dann mit dem Messer aus Schildpatt (s. S. 55) aufgeschnitten. Hierauf schüttet man sie in einen oder mehrere der großen geflochtenen Körbe — *aturund* — (s. S. 49) und hängt sie für vier Tage am Uferrand eines Flusses ins Wasser, um ihnen die Bitterstoffe zu entziehen. Danach werden sie von den Frauen noch tüchtig mit den Füßen gerieben. In der Gunst der „Feinschmecker" nehmen diese Früchte zwar nur eine zweitrangige Stelle ein, aber sie füllen doch wenigstens den Magen. Außerdem wurde mir versichert, daß diese Frucht in alter Zeit, d. h. vor der Einführung der Banane, eine wesentlich größere Rolle im Nahrungsmittelhaushalt gespielt hätte.

Alle aufgezählten Speisen werden in der Regel ohne Gewürz gegessen. Nur hin und wieder fügen einige Männer und Frauen etwas von ihrem angebauten Pfeffer hinzu, der vorher geröstet wird. Meinem Salz, wovon ich mehrere Kilogramm mitgebracht hatte, in der Annahme, daß sich die Indianer darüber freuen würden, gewann kein einziger Stammesangehöriger Geschmack ab, und es bestand keinerlei Interesse, etwas davon zu erwerben[105]).

Diese Abneigung gegen das Salz findet man auch bei vielen anderen Stämmen, und schon in einer Nachricht aus dem XVI. Jahrhundert kann man folgende Bemerkung lesen: „Die Waldleute können kein Salz gebrauchen, weil es sie krank macht, denn sie sind nicht daran gewöhnt; essen sie es, so sterben sie fast immer in kurzer Zeit"[106]). Es sei auch noch auf eine Aussage von Roquette-Pinto verwiesen, worin er zum Ausdruck bringt, daß die Indianer der Serra do Norte alle gesalzenen Gerichte zurückweisen[107]).

Doch es gibt auch Stämme, bei denen sich das Salz einer gewissen Wertschätzung erfreut. So berichtet Herbert Baldus von einem Bororo, der sich darüber beklagte, daß er nie genügend Salz aus der Missionsküche bekäme. Dabei war diesen Indianern das Salz früher unbekannt[108]). Die Tapirapé und Karajá haben das Salz ebenfalls sehr gern[109]), während es bei den Tupari nur die Männer mit Vorliebe verwenden, mehrere Frauen dagegen gar nicht[110]). Bemerkenswert ist noch der folgende Hinweis von Koch-Grünberg über die Arekuná-Taulipang: „Im allgemeinen salzen die Indianer die Speisen wenig, lieben aber das Salz sehr und nehmen es gern als Bezahlung für geleistete Dienste"[111]).

Reichhaltig ist die Zahl der Getränke, welche man aus dem nahrhaften Fruchtfleisch wildwachsender Palmen bereitet. Besonders beliebt sind die bläulichen, etwa pflaumengroßen Açaí- und Bacabafrüchte (s. S. 78), die zwischen Dezember—März reifen. In Kalebassen, die mit Wasser gefüllt sind, werden sie geknetet und gerieben. Dadurch entsteht eine graubraune, fettige Brühe, welche, nachdem man die fleischigen Hüllen herausgefischt und fortgeworfen hat, im Aussehen und Geschmack an Kakao erinnert und ungemein sättigt. Noch angenehmer schmeckten mir diese Getränke, wenn ich etwas Zucker hinzufügte. Die Indianer, welche davon probierten, waren aber von dieser Beimischung nicht begeistert, denn Zucker behagte ihnen ebensowenig wie Salz. Auch mit meinen Bonbons konnte ich weder Kinder noch Erwachsene beglücken. Die Früchte der Baçu-, Buriti-, Curauá-, Piaçaba- und Ubimpalme (s. S. 78) werden in der gleichen Weise zu Getränken verarbeitet, während man jene der Inajápalme vorher kocht. Die hieraus gewonnene Brühe schmeckt zwar recht fade, besitzt aber ebenfalls einen großen Nährwert.

Sodann ist noch zu erwähnen, daß auch aus dem gesammelten Honig stets ein Getränk bereitet wird, indem man ihn in Wasser auflöst. Nie habe ich beobachtet, daß er gegessen wird, wie es bei den Waika[112]) und verschiedenen

[105]) Die vom Körper benötigte Salzmenge führen sie ihm aber durch die Holzasche zu, womit die Tabakrolle (s. S. 88) gemischt wird.

anderen Stämmen Guayanas[109]) [110]) festgestellt wurde.

Wie die obigen Ausführungen zeigen, fehlt es den Surára und Pakidái in bezug auf Getränke nicht an Abwechslung, so daß sie sich nur in den seltensten Fällen des unvermischten Wassers bedienen müssen, wie es, nach den Ausführungen von Zerries, bei den Waiká der Fall ist[111]). Genau wie letzteren[112]) sind aber auch den Surára und Pakidái alkoholische Getränke völlig unbekannt.

9. *Mahlzeiten und Gebräuche beim Essen*

Morgens essen die Surára und Pakidái sehr wenig, meist nur ein bis zwei in der heißen Asche geröstete Bananen oder Wurzelknollen. Oft erlebte ich es auch, daß Männer und Frauen nüchtern zur Jagd, bzw. zum Sammeln aufbrechen. Wenn sie jedoch während ihres Umherschweifens auf wildwachsende Früchte stoßen, so langen sie tüchtig zu. Mittags werden kleine, leichte Mahlzeiten eingenommen, in Gestalt einer Bananensuppe, gerösteten oder gedünsteten Bananen, Pupunha-Früchten, süßen Kartoffeln usw. Manchmal sind auch noch einige Fleischreste vom Vortage da. Die tägliche Hauptmahlzeit findet erst nach dem Untergang der Sonne statt, im Schein der hellodernden Feuer. Denn jetzt ist die ganze Familie meist wieder beisammen, und die Jagdbeute, welche der Mann vielleicht am Nachmittag nach Hause brachte, oder die Sammelergebnisse der Frau sind zubereitet. Überall sieht man die Männer neben dem Feuer hocken und auf das Essen warten, wozu auch größere oder kleinere Fleischstücke gehören, die durch vegetabilische Kost ergänzt werden. Vor ihnen haben die Frauen jeweils einige Palmblätter ausgebreitet, als Unterlage für die Speisen. Zuerst essen die Männer, und sie bekommen auch die besten Fleischstücke. Wenn sie gesättigt sind, können die Frauen und Kinder mit dem Essen beginnen. Während der Mahlzeit wird nichts getrunken, doch danach labt man sich an einem Palmfrucht- oder Honiggetränk.

Gegessen wird mit den Händen. In einer Hand hat der Indianer ein gebratenes oder gekochtes Stück Fleisch und in der anderen eine geröstete Banane, einen Maniokfladen oder ähnliches. Zwischendurch greift man immer wieder in den Topf hinein und holt sich ein weiteres Stück heraus oder schneidet es vom hölzernen Bratspieß, resp. Bratständer, ab. Suppen werden aus Cuyenschalen oder Kalebassen getrunken, genau wie Palmfrucht- und Honiggetränke.

Wenn die Jagdbeute besonders gut ausfiel, so kann man beobachten, daß viele Indianer, Männer, Frauen und Kinder, die ganze Nacht hindurch essen, denn konserviert wird das Fleisch ja nur vor Festen. Die einzelnen Familienmitglieder liegen dabei gemütlich in der Hängematte, unterhalten sich, schlafen zwischendurch auch ein Weilchen, um sich dann erneut ein Fleischstück vom Bratspieß oder -ständer zu holen. Es ist erstaunlich, welche Mengen sie in solch einer Nacht verzehren. Doch anderseits können sie auch mit Leichtigkeit längere Zeit fasten.

Ein Schamgefühl beim Essen, wie es beispielsweise Karl von den Steinen von den Bakaïri beschreibt[113]), existiert nicht. Dagegen gibt es Speisetabus für Kranke, schwangere Frauen, für Mädchen während der ersten und zweiten Menstruation sowie für junge Männer anläßlich ihrer zweimonatigen Ausbildung als Medizinmannsgehilfen.

10. *Zahme Tiere*

Als einziges echtes Haustier findet sich bei den Surára und Pakidái nur der Hund — *hima* —. Daneben werden, aus Liebhaberei und Freude am Tier, noch europäische Hähne gehalten sowie kleine Affen, meerschweinähnliche Hamsterchen (*Cavia leucopyga*), Papageien, Ararus und Periquitos (*Conuridae*).

Bei den Hunden handelt es sich um zwei bellende Arten. Eine gleicht dem deutschen Schäferhund, während die andere, welche kurz-

[113]) Karl von den Steinen, 1894, S. 66.

haarig, weiß oder gefleckt ist, unserem Foxterrier sehr ähnlich sieht. Gut abgerichtete Jagdhunde, mit denen man auch einen einträglichen Tauschhandel betreibt, werden sehr liebevoll gepflegt und bekommen stets reichliches Futter, während man die übrigen auch schon mal vernachlässigt. Aber im Grunde genommen hängen die Indianer auch an diesen Tieren, was schon daraus zu ersehen ist, daß jede Familie, welche Hunde besitzt, meist ein bis zwei, hinter ihrer Feuerstelle ein „Hundebett", d. h. ein Schlafgestell für die treuen Hausgenossen, errichtet hat (Abb. 30) (s. S. 14). Bisweilen werden junge Hunde sogar von Frauen gestillt. Wenn eine Hündin geworfen hat, so bitten alle Verwandten und Freunde um die spätere Überlassung eines Jungen, dem sie nach Erhalt sofort einen Namen geben. Von Interesse ist es vielleicht auch, darauf hinzuweisen, daß die genannten Indianer ihre Hunde niemals heranpfeifen. Meist rufen sie dieselben mit ihren Namen, oder sie zischen, indem sie die Zungenspitze gegen die Zähne pressen[113]).

Niemals werden Hunde getötet, man läßt sie solange leben, bis sie vor Altersschwäche sterben. Auf meine Frage, ob früher jemals Hundefleisch gegessen wurde, gaben mir Männer und Frauen mit entsetzten Gesichtern verneinende Antworten. Dabei soll dieser Brauch einstmals bei verschiedenen Stämmen Guayanas geherrscht haben[114]). Hundemythen scheint es nicht zu geben.

Erwähnen möchte ich noch, daß es mir, anläßlich meines monatelangen, überaus freundschaftlichen Zusammenlebens mit den Surára und Pakidái trotz vieler Bemühungen, wobei mir die Indianer halfen, nicht gelang, auch die Zuneigung ihrer Hunde zu gewinnen. Es bedeutete schon viel, daß ich mit der Zeit von ihnen geduldet wurde. Daher kann ich Friederici voll und ganz zustimmen, wenn er schreibt: „Der Indianerhund hat immer den weißen Mann gehaßt, und umgekehrt der Hund des Europäers den Indianer. Die Ausdünstungen der Rassen sind so verschieden, daß meistens schon eine menschliche Nase den Unterschied herausmerkt, wie viel mehr der Hund. Ging ein weißer Mann durch ein Indianerlager, so hatte er gewöhnlich eine ganze Bande knurrender und fletschender Hunde hinter sich"[115]). Doch auch den konträren Fall fand ich bestätigt. Denn die beim Indianerschutzposten Ajuricaba am mittleren Rio Demini gehaltenen Hunde, Bastarde der verschiedensten Rassen, unter ihnen aber auch frühere Indianerhunde, gebärdeten sich vor Haß ebenfalls wie toll, wenn Pakidái-Familien zu Besuch kamen[116]). Aber in einem noch größeren Maße war die Feindschaft untereinander ausgeprägt, d. h. zwischen den Hunden des Postenpersonals und denen der Pakidái, denn wenn sie sich nur sahen, so verbissen sie sich sofort ineinander.

Bezüglich der Herkunft dieser beiden Hunderassen, welche wohl schon seit Jahrhunderten von den Surára und Pakidái gehalten werden, läßt sich noch nichts Endgültiges aussagen. Bei der von mir erwähnten ersten Art, welche unserem Schäferhund ähnlich sieht, scheint es sich jedoch um einen ganz besonders typischen Indianerhund zu handeln, denn er entspricht völlig der Schilderung, welche Friederici von einem echten Indianerhund gibt: „Die Gesamterscheinung des unverfälschten Indianerhundes war, so weit man noch aus Beschreibung und Zeichnung erkennen kann, das Bild des deutschen Schäferhundes sogen. thüringischen Schlages, mit etwas mehr Wildhundcharakter und mit rauh- oder stockhaariger Behaarung"[117]). Friederici befaßt sich hier zwar mit dem Indianerhund Nordamerikas, doch nach Alexander von Humboldt ist diese Rasse auch bereits in präkolumbischer Zeit für Guayana bezeugt, was aus dem nachfolgenden Zitat zu ersehen ist: „. . . . aber nichts desto weniger steht fest, daß es vor der Eroberung in Peru, Neu-Grenada und Guayana eine unsern Schäferhunden ähnliche Hunderace

[113]) In der gleichen Weise verfahren viele nordamerikanische Indianer. (Friederici, 1899, S. 363).

[114]) Alexander von Humboldt, 1860, IV, S. 189.

[115]) Friederici, 1899, S. 365.

[116]) Auch Baldus beobachtete anläßlich seiner Chaco-Expedition, daß Indianerhunde, wenn sie in die Hände von Weißen kommen, zu erbittertsten Feinden ihrer früheren Herren werden. (Baldus, 1931, S. 18).

[117]) Friederici, 1899, S. 362.

gab"[418]). Bei den Waikâ fand Zerries diese Hundeart merkwürdigerweise nicht vor, sondern nur jene kleine, kurzhaarige, die dem Foxterrier ähnelt, und er vermutet, daß sie z. T. noch von den Hunden abstammt, die vor etwa 15000 Jahren mit den ersten Einwanderern aus Asien über die Beringstraße kam[419]). Doch die nachfolgenden Ausführungen Franz Termers zeigen, daß für letztere Annahme noch sichere Beweise fehlen. Der Gelehrte schreibt nämlich: „Ob schon die ersten, aus Nordost- und Nordasien über die Beringstraße nach Amerika eingewanderten Jäger-Sammler-Horden den Hund mitbrachten, ist, abgesehen vom Eskimohund, bisher nicht mit Sicherheit erwiesen, wenn auch wahrscheinlich. Ob sich von solchen frühen, d. h. späteiszeitlichen bis frühnacheiszeitlichen, mit den Menschen eingewanderten Hunden, die neuweltlichen ableiten lassen oder ob diese aus autochthonen Vorfahren neuweltlichen Ursprungs hervorgegangen sind, ist eine zoologische Frage, zu der hier nicht Stellung genommen werden kann. Die Meinungen darüber sind geteilt. Es scheint in jüngster Zeit eher die Neigung zu bestehen, einen neotropischen Ursprung der Indianerhunde zu vertreten"[420]). Mit dieser letzten Aussage bezieht sich Termer auf Angaben von Gilmore[421]).

Im Gegensatz zu der ungeklärten Herkunft beider Hundearten gibt es für jene der Hähne — *cacard* — keine Zweifel, denn diese werden erst seit kurzer Zeit von den Caboclos (Pflanzer, Gummi- und Palmfasersammler) im Tausch erworben. Doch es überraschte mich sehr, als ich beim Betreten der Surára- und Pakidái-Malokas eine große Zahl von Hähnen vorfand, aber keine Hühner[422]), obgleich sie jene ebenfalls erhalten könnten. Aber dafür besteht kein Interesse, denn die Hähne halten sie nur wegen ihres bunten Gefieders und ihres Krähens in der Morgenstunde[423]). Die meisten Familien besitzen ein bis zwei, welchen sie auch Namen geben; gefüttert werden sie von den Frauen. Tagsüber laufen dieselben frei herum, und nachts sperrt man sie in einen gemeinsamen Stall, den man neben jeder Maloka aus dünnen Stämmen und Stöcken errichtet hat. Wenn der Stamm wandert, ist es die Aufgabe der kleinen Jungen, jeweils einen Hahn in dem geflochtenen Tragkorb aus den Baststreifen der Curauá-Pflanze (s. S. 49) zu tragen. Wird nachmittags ein Behelfslager errichtet, so läßt man die Hähne frei. Die Nacht über ruhen sie auf den Ästen niedriger Bäume, meist in der Nähe ihrer Besitzer. Bevor dann am nächsten Morgen der Marsch weitergeht, werden sie wieder eingefangen und in die Körbe der Knaben gesetzt. Erwähnen möchte ich noch, daß die Surára und Pakidái niemals einen Hahn schlachten, denn er ist ja ein Hausgenosse, und außerdem glauben sie, daß Hähne und Hühner unsaubere Tiere seien, die jeglichen Schmutz fressen. Deshalb wäre der Genuß ihres Fleisches, einschließlich der Eier, für die Menschen sehr schädlich[424]).

Auch die gezähmten Wildtiere, wie Affen, Papageien, Araras und Periquitos, genießen jegliche Freiheit. Niemals habe ich es erlebt, daß man sie festbindet, wie es beispielsweise Baldus von Chacostämmen erwähnt[425]). Die Affen erklettern abends die höchsten Bäume, um in deren Kronen die Nacht zu verbringen, und auch die Vögel fliegen gelegentlich davon. Doch alle Tiere kommen zurück, weil sie ja von klein auf gezähmt wurden und an den Indianern, die sie

[420]) Termer, 1957, S. 2.

[421]) Gilmore, 1950, S. 377.

[422]) Diese werden übrigens gleichfalls *cacard* genannt.

[423]) Ehrenreich berichtet übrigens von den Ipurina, einem Arawakstamm, daß sie nur Hunde und Hühner als Haustiere halten, und letztere seien besonders als Wächter sehr beliebt gewesen. (Ehrenreich, 1891, S. 61).

[424]) Auch bei verschiedenen Karaiben- und Arawakstämmen Guayanas, wo viele Hühner gehalten werden, ißt man weder deren Fleisch noch die Eier. (Im Thurn, 1883, S. 263). Gleiches berichtet Ehrenreich von den Karajá: „Selbst das Haushuhn, welches schon seit langem im domesticirten Zustande zu den Araguayastämmen gelangt ist und sich massenhaft vermehrt, wird als Hausgenosse nicht zur Nahrung verwendet, ebensowenig wie seine Eier. Neuerdings dient es jedoch als Tauschartikel im Verkehr mit den Reisenden, die auf den ersten Ansiedlungen der Provinz Para das Geflügel mit hohem Profit absetzen." (Ehrenreich, 1891, S. 13/14).

[425]) Baldus, 1931, S. 18.

immer liebevoll behandeln, sehr hängen. Mit großer Geduld bemüht man sich, den Papageien und Periquitos das Sprechen beizubringen, und ist glücklich, wenn sich die ersten Erfolge zeigen.

11. Genußmittel

Nur zwei Genußmittel werden von den Surára und Pakidái verwandt, Tabak — *peundhs* — und ein Schnupfpulver — *epená* —. Ersterer dient dem profanen und letzteres ausschließlich dem rituellen Gebrauch.

Doch der Tabak wird nicht geraucht. Die Blätter werden im grünen Zustand zerkleinert, mit Holzasche und Wasser, resp. Speichel, vermischt und zwischen den Händen zu kleinen Rollen gedreht. Diese schiebt man dann zwischen Unter- oder Oberlippe und Zähne, wo sie ausgesogen werden. Jenem Genuß, mit dem auch ein sehr praktischer Zweck verbunden ist, denn die Indianer können dadurch den ganzen Tag im Urwald herumlaufen, ohne ein Hunger- oder Durstgefühl zu verspüren, huldigen beide Geschlechter, einschließlich der Kinder; doch ihre schönen Gesichter wirken durch die Tabakrollen recht entstellt (Abb. 41).

In derselben Weise bedient man sich des Tabaks bei den Waiká, doch hier wird, den Angaben von Zerries zufolge, die Rolle nur zwischen Unterlippe und Zähne geschoben[420] [421]). Sodann erwähnt der genannte Forscher die gelegentliche Verwendung von wildwachsenden Ersatzpflanzen, falls der Tabak einmal fehlt[420] [422]). Bei den Surára und Pakidái konnte ich eine diesbezügliche Erfahrung nicht machen, obgleich auch dort der Tabakverbrauch ungewöhnlich groß ist. Sie bauen aber in allen Waldrodungen reichlich Tabak an, und falls er auf den Feldern ihres jeweiligen Aufenthaltsortes einmal restlos abgeerntet wurde, so holen ihn die Männer von anderen, weit entfernt liegenden Roças, oder sie tauschen ihn notfalls von befreundeten Stämmen ein.

Koch-Grünberg berichtet, daß die von ihm besuchten Xiriána- und Waiká-Horden den Tabak kauen[423]). Doch aus seiner Beschreibung ist zu ersehen, daß es sich in Wirklichkeit auch um ein Aussaugen des Tabaks handelt. Auch die Arekuná am Roroima verfuhren wahrscheinlich in der gleichen Weise, obwohl Richard Schomburgk[424]) und Appun[425]) übereinstimmend von „Tabakkauen" sprechen. Bemerkenswert ist es, daß Koch-Grünberg[426]) diese Art des Tabakgenusses bei keinem Stamm im Roroimagebiet mehr beobachten konnte, denn anläßlich seiner Besuche rauchten die Männer den Tabak als Zigarren oder in kurzen englischen Pfeifen, welche aus Britisch Guayana eingeführt wurden; Frauen sah er niemals rauchen.

Wenn ich den Surára und Pakidái Zigaretten anbot, so entfernten sie anfangs stets das Papier und genossen den Tabak in der gleichen Weise wie ihren angebauten. Doch sie waren nicht sehr begeistert davon, denn für ihre Begriffe war der Zigarettentabak viel zu schwach. Mit der Zeit gewöhnten sich aber Männer und Kinder an das Rauchen[427]), Frauen dagegen nicht.

Das narkotische Schnupfpulver, ähnlich dem Yopo oder Paricá, setzt sich aus verschiedenen Ingredienzien zusammen, von denen mir neben den gerösteten und pulverisierten Paricá-Samen (*Piptadenia peregrina* Benth.) noch die zu Asche verbrannte Rinde einer wildwachsenden Mimosenart (*Mimosa acacioides ?*) — *hekurdhihend* —[428]) sowie ein angebautes Pfeffergewächs

[420]) Zerries, 1956b, S. 154.

[426]) Appun, 1871, S. 321.
[427]) Koch-Grünberg, 1923a, S. 57.
[428]) Hierdurch schwanden unsere Zigarettenvorräte rasch dahin, und mein Diener Mateus und ich waren danach auf den angebauten Tabak der Indianer angewiesen, welcher aber so stark war, daß wir ihn einfach nicht genießen konnten. Mateus kam jedoch auf die glückliche Idee, den Tabak mehrfach zu waschen, und anschließend ließ er ihn an der Sonne trocknen. Da wir in reichlichem Maße Zigarettenpapier mit uns führten, brauchten wir also nicht auf den gewohnten Zigarettengenuß zu verzichten. An das Aussaugen des Tabaks hätten wir uns nie gewöhnen können, denn jeder Versuch verursachte schon Brechreize.
[429]) Hierin steckt bemerkenswerterweise das Wort, mit dem die gigantischen Tier- und Pflanzengeister benannt werden — *hekurd* — und mit denen die Männer nur mittels des Schnupfpulvers in Verbindung treten können.

(*Piperacea* sp.) — *maxarahá* — bekannt wurden[880] [881].

Genau wie das Pfeilgift wird auch dieses Pulver nur von bestimmten Männern angefertigt. Es wird in Bambusröhren — *hira* — aufbewahrt (Fig. 28a), die man mit Blättern verschließt. Vor Gebeten, anläßlich großer Feste und vor Krankenheilungen, an denen außer dem Häuptling noch mehrere Männer beteiligt sind, schüttet man das Pulver auf einen großen, von den Xiriána überlassenen Tonteller. Von hier wird es dann in die 60—70 cm langen Schnupfrohre aus Bambus gefüllt, an deren einer Seite eine durchbohrte, längliche Palmnuß mittels Baumharz angekittet ist (Fig. 28b). An dem freien Ende ist die Nuß spitz zugeschliffen, damit sie der Mann, welcher schnupfen will, in ein Nasenloch stecken kann. Von der anderen Seite

Fig. 28a Bambusröhre zum Aufbewahren des Schnupfpulvers
Fig. 28b Schnupfrohr aus Bambus

des Rohres bläst ihm dann ein befreundeter Stammesgenosse, der dabei halb in die Kniebeuge geht, das Pulver mit aller Kraft in die Nase (Abb. 44).

Schon nach wenigen Augenblicken gerät der Schnupfende dann in einen unvorstellbaren Rauschzustand, wobei er tobt, schreit, singt, tanzt und hin und her springt (Abb. 45, 46). Da ich mich, nach meiner Aufnahme in den Stamm der Surára, dieses Genusses ebenfalls unterzog, bin ich in der Lage, die Wirkung genau zu beschreiben. Ich möchte hier nur kurz andeuten, daß ich gleich danach rasende Kopfschmerzen bekam und einen starken Brechreiz verspürte, genau wie Jünglinge, welche zum ersten Mal mit dieser Droge Bekanntschaft machen. Doch kurz darauf vollzog sich in mir ein eigenartiger Vorgang, denn ich fühlte mich als Riese unter Riesen. Alle in meiner Nähe befindlichen Menschen, aber auch Hunde und Papageien, schienen plötzlich Giganten zu sein. Diese Wirkung, welche auf die im Pulver befindlichen Alkaloide zurückzuführen ist, hängt eng mit den Vorstellungen von den gigantischen Tier- und Pflanzengeistern zusammen (s. S. 92/93).

Bei den Waiká wird dieses Schnupfen in derselben Weise durchgeführt[882]. Auch die Tu-

parí[883] und zahlreiche andere Stämme des westlichen Südamerikas[884] frönen dieser Sitte, obgleich die Zusammensetzung des Pulvers, abgesehen von den Paricá- oder Piptadenia-Samen, scheinbar von Stamm zu Stamm verschieden ist. Cooper kommt übrigens in einer vergleichenden Arbeit über das Piptadenia-Schnupfen zu dem Schluß, daß es sich hierbei um einen „western trait" handelt[885].

12. Hygiene

Ein regelmäßiges Baden, Waschen von Gesicht und Händen und Reinigen der Finger- und Zehennägel kennt man nicht; dies trifft auch für die Säuglinge zu, welche oft mit förmlichen Schmutzkrusten bedeckt sind. Auch die

[880] Die gleiche Zusammenstellung fand Zerries bei den Waiká vor und selbst die Namen für das Pfeilgewächs stimmen nahezu überein, die Waiká nennen es „masho hara". Die Rinde der Mimose, in welcher Zerries ein Alkaloid vermutet, wird aber nur im getrockneten, bzw. gerösteten Zustand benutzt. (Zerries, 1956b, S. 134).

[881] Herr Prof. Dr. Klaus Bastkirig vom Pharmakologischen Institut der Universität Hamburg ist gegenwärtig noch dabei, mein mitgebrachtes Pulver zu analysieren. Das Ergebnis soll später in einem Aufsatz veröffentlicht werden.

[882] Zerries, 1935b, S. 665.

[885] Cooper, 1949, S. 536—538 und Karte 12.

Zähne werden nicht geputzt, noch wird jemals der Mund ausgespült. Trotzdem habe ich nie einen unangenehmen Körper- und Mundgeruch an den Indianern wahrgenommen, und ihre Zähne sind bis ins hohe Alter hinein blendend weiß und gesund. Doch wenn Männer und Frauen dann beim Jagen, bzw. Sammeln einen Bach oder einen kleinen Fluß durchqueren müssen, benutzen sie gern die Gelegenheit, um ein erfrischendes Bad zu nehmen, desgleichen, wenn weibliche Stammesangehörige Wasser holen. Von Kindern und jüngeren Leuten wird ein Bad sehr geschätzt, von älteren dagegen gar nicht. Die meisten Männer können recht gut schwimmen und lehren es auch ihre Söhne; schwimmende Frauen und Mädchen bilden Ausnahmen. Durch gelegentliche Berührungen mit den Palmfasersammlern am Rio Aracá, resp. dem Personal des Indianerschutzpostens am Demini haben die Surára und Pakidái seit einiger Zeit die Seife kennengelernt, und verschiedene Indianer, vorwiegend Kinder sowie jüngere Männer und Frauen, lieben es, sich bei einem Bad damit einzuseifen. Einige Frauen waren sogar schon dazu übergegangen, ihre Hängematten hin und wieder mit Seife zu waschen. Die Seifenstücke, welche ich bei mir führte, waren daher sehr begehrt, desgleichen Parfüm und Haarwasser.

Gegessen wird nur mit den Händen (s. S. 85). War das Fleisch sehr fettig und sind die Hände völlig mit Schmutz und Fett verschmiert, so reibt man sie an einem Pfosten etwas ab und fährt sich danach ein paar Mal durch das Haar. Die Eßschalen und Töpfe werden dann mit den Resten der Mahlzeit den Hunden vorgesetzt, welche auch gleichzeitig die Arbeit des Reinigens übernehmen; gespült werden die Eßgeräte nämlich nur selten. Werden sie für die nächste Mahlzeit gebraucht, so fährt die Frau damit einige Male über das Haar. Falls jedoch noch einige Schmutzkrusten vorhanden sind, spukt sie darauf und reibt mit der Hand darüber.

Während und nach dem Essen wird häufig aufgestoßen, und nicht selten kommt es vor, daß ein Familienmitglied d[illegible]uft abläßt, oft sogar mit lautem Geräusch, was man aber, ohne Beeinträchtigung des Appetits, mit fröhlichem Gelächter quittiert. Ansonsten sieht man beide Geschlechter auch viel spucken, bedingt durch die Tabakrollen, welche sie fast ständig im Munde haben (s. S. 88).

Uriniert wird am Tage in unmittelbarer Umgebung der Maloka und nachts in die Feuerstellen. Auch Männer und Knaben urinieren, genau wie Frauen und Mädchen, stets im Hocksitz. Für größere Geschäfte gehen tagsüber alle ein Stück tiefer in die Waldrodung hinein oder gar bis zum Rande des Urwaldes. Nach der Beendigung reiben sie das Gesäß einige Male auf dem Boden hin und her oder an einem Baumstamm. Kleinkinder hält die Mutter, falls sie gerade in der Hängematte liegt, über den Rand derselben ab. Danach wischt sie mit der Hand oder dem Unterarm einige Male über das Gesäß, oder sie bedient sich, falls nötig, zur Reinigung eines Stöckchens. Das kleine Häufchen wird mit Asche oder Erde überstreut und von der Mutter in den Boden eingetreten. Hat ein Erwachsener nachts ein größeres Geschäft zu verrichten, so gräbt er dazu ein kleines Loch neben der Hängematte und schüttet dieses anschließend mit etwas Asche oder Erde zu. Alte oder kranke Personen verfahren auch am Tage in dieser Weise. Daß die Surára und Pakidái zu dem oben erwähnten Zweck nachts die Maloka nicht verlassen, ist darauf zurückzuführen, daß sie Angst vor Schlangen und Jaguaren haben, sowie vor Nonexi, dem bösen Geist, welcher Krankheiten überträgt (s. S. 96). Doch anhaltende unangenehme Gerüche sind selbst in geschlossenen Malokas nicht zu verspüren, da sie durch den aufsteigenden Rauch der ständig brennenden Feuer vertrieben werden.

Während der Menstruation benutzen die Frauen keinerlei Mittel, um das Blut aufzufangen (s. S. 66/67). Blutlachen, welche auf dem Boden zurückbleiben, verwischen sie mit den Füßen.

Im übrigen wird das Gemeinschaftshaus aber recht sauber gehalten. Ständig sieht man Männer und Frauen, die mit Besen aus Piaçabafasern fegen. Für diese Arbeit sogen beide Geschlechter recht gern die von mir als Geschenkartikel mitgebrachten Hemden und Hosen bzw. Kleider an, welche sonst durchaus nicht sehr geschätzt wurden.

VIII. Religion und Magie

1. Das religiöse Weltbild

Nach Ansicht der Surára und Pakidái ist die Erde eine Scheibe, über welcher sich der Himmel glockenförmig wölbt. Alle Macht geht von dem Monde — *Perimbó* — und von *Porí*, dem Herren des Mondes, aus, den man sich als alten Mann mit langem weißen Bart und rotbemalter Tonsur vorstellt. Gelegentlich steigt er zur Erde herab, ist aber dann für die Menschen unsichtbar.

Porí und *Perimbó* bilden also eine untrennbare Einheit, die als ewig, gerecht und gütig gilt, aber auch strafen kann, wenn es notwendig ist. Ihr wird die Entstehung der Erde und alles Lebens zugeschrieben, wobei man annimmt, daß die Schöpfungsvorgänge sowohl in direkter als auch in indirekter Weise[442]) erfolgten.

Der Mond, eine große, offene, kreisrunde Maloka, die inmitten einer Pflanzung liegt und von Wäldern, Bergen und Flüssen umgeben ist[443]), wird gleichzeitig als der Ort betrachtet, wo alle Seelen von Menschen, die nach ihrem Tode verbrannt wurden, unter *Porí* ein paradiesisches Dasein führen. Tiere, Pflanzen und Früchte gibt es hier in Hülle und Fülle, und kein Mondbewohner braucht jemals Hunger und Durst zu leiden.

Aber nur mit dem während der Verbrennung aufsteigendem Rauch kann eine Seele — *wuzih* — (identisch mit Wolke, Rauch), die sich in den Knochen befindet und bei Lebzeiten nie den Körper verläßt, dieses Paradies erreichen. Die Seelen von nicht verbrannten Verstorbenen werden zu Schatten — *patanubi* —, welche ruhelos, ohne Speisen und Getränke, zwischen Erde, Sonne und Mond umherirren müssen[444]).

Alle Surára und Pakidái haben daher große Furcht, daß sie nach ihrem Tode einmal solche Schatten werden könnten. Deshalb bemühen sie sich auch nach kriegerischen Handlungen ihre gefallenen Stammesangehörigen zu bergen, um sie zu verbrennen. Von alten Personen wird zwar nur der Kopf verbrannt (s. S. 72), aber man glaubt, daß dies genügt, um die Seele ebenfalls zum Monde emporzuführen. Feinde verbrennt man dagegen nicht, denn ihnen wünscht man das Schattendasein.

Verbündete des Mondes sind die unzähligen Sterne, welche auch alle von Stämmen bewohnt werden[445]). Wenn eine Sternschnuppe fällt, so glaubt man, daß die Bevölkerung eines Sternes jene von einem anderen besucht.

Der Sonne wird im religiösen Leben nur eine geringe Bedeutung beigemessen. Man hält sie für ziemlich kraft- und machtlos, weil sie ja allein am Himmel steht, keine starken Verbündeten hat und wie ein Vagabund um die Erdscheibe läuft. Nur die umherirrenden Seelen unverbrannter Verstorbener beherrscht sie und bedient sich ihrer Schatten, um im Schutze derselben an Menschen, Tieren und Pflanzen den brennenden, unstillbaren Durst zu löschen. Am Schweiß, so sagten mir meine Gewährsleute, sieht man deutlich, wie sie die Flüssigkeit aus den Körpern herauszieht, und anschließend bleibt ja auch beim Mensch und Tier ein Durst- und Schwächegefühl zurück, während Pflanzen oft verdorren. Daher, und besonders aus Furcht vor den Schatten, hält man Sonnenstrahlen für gefährlich. Deshalb werden Arbeiten, bei denen man sich einer unmittelbaren Sonnenbestrahlung aussetzen müßte, z. B. Waldrodung, Feld- und Hausbau, lieber bei trübem oder sogar regnerischem Wetter durchgeführt. In letzterem Falle ergibt sich sogar ein unmittelbarer Zufort ist, ein jammerhaftes Schattendasein führen müssen.

[442]) Die Ursprungsmythe der Yanomámi stellt ein Beispiel solcher indirekten Schöpfungen dar (s. S. 113/14).

[443]) Das Bild, welches man sich von der Oberfläche des Mondes macht, entspricht der offenen nahezu kreisrunden Surára-Maloka (s. S. 11/12).

[444]) Man fühlt sich hier an die Vorstellung der homerischen Griechen erinnert, welche ja auch annahmen, daß die Toten, nachdem das eigentliche Leben

[445]) Die Surára und Pakidái haben keine besonderen Bezeichnungen für die einzelnen Sterne und Konstellationen. Es gibt nur zwei generelle Namen, Stern — *parimá* — und großer Stern — *parimá kwa* —.

zusammenhang mit dem Monde. Auf diesem Himmelskörper steht nämlich in der Mitte jener offenen Maloka ein großer Baum. Schüttelt *Purí* denselben, kommt erst Wind auf, und danach fällt der Regen. Der Abscheu der Surára und Pakidái vor den unbarmherzigen Sonnenstrahlen der Äquatorialzone findet aber noch eine weitere reale Erklärung darin, daß sie früher, als reine Jäger und Sammler, praktisch nie aus dem ewigen Halbdunkel des Urwaldes herauskamen.

Die Ehrfurcht vor *Purí* und dem Monde ist so groß, daß es die Indianer nicht wagen, persönlich zu dieser vereinigten Höchsten Gottheit zu beten. Serras — *postile* — sowie gigantische Tier- und Pflanzengeister — *hekurá* —[446]), die auf ihnen wohnen und sich durch übernatürliche Eigenschaften auszeichnen, sind die Vermittler. Hierfür eignen sich die Serras deshalb so gut, weil sie ja zwischen der Erde einerseits und dem Mond und der Sonne anderseits liegen. Sie werden als höhere göttliche Gehilfen betrachtet, die nach *Purí* und *Perimbó* am mächtigsten sind. Gleichzeitig sieht man sie als Oberhäupter aller auf ihnen lebenden Tier- und Pflanzengeister an. Ihre Macht ist deshalb viel größer als die der Sonne, weil es ja nur eine Sonne gibt, aber unendlich viele Serras. Doch die Haltung derselben gegenüber *Purí* und *Perimbó* ist nicht immer eine loyale. Meist stehen sie zwar auf deren Seite, wenn es zwischen ihnen aber mal zu einem Streit kommt, kann es passieren, daß sie sich für eine gewisse Zeit mit der Sonne verbünden. Die vereinigte Höchste Gottheit hat aber vorgesorgt und jede eventuelle Gefahr berücksichtigt. Denn dadurch, daß sie für die gigantischen Tier- und Pflanzengeister die Serras als Wohnsitze auserwählte, ist deren Stärke, wenn sie sich gegen *Purí* und *Perimbó* richtet, beeinträchtigt. Im Gegensatz zu den Serras sind nämlich die *Hekurá* unverbrüchlich treue Gefolgsleute der vereinigten Mondgottheiten und schützen sie, gemeinsam mit den Sternen, gegen jegliche Überfälle seitens der Sonne und deren zeitweilige Verbündete. Manchmal tritt bei einem Streit, den die Serras mit dem Monde oder mit der Sonne führen, eine Mond- bzw. Sonnenfinsternis ein, weil sich der jeweilige Himmelskörper dann vor dem anderen verbergen will, um nicht in die Auseinandersetzung hineingezogen zu werden[447]). Wird es z. B. vor einem Gewitter dunkel und beginnen Blitze zu zucken, dann ist die Sonne sehr durstig, verbirgt sich hinter den Serras und bittet um Regen. Diese geben die Bitte an den Mond weiter. Doch jener will nicht dem Wunsche der Sonne entsprechen, und schon ist ein Anlaß gegeben, daß sich die Serras und der Mond streiten. Wenn es dann donnert, hat *Purí* vor Ärger Kopfschmerzen und schüttelt schließlich doch den Regenbaum, damit der Streit ein Ende findet.

Bei den *Hekurá* handelt es sich um gigantische Prototypen aller Tier- und Pflanzenarten, welche auf bestimmten Serras leben, die für Menschen tabu sind. Jene Naturgeister werden als niedere Gehilfen von *Purí* und *Perimbó* betrachtet. Den Menschen sind sie meist wohlgesinnt, gestatten und erleichtern ihnen die Jagd, das Sammeln und den Feldbau. Doch die Männer müssen ihnen durch Gebete stets ihre Dankbarkeit erweisen, und sie dürfen Tiere und Pflanzen nicht wahllos vernichten. Hiermit hängt auch zusammen, daß alle Stammesmitglieder, Männer, Frauen und Kinder, Namen von Tieren oder Pflanzen tragen (s. S. 64/65). Dadurch ergibt sich eine Symbiose, die gleichzeitig den Beweis für das hier auftretende Alter ego — Motiv liefert. Stirbt ein Mensch, der das dritte Lebensjahr überschritten hat, so muß ein Tier oder eine Pflanze jener Gattung, deren Namen er trug, ebenfalls getötet, bzw. zum Absterben gebracht werden. Dies geschieht, damit die Seele des Toten für den langen Weg zum Monde einen Begleiter hat, der die Führung übernimmt und ihr den Eintritt in das paradiesische Totenreich erleichtert (s. auch S. 70).

[446]) Dieser Name wird abgeleitet von *hekuniasi* — Himmel und *ko* — Kopf, oben.

[447]) Das Verhältnis von Mond und Sonne spielt auch in den religiösen und mythologischen Vorstellungen verschiedener anderer Indianerstämme eine besondere Rolle. In einer Mythe der Yurukaré wird es beispielsweise im Sinne des Orpheusmotives behandelt. (Rodrigues, 1875, S. 230 ff.; d'Orbigny, 1835/47, III, S. 220).

Wenn die Häuptlinge, die ja gleichzeitig Medizinmänner sind, oder andere männliche Stammesmitglieder mit den Naturgeistern in Verbindung treten wollen, sei es bei Krankenheilungen, vor oder nach Jagdzügen, anläßlich von Dankgebeten für eine erfolgreiche Ernte usw., so lassen sie sich vorher von einem anderen Mann mittels eines Bambusrohres narkotisches Pulver in die Nase blasen und geraten unmittelbar danach in einen Rauschzustand, wobei sie sich als Riesen unter Riesen fühlen (s. S. 89). Daher ist es auch verständlich, daß sie sich während eines Schnupfpulverrausches mit den *Hekurá* identifizieren und jegliche magische Handlung mit einem sehr ähnlich klingenden Wort — *rekurá* — bezeichnen.

Vergleicht man die Glaubensvorstellungen der Surára und Pakidái mit denen der verwandten Waiká, welche von Otto Zerries, Meinhard Schuster und dem amerikanischen Missionar James Paul Barker untersucht wurden[888]) [889]) [890]), so läßt sich feststellen, daß sie in ihren Grundzügen weitgehend übereinstimmen.

Alle genannten Stämme glauben an ein Höchstes Wesen, *Pore*, bzw. „Omawa", und schreiben ihm die Erschaffung der Erde und aller Lebewesen zu. Dabei gibt es zwar gewisse Differenzierungen, welche aber wohl auf äußere Einflüsse zurückzuführen sind. So wird *Pore* mit dem Monde — *Parimâ* — in Verbindung gebracht und bildet mit diesem eine untrennbare Einheit[891]), während „Omawa" zusammen mit einem Helfer, „Yoma", im westlichen Himmel lebt, wo sie auch den Regen erzeugen, indem sie das Wasser aus den beiden Himmelsflüssen gießen[892]). Demgegenüber glaubt man bei den Surára und Pakidái, daß *Pore* den Regenbaum des Mondes schüttelt (s. S. 92).

Doch dem Monde wird auch von den Waiká eine große Bedeutung beigemessen, und zwar bezeichnenderweise ebenfalls im Zusammenhang mit der Schöpfung von Menschen. Dies ist aus ihrer Urzeitlegende zu ersehen[893]), welche, bis auf geringfügige Abweichungen, jener entspricht, die mir der Surára-Häuptling Hewemáo erzählte (s. S. 113/14)[894]). Als weitere Parallele ist sodann auf die Beingeburten zu verweisen. Nach der Surára- und Pakidái-Version kamen die ersten vier Männer und eine Frau in gewissen Abständen aus dem Bein eines kleinen Vogels (s. S. 113), während nach jener der Waiká die erste Frau aus dem schwangeren Bein eines Mannes hervorging[895]) [896]). Beiden Mythen gemeinsam ist aber der polyandrische Zug, denn die Frau bekam mit den Männern einen Knaben (Surára und Pakidái) (s. S. 113), bzw. mehrere Kinder (Waiká)[897]).

[888]) Zerries, 1938a.
[889]) Zerries, 1938b.
[890]) Barker, 1953.
[891]) Diese etwas ungewöhnlich anmutende Vorstellung, in welcher Josef Haekel deshalb einen Widerspruch zu erkennen glaubt (Haekel, 1959, S. 40), ist aber auch für die Ufotto belegt, denn Preuss schreibt darüber u. a.: „Wir haben hier also den seltenen Fall, daß durch die Verbindung von Weltgott und Monddirnen eine einzige Gottheit entstanden ist, eine Art Monotheismus, neben der es nur ganz bedeutungslose Dämonen gibt." (Preuss, 1921, S. 176). Und an anderer Stelle führt er noch aus: „Daß Mond und höchstes Wesen hier zusammenhalten, kann daher später eingetreten sein, bewiesen ist aber nicht zu sein. Heute haben wir sie als untrennbare Einheit." (Preuss, 1921, S. 184).
[892]) Zerries, 1938b, S. 280.
[893]) Zerries, 1938b, S. 280.
[894]) Aber bei den Waiká gibt es dankenswerterweise noch eine zweite Vorstellung, welche besagt, daß die ersten Menschen im Regen zur Erde kamen (Zerries, 1938b, S. 281). Demnach müßten sie also aus dem westlichen Himmel hervorgegangen sein, wo ja Omawa lebt und den Regen erzeugt. Zerries hält es jedoch für möglich, daß jener Regen mit dem Blute des verwundeten Mondes identisch ist, und verweist als Parallele auf eine Ufotto-Mythe (Zerries, 1938b, S. 281). In dieser Mythe ist der Monatslehrer der Tochter des Vornehmen den Festen der Tiere als feiner kalter Regen zu sehen, was Preuss als die Flut im Kleinen deutet, welche eintritt, sobald der Dunkelmond entsteht; sie entspricht der monatlichen Regel. (Preuss, 1921, S. 113—115).
[895]) Zerries, 1938b, S. 280.
[896]) Auch für andere südamerikanische Stämme sind die Vorstellungen von Beingeburten belegt. So treten bei den Tukuna die Stammesheroen Dyui und Epi gemeinsam mit ihren beiden Schwestern aus den durch Wespenstiche angeschwollenen Knien des männlichen Notapa (Nimuendajú, 1952, S. 122), und bei den Umotina, welche als Stammeseinheit leider nicht mehr existieren, glaubt man, daß Zivilisierte und feindliche Indianerstämme aus den entzündeten und geschwollenen Waden des ersten Menschen Alpahe kamen (Oberg, 1953, S. 108).
[897]) Zerries, 1938b, S. 280.

In der religiösen Gedankenwelt der Waikâ findet man aber auch Vorstellungen, die sehr widersprechend sind. So wird „Omama" einerseits als Höchstes Wesen und Schöpfer der Erde und der Menschheit betrachtet und andererseits geradezu als ein Feind der Waikâ empfunden, den man eng mit Fremdstämmen im Westen und den Weißen in Verbindung bringt, sowie mit deren unheilvollen Einflüssen, Krankheiten, rätselhaften Kulturgütern (Motor, Benzin etc.)[480]. Weiterhin ist es bemerkenswert, daß „Omama" bei weißer und schwarzer Magie direkt angerufen wird[481] (die Surára und Pakidái verehren mit *Puri/Pariwâ* nur über Vermittler), und daß bei ihm ein kannibalisches Wesen, „Omayalí", lebt, welches nach Zerries vermutlich eine Hypostase des ersteren darstellt[482]. Er glaubt jedoch, daß es sich bei „Omama — Omayalí" um Importgut aus einem anderen Kulturbereich handelt, und führt von Aruak-Stämmen Nordwestbrasiliens sowie von Karaiben Guayanas entsprechende Parallelen an[483], welche von Hackel noch erweitert werden[484]. Der letztgenannte Gelehrte stellt dann die Frage: „Fehlte nun aber den Waika vor dieser Fremdbeeinflussung die Vorstellung von einem Höchsten Wesen?"[485]. Daran knüpft er die Vermutung, daß ihnen eine Hochgottvorstellung im Sinne ihrer verwandten Surára und Pakidái bekannt gewesen sein könnte, da ja in den genannten Volksgruppen der Mond, bzw. der Herr des Mondes gelegentlich auf die Erde herabsteigt, und als weitere Verbindung führt er die Vorstellung von einem himmlischen Paradies der Seelen an[486]. Sodann weist Hackel darauf hin, daß die Surára und Pakidái sowie die Waika in religiös-mythologischer Hinsicht auffallende Ähnlichkeit mit den nachstehend aufgeführten Karaiben-Stämmen zeigen[487], wobei jedoch zu bemerken ist, daß manche das Höchste Wesen mit dem Mond und andere mit der Sonne in Verbindung bringen[488]: Kachuyana (Kashoiéna) (selbst der Name des Höchsten Wesens lautet hier sehr ähnlich, Purá)[489], Baruana[490], Kalina[491], Wajana (Oyana)[492], Makiritare[493].

„Die angedeuteten Parallelen", so führt Hackel hierzu aus, „zwischen Yanoama und Karaiben machen jedenfalls auf eine Reihe von Problemen aufmerksam, von deren Lösung wir heute allerdings noch weit entfernt sind. An der Wahrscheinlichkeit von historischen Beziehungen wird man wohl kaum vorbeisehen können. Wer waren aber nun die „Gebenden", wer die „Nehmenden"? Daß die Surara-Pakidai und Waika in der Einflußsphäre karibischer Stämme liegen, ist offensichtlich, doch besteht meines Erachtens keine Berechtigung, bei den zutage tretenden Anklängen bloß an Einwirkungen von Seiten der Karaiben denken zu wollen. Es wäre auch in Betracht zu ziehen, daß sowohl Yanoama als auch Karaiben gemeinsam an einem älteren Substrat partizipierten"[494]. Hierin stimme ich mit Hackel vollständig überein. Auch seine gewissen Bedenken teile ich in bezug auf die ausgesprochen westliche Orientierung der Waikâ-, resp. Yanomámi-Kultur[495], welche von Zerries vertreten wird[496]. Vieles spricht zwar dafür, u. a. eine bestimmte Form des Endokannibalismus und das rituelle Schnupfen eines narkotischen Pulvers. Als weiterer Beweis könnte auch die Tatsache gewertet werden, daß man bei den Ipurina am Rio Purús den Mond — „pati" — als Höchstes Wesen und „Vater" verehrt, der die Früchte wachsen läßt[497]. Ehrenreich glaubt jedoch in diesem Falle, daß eine christliche Beeinflussung vorliegt. Auch bei den Sáliva im südlichen und östlichen Kolum-

hien findet man gewisse Züge in der Religion und Mythologie, die an jene der Yanomámi und Karaiben erinnern, und das von ihnen verehrte Höchste Wesen heißt „Pura“[...], ein Name, der sehr ähnlich klingt wie *Puri* und „Puri“. Sodann weist Hackel noch darauf hin, daß die Religion der Sáliva eine betonte Übereinstimmung mit den benachbarten arawakischen Achagua zeigt[...], die von Hernandez de Alba beschrieben wurde[...]. Außerdem ist zu erwähnen, daß die Guahibo-Indianer am venezolanischen Ufer des Orinoco ihre Gottheit Purumáli nach Zerries von den Achagua, bzw. Sáliva übernommen haben[...].

Aber auch in den östlichen Regionen Guayanas finden sich bedeutsame Parallelen in bezug auf die religiösen und mythologischen Vorstellungen der genannten Yanomámi. Auf die Kachuyana und ihr Höchstes Wesen Purú wurde bereits hingewiesen (s. S. 94). Noch stärker ausgeprägt sind sie bei den Warrau. In ihrer Hauptmythe von „Aboré“ und „Wowáh“ hat der Mond den Charakter eines Kulturheros[...], genau wie bei den Surára und Pakidái; außerdem ist die Übereinstimmung der Namen Aboré und *Puré* besonders groß. Auch die Verwandtschaft mit Kultusgütern führt man jeweils auf die Gottheiten zurück. In der Warraumythe heißt es sogar, daß Aboré vor Wowáh in das Land der Weißen flüchtete, von wo aus er seine Stammesangehörigen mit Importartikeln versorgte[...].

Auch die Vorstellung, daß es von jeder Tier- und Pflanzengattung gigantische Prototypen gibt, existiert bei anderen südamerikanischen Stämmen. Zerries hat hierüber bereits zusammenhängend gearbeitet und mehrere Forscher zitiert, die gleiche oder ähnliche Anschauungen für verschiedene indianische Volksschaften belegten, u. a. Arawak, Mura, Stämme des Chaco, Karaiben in Guayana (Arekuná-Taulipang), Cariña- und Tamanaco-Indianer Nordostboliviens, Cayapa in Ecuador und Yaruro in Venezuela[...].

Besonders die Auffassung der Yaruro zeigt nach Petrullos Beschreibung übereinstimmende Parallelen[...]. Für den Karaibenstamm Arekuná bezeugt Koch-Grünberg zwar keine gigantischen Pflanzengeister, aber ihre Vorstellung von den Tiergeistern ist sehr ähnlich; sie werden hier „Pudshi“ — Vater genannt[...].

Vergleicht man danach die Mythen, welche vom Geschehen auf der bereits geschaffenen Erde handeln, so fällt auf, daß bei den Waiká die Verwandlungen von Menschen in Landtiere einen breiten Raum einnehmen[...]. Dasselbe ist auch bei den Surára und Pakidái der Fall, doch kommen noch solche der Tiere selbst, und zwar werden stets kleinere in größere verwandelt (s. S. 115). Die Mythe von der Erschaffung des Anwohnsitzes, in welcher Onoma bzw. *Puré* einen Kuan in jenes Tier verwandelt, der mit seiner Schwiegermutter Inzest begangen hatte, ist den Waiká[...] sowie den Surára und Pakidái in gleicher Fassung bekannt (s. S. 115).

Gleichfalls synonym ist das System der Speisegeister von Tieren und Pflanzen, *kokorí* (Surára und Pakidái) resp. „kokoshi“ (Waiká)[...], welches eng mit dem Medizinmannwesen verbunden ist.

Von Interesse sind schließlich noch Vergleiche über die Vorstellung der menschlichen Seele. Sie kann jeweils nur durch zum Monde (Surára und Pakidái) bzw. Himmel (Waiká[...]) emporsteigen, wenn die Leiche verbrannt wird, denn ihr Name *wawáh* (Surára und Pakidái) resp. „wahwáh“ (Waiká)[...] ist mit dem für Wolke, Rauch identisch. Nach Ansicht der Surára und Pakidái befindet sich die Seele in den Knochen (s. S. 71)[...]. Deshalb verbrennen sie auch nur

[...] Hierin stimmen sie mit vielen anderen Stämmen überein, denen in seinem Aufsatz „Die Anthropophagie der südamerikanischen Indianer“ schreibt Koch-Grünberg: „Aus allen diesen Gebräuchen geht hervor, daß der Indianer, weitab von körperlichen von dem Gedanken an Genuß, die Knochen, die noch der Bestattung des Leibes übrig bleiben, als den eigentlichen und besten Sitz der Seele betrachtet.“ (Koch-Grünberg), ebda, S. 84.

die Sicherheit ihrer Toten, denen wohl das Fleisch noch verbunden, so bleiben die Seele ja nicht völlig genug beisammen. Auch das zeremonielle Trinken der Knochenasche, erklärlich als jährlich stattfindendes Totenvereinigungsfest, hängt mit der Vorstellung zusammen, daß darin noch kräftigende Bestandteile der Seele vorhanden sind. Bezüglich der Wahl scheidet Zaviera in diesem Zusammenhang: „Allerdings kommen wir die Vorstellung einer Knochenseele bei den Wahe nicht feststellen, wenn wir von der Verbindung zwischen Knochenasche und Seele absehen"[1]. Zaviera hebt auch hervor, daß die Seele nach Ansicht der Wahe nur dem Menschen eigen sei, nicht aber dem Tier[2]. Nach den Aussagen der Saviera- und Pokómo-Häuptlinge soll aber die menschliche Totenseele anläßlich ihrer Wanderung zum Monde von einer gleichzeitigen Gruppe oder pflanzlichen Totenseele begleitet sein, die als Führer dient (s. S. 70/71). Von Kindern nimmt man bei den Saviera und Pokómo an, daß sie bis zum vollendeten 3. Lebensjahre ohne Seele sind, weil sie ja solange von der Mutter getillt werden und daher noch zum Fleisch und Blut gerade zur Seele derselben gehören (s. auch S. 64 und 73). Wahe-Kinder sollen ihre Seele sogar erst nach der Vollendung des 6. Lebensjahres bekommen[3].

2. Krankheiten

a) Allgemeines

Alle Krankheiten werden feindlichen Zauberkünsten, besonders jenen der Wahe, zugeschrieben[4]. Als Überträger bedienen sich derselben den Gerstekorn-Vogel (*Thamnistes hartyptis* L.) und der Fledermaus. Beide Tiere bezeichnet man deshalb gemein als — *mwezi* —, d. h. böser Geist oder Krankheitsgeister[5] [6]. Wird solch ein Tier erblickt, tötet man es sofort, um dadurch ein Unheil zu verhüten. Außerdem wird angenommen, daß mit dem Tode derselben auch ein feindlicher Medizinmann, der ihm ja vorübergehend innewohnt, sein Leben ausgehaucht hat. Die Flügeldecken des Gerstekorn-Vogels werden deshalb für einige Tage als Trophäe in die Haare gesteckt (s. S. 44).

Ist ein Stammesangehöriger erkrankt, so kann man ihn nur dadurch heilen, daß der Häuptling, welcher bei den Saviera und Pokómo zu gleicher Zeit Medizinmann ist, und seine Gehilfen versuchen, die Krankheit an den Feinden zurückzuübertragen. Dies kann aber nur im Schutzgeisterzauber und unter Anrufung der *Mukuru* erfolgen, und zwar am allerbesten in der Nacht bei Mondschein[7]. Den ganzen Tag über haben meist schon ein bis zwei oder mehrmal auch mehrere Männer einbrechende Hahnenrufe durchgeführt. Für alle Krankheiten gibt es ganz bestimmte Texte, Melodien und Tanzarten, die den jungen Männern in einem zweimonatigen Kursus von ihrem jeweiligen Häuptling beigebracht werden (s. S. 67/68). Wenn der Patient trotz aller aufgewandten Mühen stirbt, so ergibt man sich einem gewissen Fatalismus, weil dann eben die Kraft des feindlichen Medizinmannes stärker war[8].

Aus den genannten Gründen gibt es nur eine suggestive Therapie, die durch Fasten und eine Behandlung mit kaltem Wasser ergänzt wird. Im letzteren Falle muß ein Kranker, auch bei höchstem Fieber, viel Wasser trinken und im nahegelegenen Fluß oder Bach häufige Bäder nehmen. Man setzt ihn auch gern dem strömen-

[1] Zaviera, ungdr., S. 103.
[2] Zaviera, ungdr., S. 104.
[3] Zaviera, ungdr., S. 108.
[4] Die Vorstellung, daß Krankheiten von Zauberkünsten verursacht werden, ist in Südostafrika so weit verbreitet, daß ich von der großen Zahl von Belegen nur zwei Autoren zum Vergleich anführen möchte: Roth, 1903, S. 308; Kisch-Gelehrung, 1930/31, S. 190.
[5] *Mwezi* ist eher auch der spezielle Name des Gerstekorn-

[6] Das gleiche Wesen „*mwezi*" oder „*mwizi*" bedeutet Zaviera für die Wahe. Durch diese Identifizierung dürfte die Schuldfrage eher den Affen treffen. (Zaviera, ungdr., S. 108).
[7] Die *Mukuru* sind die Vermittler zwischen den Menschen und dem verborgenen Höchsten Wesen Pwiti (Pwiti) (s. S. 91f.).
[8] Gleiches berichten auch Kisch-Gelehrung von den Ambundu-Umbangala (Kisch-Gelehrung, 1930/31, S. 200), Richard Schmidtlough von den Wahehe (Richard Schmidtlough, 1897, S. 170) und Dundas sowie Quanda von den Galla und Azteken (Dundas, 1913, S. 108/11; Quanda, 1890, S. 160), um nur einige Parallelen zu erwähnen.

den Regen um (Abb. 49), da man annimmt, daß derselbe Heilkräfte in sich birgt, weil er ja vom Regenbaum des Mondes kommt (s. S. 91). Kranke, die jedoch schon zu schwach sind und ihre Hängematte nicht mehr verlassen können, übergießt man in regelmäßigen Abständen mit kaltem Wasser[98].

Während meines verhältnismäßigen Aufenthalts unter den Surára und Pakidái traten dort folgende Krankheiten auf: Grippe, Lungenentzündung, Malaria, Windpocken und ein gastrisches Fieber; zum Glück verlief aber keine tödlich[99]. Doch die beiden an Lungenentzündung erkrankten Surára-Frauen, anfangs eine junge, Xamámi, die Frau von Kúrikayawé, dem jüngeren Bruder des Häuptlings, später eine ältere, Xanámá, die etwa 47 Jahre alte Mutter von Amyarawé (s. S. 57/58), und ein etwa 12 Jahre alter Junge, Xanáwé (s. S. 58), wären wohl ohne mein mitgeführtes Penicillin nicht lebend davongekommen, denn trotz der unerschöpflichen Kuren des Häuptlings und seiner Gehilfen verschlimmerte sich deren Zustand von Tag zu Tag. Im ersten Fall erbaten mir der Häuptling Hewenáo und der Ehemann Kurikayawé schließlich, daß ich Xamámi an zwei aufeinanderfolgenden Tagen je eine Penicillin-Injektion in den Oberarm gab, wodurch sich schlagartig eine Besserung bei ihr einstellte[100]. Im zweiten und dritten Fall bat mich der Häuptling, nachdem auch diesmal seine Heilversuche nicht zum Erfolg führten, sogar darum, den Patienten „Penicillina" zu geben.

[98] Die Behandlung mit kaltem Wasser ist in Südamerika weit verbreitet. Abweichen Vergleichshalber möchte ich die Kashibá-Indianer im nordöstlichen Chaco erwähnen, bei denen der Zauberer die Kranken in derselben Weise zu heilen versucht. (Baldus, 1931, S. 145).

[99] Nur der Pakidái-Jüngling Hakuwáwawéwé starb nach dem Stich von einer Pogonáis-Palme, wobei er sich wahrscheinlich innere Verletzungen zugezogen hatte (s. S. 30).

[100] Dieser Heilung schrieb mein Assistent zugeschrieben, so daß ich dennoch zugestimmt in den Stamm der Surára aufgenommen wurde und natürlich das großen Tatsacheneingeschlossen auch die mit der Krankenstube verbundenen Angehörigen verwichte. Besonderes Interesse dürfte (s. S. 108). Wäre die Frau jedoch nach der Injektion gestorben, so hätte der Häuptling böse Folgen für mich haben können.

Von den verschiedenen Kuren, denen ich beiwohnen durfte, möchte ich nachstehende zwei Behandlungen ausführlich schildern:

b) Zauberkur (Rehawé) für Xamámi:

Xamámi, die junge, schöne Frau von Kurikayawé, war ganz plötzlich erkrankt. Sie hatte hohes Fieber, lag apathisch in ihrer Hängematte und klagte über starke Brustschmerzen. Ihr Mann, der den ganzen ersten Tag in rührender Anhänglichkeit bei ihr blieb, er saß neben ihr oder lag in seiner Hängematte, führte sie mehrmals zu dem nahegelegenen kleinen Fluß, worin sie stets längere Zeit verweilte und in reichlichem Maße trank. Essen durfte sie nichts, doch sie hatte auch kein Verlangen danach. In der Nacht schien das Fieber zu steigen, denn sie phantasierte viel und fand keinen festen Schlaf. Am nächsten Tag fühlte sie sich noch schlechter. Dreimal brachte sie ihr Mann am Vormittag und ebenso oft am Nachmittag zu dem Fluß, ohne daß nach den Bädern und dem Trinken eine Besserung eintrat. Am Mittag des dritten Tages begann dann der Ehemann, zusammen mit zwei anderen Männern, die erste Spezialkur. Zuerst malten sich Kurikayawé und der zweite Teilnehmer mit Urucu schlangenförmige Linien in das Gesicht und auf den Körper, während sich der dritte vollständig mit Ruß einrieb. Danach bliesen sich alle drei gegenseitig Schnupfpulver in die Nase und gerieten schon nach wenigen Augenblicken in Ekstase, indem sie wie wild um die in ihrer Hängematte liegende Kranke herumsprangen, laut schrien und gestikulierten. Doch dann verlief die Kur nach ganz bestimmten Richtlinien. Der völlig schwarz gefärbte Mann stellte symbolisch den Krankheitsgeist — *wenzi* — dar, den ein feindlicher Medizinmann in den Körper der Kranken gezaubert hatte, und die beiden anderen Männer, die sich jetzt mit den *Rehawé* identifizierten (s. S. 92), führten gegen ihn einen Schaukampf. Anfangs waren sie mit großen Stöcken bewaffnet und schlugen auf „*wenzi*" ein, um diesen zu töten. Doch er wehrte sich mit allen Kräften. Dann schleuderten sie Pfeile auf ihn, die er aber zurückwarf. Hierauf stülpte sich der

Krankheitsgeist einen Tragkorb auf den Kopf, der ihm plötzlich herunterfiel. Sofort schlugen die zwei anderen Männer mit ihren Stöcken ganz heftig auf den Korb, um der Krankheit den Garaus zu machen. Alle Bewegungen wurden in einem Tanzrhythmus, zwei Schritte vor und einer zurück, durchgeführt, wobei die *„Hekurá"* ununterbrochen die Worte ho-he-hi-ha-fi, ho-he-hi-ha-fi sangen, während *„Nonexí"* zwischendurch schrille Laute von sich gab. Erst spielte sich der „Kampf" in einiger Entfernung von der Kranken ab, doch während der „Auseinandersetzung" näherten sie sich ihr. *„Nonexí"* tanzte nun allein am Kopfende von Xunamí, und die beiden *„Hekurá"* strichen über den Körper der Kranken und sangen daran. Danach erbrachen sie sich und einer nahm plötzlich einen Stein und der andere ein Stück Holz aus dem Mund. Mit schrillen Schreien warfen sie diese Gegenstände fort, wobei sich *„Nonexí"*, der noch am Kopfende der Patientin verharrte, duckte und laut zu wimmern begann. Mit dem Stein und dem Stück Holz wollte man die Krankheit zu den Waiká schleudern. Hierauf begann erneut das Schringericht zwischen *„Nonexí"* und den *„Hekurá"*, oftmals unterbrochen durch Saugen und Streichen an dem Körper der Kranken, die alles völlig willenlos über sich ergehen ließ. Zwischendurch bliesen sich die Männer immer wieder Schnupfpulver in die Nase. Vier Stunden lang wurde die Kur durchgeführt, doch bei Xunamí war noch keine Besserung festzustellen, sondern eher eine Verschlechterung. Man setzte nun die Kranke vor ihre Hängematte auf den Boden, und zwei andere Männer, diesmal nur personifizierte *Hekurá*, führten im Schnupfpulverrausch die Kur weiter, indem sie um die Frau herumtanzten, sangen und laut schrieen. Zwischendurch bestrichen sie Xunamís Körper und sangen kleine Steine heraus, die sie bespuckten, beleckten und danach an ihrem eigenen Körpern rieben, bevor sie dieselben unter schrillen Schreien fortschleuderten. Hin und wieder schlugen sie auch mit den Händen und Füßen um sich herum einen unsichtbaren Feind. Gelegentlich spuckten sie auch und traten mit Gebärden des Abscheus auf das Sputum. Danach wurde die Patientin wieder in ihre Hängematte gelegt und mit kaltem Wasser übergossen.

Infolge des hohen Fiebers und durch das lange Fasten war Xunamí schon sehr geschwächt. Doch in der kommenden Nacht sollte nun eine ganz große *Rekurá* (magische Kur; s. auch S. 96) durchgeführt werden, und zwar vom Häuptling Hewemáo und acht Gehilfen. (Der Häuptling greift erst dann ein, wenn die Tageskuren einzelner Männer ergebnislos waren). Gleich nach dem Einbruch der Dunkelheit versammelten sich die Männer, von denen acht, einschließlich des Häuptlings, ihr Gesicht und den Körper mit roten, schlangenförmigen Linien bemalt hatten und der neunte mit Ruß schwarz gefärbt war. Ein Stück abseits von der Kranken bildeten sie einen Kreis um den in der Mitte stehenden großen Tonteller, auf dem sich das Schnupfpulver befand. Hiervon bliesen sie sich gegenseitig erhebliche Mengen in die Nase und tanzten danach laut singend und schreiend im Kreise herum. Dadurch sollte, wie mir der Häuptling später erklärte, der Kontakt mit den Hekurá hergestellt werden. Diese Vorbereitungen währten etwa eine halbe Stunde. Darauf näherten sie sich tanzend und singend der Kranken. Diese stand diesmal vor der Hängematte, gehalten von dem Ehemann, der seine Arme unter den übrigen durchgesteckt und über ihrer Brust gefaltet hatte, denn sie war schon nicht mehr in der Lage, allein zu stehen. Laut schreiend tanzten die Männer mehrmals um sie herum und sprangen dann in das innere Rund der großen, offenen Maloka, wo sie mit Ingrimm unsichtbare Gegenstände fortschleuderten. Dann spuckten sie auf dieselben und trampelten wütend auf jenen imaginären Objekten herum, wobei sie laute Drohungen gegen die Waiká ausstießen. Hierauf tanzten und sprangen sie in einem scheinbaren Durcheinander zwischen der Kranken, deren Körper sie jeweils einige Male bestrichen, und dem inneren Hof der Maloka hin und her, wobei sie ab und zu laut schrieen, wilde Sprünge ausführten und sich dabei im Kreise drehten. Immer wenn sie außerhalb des Wohnteiles kamen, warfen sie erneut unsichtbare Gegenstände von sich. Dieses Tanzen, Springen und Schreien, die Bewegungen des

Fortwerfens, in die Kniebeuge gehen, mit den Händen nach vorn und oben zeigen, erschien wie ein Wirwarr, und der dabei vollführte Lärm war unbeschreiblich. Anschließend tanzten der Häuptling und sein Bruder, die Kranke wurde währenddessen von einem anderen Mann gehalten, für etwa 40 Minuten allein um dieselbe herum. Sie bliesen nach ihr und saugten am Körper, wobei sie ihn gleichzeitig massierten. Abwechselnd sprangen sie dann einige Meter zurück und warfen imaginäre Gegenstände von sich. — Die acht Medizinmannsgehilfen hatten sich inzwischen ein Stück von der Feuerstelle entfernt. Der mit Ruß gefärbte Mann lag auf dem Boden, symbolisch den bösen *Nosexi* darstellend, während die anderen sieben, welche sich, genau wie der Häuptling und sein Bruder, mit den Hekurá identifizierten, um denselben herumtanzten und -sprangen. Dabei stießen sie mit den Füßen nach ihm, sprachen Schimpfworte aus, drohten mit den Fäusten und schlugen auf ihn ein. Plötzlich versuchte „*Nosexi*" zu fliehen, doch die anderen Männer holten ihn rasch wieder ein und warfen den „bösen Krankheitsgeist" erneut zu Boden. Man beklopfte seinen Körper, saugte daran und spuckte über ihm aus. Ja, man schlug sogar symbolisch mit Stöcken auf denselben ein. Dann wurde ein 2 kg schwerer Stein auf den Leib von „*Nosexi*" gelegt, nach kurzer Zeit wieder aufgenommen und fortgeschleudert. Hierauf verstummte mit einem Male der Höllenlärm. Der Häuptling Hewemäo hockte völlig in sich versunken vor der Kranken. Hinter ihm kauerte sein Bruder Kurikayawö, der ihm über den Körper und den Kopf strich und leicht seinen Rücken beklopfte. Es herrschte ein völliges Schweigen, nur das Stöhnen des Häuptlings und der Kranken war zu vernehmen, welches oft durch laute Seufzer des ersteren unterbrochen wurde. Die übrigen sieben „*Hekurá*" hockten indessen schweigend um den liegenden „*Nosexi*" herum. Die Kranke saß nun zwischen den Beinen jenes Mannes, der sie bisher gestützt hatte. Nach der Sammlung des Häuptlings, die etwa 30 Minuten währte, bildeten alle Teilnehmer der *Rahurá* einen Kreis um Xunamä. Der Häuptling kauerte sich ihr direkt von Angesicht zu Angesicht gegenüber und begann laut mit einer wunderbaren Baritonstimme zu singen, während die übrigen acht Mann, mit Ausnahme des „*Nosexi*", im Chor einstimmten. Es war ein mehrstimmiger Gesang und so melodisch, daß er auf mich wie ein Orgelklang wirkte. Ab und zu standen die Medizinmannsgehilfen auf und gingen singend um die Patientin herum, während ihr der Häuptling vom Kopf bis zu den Füßen über den Körper strich, sie massierte, beklopfte und an ihr saugte. Danach spuckte er jeweils imaginäre Gegenstände aus, wobei die anderen Männer stets in laute Ah- und Oh-Rufe ausbrachen. Dieser Chorgesang und die dabei durchgeführten Handlungen währten ca. drei Stunden. Anschließend saugte Hewemäo besonders heftig an Xunamäs Körper, wobei seine Hände an ihr immer von oben nach unten strichen. Mit einem Male befanden sich ein etwa 1 kg schwerer Stein in seiner rechten Hand und drei kleine Steine, zwei Stückchen Holz und zwei Fingernägel in seiner linken. Alle Objekte hatte er aus ihrem Körper gesaugt und schleuderte sie nun, unter lauten Ah- und Oh-Rufen seiner Gehilfen, mit Gebärden des Abscheus fort. Während dieses Saugens und Bestreichens schwoll der Chor aller im Kreise stehender „*Hekurá*" zu einer ungeheueren Stärke an und ebbte erst wieder ab, nachdem sich Hewemäo langsam zurückgezogen hatte, denn seine Arbeit war zunächst beendet. Er war in Schweiß gebadet und legte sich völlig erschöpft in seine Hängematte, wo ihn seine beiden Frauen mit einer nahrhaften Mahlzeit, bestehend aus gebratenem Tapirfleisch, Maniokfladen und einem Bacabagetränk, versorgten.

Doch die Kranke war auch nach dieser fünfstündigen Kur noch nicht erlöst. Von 23.00 bis 1.00 Uhr führten der Ehemann und die Medizinmannsgehilfen dieselbe weiter, und zwar in der gleichen oben beschriebenen Weise. Die Hauptsache waren der Chorgesang und das schreitende Tanzen, dazu kamen gelegentliches Sitzen, Bestreichen der Kranken, Saugen, drohende Handbewegungen zu einem unsichtbaren Gegner, Ausspeien usw. Um 1.00 Uhr schieden zwei weitere Männer aus, u. a. der Ehemann. Dieser hob jetzt seine Frau auf und legte sie in ihre

Hängematte, dann kauerte er sich daneben und stützte ihr ärztlich den Kopf. Noch etwa zwei Stunden lang sangen und „kurierten" die Medizinmannsgehilfen weiter und danach bis gegen 5.00 Uhr einer allein. Erst dann konnte sich die kranke Frau für kurze Zeit der wohlverdienten Ruhe hingeben[202]). Von den übrigen Stammesangehörigen schauten viele dieser Zauberhandlung zu, vor allem Frauen, die dabei leise weinten. In einem etwas größeren Abstand kauerten sie im Halbkreis und beobachteten die Vorgänge mit gespannter Aufmerksamkeit, jedoch nur, solange der Häuptling in Tätigkeit war. Als er seine Arbeit beendet hatte, verschwanden auch nach und nach die Zuschauer.

Leider blieben in diesem Falle alle aufgewandten Mühen ohne Erfolg, und Hewemäo gestand mir am nächsten Tag, als es der Kranken noch viel schlechter ging, daß diesmal die Kraft der Waiká-Medizinmänner ungewöhnlich groß sei. Daraufhin schlug ich ihm vor, daß ich Xunamí Penicillin-Injektionen geben wolle. Nach längeren Beratungen mit dem Ehemann und anderen männlichen Stammesangehörigen willigte er, wenn auch mit Bedenken, ein, und das Glück stand sowohl der Kranken als auch mir zur Seite. Von diesem Augenblick an wurde der Name Penicilina (portugiesische Schreibweise) zu einem Zauberwort, denn es hatte ja dazu beigetragen, die Krankheit fortzuscheuchen. Hewemäo bat mich sogar, daß ich ihm beim nächsten Besuch recht viel davon mitbringe.

c) Zauberkur (*Rekurd*) für Xanimá:

Xanimá, die etwa 47 Jahre alte Mutter von Anyarawë (s. S. 58), war seit fünf Tagen an Windpocken erkrankt und hatte ständig hohes Fieber. Anfangs führte man auch bei ihr die Wasserkuren durch, d. h. sie mußte im Fluß ständig Bäder nehmen und viel Wasser trinken; bei zunehmender Schwäche blieb sie in der Hängematte liegen und wurde mit kaltem Wasser übergossen. Danach gab es Scheingefechte zwischen zwei „*Hekurá*" und dem bösen, schwarzgefärbten Krankheitsgeist „*Nowazi*".

Als keine Besserung eintrat, veranstalteten der Häuptling Hewemäo und acht Gehilfen wiederum eine große, jedoch diesmal etwas abweichende nächtliche *Rekurá*, weil es sich ja um eine andere Krankheit handelte[203]). Zuerst bildeten die Männer, acht hatten sich rote schlangenförmige Linien auf Gesicht und Körper gemalt und einer war schwarz gefärbt, im Schein der Feuerstelle wieder einen Kreis um den in der Mitte stehenden großen Tonteller, auf welchen man Schnupfpulver geschüttet hatte. Sie füllten reichlich davon in ihre Schnupfrohre und bliesen es sich gegenseitig in die Nase, worauf schon nach wenigen Augenblicken der Ekstasezustand eintrat. Die Männer hüpften mehrmals um ihre eigene Achse und stürmten, auf einen Zischlaut des Häuptlings, mit anhaltend schrillen Schreien, die in den verschiedensten Tönen erfolgten, auf die Kranke zu. Sie wirkten wie eine wilde Horde, denn die Teilnehmer überschrieen sich, hüpften vor und zurück, drehten sich im Kreise, gingen in die Kniebeuge, sprangen in die Höhe und drohten mit den Fäusten gegen einen unsichtbaren Feind. Nach einem erneuten Zischlaut Hewemäos stellten sie sich im Kreis um die in ihrer Hängematte liegende kranke Frau, und jeder Mann legte beide Hände auf die Schultern des vor ihm stehenden. Mit wiegenden Tanzschritten, zwei vor und einer zurück, wobei sie ho-he-hi-ha-fk, ho-he-hi-ha-fk sangen, liefen sie längere Zeit um die Patientin herum. Dann zischte Hewemäo zum dritten Mal, worauf der Gesang verstummte. Hierauf stimmte der Häuptling einen melodischen Gesang an, den die Gehilfen durch Summen untermalten. Währenddessen bewegten sie sich weiter wiegenden Schrittes um die Kranke, wobei die Hände nach wie vor auf den Schultern des jeweiligen Vordermannes lagen. Nach 15 Minuten zischte Hewemäo erneut, und jetzt legte man die Hände gekreuzt auf die Schultern des Voranschreitenden. Gleichzeitig fielen alle Männer in den Ge-

[202]) Hat sich bei Patienten die Krankheit sehr verschlimmert, so läßt man sie möglichst wach, um ihr Leben nicht aufs Spiel zu setzen. Dann wenn sie einschliefen, so könnte der Tod von ihnen Besitz ergreifen.

[203]) Wie schon oben erwähnt (s. S. 96), gibt es für jede Krankheit ganz bestimmte Texte, Melodien und Tanzschritte.

sang des Häuptlings ein, und zwar wurde wieder mehrstimmig gesungen. Dieser Chorgesang, in Verbindung mit dem schreitenden Tanz, währte weitere 20 Minuten. Danach stellten sich der Häuptling und sein Bruder Kurikayawö am Kopfende der Patientin einander gegenüber und stimmten einen Wechselgesang an. Am Fußende hockten zwei Gehilfen, die sich ebenfalls anschauten und leise summten. Ein Stück hinter dem Kopfende tanzten zwei weitere Gehilfen mit zugewandten Gesichtern vor und zurück, welche ebenfalls summten und gelegentlich vogelartige Laute ausstießen; mit den Händen fuhren sie häufig durch das Kopfhaar und strichen sie danach regelmäßig über das Gesäß nach unten. Die restlichen drei Männer, zwei rotbemalte und der eine schwarzgefärbte, d. h. zwei „*Hekurd*" und „*Nonezi*", führten währenddessen hinter dem Fußende von Xanimá ein Scheingefecht durch, in ähnlicher Weise, wie es bereits auf S. 99 geschildert wurde. Inzwischen hatte die Schwiegertochter der Kranken dieselbe aufgerichtet und sich hinter ihr in die Hängematte gesetzt, gleichzeitig stützte sie die alte Frau mit beiden Armen. Als dann das Scheingefecht beendet war und der böse „*Nonezi*" am Erdboden lag und die beiden „*Hekurd*" neben ihm als „Sieger" kauerten, begann erneut ein mehrstimmiger Gesang aller Teilnehmer. Gleichzeitig strich der Häuptling über den Kopf und anschließend über den Körper der Kranken. Dann begann er an ihr zu saugen, erst am Kopf, danach an der Brust, am Bauch und an den Oberschenkeln. Hierauf stieß er schrille Schreie aus und erbrach sich. In diesem Augenblick verstummte der Gesang, und alle Gehilfen stießen laute Ah- und Oh-Rufe aus. Hierauf schleuderte Hewemäo unsichtbare Gegenstände zur Seite, was von den übrigen Männern stets mit Ah- und Oh-Rufen begleitet wurde. Dann stimmte man erneut einen Chor an. Dieser Teil der Zauberhandlung dehnte sich über zwei Stunden lang aus. Nachdem der Häuptling aber Steine und Holzstücke aus dem Körper der Kranken herausgesaugt und unter begeisterten Ah- und Oh-Rufen der Gehilfen fortgeschleudert hatte, steigerte sich die Lautstärke des Gesanges, dem sich schrille Schreie anschlossen, die in einem allgemeinen Summen endeten. — Danach trat völlige Ruhe ein. Die Männer setzten sich im Kreis um Xanimá, und jeder stützte den Kopf auf die Knie, denn alle waren sichtlich erschöpft, besonders der Häuptling und sein Bruder. Doch die Frauen der letzteren hatten sich hinter dieselben gesetzt und strichen ihnen über den Kopf, über die Schultern und beklopften leicht den Rücken, um den Ermatteten neue Kräfte zu verleihen, denn während des Heilprozesses hatten sie sich vollständig verausgabt. Auch die Kranke konnte jetzt wieder liegen. Sie hatte die Augen geschlossen, und man merkte, wie mitgenommen sie von dem langen Sitzen war. Nach dem bisherigen Lärm wirkte die Stille recht eigenartig. Aber bereits nach 15 Minuten erhob sich einer der Medizinmannsgehilfen; er begann im Kreise um die Kranke herumzutanzen, wobei er leise sang. Doch inzwischen hatten sich Wolken vor den Mond geschoben, und ein heftiger Regen setzte ein. Daraufhin beschloß Hewemäo, die Sitzung zunächst abzubrechen, um sie im Morgengrauen fortzusetzen. „Denn bei verdunkeltem Himmel", so meinte er, „ohne die Mitwirkung des Mondes, sei es nicht möglich, die Frau von ihrer Krankheit zu befreien." Zwei Gehilfen ließ er bei der stöhnenden, von Fieberschauern geschüttelten Xanimá zurück, die links und rechts von ihrem Kopfende kauerten und leise summten, damit, wie mir Hewemäo sagte, der Kontakt zu den *Hekurd* nicht abgebrochen wurde. Gegen 4.30 Uhr, der Regen hatte inzwischen aufgehört, versammelten sich die neun Männer erneut um die Kranke und setzten die Kur in der oben beschriebenen Weise noch zwei Stunden lang fort. Bereits am Vormittag war das Fieber beseitigt, und die Frau befand sich auf dem Wege der Besserung. Sie und jeder andere Stammesangehörige waren davon überzeugt, daß Hewemäo den bösen Krankheitsgeist *Nonezi* zu den Waiká geschleudert hätte. Doch auch Hewemäo selbst glaubt fest daran, daß er im Schnupfpulverrausch und mit Hilfe der *Hekurd* und des Mondes Krankheiten und Unglücksfälle abwehren, aber auch verursachen könne.

Die beiden geschilderten Zauberhandlungen zur Abwehr von zwei verschiedenen Krankheiten lassen ein gewisses äußeres Schema erkennen. Jede Kur beginnt mit der Einnahme von Schnupfpulver, wodurch der Häuptling und seine Gehilfen in einen Rauschzustand geraten und sich dabei mit den *Hekurá* identifizieren. Es folgt das Anrufen der *Hekurá*, was durch wilde Gebärden unterstützt wird, dann das Scheingefecht zwischen zwei oder mehreren „*Hekurá*" und dem Krankheitsgeist „*Nosexi*". Doch danach wendet man für jede Krankheit ganz bestimmte Texte, Melodien und Tänze an. Unvergeßlich werden mir die mehrstimmigen Chorgesänge bleiben, welche die Bitten an die Hekurá und die Serras enthalten, die sie ihrerseits an *Porí/Perimbó* weiterleiten (s. S. 91 ff.)[888])

Bei allen Kuren durfte ich als Zuschauer teilnehmen und jede *Rekurá* war ein erneutes, großes Erlebnis für mich. Ich fand es bewunderungswürdig, mit welcher Aufopferung, Leidenschaft und Inbrunst der Häuptling und seine Gehilfen sich mit allen ihren physischen und psychischen Kräften dafür einsetzten, die Krankheiten von ihren Stammesangehörigen abzuwehren[889]). Daher ist es verständlich, daß die Surára und Pakidái ihren Häuptlingen ein so grenzenloses Vertrauen entgegenbringen und restlos von deren Zauberkräften überzeugt sind. Diesem unerschütterlichen Glauben ist es deshalb wohl auch zu verdanken, daß so viele Kranke geheilt werden können[890]).

In diesem Zusammenhang möchte ich noch folgende sehr aufschlußreiche Schilderung von Herbert Baldus zitieren: „Die Zauberärzte wurden von früheren Reisenden einfach für Betrüger erklärt, und heute noch sind alle Weißen, welche die Psyche des Indianers nicht zu begreifen vermögen, derselben Ansicht. Man vergißt, daß bei der Suggestibilität des Primitiven die zauberischen Handlungen nicht nur dem Kranken wesentlich helfen und seinen Angehörigen die Angst nehmen, sondern auch den Ausübenden selbst derartig in ihren Bann ziehen, daß es unmöglich ist zu unterscheiden, wieweit er gläubig wirkt und wieweit er heuchelt"[891]). Daß aber selbst in der modernen Medizin der suggestiven Einwirkung des Arztes auf seinen Patienten heute eine große Bedeutung beigemessen wird, zeigen die nachfolgenden Ausführungen von Hans Grimm: „Wenn wir betonen, daß die suggestive Einwirkung der Arztpersönlichkeit auf den Patienten vielfach von entscheidender Bedeutung ist (Jores), wenn wir Hypnose, das sogenannte „autogene Training" usw. verwenden, so kehren wir in unserer Weise zu dem zurück, was schon in den schamanistischen Techniken eine Rolle spielte"[892]).

3. Religiöse Feste

In jedem Jahr, gegen Ende der Trockenzeit, März—April, feiern die Surára und Pakidái gemeinsam das Totenerinnerungsfest — *patapánomõo* —[893]). Es findet regelmäßig in der großen, offenen Surára-Maloka Jaracá (s. S. 11 ff.) statt. Gelegentlich nehmen auch einige Familien befreundeter Stämme (Xiriána, Pusheweteri, Aramamesteri usw.) daran teil. Das Patapánomõo-Fest, welches ich in allen Phasen mit-

[888]) Ich bedauere es zutiefst, daß ich diese Gesänge nicht auf einem Tonband festhalten konnte. Aber leider war das Tonbandgerät, welches mir die Deutsche Forschungsgemeinschaft vor Antritt meiner Expedition auf dem Kurierwege an das Deutsche Generalkonsulat in São Paulo geschickt hatte, von einem dortigen Angestellten beschädigt worden. Er hatte es unberechtigterweise ausgepackt und damit herumgespielt. So kann ich nur hoffen, daß es mir vergönnt sein wird, diese Gesänge bei einer späteren Forschungsreise noch aufzunehmen.

[889]) Aber auch mir, dem Fremdling, ließ man die gleiche Fürsorge angedeihen. Wenn ich einen Malariaanfall hatte, tanzte der Häuptling mit seinen Gehilfen ebenfalls um mich herum, und sie sangen im Chor, während Hewemõo meinen Körper bestrich, massierte und daran saugte. Er war der Meinung, daß die Waihá mein Blut vergiftet hätten, weil ich mit den Surára in Freundschaft lebte und ihnen so viele schöne Geschenke mitgebracht hatte.

[890]) Nie beobachtete ich, daß die Häuptlinge für ihre Kuren ein Honorar verlangten. Aber die Stammesangehörigen zeigen sich erkenntlich, indem sie ihren Häuptlingen laufend größere und kleinere Geschenke darbringen (s. S. 60).

[891]) Baldus, 1931, S. 142.

[892]) Grimm, 1938/39, S. 337.

[893]) Hierin ist das Wort für Leiche, der oder die Tote — *masmãe* — enthalten.

erlebte, wurde in der Zeit vom 4.—6. IV. 1956 durchgeführt. Doch schon vorher traf man zu diesem Zwecke große Vorbereitungen. Die Männer gingen auf Gemeinschaftsjagd, um möglichst viele Tapire zu erlegen, deren Fleisch dann auf den Bratständern, bei gleichbleibendem, nicht zu starkem Feuer, solange durchgebraten wurde, bis es schwarz und knochenhart war, so daß man es einige Tage aufbewahren konnte. Dieses Braten gehörte zum Aufgabenbereich der Männer, genau wie das Ernten der Pupunha-Früchte. Von den Frauen wurden die letzteren dann zu einem Getränk verarbeitet. Außerdem holten sie aus der Pflanzung große Mengen Bananen, welche man in die Sonne legte, damit sie nachreifen konnten, und schließlich ist noch zu erwähnen, daß sich bei allen Familien nach und nach mehrere Haufen von Maniokfladen stapelten.

Am Abend des 4. April, gegen 21.00 Uhr, begann dann das eigentliche Fest. Fünf Männer und fünf Knaben, welche über ihren Hüftschnüren baumwollene Gürtel trugen, tanzten, nachdem sich die ersteren vorher noch Schnupfpulver in die Nase geblasen hatten, einer hinter dem anderen (zwei Schritte vor und einer zurück, wobei das stärkere Anheben der Knice bei leichter Auswärtsdrehung des Beines zu bemerken ist) auf einer Kreisbahn im offenen Rund der Maloka herum, und zwar gegen den Uhrzeigersinn[*]). Die beiden ersten Männer hielten je zwei Pfeile in der rechten Hand, und die übrigen, sowie alle Knaben, hatten die Hände hinter dem Kopf verschränkt. Gelegentlich sang ein Mann mit schöner, voller Baßstimme, und die anderen fielen danach im Chor ein. Die Gesänge waren sehr melodisch und gaben den Rhythmus für die Tanzschritte ab[**]). Gegen 22.00 Uhr stießen weitere Männer, z. T. mit, z. T. ohne Pfeile, und Knaben (alle ohne Pfeile) zu den Tanzenden, und 23.30 Uhr waren, mit Ausnahme des Surára-Häuptlings, alle Männer und Knaben in der Mitte des Maloka-Hofes versammelt, wo sie sich von einem mit Schnupfpulver gefüllten großen Tonteller, den man inzwischen hier aufgestellt hatte, einschließlich mehrerer Schnupfrohre, gegenseitig gewaltige Mengen in die Nase bliesen. Danach setzten sie sich im Kreise nieder und begannen einen Chorgesang anzustimmen. Bald darauf erhoben sich fünf Krieger, die in beiden Händen Pfeile hielten, und tanzten um die Singenden herum. Ab und zu führten sie gewaltige Sprünge aus und schrieen dabei mit hoher, schriller Stimme. Alles spielte sich in einer kühlen, wolkenverhangenen Vollmondnacht ab, die zahlreichen Feuerstellen trugen aber etwas zur Erhellung bei. Alle Frauen und Mädchen sowie mein Diener Mateus und ich lagen in den Hängematten und schauten dem einzigartigen Schauspiel zu. Gegen 1.00 Uhr morgens erhoben sich die männlichen Festteilnehmer und tanzten jetzt, wieder einer hinter dem anderen, im Außenkreis des Maloka-Hofes herum. Sie waren in der Weise formiert, daß hinter einem Mann mit zwei Pfeilen stets einer folgte, der die Hände hinter dem Kopf verschränkt hatte.

Plötzlich wurde der neben mir in seiner Hängematte schlafende Häuptling Hewemão von einem Krieger mit dem Pfeil leicht angestoßen. Er stand sofort auf, zog Hemd und Hose aus (die beiden Kleidungsstücke hatte er von mir als Geschenk erhalten), nahm einen Bogen ohne Sehne in die Hand, ließ sich Schnupfpulver in die Nase blasen und mischte sich unter die Tänzer, welche aber sofort nach seinem Eintritt folgende neue Formation bildeten: Zehn Männer hatten sich an der Spitze des Tanzzuges in Rhombusform aufgestellt, einer ganz vorn, zwei seitlich dahinter und wiederum zwei seitlich hinter diesen; letzteren standen zwei unmittelbar gegenüber, dann folgten zwei, die etwas nach innen standen, und schließlich einer, der sich in der Mitte hinter diesen befand (Fig. 29). Die ersten fünf Krieger, welche sich mit Ruß schwarz gefärbt hatten, symbolisierten die *Nowaxi* (böse Geister bzw. Krankheitsgeister, s. S. 96) und mußten rückwärts tanzen. Die ihnen folgenden fünf Tänzer verkörperten *Hekurá* (gigantische Tier- und Pflanzengeister, die den Surára und

[*]) Bei allen Tänzen, die sich auf der Peripherie eines Kreises bewegen, tanzen die Teilnehmer entgegen dem Uhrzeigersinn.

[**]) Die Surára und Pakidái begleiten ihre Tänze teilweise mit Gesängen, denn Musikinstrumente sind ihnen nicht bekannt.

Fig. 29 Aufstellung der Tänzer anläßlich einer Zeremonie des Totenerinnerungsfestes

Pakidái wohlgesinnt sind, s. S. 92, 97 ff.). Zwischen diesen beiden Fünfergruppen, deren Teilnehmer je zwei Pfeile in den Händen hielten, wurde während des Tanzes ein Scheingefecht durchgeführt (s. auch S. 97 ff.). Die Männer der ersten Gruppe tanzten je zwei Schritte zurück und einen vor und die der zweiten zwei Schritte vor und einen zurück. Dazwischen wurden wilde Sprünge und Drehungen ausgeführt, man bedrohte sich mit den Pfeilen und schrie in den höchsten Tönen. Die „*Nonaxí*" waren also ununterbrochen auf dem Rückzuge und verteidigten sich mit allen Kräften gegen die vordringenden „*Hekurá*". Hinter diesen zehn „kämpfenden" Tänzern folgten sechs Männer in Reihe, die je einen Pfeil in der Hand hatten, die Vorhut des Häuptlings. Mit kleinem Abstand schloß sich ihnen der Surára-Häuptling Hewemão an, eingerahmt zu beiden Seiten von je sechs in Doppelreihe formierten Männern. Bei letzteren handelte es sich ebenfalls um hervorragende Persönlichkeiten; so gehörten ihnen die beiden jüngeren Brüder des Häuptlings an, der Kriegshäuptling der Surára, Häuptling und Kriegshäuptling der Pakidái sowie besonders bewährte ältere Krieger beider Stämme. Danach kamen, als Nachhut, in der Formation einer Doppelreihe, die übrigen Männer, Jünglinge und Knaben. Alle Teilnehmer des Zuges bewegten sich in den üblichen Tanzschritten, zwei vor und einen zurück, wozu sie im Chor sangen. Ab und zu stieß der Häuptling Hewemão einen Zischlaut aus, worauf sich alle Teilnehmer in der Mitte des Platzes um den großen Tonteller mit Schnupfpulver gruppierten. In singendem Tonfall betete der Häuptling hier zuden *Hekurá* und bat sie um Fürsprache bei *Purí/Perimbó*, damit dem Fest ein glücklicher und erfolgreicher Verlauf beschieden sei. Dann bliesen sich die Männer gegenseitig neues Schnupfpulver in die Nase, worauf der Tanz in jener oben geschilderten Weise fortgesetzt wurde. Dieses Tanzen und Singen währte, mit Ausnahme der kurzen Unterbrechungen am Tonteller, bis 6.00 Uhr morgens.

Gleich anschließend kauerte sich der Surára-Häuptling an seiner Feuerstelle nieder, und neben ihn hockte sich ein Medizinmannsgehilfe. Auf der gegenüberliegenden Seite der großen Maloka hatten der Pakidái-Häuptling und ein Gehilfe die gleiche Stellung eingenommen. Hewemão, der erstgenannte Häuptling, begann laut und vernehmlich mit den *Hekurá* (gigantische Tier- und Pflanzengeister) zu sprechen. Dabei strich er sich ständig von vorn nach hinten über das Haar und klatschte sich anschließend auf sein Gesäß. Der neben ihm hockende Gehilfe wiederholte jedes seiner Worte und kopierte alle Bewegungen. (Hierdurch soll symbolisch zum Ausdruck gebracht werden, daß die *Hekurá*, jene Vermittler zwischen den Menschen und dem vereinigten Höchsten Wesen, *Purí/Perimbó*, auch tatsächlich alle Fragen, Bitten und Wünsche weiterleiten). Nach Hewemão sprach der Pakidái-Häuptling mit den *Hekurá*, und sein Gehilfe wiederholte ebenfalls jedes Wort und ahmte die Gesten (Haarstreichen und Klatschen auf das Gesäß) nach. Diese Geisterbeschwörung, welche die beiden Häuptlinge wechselseitig durchführten, dauerte eine Stunde.

Danach legten sich die beiden erschöpften Häuptlinge und die übrigen Männer, Jünglinge und Knaben zur wohlverdienten Ruhe nieder.

Die Frauen gingen inzwischen ihrer gewohnten Tätigkeit nach. Sie holten Wasser, bereiteten das Essen, versorgten die Kinder; manche flochten inzwischen auch an einem Korb, oder sie zogen Glasperlen auf eine Schnur. Diejenigen Männer, welche inzwischen wieder erwacht waren, blieben z. T. untätig in ihrer Hängematte liegen, manche spielten auch mit den Kindern, während andere gruppenweise zusammensaßen und sich unterhielten.

Gegen 14.00 Uhr nahm das Fest seinen Fortgang, als 20 Männer, Jünglinge und Knaben, von denen jeder einen Pfeil in der Hand hielt, mit lauten Schreien in den Maloka-Hof stürmten. Sie waren prächtig bemalt[111]) und an den Oberarmen und z. T. in den Ohrläppchen mit bunten Federziefaten geschmückt (s. S. 43/44). Außerdem hatten sich alle die weißen Flaumfedern des Gavião-real (*Thrasaetus harpyia* L.), des gefürchteten Überträgers der Krankheiten (s. S. 96), in die Haare geklebt (Abb. 43). Sie vollführten gewaltige Sprünge, gingen danach in die Kniebeuge, drehten sich zwischendurch mehrere Male, warfen die Pfeile in die Luft und fingen sie wieder auf. Hiernach verfielen sie in einen schreitenden Tanz, wozu sie sangen. Doch dieser Tanz wurde immer wieder von wildem Vorwärtsstürmen und anfeuernden Schreien unterbrochen, wodurch die *Nonaxi* aus der Maloka vertrieben werden sollten, und man wollte ihnen zeigen, wie gefährlich es sei, überhaupt hierherzukommen. Die übrigen Anwesenden sahen dieser Vorführung von ihren Feuerstellen aus begeistert zu. Doch aus Anlaß des Festes hatten sich alle Männer, Frauen und Kinder gleichfalls bemalt und z. T. die baumwollenen Gürtel angelegt; die Männer trugen außerdem ihren Oberarmschmuck aus Federn (Abb. 9—11).

Nach dieser zweistündigen Tanzveranstaltung fand eine besonders feierliche Zeremonie statt, die Segnung der aufbewahrten Knochenasche verstorbener Stammesangehöriger. Zu diesem Zweck hatten sich je zwei führende Persönlichkeiten beider Stämme in Viereckform vor der Häuptlingshütte niedergelassen. Der Surára-Häuptling Hewemão kauerte so, daß er in Richtung des Maloka-Hofes schaute. Rechts und links von ihm, ein wenig seitlich nach vorn, hockten der Pakidái-Häuptling Karenanõ, bzw. Hewemãos Bruder Kurikayawõ und gegenüber von Hewemão hatte Poréhiwõ, der Kriegshäuptling der Pakidái, seinen Platz. Vor letzterem waren 10 kleine mit Knochenasche gefüllte Jamarugefäße (Jamaru = *Cucurbita idolatrica* Lacerda) aufgebaut. Dahinter standen eine leere und eine mit Urucu gefüllte Cuyenschale. Der Pakidái-Häuptling Karenanõ hatte dagegen zwei größere, leere Jamarugefäße vor sich stehen.

Poréhiwõ schüttete nun der Reihe nach aus den kleinen Jamarugefäßen Knochenasche in die leeren Cuyenschalen, fügte etwas Urucu hinzu, vermengte beides mit den Händen und übergab die Schale an Karenanõ, der den Inhalt jeweils in eines der größeren Jamarugefäße füllte. Während die beiden Pakidái ihre Arbeit schweigend verrichteten, betete Hewemão in einer halb singenden Tonart zu den *Hekurá* und strich sich dabei ständig mit den Händen vom Kopf bis zu den Füßen herunter. Sein Bruder Kurikayawõ wiederholte jedes seiner Worte und imitierte die Gesten[112]). Um die vier Männer herum, welche jetzt als Priester fungierten, kauerten rotbemalte Krieger, deren Kopfhaare über und über mit Flaumfedern des Gavião-real bedeckt waren. Wenn der Pakidái-Häuptling ein neues Gemisch von Knochenasche und Urucu in ein größeres Jamarugefäß gefüllt hatte, zog er stets einige Federn von den Köpfen der Krieger und warf sie dazu[113]). Hinter den Kriegern saßen die nächsten Angehörigen der kürzlich Verstorbenen und schluchzten herzzerreißend, vor allem die Frauen. Ihre Tränen

[111]) Die Bemalung wurde mit Urucufarbe durchgeführt und bestand aus schlangenförmigen Linien, Kreisen und Punkten; einige Männer hatten sich aber auch den ganzen Körper rot gefärbt.

[112]) Hierbei handelt es sich wiederum um die symbolische Übertragung der Gebete von den *Hekurá* an *Pwdë/Periwãdë* (s. auch S. 104).

[113]) Hiermit ist ein Abwehrzauber verbunden. Denn wenn die Männer beim späteren zeremoniellen Trinken der mit Knochenasche vermischten Bananensuppe diese Federn mit hineinerschluchzen, sind sie und ihre Angehörigen besser gegen Krankheiten gefeit.

flossen ununterbrochen, und gleichzeitig beteten sie in einem halblauten, singenden Tonfall. Wurde von Poréhiwö die Knochenasche eines weiteren Jamarugefäßes mit Urucu vermischt, so gingen ihr Schluchzen und die Gebete in hohe, schrille Töne über. Doch die Medizinmänner ließen sich davon nicht beeindrucken, sondern setzten unbeirrt ihre Tätigkeit fort. Die Trauergemeinde wurde von einem Kreis stehender, rotbemalter und mit Oberarmfedern geschmückter Krieger umschlossen, welche Bogen und Pfeile in den Händen hielten und zur Außenseite blickten. Ihre Aufgabe war es, die Zeremonie gegen böse, äußere Einflüsse abzuschirmen. Hinter diesen standen zahlreiche männliche Zuschauer, welche den Vorgang zwar mit Interesse, aber ohne innere Anteilnahme verfolgten, denn zwischendurch lachten und scherzten sie.

Als die etwa zwei Stunden dauernde Vermischung der Knochenasche beendet war, gab Poréhiwö die halbgeleerten kleinen Jamarugefäße an die Angehörigen zurück, die sie mit Klagelauten zur weiteren Aufbewahrung entgegennahmen. Darauf begann eine feierliche Prozession, an welcher sich der Surára-Häuptling jedoch nicht beteiligte. Karenauö, der Pakidái-Häuptling, schritt voran, ihm folgten Poréhiwö und Kurikayawö, die je eine der großen, mit Knochenasche, etwas Urucu und einigen Flaumfedern des Gavião-real gefüllten großen Jamarugefäße in den Händen hielten; alle drei sangen Gebete. Weinend und klagend schritten dahinter die nächsten Angehörigen, welche die kleinen Jamarugefäße trugen. Das Ende des Zuges bildeten die an der Zeremonie teilnehmenden Krieger. Diese Prozession, welche mehrere Male um den Maloka-Hof herumschritt, wurde nach einer halben Stunde vor der Häuptlingshütte mit einem gemeinsam gesungenen Gebet abgeschlossen.

Inzwischen war die Nacht hereingebrochen, und die meisten Angehörigen der beiden Stämme lagen in ihren Hängematten, saßen um die Feuer herum oder besuchten sich einzeln bzw. familienweise, um zu plaudern. Oft erschallte ein lautes, fröhliches Lachen. Doch gegenüber der Hütte des Surára-Häuptlings hatten sechs Krieger, die Federn des Gavião-real im Haar trugen, drei hellodernde Feuer entzündet, auf denen sie in mehreren schwarzen, rundbodigen Tongefäßen (s. S. 53) bis Mitternacht Bananensuppe kochten. Während dieser Zeit lief ein Medizinmannsgehilfe, der Bogen und Pfeile in der Hand trug, laut singend im äußeren Rund des Maloka-Hofes herum und erbat den Beistand der Hekurá für das Gelingen der Suppe. Danach trat allgemeine Ruhe ein, nur zwei Männer gingen, wie allnächtlich, vor der Maloka ihre Runden, um die Bewohner gegebenenfalls vor einem feindlichen Überfall zu warnen[112]).

Am nächsten Tag, dem 6. April 1956, erreichte das Fest seinen Höhepunkt. Gegen 9.00 Uhr setzten sich der Surára-Häuptling, sein Bruder Kurikayawö und der Häuptling und Kriegshäuptling der Pakidái um die Töpfe mit der Bananensuppe, vor denen auch die beiden Jamarugefäße mit der Knochenasche der Verstorbenen standen, und alle übrigen männlichen Stammesangehörigen saßen um sie herum. Der Surára-Häuptling begann laut zu beten, worauf ein längeres Chorlied angestimmt wurde. Danach schüttete er die Knochenasche in alle Suppentöpfe, mengte sie mit den Händen gut durch und schöpfte sich anschließend eine Kalebasse voll, welche er hastig und bis zur Neige leerte. Hierauf tranken der Pakidái-Häuptling, der Bruder von Hewemäo und die Kriegshäuptlinge beider Stämme, denen sich alle älteren und jüngeren Männer, einschließlich der größeren Knaben, welche zuletzt tranken, anschlossen[113]). Durch dieses zeremonielle Trinken der Knochenasche würden, so glaubt man, Kraft und Geist der Verstorbenen innerhalb der Stämme verbleiben und zu deren Stärkung beitragen.

Im Anschluß an diesen Trunk wurde ein Dankgebet gesungen. Danach aßen die Männer, Jünglinge und Knaben gemeinsam große Mengen

[112]) Die Einteilung der Wachen wird jeden Abend vom Kriegshäuptling vorgenommen. Die Krieger haben es im Gefühl, wann ihre Zeit herum ist und sie die Nachfolger wecken müssen; in der Regel geschieht dies nach zwei bis drei Stunden.

[113]) Auch meinem Diener und mir hatte Hewemäo, gleich im Anschluß an die Kriegshäuptlinge, je eine volle Kalebasse davon angeboten. Als wir sie ausgetrunken hatten, klopfte er uns anerkennend auf die Schulter und sagte, daß wir nun echte Surára seien.

des gebratenen Tapirfleisches sowie Maniokfladen, und hinterher reichten ihnen die Frauen volle Kalebassen mit dem erfrischenden Getränk aus Pupunha-Früchten.

Gut gestärkt und ausgerüstet mit den Kräften der Verstorbenen, konnten die Männer nunmehr zu dem anstrengendsten Teil des Festes schreiten. Doch bevor dieser begann, schwärzte sich die Hälfte von ihnen Gesicht und Körper mit Ruß, den sie von ihren Kochtöpfen abkratzten. Inzwischen hatten andere in der Mitte des Malokarundes wieder den großen Tonteller aufgestellt, auf welchen sie aus Bambusbehältern das bräunliche Schnupfpulver — *epená* — schütteten, und vor den Teller legten sie eine große Anzahl von Schnupfrohren. Im Anschluß an diese Vorbereitungen versammelten sich die Häuptlinge, alle Männer, Jünglinge und Knaben, helle und schwarzgefärbte Teilnehmer, außerhalb der Maloka. Auf einen Zischlaut von Hewemõo stürmten sie dann laut schreiend in den Hof, liefen einmal am Außenrande herum und gruppierten sich danach um den Tonteller. In die Schnupfrohre wurde Pulver hineingefüllt, und je zwei Männer bliesen es sich gegenseitig mit aller Kraft in die Nase (Abb. 44). Anläßlich dieses Festes schnupfen sie noch stärker als vor sonstigen Zauberhandlungen, Krankheitskuren und Gebeten. Die Wirkung war ungeheuerlich. Schon nach wenigen Augenblicken befanden sich alle Männer in einem wilden Rauschzustande (Abb. 45 u. 46). Zuerst tanzten und sprangen sie gestikulierend und schreiend in einem wilden Durcheinander um den Tonteller herum, danach stürmten sie in der gleichen Weise mehrmals um den Hof. Darauf legten sich jeweils fünf, zehn oder mehr Männer die Arme um den Hals und führten in diesen Gruppen stampfende Kreistänze durch (Abb. 47), wobei jeder Mann einen anderen fest an sich zu ziehen suchte; ab und zu tanzten sie auch in der Kniebeuge. Nach einer halben Stunde wurde dieses ekstatische Tanzen, wobei die Teilnehmer in Schweiß gebadet waren, von einer höchst merkwürdigen Sportart — *fetaplankamã* — abgelöst. Im ganzen äußeren Rund des Maloka-Hofes setzten sich überall zwei Männer, Brust an Brust, mit gespreizten Beinen gegenüber, einer hatte sie jeweils über die Oberschenkel des anderen gelegt. Bei den Partnern handelte es sich immer um einen Surára und einen Pakidái; außerdem war einer von ihnen jeweils geschwärzt. Mit den Armen umschlangen sie sich gegenseitig am Halse und zogen sich, unter kräftigen Armbewegungen, mit aller Gewalt hin und her (Abb. 48). Jeder versuchte den Kopf des Gegners ganz dicht zu sich heranzuziehen. Manchmal sanken die Arme auch auf die gegenseitigen Rücken herab, und man zog sich dann für eine Weile in dieser Stellung. Während des Kampfes riefen sie sich ständig grimmige Worte zu. Oft standen die Ehefrauen um ihre Männer herum und feuerten sie an. Doch es gab bei diesen Kämpfen keine Sieger und keine Verlierer. Erlahmte die Kraft eines Kämpfers, so kam sofort ein anderer Stammesgenosse und setzte an seiner Stelle den Kampf mit dem Gegner fort. Die Ehefrau massierte dann dem Erschöpften den Kopf, damit er rasch wieder einsatzfähig wurde. Die Häuptlinge und Kriegshäuptlinge zeichneten sich bei dieser Sportart besonders aus. Sie kämpften auch am längsten, teilweise mit fünf, sechs und mehr Gegnern; sie hatten eine geradezu unwahrscheinliche Kraft und Ausdauer.

Diese Kämpfe, bei denen symbolisch ein Mann immer den guten Geist, d. h. einen *Hekurá*, und der andere, welcher sich mit Ruß beschmiert hatte, den bösen Geist, einen *Nonaxi*, repräsentierte (s. S. 97 ff., 103 ff.), dauerte nahezu zwei Stunden. Danach waren die Männer völlig erschöpft und stärkten sich bei einem neuen, gemeinsamen Mahle mit Tapirfleisch und Maniokfladen. Hinterher litten aber noch viele Teilnehmer an starken Kopfschmerzen, hervorgerufen durch das Schnupfpulver in Verbindung mit den unmenschlichen körperlichen Anstrengungen, so daß viele Ehefrauen ihren Männern den Kopf massieren mußten.

Abends fand dann nochmals eine etwa halbstündige Prozession in dem Maloka-Hof statt, wobei man alle kleinen Jamurugefäße, in denen noch Reste der Knochenasche aufbewahrt wurden, mitführte. Dieses Zurückhalten von einem gewissen Aschenquantum ist sehr wichtig, damit man das nächste Totenerinnerungsfest für den Fall, daß bis dahin kein Stammes-

angehöriger stirbt, überhaupt feiern kann. Ohne Knochenasche verstorbener Surára oder Pakidái könnte es nämlich nicht stattfinden.

Vergleicht man dieses Jahresfest mit dem der Waiká, welches von Zerries sehr eingehend geschildert wurde[318]), so findet man in den wichtigsten Phasen weitgehende Analogien. Zerries glaubt, daß es bei den Waiká ursprünglich ein Erntefest war, zu dem sich noch andere Riten verschiedenen Charakters hinzugesellt hätten[319]). Demgegenüber ist für die Surára und Pakidái festzustellen, daß hier keinerlei Züge an ein Erntefest erinnern. Es handelt sich um ein ausgesprochenes Totenerinnerungsfest, welches durch das zeremonielle Trinken der Knochenasche verstorbener Stammesangehöriger gekennzeichnet wird. Gleichzeitig ist damit allerdings auch ein Abwehrzauber gegen die *Nonxi* verbunden, weil sie es ja sind, welche die Krankheiten übertragen und dadurch häufig den Tod herbeiführen. Wie bei allen Zauberkuren zur Heilung Kranker, wo stets die symbolischen Kämpfe zwischen den „*Hekurá*" und dem oder den „*Nonxi*" veranstaltet werden (s. S. 97 ff.), tritt dieses Faktum natürlich auch in allen Abschnitten des Festes zutage, sowohl bei den Tänzen, bei der Vermischung der Knochenasche, wenn ein Medizinmann Flaumfedern des Gavião-real aus den Haaren von Kriegern zieht und diese beifügt, als auch anläßlich der Zweikämpfe, die in sitzender Stellung durchgeführt werden. Für die Waiká sind letztere in der gleichen Weise belegt, doch Zerries schreibt, daß es weder ihm noch den amerikanischen Missionaren möglich war, Exaktes über den Sinn dieser Zeremonie zu erfahren[327]). Es ist aber zu vermuten, daß es sich um den gleichen symbolischen Kampf zwischen einem guten und einem bösen Geist handelt, wie bei den Surára und Pakidái. Von anderen Indianerstämmen ist hierüber noch nichts berichtet worden. Meine Gewährsleute sagten mir jedoch, daß auch die Xirióna, Puschewteri und Arumamesteri diese Kämpfe anläßlich ihrer Totenerinnerungsfeste veranstalten. Demnach scheint es sich also um ein ganz spezielles Charakteristikum der Yanomámi zu handeln, daß allerdings früher auch weiter verbreitet gewesen sein könnte. Herr Dr. Gerdt Kutscher machte mich nämlich im Anschluß an einen Vortrag, den ich in Berlin hielt, darauf aufmerksam, daß die Position, welche die zwei Männer hierbei einnehmen, an die Bemalung einer Tonschale vom Rio Ulúa, Honduras, erinnert[328]). Nach Zerries, Barker und Dupouy gibt es bei den Waiká auch noch einen ähnlichen Kampf, wobei sich die Partner abwechselnd mit geballter Faust auf die Brust schlagen[329a, b, c]). Diesen konnte ich bei den Surára und Pakidái nicht beobachten. Desgleichen ist dort die Sitte unbekannt, von der Zerries ebenfalls berichtet, daß sich die Männer, wenn sie im Schnupfpulverrausch umherlaufen, mit der flachen Hand auf den Rücken schlagen[330]). Der genannte Autor faßt dies als Fruchtbarkeitsritus auf. Hierbei scheint es sich jedoch um äußere Einflüsse feldbautreibender Stämme zu handeln, worauf ja auch das zeremonielle Einbringen der Pupunha-Früchte hindeutet[331]).

Weiterhin ist bemerkenswert, daß bei den Waiká Frauen und Mädchen aktiv an dem Fest teilnehmen, indem sie sich an einigen Tänzen beteiligen und sogar von der mit Knochenasche vermischten Bananensuppe trinken[332]). Die weiblichen Stammesangehörigen der Surára und Pakidái fungieren demgegenüber nur als Zuschauer.

Als ein sehr bedeutsamer gleichartiger Zug ist der Endokannibalismus zu werten. Für die Waiká wird er von Cruxent[333a]) und Zerries in mehreren Aufsätzen belegt[333b]) [334]) [335]). Außer-

dem hat letzterer Verfasser nach den Beiträgen der ersten fünf Bände des Handbook of South American Indians eine Verbreitungskarte über das Vorkommen des Endokannibalismus entworfen, die durch umfangreiche Beispiele ergänzt wird[220]). Danach tritt der Endokannibalismus in Südamerika vor allem in den westlichen Teilen des Kontinents auf und unter den marginalen und submarginalen Stämmen der Tropenzone. Besonders häufig ist dieser Brauch bei den Pano und Tukano. In den meisten Fällen wird außer den pulverisierten Knochen, die mit Chicha (z. B. Pano und Tukano), Wasser (z. B. Tapuya) oder einem Brei aus Parákastanien (Moré-Indianer) vermengt werden, auch das Fleisch gegessen. Die angewandte Praxis der Surára, Pakidái und Waikâ, welche lediglich die verbrannten, pulverisierten Knochen zu sich nehmen, ist dagegen sehr selten zu finden. Am ähnlichsten ist die entsprechende Sitte der Sáliba, Guayupe und Saé in Kolumbien. Doch auch im östlichen Guayana ist der Endokannibalismus verbreitet, so bei den karaibischen Parukotó[221]) und bei den Arapium, einem Tupistamm in der Nähe von Santarem[222]). Außerdem wird von den Kalina, Palikur und Arawak berichtet, daß sie die verbrannten Totenknochen konsumieren[223]). Von letzteren schreibt ebenfalls Ralegh, daß sie die Knochen zu Pulver zerstoßen und mit einem Getränk vermischt zu sich nehmen[224]) [225]), und auch von den Mauhé wird dasselbe bezeugt[226]).

Nach Whiffen existiert in Südamerika gar kein Endokannibalismus, da, seiner Ansicht zufolge, nur die Rachsucht gegenüber feindlichen Stämmen als Motiv der Anthropophagie angesehen werden kann. „From all this", so führt er weiter aus, „it follows that intra-tribal cannibalism would be a criminal outrage by the tribe on itself, and therefore it could never occur that a member of the tribe was eaten, ... This disposes of any such thing as the eating of dead relatives as a sign of respect. These and similar statements are due to missapprehension of facts by the writer, or a too hasty judgement on the part of the explorer"[227]). Im Anschluß an diese abwegigen und mit völlig ungerechtfertigter Kritik versehenen Ausführungen Whiffens möchte ich noch einen von Herbert Baldus und Emilio Willems verfaßten Beitrag über den Endokannibalismus zitieren[228]): „Uma forma especial do canibalismo é o endocanibalismo, isto é, o canibalismo dentro da própria tribu, o costume de comer os companheiros da tribu. Aparece das seguintes duas maneiras distintas:

1. Matam-se e comen-se os velhos e doentes da própria tribu, como, por exemplo, entre os índios Caxibo e Mayoruna (Krickeberg, 272, 273). Entre os Guayaki do Paraguay o endocanibalismo existe como privilégio usurpado só por certos cabeças de bando (v.i.) extraordinariamente fortes e brutais e condenados, por sua perversidade, pelos outros bandos. Para êsses antropófagos se atreverem a mater gente da própria tribu com o fim de moqueála como um animal e comê-la em companhia dos outros membros do bando, a fome é estímulo importante porque, muitas vezes, duas semanas a fio, não conseguem nêm uma única peça de caça. Mas a fome só, dificilmente incitaria o Guayaki a tratar como se fosse animal de caça, uma creatura que com êle partilha o aspecto, os costumes e a língua. Para chegar a tal ponto, o cabeça deve ter alcançado um estado de autocracia, que já não respeita as restrições mais rudimentares impostas pela vida em comum. Não mata somente o indivíduo isolado de outro bando podendo surpreendê-lo traiçoeiramente, mas, com a mesma perfídia, assassina também membros do próprio bando. O bando inteiro participa da comezaina. Mas, sendo vencido o cabeça em duelo com o cabeça de outro bando, seus companheiros e êle mesmo não comen mais carne humana.

[228]) Dieser erschien in dem eminent wichtigen, aber längst vergriffenen Dicionário de Etnologia e Sociologia, welches kurz vor Beginn des 2. Weltkrieges herauskam und deshalb in den meisten europäischen Bibliotheken leider nicht vorhanden ist.

2. A outra espécie do endocanibalismo afigura-se, por assim dizer, como uma das muitas variantes de sepultar os mortos. Da parte ocidental das selvas tropicais sulamericanas refere Krickeberg (273) que os Konibo e os Kokama, por ocasião de certas festas, consumiam os ossos torrados e pulverizados dos mortos em mistura com bebidas fortes. O mesmo costume, em relação à sepultura secundária (v.i.), encontra-se entre muitas tribus tukano da região do Uaupé e Yapurá e, também, mais ao norte até os caraíbas ilhéos. Predomina nêle a vontade de incorporar-se a alma do morto que vive nos ossos"[1222]).

In jüngster Zeit erschien die verdienstvolle Arbeit von Boglár „Ein endokannibalischer Ritus in Südamerika", worin der Verfasser das Material mehrerer einschlägiger Quellen zur Darstellung bringt[1223]). Mit seinen daran anknüpfenden Interpretationen kann ich jedoch nicht konform gehen. Der Genuß des Knochenpulvers Verstorbener ist nämlich durchaus nicht immer mit feldbautreibenden Stämmen in Verbindung zu bringen, denn wie mir meine Gewährsleute bei den Surára und Pakidái erklärten, übten auch schon ihre Vorfahren, welche ja noch reine Jäger und Sammler waren, diesen Brauch. Auch die Ansicht des Autors, daß die Ehrfurchtsbezeugung, die magische Vererbung von guten Eigenschaften usw. bloß als sekundäre Motive des endokannibalischen Ritus betrachtet werden können[1224]), trifft für die Surára und Pakidái nicht zu; hier sind sie ausgesprochen primär. Das Weiterleben des Toten wird bei ihnen durch die Verbrennung gewährleistet, denn mit dem aufsteigenden Rauch gelangt ja die Totenseele zum Monde (s. S. 71).

Es ist noch zu erwähnen, daß der Endokannibalismus auch für Zentralamerika, México und in einem Falle für Nordamerika belegt ist, doch Beals hält ihn für ein typisches Element der südamerikanischen Indianer[1225]).

Zwischen den *Patapãnomõ*-Festen veranstalten die Surára und Pakidái im Laufe des Jahres nur noch wenig andere Festlichkeiten. Es sind auch nur kleine Feiern, die z. B. nach der zweimonatigen Medizinmannsgehilfenausbildung zweier junger Männer stattfinden, nach einem erfolgreichen Kriegszug, beim Einzug in eine neuerrichtete Maloka und im Anschluß an die zweite Menstruation eines Mädchens. Letztere hat außerdem einen familiären Charakter, denn daran beteiligen sich lediglich verwandte und befreundete Familien.

4. Krankheits-, Jagd-, Liebes- und Regenzauber

a) Krankheitszauber:

Aus der Rindenasche einer wildwachsenden Mimosenart (*Mimosa acacioides* ?) — *hekurãhikeñã* — (s. auch S. 88) und dem Knochenpulver des Gavião-real (*Thrasaetus harpyia* L.) wird hin und wieder ein Zauberpulver bereitet. Abends, kurz vor Einbruch der Dämmerung, wenn gerade ein Gavião-real vorbeifliegt oder auf einem Baum sitzt, bläst der Häuptling jenes Pulver in die Richtung des Vogels. Dieser nimmt es auf und überträgt damit Krankheiten zu einem bestimmten feindlichen Stamm.

b) Jagdzauber:

Am Vorabend eines geplanten Jagdzuges nimmt der Jäger Schnupfpulver zu sich und betet etwa 2—3 Stunden lang zu den Hekurá (s. S. 92/93), wobei er über diese Poré und Perimbó (s. S. 91) um einen erfolgreichen Verlauf bittet. Bevor er dann am nächsten Morgen aufbricht, bemalt er sein Gesicht und den Körper mittels Urucu mit schlangenförmigen Linien. Wenn ihn seine Frau begleitet, trägt sie sich ebenfalls diese Muster auf, und einem Hund der mitgenommen wird, färbt man die Schnauze sowie dessen Füße mit der gleichen Farbe. Hierdurch soll das Jagdglück erhöht werden, und gleichzeitig ist damit ein Abwehrzauber verbunden gegen eventuelle Gefahren, die von Giftschlangen und Jaguaren drohen.

Hat der Jäger in Begleitung seiner Frau ein kleineres Wild oder einen Vogel erlegt, so trägt letztere die Jagdbeute in das Gemeinschafts-

haus. War der Mann allein, dann bringt er das Tier nur bis zum Eingang seiner Behausung. Hineingeholt wird es von seiner Frau oder einem anderen Mann. Ähnlich ist es mit einem Großwild, z. B. einem Tapir, von dem zunächst einige Fleischstücke mitgenommen werden; den Rest holen danach befreundete Stammesangehörige. Bis zum Eingang der Maloka kann der Jäger seine Jagdbeute also stets tragen, doch hineingehen darf er damit nie. Auch das Ausnehmen des Tieres muß er anderen Männern überlassen. Anschließend kann er das Fleisch zwar braten, doch nach der Zubereitung ist es ihm verwehrt, den ersten Bissen davon zu essen. Hat er seine Mahlzeit beendet, so ist er verpflichtet, erneut über die *Hekurá* zu *Poré* und *Perimbó* zu beten, denn diese fordern, daß man ihnen für die Jagdbeute dankt. Wenn der Jäger alle diese Vorschriften befolgt, werden ihm das vereinigte Höchste Wesen und die Hekurá stets wohlgesinnt bleiben und immer für einen glücklichen Jagdausgang sorgen.

Auch bei vielen anderen Stämmen Südamerikas finden sich gleiche oder ähnliche Konzeptionen für den Jagdzauber. Ich kann hier auf Zerries verweisen, der das einschlägige Quellenmaterial bereits zusammengestellt und vergleichend bearbeitet hat[137] [138]. Danach ergibt sich, daß für die Rotfärbung vor der Jagd fast immer Urucu benutzt wird. Métraux erwähnt jedoch, daß die alten Mocovi im Gran Chaco die Schnauzen ihrer Hunde mit Jaguarblut beschmierten[139]. Hieraus zieht Zerries den berechtigten Schluß, daß Urucu ein Substitut für Blut sei[140], was von Métraux für die Chiriguano auch bezeugt wird[141].

Außerdem ist noch hervorzuheben, daß jenes von den Surára- und Pakidái-Männern so streng befolgte Jagdgebot, welches besagt, daß ein Jäger seine Beute niemals selbst in die Maloka tragen darf, wahrscheinlich auf karaibische Einflüsse zurückzuführen ist. Zerries spricht in diesem Zusammenhang von Verschonungsriten, die sich auf das getötete Tier beziehen[142]. Seinen Untersuchungen zufolge schält sich hier als Kerngebiet der Norden Südamerikas heraus, wo man sie vor allem bei Karaibenstämmen der venezolanischen Küste und ihres Hinterlandes findet[143]. Als wichtigste Quellen führt der Autor Roth[144] und Crévaux[145] an sowie den sehr alten Bericht von Rochefort[146], woraus zu ersehen ist, daß auch schon die Inselkaraiben diese Sitte kannten.

c) Liebeszauber:

Zum Zwecke des Liebeszaubers tragen junge Männer gelegentlich eine Curauáfaserschnur um den Hals, an welcher ein Wurzelstöckchen der Tajá (*Colocasia antiquorum* und *Xanthosoma violaceum* Schott) — *kaarí* — befestigt ist (s. S. 37). Wenn der Träger auf dasselbe beißt und es einem Mädchen oder einer Frau unter die Nase hält, so gewinnt er durch die ausströmenden Düfte deren Zuneigung. Ja, man sagte mir, daß die Liebe dann so groß sei, daß die Frau oder das Mädchen ihm überallhin folgen würde[147].

Um sich vor diesem Liebeszauber zu schützen, verwenden verheiratete Frauen zwei Arten von Halsketten. Jüngere haben an ihrer Schnur aus Curauáfasern zahlreiche Wurzelstöckchen der Tajá festgebenden und ältere kleine Stöcke der Camarau-Liane (*Cipó* sp.) — *hií* — (s. S. 39). Diese vielen Wurzel- bzw. Lianenstöckchen heben dann die Wirkung des einen Wurzelstöckchens der jungen Männer auf.

Wenn ein Mann auf eine Frau böse ist, weil sie ihn nicht erhört, kann er auf folgende Weise an ihr Rache nehmen: An einem Regentage reißt er ein Blatt der Pupunha-Palme (*Guilielma speciosa* Mart.) herab und geht damit in den Urwald. Hat er einen Matamatá-Baum (*Eschweilera matamata* Hub.) erreicht, von dem

[146] Rochefort, 1658, S. 451.
[147] Diese Art von Liebeszauber erinnert an eine Mythe der arauakischen Manao: Die Riechwurzel (Baldus, 1938, S. 328f.).

Tropfen herniederfallen, so legt er das Palmblatt unter den Baum. Hier läßt er es so lange liegen, bis es in Fäulnis übergegangen ist. Daraus entsteht ein Wurm, welchen der Mann später holt und danach röstet. Wirft er diesen dann auf die schlafende Frau, so bekommt sie keine Kinder mehr.

d) Regenzauber:

Obgleich die Surára und Pakidái den Regen mehr schätzen als eine zu starke Sonnenbestrahlung[68], gibt es auch Anlässe, wo man ihn nicht gebrauchen kann, z. B. vor Jagdzügen oder anläßlich der Wanderung eines Stammes. In diesem Falle bemalen sich alle Männer, Frauen und Kinder den Körper mit einem Wirrwarr von schlangenförmigen Linien, um dem Regen dadurch Einhalt zu gebieten. Wenn das nichts nützt, so wird mittels einer dicken Liane ein Tauziehen — *toitoti* — veranstaltet. Diese Liane personifiziert die Socuriju (*Eunectes murinus*) — *xaikonyé* —, welche als starkes Wassertier die Macht hat, *Purí* zu veranlassen, daß er aufhört, den Regenbaum zu schütteln (s. S. 92). Zuerst führen nur zwei Gruppen von rotbemalten Männern das Tauziehen durch. Doch wenn der Regen gar nicht nachlassen will, beteiligen sich auch rotbemalte Frauen daran. Ihre Teilnahme soll den Druck auf die Socuriju verstärken, denn man nimmt von ihr an, daß sie weiblichen Geschlechtes und den Frauen daher besonders wohlgesonnen sei. Solches Tauziehen erstreckt sich oft über mehrere Stunden. Meist sah ich neben den Erwachsenen auch Kinder, die es mit einer dünnen Liane imitierten.

Wenn der Fall eintritt, daß es bei Sonnenschein regnet, so glauben die Surára und Pakidái, daß zwischen dem Mond, von dem der Regen ja kommt, und der Sonne ein schwerer Streit ausgebrochen sei. Alle Stammesangehörigen fühlen sich dann verpflichtet, ihrem Höchsten Wesen, dem Monde, beizustehen. Dies geschieht in der Weise, daß sich wiederum zwei gemischte Gruppen von Männern und Frauen formieren — eine stellt symbolisch die Bevölkerung des Mondes dar und die andere jene der Sonne —, welche sich gegenseitig mit nasser Erde bewerfen, diesen „Kampf" nennt man *xajojd*.

[68] Demgegenüber möchte ich darauf hinweisen, daß z. B. bei den Tauhpang große Furcht vor dem Regen herrscht. (Koch-Grünberg, 1916, S. 130/31).

5. *Eine besondere Art der Danksagung gegenüber Purí und Porimbó*

Im Anschluß an das Totenerinnerungsfest (s. S. 102ff.), nach der Ausbildungszeit zweier Medizinmannsgehilfen (s. S. 67f.), nach Krankenheilungen (s. S. 96ff.) u. a. Zauberzeremonien will man *Purí* und *Porimbó* (s. S. 91) außer den üblichen Gebeten, die durch Vermittlung der *Hekurá* (s. S. 92/93) erfolgen, auch noch in einer besonderen Weise danken. Zu diesem Zweck wird eine große Kalebasse mit Erde gefüllt, in welche man in Kreisform rotbemalte Zweige des Imbaúba-Baumes (*Cecropia palmata* Wild.) steckt, die man mit Fäden aus Bromeliafasern verbindet. Auch über die Stöcke werden kreuz und quer solche Fäden gezogen, und darauf klebt man Flaumfedern des Gavião-real (*Thrasaetus harpyia* L.). Das Gebilde — *ahunaxé* —, welches Frauen und Mädchen nicht sehen dürfen, wirkt wie ein Männerkopf, in dessen Haaren die Flaumfedern des Gavião-real kleben. Mehrere Krieger bringen diese Kalebasse auf Anordnung des Häuptlings in den Urwald und setzen sie an einer bestimmten Stelle nieder.

6. *Vögel als Nachrichtenübermittler*

Am 21. Mai 1956 führte der Surára-Mann Honobomá in seiner Maloka an der Cachoeira dos Índios am oberen Rio Arací ein lautes Selbstgespräch, daß früh gegen 4.00 Uhr begann und bis gegen 6.00 Uhr währte; hierbei lag er in seiner Hängematte. Über die Bedeutung jenes scheinbaren Selbstgespräches gab mir hinterher mein kleiner Dolmetscher Jibeawé folgende Erklärung: Als Honobomá aufwachte, hörte er den kleinen Vogel Kaukaumá, einen Japim (*Cacicus cela* L.), singen, in dem sich aber gegenwärtig die Seele von Purihwé, dem Kriegshäuptling der Pakidái, befand. Letzterer wollte mit seinem Stamm in der

Maloka am mittleren Demini. Die Seele in dem kleinen Vogel erzählte, daß die Pakidái im Anschluß an das Totenerinnerungsfest wieder wohlbehalten in ihr Gemeinschaftshaus gelangt seien. Gleichzeitig berichtete er ausführlich über den Verlauf der Reise, von Jagderfolgen und über den Anbau neuer Bananenstauden und Pupunha-Palmen. Wenn der kleine Vogel für einige Zeit seinen Gesang unterbrach, gab ihm Honohomá Auskunft über das Befinden der Surára.

Nach Auffassung beider Stämme ist der kleine Japim ein Nachrichtenübermittler, der auch von Krankheiten und Todesfällen berichtet sowie von kriegerischen Auseinandersetzungen mit feindlichen Stämmen.

7. *Sportarten*

Abgesehen von dem Stockduell — *zelekakalé* —, welches aus Gründen der Eifersucht durchgeführt wird[100]), haben alle anderen Sportarten einen religiösen oder magischen Charakter.

Bemerkenswert ist vor allem das Ballspiel mit einer Affenblase — *yawokami* —. An ihm dürfen sich nur männliche Stammesangehörige beteiligen, und zwar binden sie dazu stets ihre Baumwollgürtel um. Danach bilden sie einen Kreis und schlagen mit der flachen Hand die Blase unentwegt nach oben, welche dann sowohl den Mond als auch die Sonne repräsentiert (Abb. 50).

Dieses Ballspiel weist große Übereinstimmungen mit jenem der Uitoto auf, selbst hinsichtlich der damit verbundenen lunaren und solaren Vorstellungen[101]). Außerdem ist zu erwähnen, daß in einer Mythe der Paressi beide Himmelskörper als Federbälle gedacht sind[102]). Schließlich sei noch auf den azteckischen Volksglauben verwiesen, wo der fliegende Ball ebenfalls mit Sonne und Mond gleichgesetzt wird[103]).

Drei weitere Sportarten der Surára und Pakidái sind bereits an anderer Stelle beschrieben worden: *Potapoonkamé*, der im Sitzen durchgeführte Umschlingungskampf zweier Männer (s. S. 107), das Tauziehen (s. S. 112) und das gegenseitige Bewerfen mit nasser Erde (s. S. 122).

IX. Mythen und Legenden

Die nachstehenden Mythen und Legenden wurden mir von dem Surára-Häuptling Hewmáo erzählt:

Die Schöpfung der Yanomámi

Die Erde bestand schon und war voller Pflanzen und Tiere, aber noch ohne Menschen. Doch eines Tages kam der erste Mann, Urukí, aus dem Bein des Xiapó, eines kleinen Vogels mit schwarzen und gelben Federn, ähnlich dem Japim. Kurze Zeit darauf gebar das Vogelbein einen zweiten Mann, danach einen dritten, einen vierten und schließlich eine Frau, Petá. Diese vier Männer und die Frau lebten in vollkommener Harmonie zusammen. Petá war zwar die Ehegefährtin von Urukí, dem Erstgeborenen, aber die anderen drei Brüder hatten auch das Recht, sexuellen Verkehr mit ihr zu pflegen[104]).

Nach einem Jahr brachte Petá einen kräftigen und gesunden Knaben zur Welt, der schnell wuchs und alle vier Männer „Vater" nannte[105]). Das Hauptvergnügen des Jungen war, mit seinem kleinen Bogen und Pfeil Vögelchen zu erlegen. Doch eines Nachts träumte er zum Spaß

[100]) Diesen Stockduell habe ich bereits ausführlich beschrieben. (Becher, 1959, S. 161—167).

[101]) Preuss, 1921, S. 113, 133—136; 1923, S. 644 bis 659.

[102]) Karl von den Steinen, 1894, S. 435/36.

[103]) Krickeberg, 1928, S. 130.

[104]) Bei den Surára und Pakidái steht den jüngeren, unverheirateten Brüdern ebenfalls das Recht auf geschlechtlichen Verkehr mit den Frauen ihrer älteren Brüder zu. Außerdem haben die Angehörigen beider Stämme die Vorstellung, daß eine Frau nur dann kräftige Kinder gebären kann, wenn sie während ihrer Schwangerschaft auch häufig Verkehr mit anderen Männern pflegt.

[105]) Auch die Surára- und Pakidái-Kinder nennen den unverheirateten Bruder ihres Vaters nicht Onkel, sondern ebenfalls Vater.

den Mond an und schoß einen Pfeil ab. Sofort trat eine Mondfinsternis ein. Blut tropfte herab und floß wie eine Flut über die ganze Erde[102]). Aus diesem Blute entstanden alle Yanomámi, d. h. die Surára, Pakidái, Pusheweteri, Aramameteri, Xirián, Karamateri, Waikás etc. (s. S. 6).

Der Ursprung des Feuers

Der Urwald mit seinem Reichtum an Pflanzen und Früchten war bereits geschaffen, und auch die Menschen sowie alle Arten von Tieren lebten schon auf der Welt. Nur das Feuer fehlte noch. Neben ihrer pflanzlichen Kost konnten die menschlichen Bewohner daher lediglich rohes Fleisch zu sich nehmen, und während der Nacht froren sie in ihren Hängematten. Es war ihnen aber bekannt, daß der Kaiman (Jacaretinga) Feuer im Maule hatte. Doch trotz aller Bitten wollte er davon nichts abgeben. Da griffen die Menschen zu einer List. Sie baten den Kolibri, er möchte um den Kaiman herumfliegen und Späße machen. Anfangs blieb der Kaiman unbeweglich und nahm keinerlei Notiz von dem kleinen Vogel. Aber schließlich konnte er das Lachen nicht mehr unterdrücken, wobei aus seinem geöffneten Maule das Feuer herausschoß. Die Menschen waren darüber sehr glücklich und dankten dem Kolibri in überschwenglicher Form.

Die Herkunft der Bananen

Früher waren die Surára-Männer nur Jäger, und die Frauen sammelten Früchte des Urwaldes. Jegliche Art von Feldarbeit war ihnen noch unbekannt. Doch als eines Morgens der Surára-Mann Horonamó besonders zeitig aufgestanden war und vor die Maloka trat, erblickte er zu seiner Überraschung eigenartige große Pflanzen, voll mit Früchten. Sogleich wollte er eine pflücken, doch die Stimme von *Pwé*, dem Herrn des Mondes, welcher mit letzterem zusammen die höchste göttliche Macht repräsentiert (s. S. 91), ließ ihn erstarren. *Pwé* sagte aber sehr freundlich, daß er jene Pflanzen für die Surára angebaut hätte und ihr Name *kwatá* laute. Er befahl ihm dann, alle Stammesangehörigen zu benachrichtigen, daß die *Kwatá* kultiviert werden sollen, denn dadurch würden sie niemals mehr Hunger zu leiden brauchen und wären nicht allein auf das Jagdglück angewiesen. Als Horonamó seinen Dank aussprechen wollte, war *Pwé* schon verschwunden.

Die ersten Pupunha-Palmen

Die Surára kannten schon die Bananenstaude, und diese war die erste Pflanze, welche sie kultivierten. Eines nachts kam ein Japim (*Cacicus cela L.*) angeflogen und pflanzte auf Anordnung von *Pwé* zwischen den Bananenstauden Pupunha-Palmen (*Guilielma speciosa* Mart.) an. Am frühen Morgen weckte er die Surára durch einen besonders lauten Gesang, und als diese überrascht vor die Maloka traten, sagte er ihnen, daß diese Palme *kowaxamá* genannt würde und ihre Früchte — *awazá* — sich zum Essen sowie zur Bereitung eines erfrischenden Getränkes eigneten.

Die Erschaffung der Jíbóia-vermelha

Einst lebte der Surára Karemomá, welcher sehr zänkisch veranlagt war. Jeden Tag mißhandelte er seine beiden Frauen und stritt sich mit den anderen Männern herum. Nie fügte er sich den Anordnungen des Häuptlings und versuchte sogar, die Disziplin des Stammes zu unterhöhlen. Da alle Ermahnungen nichts nutzten, wurde er aus der Gemeinschaft ausgeschlossen.

Karemomá bemalte seinen Körper mit Urucu und verließ die Maloka. Nachdem er einige Stunden im Urwald gewandert war, legte er sich ermüdet auf den Boden und schlief ein. Während des Schlafes wurde er wegen seiner Unbotmäßigkeit von *Pwé* in die Jíbóia-vermelha (*Epicrates cenchris*) — *otó* — verwandelt.

Die Erschaffung des schwarzen Jaguars

Die Surára hatten schon die Brandrodung kennengelernt und kultivierten Bananenstauden und Pupunha-Palmen. Eines Tages sahen sie in der Waldrodung eine große Kröte. Ein Surára wollte sie töten, durch sie sich auf die andere

[102]) Aus diesem Grunde wird den Surára- und Pakidái-Kindern noch heute streng verboten, mit dem Pfeil in Richtung des Mondes zu schießen.

Seite der Roça (Waldrodung) und verwandelte sich dort in einen schwarzen Jaguar.

Die Erschaffung des Tapirs

Ein Cuatá-Affe fiel von einem hohen Baum und konnte nicht wieder hinaufklettern. Nach mehreren ergebnislosen Versuchen verwandelte er sich in einen Tapir.

Die Erschaffung der Wildschweine

Eine Bande von Cuxiú-Affen fiel von einem hohen Baume. Nach vergeblichen Versuchen, wieder hinaufzuklettern, verwandelten sie sich in Wildschweine.

Die Erschaffung des Ameisenbären

Ein Surára-Mann, der seine Schwiegermutter vergewaltigt hatte, wurde zur Strafe von *Purí* in einen Ameisenbär verwandelt. Seit dieser Zeit besteht die Schwiegerscheu zwischen Schwiegermutter und Schwiegersohn, und das Fleisch des Ameisenbären darf von den Stammesangehörigen nicht gegessen werden.

X. Charakter und Denkweise

Trotz geringfügiger Kontakte mit den Cabocios (Gummi- und Palmfasersammler, Pflanzer und Personal des Indianerschutzpostens Ajuricaba am mittleren Demini) haben sich die Surára und Pakidái noch durchaus den Charakter unverdorbener Naturvölker bewahrt, denen so althergebrachte indianische Tugenden, wie Gastfreundschaft, Mäßigkeit und Ehrlichkeit, noch nicht fremd geworden sind. Schon anläßlich meiner ersten Berührung mit ihnen konnte ich dies feststellen. Als ich, gemeinsam mit meinem Diener Mateus, neun Surára-Krieger an der Cachoeira dos Índios am oberen Rio Aracá traf, bestaunten sie zwar unser Boot, den Außenbordmotor und die zahlreichen Geschenke und Tauschartikel in Gestalt von Messern, Beilen, Töpfen, Glasperlen usw., rührten aber nichts an. Sie waren auch sofort bereit, uns zu ihrer etwa 70 km entfernten Maloka mitzunehmen und trugen die 50—60 kg schweren Koffer, Kisten und Säcke[222]) [223]), die ja für ihre Begriffe ungeheuere Schätze enthielten. Während des dreitägigen anstrengenden Marsches herrschte eine ungesprochene Harmonie, ständig wurde gelacht und gescherzt. Als die Indianer hörten, daß mich Mateus „doutor" nannte, brachen sie in ein besonders großes Gelächter aus und erklärten uns, daß *kaiuri* (Jaboti) eine passendere Bezeichnung für mich wäre. Der Name blieb mir dann auch bis zu meinem Abschied und war glänzend für mich geeignet, denn als Angehöriger der Zivilisation wirkt man ja, im Vergleich zu den freien Waldindianern, recht schwerfällig in den Urwaldgebieten.

Diese neun Krieger hätten uns mit Leichtigkeit umbringen und allein mit den Geschenken und Tauschartikeln davonziehen können. Doch nicht einen Augenblick lang war ich mir einer Gefahr bewußt, denn liebenswürdigere und fürsorglichere Begleiter kann es gar nicht geben. Wie groß ihre Ehrlichkeit war, möchte ich noch durch folgendes Beispiel dokumentieren: Während des Marsches auf den unwegsamen Indianerpfaden im ewigen Halbdunkel des Urwaldes war mir eine Schachtel Zigaretten aus meiner Hosentasche gefallen. Doch wer beschreibt mein Erstaunen, als mir abends am Rastort ein Indianer die Schachtel mit vollem Inhalt zurückbrachte. Es war dann selbstverständlich, daß ich dem ehrlichen Finder die Zigaretten überließ und ihm noch ein Messer dazu gab.

Auch während meines monatelangen Zusammenlebens mit beiden Stämmen hatte ich alle Koffer, Kisten und Säcke immer offen stehen, doch nie wurde mir etwas gestohlen. Selbst der Tausch von ethnographischen Gegenständen vollzog sich, meist unter Aufsicht der Häuptlinge, in völliger Ruhe und Gelassenheit. Wenn ich Männern, Frauen oder Kindern Messer, Töpfe, Glasperlen u. a. Gegenstände

[222]) Becher, 1957a, S. 113.
[223]) Becher, 1958, S. 133.

scheuchte, so nahmen sie diese stets mit unbewegtem Gesicht, aber ohne Dankesbezeugung entgegen. Doch ein Wort für „danke" existiert in ihrer Sprache ebensowenig wie in denen anderer Indianersprachen. Daß sie sich freuten, konnte ich aber an ihren leuchtenden Augen ablesen.

Vor dem Abschied einem Familienmitglieds kommt es zwischen den Angehörigen niemals zu rührseligen Szenen oder gar zu Liebkosungen, und selbst bei der Rückkehr kann man eine Gefühlsregung nur an den strahlenden Augen erkennen.

In Gegenwart von Fremden zeigen sich besonders Frauen und Mädchen anfangs scheu und ernst, doch wenn man ihr Vertrauen gewonnen hat, sind sie lustig und ausgelassen. Die Zuneigung der Kinder gewann ich besonders rasch und damit auch die ihrer Eltern und der anderen Erwachsenen. Eine wichtige Rolle im Umgang mit Indianern spielt natürlich die Behandlung. Tritt man den Suruára und Pakáásó freundlich und zuvorkommend gegenüber, so kann man bei ihnen alles erreichen. Würde man sich dagegen abfällig über ihre Sitten und Gebräuche äußern, mit ihnen schelten oder gar ein Kind schlagen, zieht man sich ihren Widerwillen zu. Nervösen Leuten wäre daher ein Besuch in den Malokas dieser Indianer nicht zu empfehlen, denn Ruhe findet man den ganzen Tag über nicht, und oft fehlt sie sogar in der Nacht. Immer standen oder saßen Männer, Frauen und Kinder um mich herum. Unermüdlich sprachen sie mir vorsagen die Worte ihrer Sprache vor, lachten mich aber nie aus, wenn ich sie mit falscher Betonung wiederholte. In der ersten Zeit wurde ich sogar am ganzen Körper betastet, und mit besonderem Interesse untersuchte man meine Brille[107]) und zeigte sich sehr erstaunt über mein blondes Haar und meine blauen Augen. Rasierte ich mich, so war ich ebenfalls von einem Kreis Zuschauer umgeben[108]). Selbst wenn ich eine Notdurft verrichten mußte, wurde ich gebeten, wußte ich gehen, und oftmals schlossen sich mir Begleiter an.

Sahen die Suruára und Pakáásó zum ersten Male etwas Neues, oder gefällt ihnen ein Gegenstand besonders gut, dann bekunden sie ihren Beifall durch lautes Schnalzen. Unterhaltungen führen sie über alles, und auch in der Nacht wird meist noch stundenlang erzählt. Dabei kommt es aber niemals vor, daß sie sich gegenseitig ins Wort fallen.

Der Mann ist zwar das Oberhaupt der Familie, doch die Frau gilt als seine gleichberechtigte Gefährtin, ohne deren Rat er nichts Wichtiges unternimmt. Hat er zwei oder mehrere Frauen, so führt die jüngste meist die Präsidialgeschäfte, für welchen auch die älteren mitarbeiten müssen. Mißhandlungen von Frauen kommen nur wegen Ehebruchs und aus Gründen der Eifersucht vor. Doch wenn ein Mann seine Frau schlägt oder ihren Körper mit dem Gallenblasensaft eines Tieres tötet, so eilen gleich mehrere Geschlechtsgenossinnen zu ihrer Hilfe herbei. Sie versuchen dem wütenden Mann die Arme festzuhalten, und eine Frau beweist sich, wie Sonstiges zu erlauben und greift es dann mit aller Kraft zusammen, so daß ihm die Lust zu weiteren Mißhandlungen vergeht. Die übrigen Stammesangehörigen schauen solch einem Schauspiel interessiert zu. Es ist übrigens bemerkenswert, daß die meisten Frauen recht energisch sind und mit Ausdauer schimpfen können. Wenn sich eine Frau über ihren Mann ärgert, weil er vielleicht untreu war oder nicht zur Jagd gegangen ist, dann schilt sie oft stundenlang so laut vor sich hin, daß alle übrigen Bewohner der Maloka jedes Wort verstehen. Der geschmähte Mann bleibt jedoch währenddessen in stoischer Ruhe in seiner Hängematte liegen, denn eine schimpfende Frau darf niemals unterbrochen werden. Aber auch zwischen den Frauen kommt es gelegentlich zu wahren Schimpfkanonaden, die mit grellem Stimmenschwall geführt werden. Ich hatte dabei stets den Eindruck, als gerieten sie jeden Augenblick handgreiflich aneinander. Manchmal kommt dies aber auch tatsächlich vor. Dann ziehen sie sich gegenseitig an den Haaren und schlagen sich mit den Händen ins Gesicht und auf den übrigen Körper.

[107]) Der Suruára-Häuptling war von meiner Brille so begeistert, daß er mich bat, ihm beim nächsten Besuch unbedingt eine mitzubringen.

[108]) Ähnliche Erlebnisse machten Chadwick bei den Kuikuró (Chadwick, 1889, S. 187/88), Koch-Grünberg bei den Taulipang und Makuschi (Koch-Grünberg, 1923a, S. 36ff) und Holdridge bei den Tapirapé. (Holdridge, 1938b, S. 69ff).

In diesem Falle greifen andere Frauen nicht ein und überantworten Männer. Alle schauen gelassen zu und warten, bis die Raserei beendet ist.

Kinder werden mit besonderer Liebe und Zärtlichkeit behandelt. Meist drücken sie ihre auch ihren Eltern, indem sie ihnen eine besonderwillkommende Aufmerksamkeit bezeugen. Wie bald ich erfuhr, daß man alle Menschen verzogen findet[**], Wenn sie allerdings so schwach oder krank geworden waren, daß sie nicht mehr an den gemeinsamen Wanderungen teilnehmen konnten, wurden sie, gemäß der Stammessitte, getötet (s. S. 707ff).

Das Gemeinliche, aufgeschlossene Wesen aller Sorten und Farbigkeit ist aber mit einem stark ausgeprägten Selbsterhaltungstrieb gepaart. Zusammen mit dem Verhältnisse, vor allem den mächtigen Kräften, führen sie sich natürlich als die Beherrscher der Welt, die ihrer Nahrung nach nur aus Urwald, Bergen, Flüssen und Seen besteht. Die Caboclos (Pflanzer, Gummi- und Palmfruchtsammler), jene einfachen Angehörigen der Zivilisation, welche ihnen bekannt sind, werden deshalb stets mit einer gewissen mitleidigen Herablassung von ihnen behandelt, da sie auf dem Standpunkt stehen, daß alle Zivilisierten, Wilde, Schwarze und Mischlinge, schwach und krüftlos sind und ihr Leben nur der wohlwollenden Nachsicht der Indianer verdanken[**]. Als ich ihnen von Städten erzählte, in denen viele weiße und schwarze Menschen leben, vom Meer und den darauf fahrenden großen Schiffen, konnten sie dies erst gar nicht fassen und wurden unschlüssend recht nachdenklich. Später, bei meinem Abschied, meinten sie mich noch, nicht so weit auf das Meer zu fahren, damit ich nicht von der Eschelsche (s. S. 91) abstürze.

XI. Verstandesmäßige Fähigkeiten

Besonders ausgeprägt ist bei den Sorára und Paháhi das Erinnerungsvermögen, sowohl in bezug auf die Mythen und Gesänge, die Religion und Stammesgeschichte als auch hinsichtlich der Flora und Fauna sowie der Eigentümlichkeiten einer Landschaft[**]. Auch die Merk-

[**] Auch Bolton berichtet von den Tapuyas, daß man dort die Alten sehr gut behandelt (Bolton, 1878, S. 603), während Peter Claesen lediglich der Tatsache in diesen Hinsicht ein sehr düsteres Bild entwirft: „Entre os indios ahem vio, e consigão dos velhos é das mais pessoas..... Pedecidamente dizer, que mesão de serem, que o velho se o velho, quando não pode mais trabalhar para o familia, é considerado como homem que já deu cavalo, e obrigarem todj comprehão dalo...." (P. Claesen, 1696, S. 25).

[**] Ähnliche Verhältnisse fand Bolton bei Stämmen des nordöstlichen Chaco (Bolton, 1931, S. 116) und Wilmsen bei den Kayapó. (Herr Prof. Wilmsen hatte mir dies während der Tagung der Deutschen Gesellschaft für Völkerkunde in Berlin, 1937, mit).

[**] Hierzu möchte ich auf eine Bemerkung von Bolton verweisen: „Was den Gedächtnis des Indianers so großen und genauen angeht, so haftet dieser nur auf das ihm augenfälligen Dinge der Landschaft, und der Umgebung, die ihn umgibt, und die ihn angeht. Er wird sich jede Eigentümlichkeit einer Landschaft, die er durchwandert, merken, denn sie ist wichtig, um den Weg wiederzufinden und für den Gummi, Landwirtschaft zu können. Die vielgerühmte „Gedächtniskapazität" des Indianers ist nichts anderes als Erinnerungsvermögen." (Bolton, 1931, S. 116).

Buchstaben und schließlich ganze Worte nachschreiben konnte[***] [***].

Jüngere Leute zeichnen sich durch rasche Auffassungsgabe und eine erstaunliche Lernfähigkeit aus. Obgleich diese Indianer sehr selten mit Caboclos in Berührung kommen, und meist sind es nur die Männer, verfügen beide Gewährsleute bereits über einen größeren Schatz portugiesischer Worte und Redewendungen. Ein kleiner, etwa neun Jahre alter Surára-Junge, Jiburawá, auch Hanáhi genannt, der fast zwei Jahre in der Hütte des Polizeikommandeurs Manuel Antonio Gómes am Rio Arauá verbracht hatte, beherrschte die portugiesische Sprache nahezu vollkommen und leistete mir einigemal Dolmetscherdienste. Ihm allein verdanke ich es überhaupt, daß ich Lieder in die geistige Kultur der Surára und Pakáhi eindringen und die vollständigen Wörterverzeichnis aufnehmen konnte[***]. Das meinem Männern fiel es auch nicht schwer, schon nach kurzer Zeit mit unseren beiden Gewährsmännern; einige konnten sogar bald den Aufnahmeapparat, und der Surára-Häuptling Hewanáu, welcher großes Interesse für meinen Photoapparat zeigte, machte recht brauchbare Aufnahmen damit. Die Denkfähigkeit scheint bei den Männern etwas stärker entwickelt zu sein als bei den Frauen[***].

[***] Gänzlich barbarisch klingen von Indianerstimmen im nordwestlichen Chaco: „Lobet mit die Indianer und mit unseren Augen schaut, denn Hirten sie im Schlafe schreien und Tschwichtern nicht hinter uns zurück." (Holden, 1931, S. 116).

[***] Aber auch die entsprechenden Erklärungen meiner weißen Freunde sollen noch angeführt werden. So handelt sich einmal um Cawana, deren nachstehende Schilderung die Optimal bietet: „Je m'amuse à reproduire les figures et les arabesques dont sont couverts les gens du village. Elles prolongeaient beaucoup d'analogie avec les guirlandes de la roche Tiaiéri du Maroni. Il me vient ensuite l'idée de tailler un morceau de charbon et de le dessiner au crayon. Jean-Louis en le prenant de dessiner sur mon cahier, qu'il voulait copier, tandis qu'il copiait les dessins qu'il voulait reproduire. Jean-Louis ne sait guère dessiner. Au contraire le petit Yanni me fait rapidement une, plus avec des charbons, mais avec un crayon, des dessins d'hommes, de chien, de tigre, enfin de tous les animaux et diables du pays.

Un autre Indien reproduit toutes sortes d'arabesques qu'il a l'habitude de peindre avec la genipa.

Ayant dessiné quelques signatures à mon dessinateur, c'est à qui me demandera un crayon pour suivre du papier. Je vois que ces ouvrages qu'un novice d'Européen abandonnerait ignorants des leurs sorts dessinent tous avec une facilité extraordinaire. ..." (Cawana, 1880, S. 76/77). — Doch nicht minder interessant ist die Aussage Kiel von den Stämmen benachbart der Suya am Xingú, mit welcher er bezeugt, daß diese Indianer den Wunsch gut zu lernen wollen und schöne Motive in ein Notizbuch zeichneten, obgleich es der erste Weiße war, den sie sahen. (Kiel von den Steinen, 1888, S. 102).

[***] Der kleine Junge hatte vor drei Jahren durch ein ungeschicktes Gebiß mit hochstehenden Beneiden lebensgefährliche Verletzungen am Unterleib erlitten. Da der Häuptling den Heilung aufgegeben hatte, daß er wieder gesund würde, wollte er ihn totschlagen lassen. Die Sitte dieses Stammes, wie auch die der Pakáhi, gebietet nämlich, daß alle alten und schwerkranken Personen, die nicht mehr an den gemeinsamen Wanderungen teilnehmen können, getötet werden müssen (s. S. 107f.). Der Großvater des kleinen Jungen, der ein Witzenbruder ist, brachte den aber einen Knaben heimlich in die Hütte des spanischen Polizeikommandeurs Manuel Antonio Gómes, dem es gelang, ihn das Leben zu retten. Der Häuptling soll über die eigenmächtige Handlung der Großmutter sehr sehr böse gewesen sein, hatte sich aber dann, als er sah, daß der Kleine Heilung fand, wieder beruhigt.

[***] Diese Feststellung deckt sich mit einer Beobachtung von Holden bei den Tumereidá, und der Gelehrte schließt eine Bemerkung an, welche auch für die Surára und Pakáhi zutreffen könnte: „Die Unterschiede in der Begabung der Geschlechter werden vielleicht durch die Lebensweise und Arbeitsteilung hervorgerufen. So hat wahrscheinlich bei den Tumereidá der Nahrungserwerb den Mannes seinen Scharfsinn gesteigert, weil er dabei nicht nur wie die Frau Pflanzen erwerbt, sondern auch auf die Jagd geht ..." (Holden, 1931, S. 114).

XII. Zählen und Zeitauffassung

Die Sentéra und Pukiláli zählen nur bis drei:

1 — *makéla*
2 — *jáwakáhi*
3 — *jáwakaháhi*.

Danach kommt viel — *jáwáki* — und sehr viel — *jáwáki, jáwáki* —. Das Gegenteil davon, wenig, heißt — *jáwáiawá* —. Eine Hand wird *makéla áuch* genannt und beide Hände *jáwakáhi áuch*. Die Finger — *tatáili* — werden niemals als Hilfsmittel für das Zählen verwendet.

Ob eine Menge größer oder kleiner geworden ist, können die genannten Indianer zwar mit einem Blick feststellen, doch es fehlt ihnen die Möglichkeit, es zahlenmäßig auszudrücken. Stehen z. B. 20 Pfeile zusammen und man vermindert oder vermehrt das Bündel während der Abwesenheit des Besitzers nur um einen, so bemerkt er diese Veränderung bei der Rückkehr sofort.

Der Tag beginnt mit dem Sonnenaufgang — *jáiamakéjakáta* — (Sentéra), — *kenaitánaili* — (Pukiláli) und endet mit dem Sonnenuntergang — *jáiamajáhak* — (Sentéra), — *kenaitáte* — (Pukiláli). Der Ort des Sonnenaufgangs wird dagegen von beiden Stämmen *jáiamajáhakamajáwakáhi* genannt und der Ort des Sonnenuntergangs *jáiamakéjakáta*. Den Rhythmus des Tagesablaufes bestimmt man nach dem Stand der Sonne — *jáwáiawá* — (Sentéra), — *kenáiwáta* — (Pukiláli), dem Helligkeitsgrad, den Temperaturschwankungen und dem Wind — *tánáhi* — (Sentéra) — *yaré* — (Pukiláli). Morgens sa sagte man mir, sei meist ein leichter Wind zu verspüren, mittags ist es fast immer windstill, und nachmittags weht er etwas stärker.

Der Tag wird *jáiamakéwá* genannt, der Morgen *kenaiki*, der Abend — *jáiamakéwátakáti* — und die Nacht — *jáiamatíli* —. Für Mittag und Mitternacht gibt es keine Bezeichnungen, auch nicht für Jahr, Monat und Woche. Man spricht nur von der Trockenzeit — *jáwáiatíá* — und der Regenzeit — *jáwáiá* —.

Außer dem Wort für Mond — *jáwáiki* —, gibt es noch Benennungen für Neumond — *tánáiki* — und Vollmond — *jáwáiakáiawa* —, sowie für Mondfinsternis — *jáwáiki* — (Sentéra), — *kakáiwi* — (Pukiláli). Die Sonnenfinsternis wird überhaupt nicht genannt. Für die einzelnen Sterne und Konstellationen hat man keine besonderen Namen, man spricht nur generell von Sternen — *jáwáiná* — und großen Sternen — *jáwáiná kwa* —.

Verzeichnis der Abbildungen

1 Indianerschutzgebiet „Ajuricaba" am mittleren Rio Demini
2 Cachoeira (Stromschnelle) des Índios am oberen Rio Araçá (während der Trockenzeit)
3 Cachoeira des Índios am oberen Rio Araçá (während der Regenzeit)
4 Konstruktion eines Familienschlafquartiers bei Wanderungen des Stammes
5 Blick auf die große, offene Surára-Malóka im Gebiet zwischen dem Demini und Araçá
6 Ein Ausschnitt der großen, offenen Surára-Malóka
7 Häuptlingshütte (rechts) und Hahnenstall innerhalb der Surára-Malóka
8 Konstruktion der geschlossenen Surára-Malóka an der Cachoeira des Índios (oberer Rio Araçá)
9 Hewendo, der Surára-Häuptling (geschnitzt für das Tsáuarinterviewprojekt)
10 Der Surára-Häuptling Hewendo mit seinen beiden Frauen und zwei Kindern
11 Kurákyawö, der jüngere Bruder des Surára-Häuptlings
12 Surára-Krieger
13 Surára-Krieger vor dem Abschuß eines Pfeiles
14 Pwaiwei, Kriegshäuptling der Pukúlis im Frotschmuck
15 Surára-Familie. (Die Frau ist eine Angehörige der Pwaiwetsiwö und trägt den charakteristischen Frauengürtel dieses Stammes)
16 Karáina-Frau (ermordet) mit deformierendem Gesichtsschmuck
17 Nákawaná, ein Mädchen der feindlichen Karawatsiwö. (Sie ist eine Gefangene der Surára)
18 Nákawaná (Nächtenansicht)
19 Yaradina, Tochter des Kriegshäuptlings der Surára, mit charakteristischer Gesichtstätowierung
20 Yaradina (links) und Rokuchíwa, zwei Surára-Mädchen
21 Jáwawei, mein kleiner Dolmetscher (rechts) und Shoschowá (Zwei Wakuénjungen vom Stamme der Surára)
22 Zwei Surára-Jungen, Kanawö (rechts) und Shoschowá, der eine Albinokinder zwischen den Beinen hält
23 Der Surára-Junge Kanawö
24 Pukúlis-Frau Ringowé
25 Die beiden ältesten Surára-Frauen: Rokowá (rechts) und Cinquawé
26 Hängematte aus Embira
27 Lasurstäbengemälde
28 Geflochtene Hängematte aus Baumwolle
29 Pukúlis-Frau mit Säugling in einer Baumwollhängematte
30 Schlafstelle für junge Hunde („Hundebett")
31 Pukúlis-Indianer bei der Feuererzeugung
32 Peruanischer Tragkorb aus Palmblättern
33 Tragkorb aus Rindenfasern der Curaná-Pflanze
34 Großer Feuerungstragkorb aus Lianenruten
35 Surára-Frau beim Flechten eines großen Feuerungskorbes
36 Henkelkorbflechten aus Lianenruten
37 Wiederbelebung der Surára im Umkreis der großen, offenen Malóka
38 Der Surára-Häuptling Hewendo bei der Feldarbeit. In der linken Hand hält er einen Grabstock
39 Erzeugen einer Papaubua-Palme mittels Kletzergerät
40 Pwaiwei, Kriegshäuptling der Pukúlis (rechts) und seine Begleiter, Meinen Dias, ein mündiger Tukuna-Indianer vom oberen Rio Negro. Im Hintergrund kauert ein Pukúlis-Jüngling
41 Pukúlis-Indianer mit Tabakrolle zwischen Unterlippe und Zähnen
42 Die Surára- und Pukúlis-Männer verrenkenen sich während des Tsáuarinterviewprojektes zum zeremoniellen Trinken der Banisteriopsis, welche mit Kiwchenschi verunreinigt ist
43 *Ein Tanz der Surára-Krieger. Links im Vordergrund sitzt der Häuptling Hewendo*
44 Surára- und Pukúlis-Männer blasen sich gegenseitig Schnupfpulver in die Nase
45 Begrenzender Rauchvorhang nach dem Genuß des Schnupfpulvers
46 Höhepunkt der Ekstase
47 Kreuzform im Zustand der Ekstase
48 *Prinjawawei — der im Wasen durchgeführte Unterlängenkampf*
49 Eine Kreuzform bei ortsansässigen Regos. (Viel Mischmöglichkeiten der Surára können um einen so Wenigen schwachen Jüngling)
50 Beifuß mit einer Albinokinder

/134/

114 During his stay among the Surára Indians, Hans Becher was able to compile an extensive vocabulary of their language. This still needs linguistic revision and further checking. Even now, however, it makes it possible to establish perfectly clearly the relationship of this language to the languages of the Waika /Waica/, [101] Širiana /Shiriana/, and Karimé. There is a very close correlation, apparent at first glance, which corresponds to the cultural unity of these Indian groups, whom Becher has classified under the name Yanomámi /Yanoama/.

The first vocabulary of a language of this group was published by Koch-Grünberg in 1913 and -- considerably expanded -- in 1928, and comes from the Širiana (Širianá) of the Uraricuera (and its tributary the Uraricapará) (1). In 1932 there appeared

1. Koch-Grünberg, 1913, p. 458; 1928, pp. 302-308.

a vocabulary of the Karimé Indians of the Catrimani River compiled by G. Salathé (2). Further material was then published by

2. Salathé, 1932, pp. 314-316.

A. Vinci, who added to his travel account a vocabulary of the Waroma-Širiana (or -Waika, listed by him as Uaroma, Guaica and Sciricciana) on the Mereuari River (3). In 1954-55 C. Zerries

3. Vinci, 1936, pp. 364-367.

and M. Schuster collected as yet unpublished material among the Waika of the upper Orinoco, and in 1956 Becher presented his vocabulary from the Surára and a number of expressions from the Paúxiú. This, to my knowledge, is all that is known about these languages at present.

114 197 As early as 1913 Koch-Grünberg found that Širiana was independent of the neighboring Karaiben /Carib/ languages and apparently isolated (4). The latter view was adopted in 1924 by

4. Koch-Grünberg, 1913, p. 455.

/134 cont./

Rivet, who at that time set up in his classification of the American languages a Tariané linguistic family which included the Tariana and Walka (5). W. Schmidt, who was familiar with the larger

5. Rivet 1924, p. 678.

Tariana vocabulary of Koch-Grünberg, still unpublished at that time, was of the same opinion and wrote in 1926 that the language of the Tariana (Schiriana) "forms an isolated group along with those of the nearby Walka" (6). C. Loukotka, who took over the

6. Schmidt, 1926, p. 221.

revision and further working out of the classification from Rivet, retains the Tariané linguistic family, but adds to it Karind, which has meanwhile become known, and Pussinlaí, which is merely mentioned, but is unknown linguistically (7). Walka was also still

7. Loukotka, 1944, pp. 8-9.

undocumented at that time, but its inclusion in the family resulted from the assertion by Koch-Grünberg that "the language of the very light-colored Walka is very closely related to the Schiriana" (8).

8. Koch-Grünberg, 1913, p. 431.

This assertion is now fully confirmed by the Walka notes of Zerries and Schuster. Up to the present time, however, the Pussinlaí has remained unconfirmed. The last version of the classification by Rivet and Loukotka, which appeared in 1952, introduces no change in the Tariana family (9).

9. Rivet and Loukotka, 1952, p. 1168.

J. A. Mason, in his comprehensive revision of the classification of South American languages undertaken for the Handbook of South American Indians, acknowledges the Tariana linguistic family

/134 cont./

(for him Shiriană, Shiriana), but disregards the unknown Pussaksă (10). His attempt at a classification of this family, in

10. Maam, 1950, p. 254.

which he subordinates the Waika (Waică) to the Siriana (Shiriană) /135/ and contains the two, put together as Waharibo (Guaharibo), Karimé (Carimé) (11), remains questionable (cf. p. ?). It has

11. Ibid.

been taken over and expanded by N. A. McQuown, however, whereby he again introduces the unknown Pussaksă and adds a questionable, likewise linguistically unknown Guaharibo (12).

12. McQuown, 1955.

Since in McQuown's work the classification is not clear, I am giving it here in the form of a table, in which I am retaining the not always fortunate orthography of McQuown:

2. 15. CHIRIANAN.

a. Guahariban. Ven. Br.

α. Chirians (861). N2-4° W61-64°30' Br.

β. Uaica (880). N1°30'-2° W62-4', N3°30' W63°30', N4° W61°? Br.; N1-3° W64°, N3° W63° Ven.

γ? Guaharibo (890). N3° W63° Ven. Br.

b. Carime (941). N4° W64° Br.

c. Pussaccas (944). N3° W64°? Br.

"Ven." means Venezuela, "Br." Brazil. the numbers in parentheses after the names of languages refer to McQuown's piece-maps. the other data are the geographical co-ordinates of the places where the languages are spoken or (if followed by ?) were spoken; in this connection it should be noted that Karimé erroneously appears on the north bank of the Unariconera instead of on the Catrimani, considerably to the south of it [approximately N1°30' W62°30'].

/135 cont./

114
197

Rivet, Schmidt, Loukotka, Mason, and McQuown all agree in regarding the Xiriana family as a more or less closed group for which it has not been possible to determine any closer relationship with other American linguistic families. On the other hand, Swadesh, in his most recent contribution to the classification of American languages, sets up a "Makro-Xiriana" group (for him macro-xiriana), which includes, besides the Xiriana family (for him xiriana), also the Čapakura family (chapakura) (13). This

13. Swadesh 1959, p. 20.

quite unexpected linkage, if it could be proved, would certainly raise very interesting and important questions for linguistics and ethnology, for the Čapakura family is found in the Guaporé basin, where it extends approximately between the tenth and sixteenth degrees south latitude over an axis formed by the 63rd degree west longitude. I therefore pursued the possibility of such a relationship and compared the languages of the Xiriana family with those of the Čapakura. Although in the process nine Čapakura languages were considered (14), a lexical relationship between the two

14. Čapakura, Kitemoka, Kapeka, Pawumwa, Itoo, Morê, Kumanê, Wanyam, and Kabixí.

linguistic families could not be established. Since Swadesh has not yet published any material as evidence for the relationship suggested by him (15), his results cannot yet be evaluated in a

15. Swadesh is preparing to publish this evidence soon under the title "Materiales para un diccionario comparativo de las lenguas amerindias /Material for a Comparative Dictionary of Amerindian Languages/"; cf. Swadesh, 1959, pp. 8-9.

case such as the present one. On the basis of my own investigation,

/135 cont./
114 however, Ciriana and Čapakura are still to be regarded as two
197 independent linguistic groups.

128 In the following, only a small selection of Surára words
197 are offered, along with the corresponding words of Waika (according to Schuster) (16), Karimé (according to Salathé, 1932),

(122)

16. My sincerest thanks are due Herr Dr. Meinhard Schuster, Frankfurt, for the willingness with which he put at my disposal an excerpt of the Waika linguistic material that he is working on.

Širianá (according to Koch-Grünberg, 1928), and Warema (according to Vinci, 1956), in order to illustrate the close relationship that exists between these languages. The chief criterion for the selection was the availability of documented forms in the five languages; moreover, care was also taken to draw on words of a "non-cultural" nature for the most part, that is, /136/ those that are not so frequently taken over by neighboring languages and thus -- if agreeing morphologically and in meaning -- represent stronger proof of the genetic relationship of the languages com-
114 pared. Becher's linguistic notes were made chiefly with Surára informants; for the designations of body parts, however, there were also additional forms (marked by P) which a Pakidái informant gave him.

104 The transcription of the five lists has been standardized;
194 that of Karimé has also been simplified somewhat by the fact that two h and ɨ sounds not adequately described by Salathé have been reproduced simply as h and ɨ. With respect to the transcription, the following should be noted: ə = middle, back (or central), unrounded vowel; ɨ = high, back (or central), unrounded vowel; ã, etc. = nasal vowel; ɛ = open e; š = unvoiced, alveopalatal fricative; x = unvoiced, palatal fricative; ? = glottal stop; : = length for the previous sound.

The languages have been arranged in such a way that those which seem to be nearest to the Surára lexically follow it directly, and those which differ from it the most come last. This gradation of similarity with respect to the Surára is given here, however, only on the basis of impressionistic findings, which, furthermore, rest only on an examination of language samples containing the above 40 words. It is therefore not a reliable basis for a linguistic classification of the entire group, though one may see in it an indication of the relationships of the individual languages to each other. In any case, support for the classifications of Mason and McQuown (pp. 1-3) cannot be drawn from it. /The bibliography on pp. 137-138 of the original source is omitted in the translation; see the foreign text./

[Title Page]

Über die Sprache der Surára und Pakidái

von

Aryon Dall'Igna Rodrigues

Während seiner Aufenthalten unter den Nambikwára-Indianern konnte Hans Becher eine umfangreiche Wörterliste ihrer Sprache sammeln. Diese bedarf noch einer linguistischen Bearbeitung und weiterer Nachprüfungen. Schon jetzt aber ermöglicht sie, die Verwandtschaft dieser Sprache mit jener der *Waiko*, *Tóriona* und *Karíwai* vollkommen deutlich festzustellen. Es handelt sich um eine sehr enge, auf den ersten Blick ins Auge fallende Zusammengehörigkeit, die somit der kulturellen Einheitlichkeit jener Indianergruppen entspricht, die Becher unter dem Namen Yuruparí-zusammengefaßt hat.

Die erste Wörterliste einer Sprache dieser Gruppe wurde von Koch-Grünberg 1913 und — wesentlich erweitert — 1928 veröffentlicht und stammt von den *Tóriona* (*Tóriwai*) vom Uraricuera (und seinem Nebenfluß Uraricapará[1]). 1932 erschien die von G. Salzbrí aufgezeichnete Wörterliste der *Karíwai*-Indianer vom Catrimani-Fluß[2]. Weiteres Material wurde dann von A. Vinci herausgebracht, der eine Wörterliste der *Waramá-Tóriona* (bzw. *-Waiko*, von ihm als *Uaruma*, *Guaica* und *Toriviana* aufgeführt) vom Mucuxi-Fluß seiner Reisebeschreibung beifügte[3]. 1954—55 sammelten O. Zerries und H. Schuster noch unveröffentlichtes Sprachmaterial bei den *Waiko* vom oberen Orinoko, und 1958 brachte Becher sein Wörterverzeichnis von den *Surára* und einige Ausdrücke von den *Pakidái*. Das ist so, W. alles, was gegenwärtig von diesen Sprachen bekannt ist.

Schon 1913 hatte Koch-Grünberg festgestellt, daß die *Tóriona* unabhängig von den benachbarten Karaibensprachen und scheinbar isoliert wären[4]. Letzte Ansicht wurde 1924 von Rivet übernommen, der in seiner damaligen Klassifikation der amerikanischen Sprachen eine die *Tóriona* und *Waiko* umfassende *Tóriwai*-Sprachfamilie aufstellte[5]. Auch W. Schmidt, der die damals noch unveröffentlichten größeren *Tóriona*-Wörterlisten von Koch-Grünberg kannte, war derselben Ansicht und erklärte 1926, daß die Sprache der *Tóriona* (*Tóriwai*) „mit denen der umwohnenden *Waiko* eine isolierte Gruppe bildet"[6]. *C. Loukotka*, der die Revision und weitere Bearbeitung der Klassifikation von Rivet übernahm, behielt die *Tóriwai*-Sprachfamilie bei, fügte ihr aber das inzwischen bekannt gewordene *Karíwai* und ein nur ernähntes, aber sprachlich unbekanntes *Pruruhwai* hinzu[7]. Das *Waiko* war damals noch nicht inbegriffen, sein Einschluß in die Familie erfolgte aber auf Grund der Behauptung Koch-Grünbergs, daß „die Sprache der sehr heftigen *Waiko* ist dem Schirianá sehr nahe verwandt"[8]. Diese Behauptung findet jetzt durch die *Waiko*-Aufzeichnungen von *Zerries* und Schuster eine vollkommene Bestätigung. Das *Pruruhwai* ist dagegen bis heute unbelegt geblieben. Die letzte, 1932 erschienene Version der Klassifikation von Rivet und Loukotka führt keine Änderung in die *Tóriwai*-Familie ein[9].

In seiner letzten, für das Handbook of South American Indians unternommenen Revision der Klassifikation der südamerikanischen Sprachen erkennt J. A. Mason die *Tóriwai*-Sprachfamilie (bei ihm *Shirianá*, *Shirianái*) an, läßt aber den unbekannten *Pruruhwai* außer acht[10]. Sein Versuch einer Gliederung dieser Familie, wobei er dem *Tóriwai* (*Shirianá*) das *Waiko* (*Waicá*)

notwendigerweise und den beiden, als Wörterliste (Kurzwörter) zusammengestellt, das *Karinal* (Caribisch) gegenübergestellt[75], bisher allerdings lediglich (vgl. S. 135). Sie wird aber von H. A. Mc Queen übernommen und erweitert, wobei er wieder das unbekannte *Pesuvian* einführt und ein hypothetisches, ebenfalls sprachlich unbekanntes Gua-Amerika hinzufügt[76]. Da in Mc Queens Arbeit die Gliederung nicht übersichtlich ist, gebe ich sie hier in Tabellenform wieder, wobei ich die nicht immer glückliche Orthographie Mc Queens beibehalte:

2. 13. CHIBCHARAN

a. Guahiban. Yva. Bc

α. *Chiricoa* (Mc). Xa—ŋ Wa:—ɑ,ŋ'ɔ' Bc

β. *Guica* (Mc). Xŋ'ɔ'—ŋ Wa:—ŋ. Xŋ'ɔ' Wŋ'ɔ'. Xŋ Wŋ' Bc; Xa—ŋ Wŋ'. Xŋ Wŋ' Yva.

γ.? *Guahiba* (ass). Xŋ Wŋ' Yva. Bc

b. *Cuiva* (Ka). Xŋ' Wŋ' Bc

c. *Peranoan* (Pa). Xŋ Wŋ' Bc

„Yva." bedeutet Venezuela, „Bc" Brasilien; die eingeklammerten Nummern nach den Sprachnamen beziehen sich auf die Lokalisierungskarten von Mc Queen; die übrigen Angaben sind die geographischen Koordinaten der Orte, wo die Sprachen gesprochen werden oder (wenn ? folgt) wurden (hierzu sei bemerkt, daß das *Karinal* wahrscheinlich am Nordufer des Orinoco statt am Caicara, wesentlich südlicher davon [ungefähr Xŋ'ɔ' Wŋ'ɔ'], anzusetzen).

Rivet, Schmidt, Loukotka, Mason und Mc Queen sind sich alle darin einig, die *Tiviano*-Familie als eine eingeborenen geschlossene Gruppe zusammen, für die keine engere Verwandtschaft mit anderen amerikanischen Sprachfamilien festgestellt werden konnte. In seinem jüngsten Beitrag zur Klassifikation der Sprachen Amerikas stellt Swadesh dagegen eine „*Maipure-Tiviano*"-Gruppe (bei ihm macro-tiviano) auf, die außer der *Tiviano*-Familie (bei ihm *tiviano*) auch die *Cajubaboa*-Familie (*Arajubaboa*) einschließt[77]. Diese ganz unerwartete Verbindung könnte an sich begründet werden, würde gewiß sehr interessante und wichtige Fragen für die Linguistik und die Ethnologie aufwerfen, denn die *Cajubaboa*-Familie ist im Gegensatz zu den *Tiviano*-Sprachen, wo sie sich etwa zwischen dem 10. und dem 16. Grad südlicher Breite über einen vom 63. Grad westlicher Länge gebildeten Achse ausdehnt. Daher bin ich der Möglichkeit einer nahen Verwandtschaft nachgegangen und habe die Sprachen der *Tiviano*-Familie mit denen der *Cajubaboa* verglichen. Obgleich dabei neun *Cajubaboa*-Sprachen berücksichtigt wurden[78], gelang es nicht, eine lexikalische Verwandtschaft zwischen den beiden Sprachfamilien festzustellen. Da Swadesh auch kein Beweismaterial für die von ihm vorgeschlagenen Verwandtschaftsverhältnisse veröffentlicht hat[79], können seine Ergebnisse, in einem Fall wie dem vorliegenden, noch nicht beurteilt werden. Auf Grund meiner eigenen Untersuchung sind aber *Tiviano* und *Cajubaboa* weiterhin als zwei voneinander unabhängige Sprachgruppen anzusehen.

Im Folgenden wird nur eine kleine Auswahl von Swadesh-Wörtern neben den entsprechenden Wörtern des *Karinal* (nach Salzbild 1936), *Tiviano* (nach Koch-Grünberg 1928) und *Warrau* (nach Vinal 1936) gebracht, um die lexikalische enge Verwandtschaft dieser Sprachen miteinander zu veranschaulichen. Hauptkriterium für die Auswahl war das Vorhandensein lediglich Formen in drei Sind Sprachen; außerdem wurde aber auch dafür gesorgt, daß möglichst Wörter „nicht-kulturelle" Natur herangezogen wurden, also

[75] Salzbild 1936, S. 10.

[76] *Cajubaboa*, *Kiriminka*, *Kapaka*, *Pesuvian*, *Ano*, *Aiwi*, *Karinal*, *Warrau* und *Kaiwi*.

[77] Swadesh stellt die lediglig Verschiedenheiten dieser Sprache unter dem Titel „*Materiales para un diccionario comparativo de las lenguas amerindias*" vor, vgl. Swadesh 1959, S. 6—9.

[78] Herrn Dr. Bernhard Schuster, Frankfurt, gilt mein aufrichtigster Dank für die Bereitwilligkeit, mit der er seinen Anteil des Wörter-Sprachmaterials, das er bearbeitet, zur Verfügung stellte.

Lautwert und Phonem	Wörter	Kürzel	Sinnen	Wurzeln

	Tembé und Tenetehára	Wayãpi	Karajá	Xerente	Warao
Hand	ãwat	ãpẽ	ãbe	ãpẽ	ãʔã

Nase	ãwaʔ	ãwaʔ	ãwaʔ	ãwãʔã	ãkwaʔaʔ

Ohne und die Sprachen so ausgewählt wurden, daß diejenige, die dem Tembé lexikalisch am nächsten zu stehen schien, dem ursprünglichen, und diejenige, die sich von ihm am meisten unterscheidet, an letzter Stelle steht. Diese Reihenfolgeanordnung bezüglich des Tembé wird hier aber nur auf Grund einer impressionistischen Feststellung durchgeführt, die noch durch nur auf einer Durchsicht der obigen, gr Wörter entstehenden Sprachgruppen beruht. Sie ist also noch keine unerläßige Basis für eine linguistische Gliederung der genannten Gruppe, jedoch darf man in der eine Bestätigung auf die gegenseitigen Verhältnisse der einzelnen Sprachen sehen. Eine Untersuchung für die Gliederungen von Ri-ua und Ri-Queres (S. 130—133 kann allerdings darum nicht entnommen werden.

/11/ Introduction

101 131 [132] The native tribes that are discussed in the present report inhabit the northwest zone of the Escudo Guayanés, located in the southern part of the Republic of Venezuela. As the natural boundaries of this region, which we call "the Orinoco-Ventuari region," one may point out the rivers: the Orinoco in the north and west; the Ventuari in the south, and the Caura in the east. Geographically the zone is enclosed between 64°-68°W. and 4°-8° N. approximately. The northern part of it corresponds to the Distrito Cedeño of Bolívar state, while the southern part, as Departamento Atures, belongs to the Territorio Federal Amazonas.

133 101 Hydrographically speaking, the region includes five river basins which carry off its water and which at the same time set off the various areas of native distribution (1).

[128] 1. We do not include here the small native groups who recently arrived (Guahibo, Piapoco, Puinave, Curipaco). They live along the periphery of the region, except the Guahibo, who advanced a few years ago to the Manapiare river.

a) The basin of the Caura, with the Mayongon /Maioncon/, a subgroup of the Makiritare, the Yecuana, and with some Sanemá groups;
b) The basin of the Cuchivero, with the Panare Indians and some unknown groups on the headwaters;
c) The basin of the Suapure, which, with the exception of some Panare nuclei, does not at the present time have any native populations;
d) The basin of the Sipapo, with the Piaroa and Macú Indians;
e) The basin of the Ventuari, with the Yaberana Indians on the Manapiare River, the Yecuana (Decuana) subtribe of the Makiritare, and the Nahuduh, a Sanemá subgroup (cf. hydrographic map /see p.12/).

Guahibo SC19
Yaharana, Panare SS22 SS23
Sanema Sulva SS15 Makiritare SS20

/11 cont./

All these basins, without exception, pour their great volumes of water into the Orinoco, which, like a gigantic arc, runs across the north of the Escudo de Guayana, thus enclosing all the native tribes studied here and marking the southernmost boundary and end of their primitive world (cf. ethnic map /see p. 6 /- /12/ /Map appears here/-/

/12/ It is interesting to point out that the extensive fluvial network of the Orinoco-Ventuari zone does not serve the majority of the tribes as a means of communication or as an outstanding source of food. The Panare of the basin of the Cuchivero do not travel by river, and on the Cuchivero we found only one dugout /bongo/, which was used solely for crossing the river. In general the curiara /dugout canoe/ seems to be a foreign element in Panare culture, introduced recently by the Creoles. Nor did the Yabarana of the basin of the Ventuari use the curiara, and they recently learned from their neighbors, the Makiritare, the art of making them. For the Sanema the river represents an obstacle rather than a means of communication, and they use rafts in order to cross it. At the present time, only the groups who live in symbiosis with the Makiritare make curiaras, but there is not the slightest doubt that this industry was adopted recently. The Sanemá spend less time at fishing than do the Panare, Yabarana, and Guahibo, since the latter two are among those Indians oriented toward the land, with its roads, rather than toward the rivers and navigation. The only real voyagers of the Orinoco-Ventuari zone are the Piaroa and the Makiritare, and the fame of the latter exceeds that of the former.

Culturally, the Makiritare belong to a Meso-Indian level, as do their cousins of the same linguistic affiliation, the Panare and the Yabarana. It is interesting, however, to call attention to the fact that to speak of Caribe /Carib/ Indians is not the same *eo ipso* as speaking of voyaging Indians. There are Meso-Indians who are ignorant of the curiara and who developed agriculture, not in a Meso-Indian culture (of fishermen and voyagers), but basically on top of a Paleo-Indian culture (of hunters). Meso-Indian cultures, such as that of the Warao, for example, and possibly that of the Piaroa, represent a specialization of the Paleo-American who was

/13 cont./

searching primarily for a new source of food and not so much for a better means of communication. The typical Venezuelan Caribe, at least at the present time, is a man who loves land (Pemón, Caribe, Panare, Yabarana, Tupe), and the Makiritare, river men, represent an exception among them.

According to the relative importance which the river has among the different tribes, nuclei of them are found along the principal aquatic arteries, such as those of the Makiritare, or at a distance from them, on the tributaries and headwaters, as among the Panare, Yabarana, Guahibo, and Sanemá. This circumstance is of the utmost importance for the study of these Indians. The farther away they live from the river, the more difficult it is to make contact and to live with them. Thus the Panare are even less known than are the Makiritare and the Piaroa, and we are presenting in the present report the first relatively ample information on the Sanemá and Yabarana. /14/ /Map appears here./

/15/ The three weeks which we spent among the Panare were very laborious, and the time among the Sanemá was very hard physically.

In spite of these difficulties, which in comparison with those of a voyage at the beginning of the century are insignificant, the zone is open for any type of communication. One can go by airplane to Caicara, Puerto Ayacucho, San Juan de Manapiare, and Cucuí (between the Tenque and Oso Falls). Thus, for a special study of the Panare one can go from Caracas to Caicara on a flight of a few hours and then continue by jeep and arrive on the same day at the first bohío of the Panare. In order to study the Piaroa, one goes by airplane as far as Puerto Ayacucho and then on by foot or by curiara. The Yabarana can be visited in the dry season, going by regular flight to Puerto Ayacucho and from there to San Juan de Manapiare by a flight lasting 30 minutes in a small plane. One reaches the houses of the Yabarana on the same say, and in two days more the "Monteros," the most autochthonous of this tribe. In order to reach Makiritare territory and the Sanemá of the upper Ventuari, one goes by airplane to Puerto Ayacucho on a regular flight and then on to Cacuí on a flight lasting 50 minutes more or less in a small plane. In

Map 2. Distribution of the native tribes of the Orinoco-Ventuari region.

Y /15 cont./
122 no cost are more than three or four days needed in order to get
7 to the site of study, and the cost is relatively low. The Waica
[122] and Samatari live in a remote corner of Venezuela. On a re-
cent trip, however, we left Caracas at seven in the morning
and were among the Waica of the Padamo at five o'clock in the
afternoon of the same day. We spent five hours flying and three
in a fast curiara.

On a reconnaissance trip of long duration, such as the one we made for this present report, one needs to go more slowly in a curiara, stopping among the tribes, streams, and mountains. The only ones difficult to reach is that of the "Moreseco" and Chirano of the Sierra Guanapi.

Y The Orinoco-Ventuari region represents the secondary
133 western massif /macizo/ of the Macizo de Guayana, with eleva-
122 tions above 2,000 meters. The most difficult ascent in the region was the one south of the Saudal Alto on the Cuchivero, toward the Sierra Guanapi, and the first of the Salto Mono on the Upper Ventuari, where the level rises to more than 1,500 meters (cf. physical map /see p. 7 /). The traversing of the Salto Mono, particularly the ascent during the rainy season, is an extremely

M dangerous stretch, and one must spend at least a whole day to
[982] go and six hours to return. The Makiritare go up in six hours and
[982] come down in four hours with a load of 20-30 kilograms on their backs. We came down with 20 Sanemá and 30 Makiritare in only five hours, but such a marathon is extremely tiring. On the other hand, to cross the Mono in two days is an extraordinarily beautiful excursion because of the characteristics of this mountain and its gigantic forest, which at times allows an open view /16/ /map

M appears here/ /17/ and one can gaze on an enchanting panorama.
122 The Makiritare keep the wide path (over two meters) always open
[481] and in good repair, and at the upper port they built a house in
[985] which to rest and spend the night. There one finds curiaras with
[501] which one can follow the river to the Makiritare and Sanemá rancherías located on the headwaters of the same. From the port of Mono upriver as far as the headwaters there are no further obstacles for navigation, and the river permits easy access to all the Makiritare villages of the Upper Ventuari. We call Upper

Communication between the flatlands of the north and the Macizo are very difficult going up the rapids of the Caura. On this account the Indians themselves exhaust their strength and frequently lose their lives. During the rainy season they do not usually travel by way of these dangerous routes (Vila, 1959).

V
137
153

As is natural, physical characteristics are reflected in the different types of vegetation in the Orinoco-Venezuelan region (cf. vegetation map /see p. 16/). In the low zone along the Orinoco, Ventuari, lower Cuchivero, and Caura rivers are dense gallery forest, chaparrals, and graminous steppes, as in the upper Orinoco and in the Llanos. In the higher stretches there are xerophilous and hygrophilous deciduous forest, in part evergreen, while in the high sierra, above 1,000 meters, are found xerophilous and hygrophilous forms interrupted locally by savannas. The forest between 200 and 1,000 meters elevation is frequently cut up by graminous steppes.

P
[137]
[137]

The word "chaparral" is used to designate the savannas filled with trees, such as those of the lower Cuchivero and of the hinterland and interior of the Parure of the north. Here, typically, are found stubby trees 4-6 meters in height, with species such as Curatella americana, species of Byrsonima and Erythroxylum, Bowdichia virgilioides, Pellicourea rigida, and Haematoxylon brasiletto.

The graminous steppes, humid or dry, constitute the typical vegetation of the Llanos. They are zones almost completely lacking in trees, interrupted by dunes or, in our zone, by marshes, and on occasion with chaparrals or other woody elements in the transition zones of the north. The savannas and steppes of the high sierras of Guayana /Guiana/ still remain almost unexplored.

The gallery forests which we pointed out for the dry regions are made up in the main of moriche groves. The moriche groves of the lower Cuchivero are /18/ /map appears here/ /19/ known in Venezuela for their beauty, in spite of the fact that, for the

V /19 cont./
137 traveler, they usually indicate an obstacle, even in dry seasons.
[133] The hygrophilous selvas, constantly green (tropical rain forest), are made up of trees from 20-50 meters in height, intertwined with lianas and epiphytes. The trunks on occasion measure over two meters in diameter, and once in a while they have tabular roots. Among the characteristic species are found: Anacardium rhinocarpus, Terminalia amazonica, Philodendron bipinnatum, Sterculia apetala, Basiloxylon brasiliensis, Astronium graveolens, Brosimum spec., Pouteria spec., Guarea spec., Carapa guianensis, Mora excelsa, Bertholletia excelsa, Hevea benthamiana, and Ochroma lagopus.

In the Venezuelan region of Guayana it is difficult to make a distinction between the zones of hygrophilous selvas and the deciduous mesophilous forests. In Venezuela the deciduous mesophilous forests occupy the most extensive part of all the forest zones. Owing to the dry season, this type of forest has a smaller number of species than the hygrophilous selvas. The trees attain a height between 20-40 meters, and lianas are less abundant than in the hygrophilous forests. Among the important species in the deciduous forests of our region are found: Cedrela mexicana (cedar), Swietenia macrophylla (mahogany), Anacardium rhinocarpus (mijao) Mombacopsis sepium (saquisaqui), Spondias mombin (jobo), Samanea saman (saman) and Tabebuia pentaphylla (apamate) (Hueck, 1960).

V
114 As we have already indicated in the preface /untranslated/,
127 the present book is the result of a report on two trips and of a bibliographical study of the extant data on the zone visited (cf. map: Route of the expedition /see p. 3 /). Although it is true that no monographic work has yet been written for any of the tribes of the Orinoco-Ventuari region, it is also true that the great number of articles which have been published on the Indians of that zone is surprising. The material is primarily descriptive, but since they often describe for us aspects of native life which have now disappeared or changed, the general material of these authors is of great value and interest.

/19 cont./

In the present report we use most of the extant data, and their compilation, ordering, and selection, together with our own personal contribution, constitute the study which we present here on the Indians of this part of Venezuela.

For our purpose we followed the footsteps of the great Venezuelan ethnologist, Lisandro Alvarado, who, with the publication of his book, Datos Etnográficos de Venezuela /Ethnographic Data of Venezuela/, took a firm step toward the great task of compiling /20/ all the objective material written over the course of many decades regarding the native tribes of this part of the world (2).

2. Obras completas de Lisandro Alvarado /Complete Works of Lisandro Alvarado/, Vol. 4 (Ministerio de Educación, Dirección de Cultura y Bellas Artes). Caracas, 1956.

Our report lacks uniformity with regard to the character and volume of material on the various tribes to which we refer, but this fact reflects precisely our present sporadic knowledge concerning the tribes, which, in the last phase of their autochthonous life, urgently invite the competent ethnologist to leave testimony of a human conglomerate of our ancient American continent. /Maps 5 and 6 appear here. Pages 21-176 are not included in the translation./

The Sanemá

101 The word Sanemá appears here as the designation for a subtribe of the Yanoama. The Sanemá were called Guaharibo and were sometimes confused also with the Shirishana /Shiriana/.

The terms Guaharibo and Shirishana (written with abusive orthographic freedom) lack proper sense when applied to the Sanemá, and they must not, as has heretofore happened, be applied to this tribe or to the peripheral bands, who accepted them as designations used by the Whites (Guaharibo) and by the Makiritare (Shirishana).

The name Guaharibo, like Macú and Tapuya, is a vague and collective designation which includes many primitive tribes and which, therefore, has little classificatory value and will not stand up to scientific and impartial criticism.

The term Shirishana, for its part, seems to us to be a nickname rather than a generic denomination, since it means "araguato monkey" and is used by the Caribe in a contemptuous tone when they refer to the Sanemá, whom they consider to be subhuman beings born from the dust of their shadows. The name also lends itself easily to confusion with the Crichaná of the Ianaperi River and of Caribe affiliation.

For the above-mentioned reasons we prefer the term Sanemá, which means "people," to that of Guaharibo, which is equivalent to "savage," or to Shirishana, "araguato monkey." This preference has more scientific aspects and more human respect.

[114] It would seem that the term Yanoama was introduced into ethnographic literature by Zerries (1956a, p. 187) and was accepted, quite rightly, by Schuster (1958, p. 115) and Becher (1960, p. 6) as a generic name for the Casapare, Sanemá, Waica, Samatari, Surara, and Pakidai.

128 101 In the present treatise we shall consider the Yanoama as a tribe, not so much in the politico-social sense, as in the linguistic-cultural sense, since the Yanoama, in general, represent a specific culture made up /178/ /map appears here/ /179/ of the various peculiar subcultures of the diverse subtribes which live in a coherent territory, which speak closely related languages, and possess essentially similar economic and sociological forms.

Map 7. Distribution of the Yanoama Indians (preliminary).

/179 cont./

619 [624] [596] Each subtribe is composed of a certain number of local groups which form a band of extended families and provide the peculiar characteristics of the group to which they belong, thus enriching the cultural patrimony of the subtribe. In this way we know the Casapare, Sanemá, Waica, and Samatari as subtribes of the Yanoama, while the Pakidai and Surara appear to represent two local groups of the Samatari or of a subtribe whose name we do not know.

As local groups of the Sanemá we can mention the: Nabadub of the Ventuari, the Pubmatari of the Caranakuni, the Taclaudub in the region of the source of the Caura, and others whom we shall mention in the demographic section.

[184] [194] From what has been published up to the present regarding the Yanoama subtribes, we can gather that there exist among them more or less marked cultural differences, but it is also easy to demonstrate that these differences merely represent variants of one and the same cultural pattern, in spite of the fact that these divergences would correspond basically to a separation between these subtribes which would vary between 600 years as a minimum and 3,500 years as a maximum.

127 128 In order to facilitate the study of the distribution of the Yanoama subtribes, we have put together the over-all map /see pp. 40-43/ which illustrates the present work. The data referring to the Surara and Pakidai settlements have been taken from the study by Becher (1960), who located them between the Demini and Aracá rivers in Brazil. The location of the Samatari of Brazil corresponds to the map published by Seitz (1960), and that of the Samatari of Venezuela to one drawn up by the Malariología, placed between the Waica on the upper Orinoco across from the mouth of the tributary Mavaca. From this latter source we have also taken the anthropogeographic data on the Waica and on the Sanemá of the Padamo. The reference map has been drawn up according to [797] empirical data from the personnel of the Malariología, which were collected with the collaboration of the missionaries of this zone, above all, with that of Mr. James Barker of the New Tribes Mission, who has close contact with the Indians of this region.

Warao SS 18
Saliva SS 15

/179 cont./

Y 131 127 128 We have knowledge of the distribution of the Sanemá of the Ventuari, Erebato, and Caura from our own expedition's personnel, while we took the data on the Casapare from the excellent cartographic work of Montoya (1958), who visited the zone over a period of several months.

Y [101] /180/ The name Casapare is employed by the Sanemá to designate their neighbors to the east. Koch-Grünberg (1923) had already mentioned the group of the Upper Uraricaparã, a tributary of the Uraricuera and the one that occupied the right shore of the Uraricuera River, facing the Marutani range, on the Motomotõ River. The broken lines indicate, approximately, the territory occupied by each Yanoama subtribe. The location of the Makiritare of the Cunucunuma comes from the map published by Civrieux (1959), and that of the other settlements of that tribe was verified by the personnel of our expedition.

M 131 127

Y 131 161 According to this map, the territory inhabited at the present time by the Yanoama is located between 0° 30' – 5° N and 62° – 65° 30' W. If we grant that the total Yanoama population reaches the figure of 20,000 individuals spread out over an area of 150,000 square kilometers, we recognize as the density index of the population that of one person per 7.5 square kilometers. There are authors who, being overly generous, raise the Yanoama population to 30,000 and even 50,000 inhabitants, but this number seems exaggerated to us.

B S U 161 177 It is interesting to point out that the highest figures for the native population correspond to the primitive tribes of hunters and fishermen or to those who had an incipient or rudimentary agriculture, such as: the Barí (Motilones, Mapé), 2,000; the Piaroa, 4,000; and the Warao, 8,000.

They are also the tribes which have had least contact with the white man. There is an interesting and instructive relation between the demographic datum of a native population and the number of years that it has had contact with Whites: the higher the latter, the lower the former.

Sanema
Warao 5518
Saliva 5515
Bari 5513

/180 cont./

The Barí suffered greatly from the Yupa, the Piaroa and Warao from the Caribe, but these sufferings were minimal compared to the oppression to which other tribes were subjected by the Whites. The Yanoama have been attacked for hundreds of years by the Caribe, who surrounded their territory with a semicircle along the north; the Yanoama endured something similar from the Arawak, who surrounded them in a semicircle along the south. But all in all, the White has not been very successful so far in approaching this primitive population and his destructive influence has not affected their ancestral customs. The Caribe and Arawak have declined gradually in vigor and numbers; now we are witnesses of the triumph of the Yanoama over their neighbors of a more refined culture, for not only did they defend their territory, but were successful in spreading to the north and west.

The strongest and most efficaceous ally of the Yanoama has been the Cordillera de Parima, together with the dense tropical selva of the Territorio Amazonas. In the /181/ fateful period of persecution they have always found a safe refuge in the protecting selva. Nevertheless, as of relatively recent times, the different Yanoama subtribes are beginning to realize that the space beyond the conventional boundaries of their tribal territory is sparsely populated, almost deserted. The number of their traditional enemies has diminished considerably, and the invasions of their territory have had practically no consequences. In this manner they have gained almost 100 kilometers to the north of the Sierra de Pacarima, where the Casapare now live on the Upper Paragua, and the northern group of the Sanemá on the headwaters of the Ventuari, Erebato, and Caura rivers.

The center of distribution of the Casapare is located to the south of the Sierra Pacarima in the basin of the Río Branco. We know this Yanoama subtribe only through a few sporadic superficial contacts, and the people, as well as their territory, remain practically unknown. For this reason we consider the name Casapare with which we designated all the Yanoama in the zone of study as strictly preliminary, and we would not be surprised if we had to change it in the future for a more exact and adequate

/181 cont./

101 name. We included the Casapare among the Yanoama on the basis of information from the Sanemá of the Erebato, who assured us that they speak a language similar to theirs.

101 127 The limited scientific data at our disposal and which refer to the Casapare all come from the northern group, and their interpretation is relatively difficult because of the fact that on the Uraricuera River the Waica and Sanemá zones of distribution come together with that of the Casapare, and the chroniclers were unable to distinguish with precision and clarity the representatives of the different subtribes.

101 The ethnic differentiation which appeared very early in the respective biographical sources was that of the Shirishana and Guaharibo (with their multiple orthographic variations). At the present time there is not the slightest doubt that we are dealing with Yanoama Indians, but we do not think that it is proper to identify the Guaharibo and Shirishana as a single group with two distinct names. It is our opinion, on the contrary, that each name designates a more or less distinct group of the Yanoama, and that "Shirishana" refers to the Casapare, and "Guaharibo" to the Sanemá. The Sanemá of the Territorio Amazonas of Venezuela have been known from the beginning by the name Guaharibo. The confusion of the two terms originates precisely in the northern zone under discussion, where the two subtribes live in close geographic proximity. Thus, we believe that among the Yanoama of the Paragua there are Sanemá in the west or on the headwaters of the Paragua itself, while the Casapare /182/ occupy the territory toward the east and are established principally along the length and on the banks of the Paramichi.

This close contact between the representatives of the two subtribes is recent, as we shall point out later on, and it is almost certain that today there is some genetic and cultural fusion between the two groups. To the south of the Sierra Pacarima they also have some relations, but more sporadically, since they occupy two distinct zones: the Casapare (Shirishana) on the Uraricuera to the north of Maraca Island; and the Sanemá (Guaharibo) and the Waica, the territory farther to the southwest.

Sanema
Casapare
Makiritare SS 20
Pemon SS 16

Y
101
[127]

/182 cont./

With regard to the Casapare of the Uraricuera River, we have the data supplied us by Koch-Grünberg (1923, pp. 284-319), and a comparison of his "Shirishana" vocabulary with the "Shirishana" vocabulary of Armellada and Matallana (1942, pp. 101-108) gives us the impression that both are very much alike, but differ greatly from the Sanemá family (cf. glotto-chronological sketch see p. 49 /). In spite of the fact that they now occupy adjacent geographic zones, we prefer to make a clear distinction in the literature between the "Shirishana" (Casapare) and "Guaharibo" (Sanemá), considering them as two different subtribes of the Yanoama tribe. According to their linguistic separation, they represent, in fact, the two extreme poles of maximum distance (18).

18. Note that this does not mean that we also continue with the old nomenclature, but rather that the name "Shirishana" of the literature corresponds to the Casapare subtribe, and the name "Guaharibo" to the Sanemá subtribe, of this work.

Y
648
P
M
648
361

From their center of distribution in Brazil, the Casapare harassed their neighbors, the Pemón and the Makiritare, with continuous raiding from the time that the latter arrived at the northern slope of the Serranía. It seems that the Taurepán (Pemón) were never able to establish a pueblo farther west than the eastern point of Maraca Island on the Uraricuera and that the Makiritare maintained their advanced posts at the cost of great losses and sacrifices, until finally they were forced to abandon them in the face of the constant threat and the imminent danger of losing their lives.

Y
M
648
361

The Makiritare began to lose ground at least some 120 years ago, when the Yanoama killed a number of Makiritare Indians (Schomburgk, 1841, pp. 437-8, 444), and it would seem that at the present time Tarakuñña on the upper Yararejuri is the last Makiritare stronghold south of the Serranía.

000
Y
648

/182 cont./
the last Makiritare stronghold south of the Serranía. The Yanoama, however, by their own strength, were able to contain the advance of the Caribe in the northeastern part of their territory.

M
Y
114
648

The massacre of the Indians to which we have made reference above was pointed out by Schomburgk (1841), who visited this land around 1839, /183/ and his data constitute the first report regarding the Yanoama of the north. Schomburgk had crossed the Sierra Pacarima when, on the way to the sources of the Orinoco, he found the Makiritare in the grip of great panic. The Yanoama, possibly a group of Waica, had killed a number of Makiritare who had been on their way to the Yanoama rancherías in order to establish commercial relations with them. A short time after that horrible massacre, the same Yanoama attacked a Makiritare rancheria with the intent of exterminating all its inhabitants. This event marked the date of the withdrawal of all the Makiritare south of this zone. Even the Caribe companions who were with Schomburgk accompanied them on their flight, abandoning him with his baggage a short distance from the sources of the Orinoco. It is easy to understand Schomburgk's emotional state, bordering on desperation, on finding himself so close to his goal without being able to reach it.

M
[261]
[167]

Y
114

On the upper Uraricuera, in the region of the Sierra Marutani, Schomburgk came upon a conuco /cultivated area/ of the "Kirishanas," whom he described as nomad Indians who depended primarily on hunting, fishing, and the gathering of wild fruits for their basic sustenance; some, however, cultivated small plantings of bitter yuca and peppers (Schomburgk, 1841, p. 417). Seventy-two years after this first report, Koch-Grünberg, in December of 1911, once again established brief communication with the Yanoama of this zone, and his information constituted, until a few years ago, the most important material on the Yanoama in general. Koch-Grünberg met representatives of two distinct groups. The first group (Casapare), which he found at the Purumamé Falls, lived at that time on the upper Uraricapará, although it had only recently arrived in that region from the Uraricuera, above the island of Maraca. That was the place where they took by surprise all the Indians whom they robbed and killed.

161

/183 cont./

At the other end of the island of Maraca the territory of the Taurepan (Pemón) begins, and it is interesting to note that about the year 1911 the Casapare, under the command of one captain Kuranaí, had established peaceful contacts with the neighboring Caribe for the purpose of acquiring by barter European utensils, which they valued very highly. The custom of cultivating small plantings, which were noted by Schomburgk, Koch-Grünberg, and Gheerbrandt (1955, p. 345), must also be of Caribe origin.

Koch-Grünberg (1928, pp. 302-308) was able to publish the first vocabulary of a Yanoama language, and, as the same author points out, some words of Caribe origin can be distinguished in this idiom of the Uraricapará River, /184/ but almost all of them refer to utensils and cultivated plants of Caribe or European origin.

The other group (Waica?) was visited by Koch-Grünberg four weeks after his first encounter with Yanoama people, with whom he lived in a rancheria on the Motomotó across from the Sierra Marutani. This group had relations with the Makú of the Auarí River, from whom they adopted certain cultural elements, such as agriculture. We do not have a vocabulary from this group, but, according to information given to Koch-Grünberg by his native companions, they speak the same Yanoama idiom with slight dialectal differences.

The expansion of the Casapare toward the north is of recent date, since their sworn enemies, the inhabitants of the Paragua, as well as the Pemón to the northeast, ceased their reprisals and allowed the unhindered advance of the Yanoama nomads. It seems that at the same time the Sanemá of the southwest and the Casapare began to invade the zone. At the present time, the Yanoama dominate as far as the Marí River, a left tributary of the Paragua (5° 10'). The Pemón to the east of the Paragua have vacated the space between this river and the Caroní. Their nuclei are to be found on the Gran Sabana, in the southeastern part of Venezuela. Under the joint influence of civilization and the mission they have lost their characteristics as Caribe

P
197 /184 cont./ Casapare
799 Avake 555
161 Pemon 55 16

expansionists, and their number at present is quite small; they number 1,800 individuals and show a density of 1:16.5 square kilometers.

Y
177 The Mayoncon and Arecuna, along the north, do not make
648 an effective barrier to Yanoama expansion. Here, however they are liable to clash with the already advanced civilization of these regions where they will meet the Indian, the Negro, and the White with individual cultures irreducible by the Paleo-Indian culture of the Yanoama.

Y
101 Among the tribes which have been absorbed by the Yanoama
619 are the Kalíana, Auakí, etc., about whose identification there is some confusion in the literature.

Y
A
104 Kaliana, however, is the name which the Casapare give to the Sapé. The latter were identified as Kaliana by a native companion of Koch-Grünberg (1923, pp. 12-13; cf. idem, 1922, p. 227), while Armellada and Matallana (1942, p. 103) identify them with the name "Shirianá" (Casapare) as Karianapuík. In 1956 the Sapé (Kariana, Kaliana) were visited by Montoya, who classifies them as related to the "Shirishana" (1958, p. 168). "It is an isolated group," says Montoya, "which lives on the Antabarí River and upper Pao; in the zones of the upper Paragua and Pauré-Murán River.

A
241 /185/ "They devote themselves to agriculture, but produce
433 only as much as they consume or a little more for barter with the
439 Shirianna who are travelers and supply them with salt and other items which they lack.

A
501 "Some of them have learned to make curiaras in such a rudimentary manner as to make the Moñongón Indians, the masters of this art, smile. But they do make very fragile 'shells,' which allow them to travel to hunting and fishing zones, carrying light loads.

A
512 "They marry frequently with the Shirianna groups and even
A with the Arekuna. They appear to be destined to disappear as
101 a differentiated ethnic group or to be totally absorbed by the Shirianna, more numerous and nearer than the Arekuna" (Montoya, ibid.).

Auake 555

/185 cont./

101 [181] [114] As can be judged from these indications regarding the character of Sapé culture, this is a little-developed culture, and Montoya is right in differentiating them from the Caribe. But, judging from the Sapé vocabulary which accompanies the work of Armellada-Matallana and another by Koch-Grünberg (1928, pp. 308-317), it is not possible to identify the Sapé group as "related to the Shirianna."

101 114 [361] The Auaké, furthermore, are identical with the Arutani, who were visited by Armellada and Matallana during their expedition to the Paragua (1942, pp. 75, 86). They found them living in two rancherías; one near Maihia Falls on the Paragua River and across from the Momurán, a tributary of the same, on the right bank, with one house and 20 inhabitants. The comparison of the Auaké vocabulary of Koch-Grünberg (1928, pp. 308-313) with the Arutani vocabulary leaves no doubt but that the two are of the same tongue.

114 105 181 [342] [501] Both groups, the Sapé (Kaliana) as well as the Arutani (Auaké), seem to have a very poorly developed culture, probably like that of the Yanoama. Montoya describes Sapé culture with typically marginal traits, and Armellada and Matallana (1942, p. 75) say of the Arutani that "these Indians are the poorest that we have seen on the whole trip; they live in an absolutely miserable rancho and the little boats that they use are made of bejucos."

175 31 [101] [622] The Portuguese commission on boundaries (1787) mentions this tribe as Aoaquis, inhabitants of the sources of the Canamé, where they lived in large numbers under the command of three captains (Coudreau, 1887:2, p. 393). In 1838 Robert Schomburgk found some Oewaku on the middle Uraricuera; he describes them as a nomad tribe that lived on the headwaters of the Uraricapará and on the source of the Paragua. In 1882 the Auaké (Arutani) /186/ were visited for the first and last time in their own home by a Comisión de Límits, which found a small group on the upper Uraricapará. They had a large, round house, provided with a palisaded wall. The latter served them as protection against the attacks of their neighbors (Relatorio, 1884, p. 189; Grupe and Thode, 1890, p. 253). In 1911 Koch-Grünberg (1923, p. 12;

[342] [712]

Casapare
Cariban Indians SR7
Auake 555

A /186 cont./
131 cf. idem, 1922, p. 226) was visited on the Urumamy Falls by
175 a small group of Auaké (Arutani), who pointed out to the ex-
plorer that their land was on the source of the Paragua, where
A
[167] they had a communal house. But even by that time the Auaké
A (Arutani) had left their southern haunts to the Casapare and had
Y
[619] migrated to the north. But a large number merged with the
Casapare, and it is very likely that the Arutani of the upper
Paragua represent the last vestiges of the Auaké.

A It is useful to stress the fact that both tribes, the Sapé and
101 the Arutani, belong among the primitive groups of South
174 America, and that their idioms constitute independent languages.
648 They have very probably served as buffers between the Caribe
[199] and the Yanoama, and while the former pushed them from the
Paragua to the south, the latter absorbed them or displaced them
C
648 toward the north. The Caribe have had the same function in
more recent times, when they were destroyed between the frontiers
of white civilization and that of the Yanoama, and today only
a few vestiges of these tribes remain.

A Regarding the idioms of the Sapé (Kaliana) and Arutani
197 (Auaké), it is interesting to point out that Loukotka (1935) found
194 Chibcha vestiges in the Auaké and the Kaliana. If we consider
that the Yanoama are related to the Warao and that both have
a relatively low cultural level, it is possible to believe in a sub-
stratum of marginal tribes with a Chibcha linguistic affiliation,
to which the present Warao, Sapé, Arutani, and Yanoama tribes
may possibly belong. We shall go into this interesting topic in
the section which describes some of the linguistic aspects of the
Yanoama /see pp. 38 ff./.

Y The most recent information that we have regarding the
114 Casapare was submitted by the previously mentioned Capuchin
fathers, Armellada and Matallana (1942), by Gheerbrandt (1955),
and by Montoya (1958).

Y The expedition of the Capuchin fathers was undertaken in
114 1940 with the intention of completing a missionary report on
797 the river and its native population. They went out in search of
162 men, and their conclusion that the Paraguá, apart from being
a dangerous river and difficult to navigate, did not have large

Avake 555

/186 cont./
indigenous groupings is interesting. In their report (1942, p. 87) they mention a total number of 296 Indians counted.

/187/ This result contrasts with the one obtained by the expedition of Montoya, and, in spite of his having traveled over much more territory than the Capuchin fathers, we must admit that Montoya found native populations in 1956 where the fathers saw none in 1940. This has its value in the first place inasmuch as it refers to Yanoama populations (Casapare, Sanemá), and it is significant for the reconstruction of the migratory history of the Yanoama. Armellada and Matallana (1942, p. 76) say that a rancheria near the mouth of the Pumpirí, a river which flows into the Paragua on the right bank, was "the only one which the Shiriana Indians have on the Venezuelan side in the Paragua basin." Twenty-six years later Montoya (1956) and his companions discovered Yanoama rancherias established from the Marí River to the headwaters of the Paragua. This indicates that the expansion of the Casapare and Sanemá is of very recent date in this zone of the Paragua and that it achieved its present volume only in the last decades. The marginal tribes, such as the Sapé and Arutani, have been pushed toward the north and are in the process of being absorbed by the Yanoama in the south and by the Caribe and the Whites in the north.

Referring to the Yanoama of the Paragua, Montoya distinguishes the Guaharibo, Guaika, and Shirianna. According to his excellent map, the Guaharibo and the Guaica live between the upper Caura and the headwaters of the Paragua itself and the river Okasiarí. It is possible that these are the Sanemá and Waica. The Shirianna occupy the Paragua River from the Marí River to the source of the Paramichí River, and these seem to represent the Casapare of our nomenclature. The region of the greatest penetration by the latter into Venezuelan territory seems to be via the Sharopae River (3° 50') from where the route to the Uraricuera River starts.

According to Montoya (1958, pp. 173-174), the Guaharibo (Sanemá) are almost totally ignorant of agriculture and cross rivers by means of their characteristic bridges, which consist simply of two thick lianas, parallel and one above the other, the upper one serving as a handrail.

/187 cont./

105 The Guaika (Waica) are considered by the above-mentioned author as "the natives with the most primitive and wild life of all those inhabiting the great region of the Venezuelan Guayana..." They have an incipient agriculture; they cultivate bananas and plantains as the principal basis of their diet, which they complement with the fruit of the pijiguao palm. They practice endocannibalism, consuming the bones of the cremated dead.

Their hammocks are knotted, their houses are triangular, and they use bows and arrows of various types, according to their uses. They keep the bones of many animals, travel by land, very rarely by water, and build bridges similar to the style of the Guaharibo (Sanemá).

/188/ Regarding the Shirianna (Casapare), Montoya says (1958) that "the real Shirianna live on the banks of river, building very stable settlements and devoting themselves to an agriculture already relatively advanced." They obtain curiaras from the Mayoncon, but have also learned to make their own, although in a rudimentary way. They use bows and arrows for hunting, but "above everything else, they are traders and travelers. They constantly travel into Brazil, leaving from the upper Paragua, using the route of the Shoropae River, Urarikuera and Parima, to Boavista. They differ from the other natives of the Paragua basin in that they are tall and strong, healthy, and well nourished.

114 The last report on the Yanoama of the northeast was pub-
101 lished by Gheerbrandt (1955, pp. 345-349), and in this report there appears for the first time the name Kaserapai, which must be an orthographic variation of the name Casapare which we use to designate a whole subtribe and not only a local group as the above-named author has done.

101 Navigating the Uraricuera in the year 1950, Gheerbrandt
114 met and heard of various Yanoama groups with different names.
648 Very near the Sierra Marutani he came upon the Guadema on the left bank of the river named. The Guadema were very much afraid of the Kaserapai, who had killed the majority of the Guadema and were in open conflict with Waikas and Waitschas on the Uraricuera. It is possible that this may be a reference to an encounter between Sanemá, Waica, and Casapare groups, but the extant data offer no certainty in this regard.

Sanoma
Makiritare SS 20

600 /188 cont./
M but the extant data offer no certainty in this regard. It is interesting that Gheerbrandt (1955, p. 348) is of the opinion that the
114 Makiritare had left the Uraricuera some twenty years previously.
167
Y The Guadema seem to be different from the Casapare,
101 according to what one can deduce from the above-mentioned book; probably it is a matter of a local Sanemá or Waica group.

The center of distribution of the Sanemá is the basin of the Padamo River, a tributary of the upper Orinoco. Their territory is bounded on the south by Waica territory, on the west by the Makiritare of the Cunucunuma, on the north by the Makiritare of the upper Ventuari, Erebato, and Caura, and on the east by the little known territory of the Casapare.

Y
101 If we judge from the present situation of the distribution
197 of the Yanoama, it is quite probable that the first Yanoama with whom the Whites had contact on their trips along the upper Orinoco were the Sanemá, who appear in historical sources as the Guaharibo. One finds the Guaharibo frequently mentioned together with the Waica, but it is interesting that from the very first reports authors made a distinction between Waica and Guaharibo.

Y
/189/ Caulin (1958, pp. 305-306), writing in 1779, places
175 the Guariba on the Maraca and its tributaries. According to him,
101 they are white in color like the Spaniards and are the same "uaribas" already mentioned by the "Expedición de Solano." Humboldt also speaks of Guaicas and of Guaharibos, having met representatives of them in the Esmeralda Mission. Spruce (1908: 1, pp. 396-398), who met an old Guaharibo man on his trip on the Casiquiare, is the first one to leave us the fullest and most authentic information regarding the Yanoama of the upper Orinoco. According to this author, the Guaharibo call themselves Kudé-Kubui, but it is difficult today to decide whether these are Guaharibo or Waica. We have a like opinion regarding the Guaharibo of Chaffanjon (1889). It is possible that the Sanemá may have occupied zones farther toward the Casiquiare and the Cunucunuma, but the Arawak and Caribe of this zone occupied these places before the arrival of the Whites, and the boundaries were established by the tribes interested in them.

Y 174 101 /189 cont./ The expansion of the Sanemá to the north, that is, from the Padamo to the upper Ventuari, Erebato, and Caura, is relatively recent, but, to judge from the data given us by glottochronology, the separation of the various groups of the subtribe corresponds to 600-1,700 years. We established contact with three northern groups of the Sanemá: the Nabudub of the upper Ventuari, the Taclaudub of the upper Caura, and the Pubmatari of the Canaracuni. They apparently represent Sanemá groups which are quite well established, and the internal distance of this linguistic family is, in a way, surprising.

Y 101 184 The Sanemá of the Padamo and of the upper Orinoco are practically unknown to science, and it is expected that the cultural difference between them and their brothers who live north of 4° and in close contact with the Makiritare is relatively pronounced.

Y 101 648 167 The geographic separation of the Sanemá into a southern group and another northern one is recent and is due to the fact that in 1947 Captain Cardona had to make a landing field on the Canaracuni (personal communication), and, since there were no Indians in the zone to help him in his venture, he went to Brazil and brought the first Sanemá to this region of Venezuela. This date marks the beginning of the infiltration of the Yanoama element on a larger scale into the land of the Makiritare, their neighbors on the northwest, with whom they have lived in deep enmity from remote times. While the Makiritare of the Cunucunuma still do not tolerate large groups of Yanoama in their territory, those of the Ventuari, Erebato, and Caura live in close contact with large groups of the Sanemá subtribe. This was the way in which Makiritare culture of the tropical selva type penetrated to that essentially /190/ preagricultural tribe composed of hunters and gatherers with a very rudimentary culture. The Sanemá received extremely bad treatment at the hands of the Makiritare, comparable to that received by a slave at the hands of his master, for which reason toward the year 1950 the Sanemá revolted against the Makiritare and declared a war without quarter against them. It was then that the different Makiritare subtribes united to repulse the Sanemá, whom they conquered in various encounters, thanks to their fire-arms.

Y M [177] Y M 648 Y M 648 4 [411]

/190 cont./

thanks to their firearms. It seems that, as a result of this incident, the Makiritare and the northern group of the Sanemá lived together more peaceably, and today it is rare to find a Makiritare settlement in that zone of the Ventuari, Erebato, and Caura, without a few Sanemá groups in the immediate vicinity.

The clash of the two cultures began a process of progressive acculturation, and the hunters and gatherers of wild plants adopted a superior culture: from then on they would be agriculturalists. Furthermore, the genetic constitution of the two tribes underwent profound changes, and that of the minority group will perhaps be absorbed by the Sanemá in a relatively short period of time.

This process of acculturation and genetic absorption is interesting, for one is in the habit of thinking that the Caribe have always been the victorious and dominant invaders. But in this concrete case the process seems to be working in the opposite direction. The advance of the Sanemá, who adopted, among other things, the art of navigation, has brought about the isolation of the two large Makiritare groups: the Yecuana (Decuana) of the Ventuari and Caura on the one hand, and the Cunuhana of the Cunucunuma on the other. Prior to this, these two groups used to visit each other frequently, their members were related to each other, and strong family ties existed between them. At the present time the Makiritare youths know only partially the rivers and routes of those regions traveled so many times by their fathers, and they travel in small groups, overcome with deep anguish every time that they have to cross the zone occupied by the Sanemá. What was observed on the trip on the upper Ventuari fully confirmed this opinion for us, for there is not the least doubt but that the Makiritare captain, who, together with our five traveling companions, had fought eight years previously against the Sanemá, felt ill at ease on leaving the Makiritare rancherías behind, and his nervousness suddenly increased when one day we came upon a Sanemá raft on the bank of the river. They could not hide their nervousness when inland, in the selva, we came across a conuco and seven houses recently vacated. They always

Makiritare SS 20

M Y 648 /190 cont./ scorn them, and, at first sight, they seemed to be unworried, but the knowledge that they no longer live alone in the land of their fathers, and the fact of having heard that four days prior to our arrival /191/ at the conuco an Indian who had sought refuge by climbing a tree was shot by a Sanemá arrow and fell lifeless into the river, constantly tortured them.

M Y 582 563 177 648 M [186] A powerful stimulus which always encouraged the Makiritare on their numerous trips was to get a wife among their neighbors of the same tribe. Nowadays, despite the intense scorn which the Makiritare profess toward the Yanoama, taking a wife from that tribe is not considered an impossible or degrading thing; there are many Yanoama women who have married Makiritare men (cf. Grelier, 1955b, p. 10). This matrimonial interchange inevitably carries with it an assimilation of cultures between the two tribes, a process in which the Makiritare cultural pattern will

Y 167 563 177 648 dominate that of the Yanoama and the Yanoama genes will infiltrate the Makiritare gene pool. There is not the least doubt but that the Sanemá, who were brought in for a short time, arrived at the upper Ventuari and Caura where they took up residence to stay, and that the present fusion between the Caribe and the Yanoama ought not to be explained so much by the good will of the former as by the vitality of the latter.

Y 101 The Waica subtribe occupies the central part of the present Yanoama territory, that of the upper Orinoco and its tributaries above the mouth of the Ocamo, including also the southern bank of the river (Barker, 1953, p. 434). As we have already mentioned, they appear to live also in the general arc of the upper Rio Branco and its western tributaries, and Schuster (1958, p. 114) is very probably right when he says that the Sierra Parima does not bound the Waica zone, but that it extends to Brazilian territory.

Y 177 797 We have already mentioned the first contacts which the Whites had with the Waica, and, after a somewhat unfruitful effort by Hamilton Rice at the beginning of the present century, the Waica world went without contact with science until the New

Y 114 Tribes Mission was able to start peaceful relations with the Waica through the missionary James Paul Barker. Some ethnographic data were also published on this Yanoama subtribe by several

/191 cont./

114 members of the Franco-Venezuelan Expedition to the Upper Orinoco (1951) (cf. Grelier, 1955b; Anduze, 1958). Finally the Waica were studied between April of 1954 and August of 1955 by the German ethnologists Zerries and Schuster, who are preparing a monograph on this Yanoama subtribe.

101 114 The southernmost groups of the Yanoama are known as Xamatari, Araraibo (Seitz, 1960), Surara and Pakidai (Becher, 1960). The latter presented a very extensive study based on the experiences that he had during the nine months (October 1955--June 1956) that he lived among them.

101 128 Because of the lack of comparative data, we have considered all these /192/ local groups as parts of a Samatari (people of the tapir) subtribe who represent a very autocthonous entity of the Yanoama. We would give warning, however, that this classification is subject to future changes, as is also the map of Yanoama distribution which we have just discussed.

126 192 The linguistic material which the author of the present work was able to assemble during his stay among the Sanemá consists of a vocabulary of the Nabudub, who live on the upper Ventuari, and of the Sanemá of the upper Caura. The former vocabulary contains 270 words, and the latter, 730 entries (Wilbert, 1961b).

128 192 174 197 In order to classify this material within the different Yanoama idioms, we compared the two vocabularies with others belonging to various Yanoama languages, and in this way we established, insofar as we were able, a basic vocabulary, calculating the minimum distances existing between them, according to the glottochronological method.

192 197 174 126 127 We have indicated that the Nabudub and Sanemá vocabularies were compiled by the author. The vocabulary of the Pubmatari (Sanemá of the Canaracuni) comes from Vinci (1956, pp. 351-357). This vocabulary has a total of 278 words, 73 of which correspond to the basic vocabulary. According to what the author says on pages 159 (1956) and 133 (1959), this is most probably a Pubmatari vocabulary.

/192 cont./

127 192 197 174 The Casapare vocabulary was taken from Koch-Grünberg (1928, pp. 302-308). It has 303 entries in all, 65 of which corresponds to the basic vocabulary. There is another Casapare vocabulary compiled by Armellada and Matallana (1942, pp. 101-108), which has a total of 232 entries, 54 words of which correspond to the basic vocabulary. From the expedition's itinerary we know that the last-mentioned authors visited the Shirianá of the Paramichí River (tributary of the headwaters of the Paragua), a zone considered in the present work as an extension of the Casapare territory of Brazil.

Koch-Grünberg obtained his vocabulary among the Schirianá of the Uraricapará (1923, p. 288), and a comparison of the two vocabularies seems to indicate a closer affinity between them than that which exists with any other Yanoama language. The glottochronological calculation is based on Koch-Grünberg's material.

The Waica vocabulary comes from Dr. Zerries, who generously furnished us a basic one of 96 words of the Waica of the upper Orinoco.

Recently another vocabulary of the same language was published by /map appears here/ /193/ Anduze (1958, pp. 258-267), which contains 369 entries. The present calculation is based on the material provided by Zerries.

We give the "Samatari" vocabulary this name provisionally, for more precisely it is the idiom of the Surara and Pakidai of the Demini River in Brazil. The material was given to us by Dr. Becher in the form of a basic vocabulary which contains 85 words. Between the Surara and Pakidai there exist only slight dialectal differences. A vocabulary of 40 words of the same idiom was published in the monograph on these Indians by Becher (1960, pp. 136-137). Another vocabulary of the southern Yanoama was published by Seitz (1960, p. 306) and contains 40 entries. The few words which permit making a semantic comparison with other similar languages indicate that the Araraibo-Xamatari of Seitz is closer to the Surara, Pakidai, Waica, and Karimé than to the Sanemá and Casapare.

/193 cont./

174 197 [192] 127] We were not able to obtain the vocabulary of the Karimé published by Salathé (1932, pp. 314-316). Dall'Igna Rodrigues (1960, pp. 134-138) places it between the Waica and the Casapare (Schiriana of Koch-Grünberg).

According to the results of the lexico-statistical calculation (cf. p. 47), it can be said that the idioms compared form a linguistic conglomerate whose internal divergences date from 6-35 minimal centuries (mc). By their temporal distribution they constitute two more or less distinct groups: a) a Sanemá family with Nabudub, Sanemá, and Pubmatari, with an internal divergence of 6-17 mc., and b) a Casapare family with Samatari, Waica, and Casapare and with an internal divergence of 8-21 mc. The extreme languages are Nabudub (of the Sanemá) and Casapare. The distance of the Waica from the three Sanemá idioms corresponds to 17 mc., which is the same as the maximum internal distance of the Sanemá family, and the Nabudub have the same difficulty in understanding a Pubmatari or a Waica; they should, however, understand each other, although with some difficulty. The Waica has greater ties with the Samatari, with whom he can communicate orally without any great difficulty.

Other classifications of the Yanoama idioms were made by Rivet (1924, p. 678), Loukotka (1944, pp. 8-9), Mason (1950, p. 254), Rivet-Loukotka (1952, p. 1140), McQuown (1955), Swadesh (1959), and Dall'Igna Rodrigues (1960, pp. 136-137).

Koch-Grünberg (1913, pp. 455-458) had established by 1913 the independence of the Yanoama idiom (Shiriana) from the Caribe and added that the idiom apparently represented an isolated language. Rivet (1924, p. 678) and W. Schmidt (1926, p. 211) shared the opinion of Koch-Grünberg regarding the affiliation and independence of the "Shirishana" family. /194/ The classification of the "Shirishana Family" by Rivet-Loukotka (1952, p. 1140) includes the following idioms:

Shirishana Family

[101] a) Shirishana (or Guaharibo), who live dispersed in small groups in the interior, along the tributaries of the

/194 cont./

174 197 101 Uraricuera and on the southern slopes of the Sierra de Parima;

b) Karime (or Shaufri), on the Catemany River in the same region;

c) Waika, who live on the upper Ocamo and Mocajahy, right tributaries of the upper Orinoco;

d) Pusírakáu, an unknown wild tribe which lives in the Sierra Parima.

174 197 [127] As we mentioned above, we are inclined to differentiate between Shirishana (Casapare) and Guaharibo (Sanemá), which would seem to be linguistically justified by the distance of 23-35 mc between them. Rivet bases his opinion, it would seem, on Koch-Grünberg's material (1928), which we have also used in our comparison. The Pusírakáu idiom (d), which also appears in Loukotka's classification (1944, pp. 8-9), is a completely unknown idiom and therefore does not figure in Mason's classification (1950, p. 254), which presented the following Shirishaná grouping:

SHIRISHANÁ

[101] A.--Waharibo (Guaharibo)

1. Shirianá

a) Waicá (Guaica, Uaica)

B.--Carimé (Karimé)

174 197 114 According to Mason, Shirianá and the less important Carimé are the principal idioms of the family. This observation is based upon Koch-Grünberg's material (1928, Shiriana), which was identified in our comparison as Casapare, and, as the greater separation of the Yanoama stock corresponds to that language, we must admit the value of Mason's opinion. Carimé does not figure in our classification.

Furthermore, Mason is of the opinion that the Waica idiom is, possibly, a dialect of Shirianá (Casapare), but, according to the glottochronological calculation, he does not seem to be on firm ground. The distance between the two idioms is 21 mc, which is much greater than a dialectal difference of 5-7 mc. Waica appears on the graph as closer to Sanemá (17-18mc). The opinion of /195/ many researchers that Shirianá (Casapare) and Waica are descended from the Guaharibo (Sanemá) seems to have some justification.

/195 cont./

174 197 114 McQuown (1955) classified the "Chirianan" family in the following way:

a) Guahariban with Chirianan, Uaica and ? Guaharibo; b) Carime; c) Pusaracau.

A more recent classification of the Yanoama family was made by Dall'Igna Rodrigues (1960, pp. 136-137). By their internal distances the author just mentioned brought together the various Yanoama idioms in the following manner: Surara and Pakidai (Samatari), Waika, Karimé, Shirianá (Casapare), Warema (Sanemá, Pubmatari) (19).

19. The names in parenthesis were added by the present author.

Dall'Igna Rodrigues arrived at this result on the basis of a comparison of 40 words of the idioms mentioned and explains that the idioms of his list were arranged according to the relative distance between each one of them with respect to Surara and Pakidai. He also emphasizes the provisional nature of his result, somewhat different from those presented by Mason and McQuown.

It is interesting, however, to observe that the classification of Dall'Igna Rodrigues coincides in its details with ours. On adding the lexico-statistical data, the classification would read as follows:

Surará-Pakidai (Samatari) 8 mc > Waica; 21mc > Shirishaná (Casapare); 21-25 mc > Warema (Sanemá).

Two American linguists, Greenberg and Swadesh, recently broke with the tradition established by Rivet, W. Schmidt, Loukotka, Mason, and McQuown, according to which the Yanoama had no close affiliation with any other South American linguistic family.

Greenberg (1956) classifies the Shirianá as a distinct group in the "Chibchan proper" subfamily of the "Macro Chibchan" family. The Tunebo also belong to the same category.

Swadesh (1959, p. 20) established a Macro-Siriana, with an internal separation of 50 mc, including Chapacura (27 mc) and

/195 cont./

114 Sirisana (21 mc). According to what Dr. Swadesh said to me
174 personally, he also planned to include the Warao in Macro-
197 Siriana, which would magnify the internal divergence of the group to 72 mc of a microphylum. I took some interest in this suggestion by Swadesh and tried to compare Warao with Yanoama, particularly with the more extensive vocabulary which I collected among the Sanemá.

I made two comparisons: a) that of the basic vocabularies, and b) that of all the possible pairs between the Sanemá vocabulary and the Warao /196/ dictionary by Barral (1957). The results of these comparisons can be expressed in the following manner: More than 20% of all the pairs compared seem to be related, a sufficiently high percentage to stimulate a more thorough linguistic study. The result of the preliminary glottochronological calculation gave a separation between the two idioms of 45 mc corresponding to 26% of common retentions.

I have the impression that that mathematical result tends to diminish and not to become greater as one goes further into his study. We also observed certain relationships between the Yanoama and the Ye /Ge/ of Brazil. But these are of a different nature and more distant than the cases considered between the Warao and Sanemá.

As we have already mentioned, there are certain indications that the Tunebo, Warao, Yanoama, and Ye idioms seem to have a common root in Chibcha and are linguistically more closely related among themselves than with the majority of South American idioms.

Y 114 126 143 At the beginning of the year 1961 I had an opportunity, together with Dr. Layrisse, to visit the Waica of the upper Orinoco, where we went with the intention of taking blood samples of that group. We obtained 140 individual samples, which, in all probability, are representative for the Yanoama in general. We shall now report an interesting genetic discovery.

Y 143 The Waica showed a complete absence of the gene Diego (Di^a). As we reported before (Layrisse, Wilbert, 1960), the antigen Diego is an exclusively Mongoloid genetic marker, but, in spite of the fact that it occurs solely in populations called "Mongoloid," it does not appear in all of them. There are Diego-positive Mongoloids and Diego-negative Mongoloids. Gradual differences of frequency between one Mongoloid population and another have also been observed. Up to the present the scale of frequency varies between 0 and 50%.

4C B [143] The Waica are one of the Diego-negative Mongoloid populations, and the tribes of South America in the same category are: the Tunebo, Barí (Motilones Bravos), and Warao. Other groups with very low incidence could be included in this category also, since the low frequency they showed for the gene can be better explained by the crossing of a population originally negative with another one highly positive. A representative of the latter group is the tribe of the Yaruro.

Y CI 143 197 During the six years of research on the Diego gene we made an observation which we consider to be of importance, which is: the various frequency groups of the Diego antigen correspond to different linguistic affinities. The most carefully studied case is that of the Caribe. We examined more than ten tribes and subtribes and they all show an average of 28% of the Di^a gene. In this case the Caribe linguistic affinity is indicatory for a positive incidence of the Di^a gene. It is understood, of course, that there is no causal relationship between these two facts and that its observation is not to be interpreted in the sense that we are trying to make a chromosome responsible for a given cultural trait. The two factors are essentially different, but their parallel appearance is an interesting fact.

CBW 197 143

/198 cont./

A linguistic connection has been observed between the Tunebo, Barí, Warao, and Yanoama, a relationship which appears to be closer than that which usually exists among all the indigenous languages of America, and, therefore, it is interesting that that group of tribes should occupy a common position and at the same time an extreme one on the distribution scale of the Di^a gene. In this case it is not a matter /199/ of a gradual difference, such as that of 12% Arawak and 28% Caribe. In this case it is a matter of an important difference between "positive" and "negative." The tribes mentioned are diametrically opposed to the Páez, Ica, and other tribes with frequencies of 45%, and this means that the Tunebo, Barí, Warao, and Yanoama are genetically distinct from their Arawak and Caribe neighbors and from the Chibcha of Colombia (Páez, Ica), but identical among themselves (speaking always of a single gene).

CBW 143

Another observation, equally interesting, is that in general terms the cultural pattern of the tribes marked with the negative Diego is relatively uniform: they are essentially gatherers and not producers with regard to obtaining food, but their social structure and their religious concepts also seem to have many common traits which at the same time are very different from those of other native tribes of Venezuela and South America. We cannot at the present time go into this interesting point in greater detail. To sum up, we shall say that the Waica (Yanoama) are genetically similar to the Warao, Barí, and Tunebo. As all these tribes show very primitive cultural traits, it is our opinion that the absence of the Di^a gene is a characteristic of the ancient populations of South America, since it is generally accepted that the tribes called Marginal belong to an early invasion of native immigration. It is noteworthy that all the tribes speak idioms with Chibcha characteristics.

CBW [197] Y 128

In the foregoing discussion we had to include the several Yanoama subtribes in order to try to locate the Sanemá within a larger ethnogeographic framework. We shall now concentrate more specifically on the Sanemá, due to the study of this subtribe which we made in the field. Many of the data gathered could be

/199 cont./

128 attributed to the other subtribes also, but we do not believe it proper to make an indiscriminate generalization, particularly if we bear in mind that the subtribes seem to be carriers of different subcultures.

101 The Sanemá live on the upper Ventuari, the Erebato, and the Caura. It is therefore a matter of the Sanemadub, Nabadub, and Pubmatari and their various local groups already mentioned in the introduction. We can, to begin with, divide these Sanemá into two groups: those who live in close association with the Makiritare, and those who, although living in the land of the Makiritare, have not been able to establish permanent relationships with them. For which reason it is difficult to record in a definitive and absolute fashion precise demographic data, and we view those which we publish here with certain reservations.

/200/

101 A. Sanemá of the upper Caura (Pubmatari)

162

Locality	No. Inhabitants	Observations
1. Canaracuni	300	In the border zone there are several nomadic bands with specific names, who accept the term "Sanemá" as a generic name of theirs. They frequently change their stopping places between Brazil and Venezuela.
2. Wanaña	200	
3. Yemekuni	300	
4. Caura source	100	
5. Nomadic bands	500	
Total	1,400 estimated individuals	

162 B. Sanemá of the upper Erebato (Sanemadub)

1. Kariana-sodi	40
2. Wasaña	62
3. Udehuduña	125
4. Kuyuhiña	143
Total	370 individuals counted 1960

/200 cont./

162 C. Sanemá of the upper Ventuari (Nabudub)

Locality	No. Inhabitants	Observations
1. Weweña	50	The Nabudub of Ihuduña
2. Wadekuña	80	frequently move between
3. Mahanaña	50	the Ventuari and the
4. Ihuduña	200	Erebato.
Total	380 estimated individuals.	

161 According to this demographic estimation there are approximately 2,150 Sanemá in the zone of the upper Ventuari, Erebato, and Caura. We do not know how many Sanemá live on the Padamo.

342 We have seen four different types of houses among the Sanemá: (a) windscreen type, (b) triangular in shape and Makiritare system, (c) rectangular, and (d) oblong. We have found types (a) and (b) together in the same encampment on the Ventuari, facing Caño Mosquito.

342 361 [501] [137] [262] On our trip through that place we saw two Sanemá rafts moored on the bank of the Ventuari. We later climbed a cliff and followed a path which led us to a conuco of the Sanemá. At one end there was a gigantic algarroba tree laden with fruit. Judging from the skins scattered on the ground, we realized that the Sanemá had consumed a great quantity. Near the tree, which in times past offered them /201/ its generous shade, we found a desolate Sanemá encampment. It was made up of five

342 triangular huts and two of the windscreen type. Both types of construction seem to be typical of the Yanoama and are remarkable for their size, somewhat small. For the construction of a triangular cabin six poles 1.60 meters long are needed to serve as posts or supports. Three pairs are made out of them, each bound at the upper end with a bejuco, and with some 30 centimeters left free in order to form a fork. The lower parts of the poles are stuck into the ground at a distance of half a meter. These forks in tepee form with a separation of two meters form a [824] regular triangle. Three sticks are later placed on the forks, and these support the roof made of platanillo /Musaceae/ leaves. A similar rancho was described by Koch-Grünberg (1923, Pl. 43).

/201 cont./

342 The two windscreens had two posts stuck superficially into the ground at a distance of two meters apart. Contiguous to the post there was a smaller stake tied to it with a bejuco. The roof of this screen was covered with interlaced branches and roofed with platanillo leaves and supported with a slight inclination against two posts. The roof projects from the posts some
[352] 40 centimeters and touches the ground at its lower edge. In these houses the Sanemá hang their hammocks of bejuco or majagua. In some ranchos we found vestiges of fire.

177 The houses of Makiritare type (rectangular or oblong) are
342 small-scale imitations and have only one room. The roofs, made of palm leaves, are of two rectangular slopes and are raised on four or six posts. The edges of the roof are straight or rounded. The walls consist of bark or juxtaposed sticks. They have an average dimension of four meters long by two meters wide and approximately three high. Each house has one or two
353 quite narrow doors. Within the house (of the Makiritare type)
[179] the greatest disorder reigns: from the roof and from the walls hang baskets, gourds, weapons, leather bags, tobacco, palm fruit, hammocks /chinchorros/ of bejuco, majagua, and cotton. On the floor there are hearths, firewood, cooking utensils, guapas with spindle and cotton, yuca graters, dogs, and children, all in confusion without order or arrangement. It is clear that they are not used to living under a roof, and the house is a place for storing things rather than a habitation.

105 The technology of the Sanemá is very little-developed, and
422 precisely for this reason one can classify the Sanemá (and
484 the Yanoama in general) as representatives of the most backward peoples of America and of the whole world. It would seem that the ideal of these seminomadic Indians is: omnia mea mecum porto -- everything that is mine I carry with me! and, apart from their weapons, a few implements, and a basket, it is unusual
[352] for them to carry anything else on their travels. They do not even transport their hammocks /202/ of bejuco or majagua from one camp to another, but rather make new ones each time they need them.

/202 cont./

372 They make fire by the rotation method, and the sticks which they use in this process are carried with them tied to the quiver (cf. Barker, 1953, p. 462, Fig. 6). If the camp is situated at a relatively short distance, the women carry a piece of lighted firewood upon which they blow on the way so that it will not go out. Fire is a source of light and heat in the rancherías, and they keep it burning all night long to protect themselves from the cold, from evil spirits, and from dangerous animals.

283 The Sanemá women spin cotton by means of a spindle which they roll on the thigh. The cord is twisted with three threads.

286 301 294 352 They do not weave and use the thread only to make ornaments, guayucos /loincloths/, and sometimes hammocks /hamacas/ and güenepes. The baskets that they manufacture are well made and are very useful for carrying the products of the conuco, firewood, and sometimes large pots made of baked clay; the method that they employ to make baskets (twining) is primitive, common to the marginal peoples of South America. The Sanemá make pottery vessels, conical in shape, but their method is very primitive. The most common container is the gourd.

285 [323] 323 415

412 [237] A cutting implement (gouging tool) which is widely used is the knife made with agouti teeth. It is used exclusively by the men and is made by attaching an incisor of the rodent to a small stick 10 centimeters long by means of gum and a fine plant-fiber. The men carry it in the quiver, under their arm ornament, or, as we saw on the upper Ventuari, in the opening of the ear lobe. With this instrument they make arrows; it is used to mount the point or to open the lower end of the shaft where the peg, provided with a groove for the bowstring, is inserted. The groove is also made with the tooth knife. Becher (1960, p. 54) reports that jealous Surará and Pakidai men sometimes use it to wound their wives, and an informant from the Erebato told us that they also used it to gouge out the eyes of enemy men who had been captured and identified as murderers of a member of the group. The Indian said that once they have gouged out the eyes they free their victims, who die a few days later in the forest. The knife is sharpened with a stone. This type of primitive knife has been found in most of the Yanoama subtribes: Waika

[593] [727] [184]

/202 cont./

412 [184] (Zerries, 1956a), Casapare (Koch-Grünberg, 1923, p. 313 and Pl. 47), Karimé (Salathé, 1931-32, p. 306 and Figure 16), Surará and Pakidai (Becher, 1960, p. 54). The handle of the knife, [171] relatively short, may be made of wood or of a simple piece of bone; it is in style also among the Guayakí (Hitte, /203/ 1897, Pl. III, Figures 4 and 6) and the Sirionó (Holmberg, 1950, p. 14), both tribes with a primitive culture.

[237] In order to smooth their bows, the Sanemá use the tusk of a [177] peccary. Before the introduction of iron axes they used stone axes, which are still found among them, although rarely.

The most important weapon of the Sanemá is the bow and 411 arrow. The bow, plano-convex, 2-2.10 meters, is made of [824] macanilla wood. In the middle it measures 2-3 centimeters in width, which tapers to 0.5 centimeter at the ends. The string is made of plant fibers. The different classes of arrows which they use are distinguished according to the different points that they have. Their total length varies between 1.60 meters and 2.40 meters (cf. Méndez-Arocha, 1960, pp. 54-60). This latter trait of having arrows of this length is another characteristic of the nomadic Indians of the Tropical Forest. The arrow points vary according to the game that they wish to hunt. The bamboo point, lance-shaped, is for large game; for medium-sized and small animals they use arrows whose point is made of monkey bone. There is another point of wood which they poison with curare and which they use as a weapon of war (cf. Koch-Grünberg, 1923, Pl. 47; Becher, 1960, p. 18). The lower part of the arrow is provided with two halves of a turkey feather, in the manner typical of the tribes of Guayana.

[627] Another weapon for combat is the club 1.50-2.50 meters in length and of heavy wood, which they use to settle local fights and which reminds one of the clubs of the Botocudo of Brazil.

291 Sanemá dress is the simplest. Both sexes wear a cord tied about the waist. The men carry the penis fastened up by the prepuce. Among the Nabudub we saw several women who wore no clothing other than the above-mentioned cord; most of the Sanemá, however, use a guayuco of cotton thread, dyed with onoto and in the same manner as the type Becher describes (1960,

291 /203 cont./
Fig. 11) for the Surará and Pakidai (cf. Koch-Grünberg, 1923,
301 Pl. 45). As adornment the girls sometimes wear cords on their
237 arms and legs or bands across their chests. White and multi-
colored feathers are frequently tied to these cords or bands by the
531 women as much as by the men. The women paint various
382 geometric figures on their bodies, and we observed a typical de-
[386] sign in zigzag form which the women wore on their cheeks. The
pigment was red (made from onoto) or blue, made from a fruit
which the Sanemá call taarimóg, with which the women paint
one another's cheeks. The design is the same as the one which
they on occasion paint on the stones which surround the camp
and which was identified with the path of the sun and of the
moon. They say that the sun is happy /204/ to see these designs.
A very similar design which we saw on the face of a woman was
interpreted for us as "path of the moon." We were not able to
verify with any certainty whether some relationship between
menstruation and this design exists for them.

721 Before entering upon belligerent relations with an enemy,
302 the warriors paint their bodies with onoto. They believe that
[789] this practice assures good aim and protects them from the arrows
[624] of the enemy. As we have mentioned before, in time of war the
Sanemá take orders from a war chief who is different from the
one who is in command in time of peace.

727 A warrior who kills an enemy returns very slowly to his
774 home, because the "dead person weighs heavily on his chest."
They believe that the hſkula of the dead person is inside the
chest of the victor. In there he tries to persuade the man to
[785] "eat a lot." But the warrior resists this and fasts for several weeks,
for otherwise the hſkula of the dead person would kill him too.
After this time has passed the hſkula of the enemy goes out to his
725 fate. It would seem that the most effective war tactic is to sur-
prise the enemy at dawn when he is asleep. We did not see
Sanemá rancherías fortified with palisades, as we did in other
Yanoama subtribes.

224 The Sanemá, like the Yanoama in general, are excellent
hunters, and many traits of their culture indicate a deep tradition
in this lore.

/204 cont./

226 They also fish, but fishing takes second place and is much less important than hunting.

222 241 Other important sources of food are wild fruits and vegetables, which they frequently obtain. Many local groups devote themselves to agriculture, which they carry on in rudimentary fashion and which they adopt from their Caribe neighbors, but for many groups the products of the earth constitute at present a primary food base.

224 The men prefer to go out hunting at dawn or in the afternoon before the sun sets. During the morning they spy on the game as it comes to drink water or to look for food in the places [223] known by the hunter. In the afternoon the Sanemá hunts birds when they return to the trees to spend the night hidden among the leaves.

The men commonly go out alone, sometimes with a com- [789] panion, or in small parties. They walk with great care, without [826] making any noise, and they believe that in a moment of great danger they can develop such power in their necks that it lifts them above the ground and they fly to the height of the trees.

224 /205/ The hunters prepare themselves in various ways for 777 their work. If one of them has had bad luck, he tries to rid 826 himself of the "dark blood," the cause of his poor aim. He [237] achieves this by piercing, by means of a ray-fish sting, the muscles of the arm or by making small incisions on the forearm. [841] "Dark blood" is produced in the body of a man when a woman during menstruation touches the hunter or one of his weapons, or also when a woman in this condition has eaten any of the game hunted by him.

224 A good hunter does not eat any of his own catch in order not 262 to lose good luck or to miss when he shoots. He eats the game [777] of his companion; of the animals caught by him he only asks for the skull and the ribs, which he carefully keeps in certain places near the rancheria or in his house. They are exhibited [554] there in order to augment his prestige as a skillful hunter, on which depend many aspects of his social life, such as, for example, obtaining a second wife.

/205 cont./

224 411 It is also dangerous to lose an arrow when one is hunting. That is why they only shoot the arrow when, should they miss the target, they can easily retrieve it. In spite of these precautions, the arrow is sometimes lost or remains hanging from an [782] inaccessible tree. Then the man, in order not to lose his aim, puts it under the protection of Omao, to whom he speaks, saying: "Omáuawan ipa ʃlaka toldíapala!" which means: "Omao, watch over my arrow!"

224 777 789 826 To lose one's aim or luck in hunting may arise from a technical reason or a supernatural cause. The former is due to a weakening of the body brought about by sickness or other causes which influence sight or the strength of the arm. If it is due to this latter cause, the hunter knows the remedy. He goes to the forest and searches for a tree with hard, heavy wood; he cuts a piece and sets fire to it and collects the ashes, which he applies to the cuts inflicted on his arm. If he bears the pain without touching the hurt arm with the other hand and does not shout, his muscles will once again recover their lost strength and the hunter will recover his luck and good aim.

224 776 777 If the hunter returns without any game, it may be because Omao did not favor him, and this is the supernatural cause of his failure.

224 782 [777] According to our informants from the Erebato, a good hunter speaks frequently with Omao, for without his protection he will not be lucky. For this reason he says to him: "Omao awayʃ ipa ʃálawa hadu kapálama!" which is translated as: "Omao, draw my game out into the open!"

Worse than being unlucky is to lose one's life in a hunting accident, and in order to implore the protection of the other world, the hunter prays, "Omao sátoria palái!" that is to say: "Omao, protect me!"

224 825 /206/ Of course, all these precautions are useless if the hunter has not learned the art of hunting. He must know how the various animals live and how to identify their tracks. If these latter should be fresh, he orders his dog to follow the track of the game; the success of a Sanemá hunter depends in great

/206 cont./

224 825 part on his dog. The hunter must also know a great variety of calls for attracting the animals and birds and, above all, know which arrow to shoot in order to kill the animal which may come in answer to his call.

224 775 All this and a great deal more about which we are ignorant must be learned by the Sanemá hunter in order to have the benefit of his knowledge not only on earth but also in the world of Omao after his death. An expert hunter continues to be one in "heaven" and there he will have the opportunity of recompensing Omao for the benevolence showed him during his earthly life.

224 The Sanemá hunt with bow and arrows. Usually each man carries with him, in addition to his bow, five arrows and a quiver with various types of points.

[415] [372] The quiver, made of bamboo, is carried, hanging by means of a bejuco, from the neck, on the chest, or across the back. In most cases they carry, tied to the same quiver, some small sticks with which to kindle fire. In the forest they pull out with extraordinary speed the point best suited to kill the animal which comes within range, and it is surprising with what dexterity and speed they can shoot one or several arrows.

If there are several hunters surrounding a pack of peccaries or a group of monkeys, the booty belongs to the one who kills it.

It seems that the Sanemá of the Erebato also use a kind of trap (Schwippgalgenfalle), particularly to capture the lapa /paca/ or deer (20).

20. It would seem that this trap reflects a cultural borrowing among the Sanemá, since the Surará, Pakidai (Becher, 1960, p. 77), and Waica (Zerries, 1956c, p. 151) do not have it.

223 In order to catch birds, the hunter climbs up into a very high tree and hides there behind some thick branches. He attracts the birds with whistles, and, when they are near, he shoots them; a companion waits at the foot of the tree for the prey's fall, in

/206 cont./

223 order to pick it up. As a result of his expertness in hunting, he knows the trees in which the birds gather to spend the night. The man, using palm leaves and bejucos, carefully prepares a blind with the sure hope that, by means of this ambush, the booty will be plentiful.

224 Hunting in groups is common among the Sanemá, and they
262 do this particularly to surround a group of monkeys, peccaries,
[237] or in order to kill a feline. /207/ They do not eat the meat of jaguars, but keep the canine teeth in the roof of the house.
[482] They tie up the peccaries that they get, front feet to the back ones, load them on their backs, and carry them home. The meat of the peccary is greatly esteemed, and the whole rancheria gathers to eat the animal, with the exception of the young unmarried men, who, by order of the capitan, must not taste the meat so that the hunters who have killed the animals will not die. They may, however, eat other kinds of meat and the food which they most like.

There are some animals that the Sanemá are prohibited from hunting: thus, they do not eat snakes, they kill the cayman, but
[.766] do not sample its flesh. The Sanemá of the Erebato told us that they cremate caymans as they do men, for, in fact, as far as
[784] they are concerned, caymans were previously men. It is taboo to kill a morrocoy or a turtle. They were people before and Omao
262 does not permit them to be killed. There are other animals which
223 they kill and eat only under certain conditions, among them the eagle (21).

> 21. The Surará and Pakidai kill the eagle, but throw away its flesh. They say that it transmits sickness (Becher, 1960, p. 77). (Cf. the section on "death" in the present study /see pp. 93-94 /.)

223 If a hunter comes upon an eagle, he believes that he is facing
825 a speciman of a species of animal which was previously a person.
262 He may be facing a friend or an enemy. Therefore, before shooting, he asks the animal if it is a friend or an enemy, and only if

262 /207 cont./
223 it answers that it is an enemy is he to kill it. In the majority of
825 cases it turns out to be an enemy, and the hunter kills it with a double aim: to have meat and to cause an enemy to disappear. The hunter carries the eagle home, and his wife prepares it for
[514] food. Those who eat the meat must not defecate on the ground,
[785] but only in the water. The hunter himself must not eat any of this meat and fasts for two months. The eagle "weighs heavily" on his chest, and only when it has "gone upwards" does the hunter get better and begin to feel well again. From now on those who have eaten of the meat may live without taking the above-mentioned precautions (22).

22. See the section which deals with "war" /see p. 57 /.

825 It might be said that for every Sanemá rancheria there exists a rancheria of eagles and of hanekasá. This belief has characteristics of the idea of the alter ego, and the Sanemá apply kinship terms to these animals when they speak to them. The same occurs with regard to jaguars and other animals which they mentioned to us vaguely.

226 Fishing plays a very secondary role in the Sanemá economy.
[433] They fish with barbasco, with bow and arrow, but we have not seen special arrows for this purpose. In recent times they have adopted fishhooks, which they now use quite frequently.

222 /208/ Of secondary importance, coming after hunting, is the gathering of various kinds of small animals, insects, wild fruit,
[527] and also honey and eggs. The shoots of palms represent an important part of the diet, but above all the fruit of the pijiguao palm (Guilielma sp.), the harvest of which, during the first three months of the year, marks the time of festivities and other social
[114] activities. We were not able to gather much information from the Sanemá regarding this matter, but Barker (1953, pp. 447-48), Zerries (1955b), and Becher (1960) refer to this festive occasion in greater detail, according to their observation of it among the Waica, Pakidai, and Surara (cf. Vinci, 1959, pp. 111-118).

/208 cont./

241 [177] Among the Sanemá, doubtless as a result of their contact with their Macú and Caribe neighbors, agriculture has taken on increasing importance. The manner of cultivation is still very rudimentary, that of "slash and burn." The principal products are: plantains, bananas, sweet and bitter yuca, ocumo /malanga/, and certain herbs which have magical importance (cf. Barker, 824 241 1953, p. 444, similar plants among the Waica). Among the magical plants of the Sanemá there is one on which they lavish great care. An informant told us about the general consternation which seized all of them one day when a band of enemies tore up, during the night, all the magical plants of their conucos. They believed that they were going to die or at least become sick, and the "sablf had much work" in order to save his people. There is here a similar belief which we have already noted in connection with the eagles and hanekasá.

241 178 [628] Agriculture has given a degree of stability to the Sanemá subgroups and has introduced changes in their traditional social system. Not all the groups have adopted this new economy and disputes and fights frequently arise because the gatherers indiscriminately appropriate the products of a conuco of the agricultural group. [648] That was the motive which caused the Makiritare to fight with the Sanemá, who at that time had still not adopted the agriculture which flourished among their neighbors.

231 The Sanemá do not have domestic animals, and even dogs are uncommon. It is possible that the Yanoama have adopted them recently. [292] They have still not found a specific name for this animal, and they call it póliawan, like the jaguar. Some informants insisted that there is a phonetic difference between the word póliawan = jaguar and póliawan = dog, but there cannot be the slightest doubt but that the same word is involved. They raise dogs so that they may serve them as helpers in hunting.

In a Sanemá rancheria there are frequently found animals of various species, but tame. The hunters take home young turkeys, cranes, macaws, and parrots, as well as guinea pigs, lapas, and monkeys, as presents for their wives or children. /Illustrations appear here./

273 The beverage of the Sanemá is water. They do not make
271 alcoholic beverages. In recent times the Sanemá who live in
177 contact with the Makiritare have learned to prepare cashíri, and they are beginning to drink it with some frequency. Nevertheless, the preparation of alcoholic beverages is not common among the Sanemá and Yanoama in general.

252 The greater part of their food is toasted or broiled in the
263 coals. They do not eat salt, properly speaking, but they use
261 wood ashes and peppers. They also clean dry clay and eat it.

276 As stimulants they have tobacco and yopo. They do not smoke, but rather roll up the tobacco leaves, and, after treating them with ashes, they put them in back of the lower lip. The yopo is made with certain leaves and ashes of bark. It seems that they have several kinds, according to the degree of strength. They showed us a gray type and a black one. One who wishes to take a dose puts the intoxicating powder in a tube and a companion blows it into his nose. In general, yopo is re-
[764] lated to religious ideas. It appears that they take it at burial ceremonies when they accompany a deceased person and his "híkula upwards." The theurgists also use it frequently in their various ceremonies. There are known cases in which a man "flew off" with a strong dose of yopo and, losing his way, never came back to earth!

581 The founding of a family is the fervent desire of all the
183 young people of the tribe. We observed a degree of irregularity
591 in the custom of determining the matrimonial residence. In the
184 Sanemá group of the Erebato, this seems to be bilocal, as among the Waica of the upper Orinoco (Barker, 1953, p. 478), while on the Ventuari we noticed a tendency toward unilocality. We
591 are not certain, but it would seem that normal residence is initially
182 matrilocal with postmatrimonial betrothal service and then changes
596 to bilocal. This arrangement brings about the formation of bilocal extended families in Yanoama society.

596 Societies with bilocal extended families are relatively
591 rare, but their existence among the Sanemá does not surprise us if we bear in mind that the economic situation of the tribe lends

/209 cont./

596 591 [182] itself to an arrangement of this sort. In their seminomadic state there do not seem to be any sufficiently decisive economic factors to require a unilocal residence rule, which in a way would hinder a young man, after his marriage, from remaining in the group of his family of orientation or from leaving in order to found his family of procreation matrilocally, according to the particular circumstances. But what we are sure of is that the irregularities observed are precisely a result of the economic and technological changes which the Sanemá of the regions /210/ adjacent to the Makiritare are undergoing via the process of acculturation. The cultivation of the land, although still rudimentary, and the possibility of augmenting their properties have brought about as a natural consequence, not only greater stability and possibly a considerable demographic increase, but also the impetus which disrupts the balanced equilibrium present in the custom of choosing the postnuptial residence which is fundamental for the bilocal extended family (cf. Murdock, 1949, p. 35). So it is that one of the factors which has most contributed to bringing about disequilibrium among the Sanemá was the adoption of the Caribe agricultural system. The postmatrimonial moving from one local group to another was not of any particular importance in a nomadic society, but nowadays it presents certain difficulties not even suspected previously, for a man now has to leave his cultivated fields if he is to go with his wife. We are sure that the tendencies in the direction of the unilocal custom have their roots precisely in this economic change. Finally, the existence of the bilocal extended family among the Yanoama is in complete accord with the Hawaiian type of social organization which we are describing as typical for this tribe.

591 596 197 241 [601]

594 621 Without knowing a Sanemá nuclear family intimately, it is difficult to group with certainty the members of a local group solely on the basis of their family ties, particularly in a community in which polygamy, the sororate, the levirate, and a Hawaiian kinship system are practiced. There are occasions, however, on which the members of a nuclear family gather together: to eat, to sleep, etc., and, in spite of our not having full knowledge of Sanemá society, we can, with all this, say that the nuclear

/210 cont./

594 621 family exists as a definite cell in that tribe, assuming all the functions and all the specific responsibilities of that social entity. Thus, there exists the formal arrangement of marriage, which sanctions sexual contact between the spouses and guarantees procreation. There exists economic co-operation among the members of the nuclear family, which organizes work and apportions the necessary subsistance and, in this way, [86] injects persistence in the family's living together. There are practically no tasks which exceed the capacity of the nuclear family and the children learn the way of life directly from their parents and elders.

594 354 The most visible center of the nuclear family is the fire around which they eat and sleep. From here they go out to their work and, upon their return, reassemble at the fireside. After a long trip, the man takes the small sticks from his quiver and makes a fire; there is a new fire; a new home is established.

596 621 Each individual Sanemá belongs also to an extended family made up according to the residence rules already explained. The local group /211/ consists of two or more of these extended families of the same bilateral kinsfolk and form /sic/ a band. This local group or band is the largest social unit to which [619] a Sanemá belongs. The terms "subtribe" and "tribe" which we use are artificial terms lacking in real meaning for the Sanemá. But the band is definitely a familiar concept for him, one which he knows very well and with which he identifies. The band guarantees economic and social stability, and its well-being benefits the individual member, who feels tied to it by a multitude of family ties.

621 628 Each local group has innumerable enemies, while the circle of friends is extremely small. Contact between all of one group with a neighboring group is rare, but does sometimes occur. They sometimes get together for commercial reasons or at funeral ceremonies, but their friendship is weak and unstable.

601 582 600 We were unable, for lack of an informant, to obtain a list of kinship terms. Our impression is that a Hawaiian system is involved. One may not marry a female cross or parallel cousin. There are

/211 cont./ There are
601 personal names which an individual receives from the theurgist,
551 but the kinship term seems to be used more in daily contact be-
[689 tween persons. It is considered an offense to mention the name
[825 of a deceased person in the presence of any of his relatives, and,
as we mentioned before, kinship terms are extended even to
speaking with certain animals during the hunt.

606 In general, dealings between persons are very free, with the exception of the strong prohibitive taboo which exists between the son-in-law and his mother-in-law and father-in-law. Usually, one must not approach one's wife's parents. Only in cases of emergency can this be done, thus breaking the custom. These cases of emergency come about, for instance, during a battle, when one of the persons is wounded.

597 The adoption of an orphan takes place informally when it is a matter of a small child. The family that adopts him takes him in like another one of its own members. Older children also live in a family of the group, but they are not adopted, properly speaking, for they are not given specific kinship denominations. We do not think that there are special terms to express a relationship of adoption.

554 Regarding the social structure, it seems that the main distinctions are those of sex and age. The man who carries out his daily tasks with dexterity enjoys great prestige among his peers, and those who are really successful in their work rise to the top of /212/ the social hierarchy. In Sanemá society the three theurgists which we shall mention later on enjoy high rank; but we must repeat the fact that the data regarding this matter which we present here are provisional and therefore subject to possible modification.

554 As we shall see, Sanemá society seems to have three differ-
791 ent theurgists: a "magician" /mago/, a shaman, and a priest.
756 This last one possesses characteristics of a real specialist, since,
793 for the most part, he earns his living from his office. There is not the least doubt but that the theurgists in general, and the shaman and priest in particular, represent the most influential position in Sanemá society; particularly if the two offices are carried out
000 by one and the same person. We were greatly surprised to find

/212 cont./ We were greatly surprised to find
554 this stratification among the Sanemá nomads, although it did
791 not overwhelm us, since we were already aware of a similar
793 situation among the Warao (Wilbert, 1957a).
756 The opinion most commonly held among ethnologists
171 who have studied this matter[1] is that it is a matter of a Circum-
194 Caribbean and Andean trait in what is related to the trilogy of
793 priest, temple, idol, and that the existence of this cultural
771 complex among the Warao would be an index of their decadence,
121 owing to circumstances adverse to their culture. Regarding the
191 temple cult itself, we also believe that it is a trait common to formative cultures and indigenous civilizations, but it is very probable that this temple cult is based on a very ancient platform of South American Paleo-Indian culture, which, by its specific conditions, lent itself to the development or to the adoption of the cult.

121 We do not think that anybody would care to argue that the
773 Yanoama represent a degenerate people, for, if we admit
793 authentic Marginals, the Yanoama are part of them. They have,
756 however, the concept of a deified Cultural Hero, the author of all and constantly concerned with his creation. He is the cause, the beginning, and the end of all men and makes use of a priest as an intermediary between the earth and the sky. This personage is different from the shaman and his sphere.

771 The Sanemá do not have a temple cult, but their concepts
171 of magic and religion are almost identical with those of the
174 Warao where these primitive concepts serve as the basis for the cult. This basis, as we have proved through our investigations, is primitive and peculiar to the Marginals, and the identification of the superstructure as a cultural loan among the Warao makes it easier for us to understand the cult in that tribe. It is also certainly easier to explain the temple cult of the Warao if we consider it as a loan rather than as a cultural vestige of a society in decadence.

[1] [i.e., regarding the stratification of priest, shaman, and magician in the society -- An.]

/213/

197 174 Regarding the Chibcha characteristics in the Warao and Yanoama idioms, it is probably a substratum which we shall provisionally call proto-Chibcha. The Chibcha traits which are perceived in them do not seem to represent elements acquired owing to contact, but rather an ancient stratum common to the idioms which are at the present time identified as Chibcha.

143 174 Finally, it is necessary to point out that, judging from the genetic constitution (the Diego antigen) of some Chibcha tribes, it might be surmised that the highly formative culture was introduced by people genetically different from the Marginal Chibcha such as Tunebo, Barí, Warao, Yanoama, whose culture was favorably conditioned in the direction of the adoption and the increment of formative cultures and indigenous civilizations. Some tribes were absorbed by the invaders; others, such as the tribes that we have just mentioned, maintained their independence. Perhaps we shall have to deal with greater emphasis in the future with primitive reminiscences in the formative cultures instead of talking so much about traits and loans from the west among the Marginals of Guayana /Guiana/ and others. We have the impression that we are bringing out a complex of ancient culture in South America, from which a number of traits have survived in the more highly developed cultures.

623 [624] [793] Political duties are performed by a chief /jefe/ and a military leader. We are of the opinion that the priest can at the same time be the chief of a local group. We cannot, however, make a categorical affirmation, owing to the confusion which exists among the people as a consequence of the strong cultural current which is invading this Sanemá nucleus. In the same group on the Ventuari we observed that the office of chief is inherited patrilineally. The old chief had left his duties to his eldest son, about 28 years old, and it was easy to see that his younger brother, about 20 years old, was also respected as a possible future chief (cf. Becher, 1960, pp. 60-61. Chieftainships over more than a local group do not exist.

/213 cont./

793 For reasons of a religious nature, which we shall explain
624 later on, the priest (who may be the chief in many cases) may
[622] not participate actively in a war; in these cases the one in command is the "war chief," who in peacetime is one among many in the society, but automatically assumes his power during the dangers of hostilities.

554 There is one man whom all fear. He is the "guapo" /the daring one/. We do not understand his function in the society, but his actions are violent and sanction-passive /pasivas de sanción/ in extreme cases.

554 During the first few days of our visit, he gave us the im-
123 pression of being truly crazy, but we later came to realize that, although mentally /214/ sane, his effrontery is carried to extremes. By way of greeting he aimed an arrow at our throats, danced like a person possessed, and for a whole day he amused himself by walking around us in circles with his arrow constantly
[276] aimed and ready to shoot. From noon on he was under the intoxicating influence of "yopo" and his conduct was applauded by some and censured by the others. The chief, with whom we spent most of the day, paid no attention to what was being done to us and was very little concerned.

554 There was also a guapo in the Erebato group, and one of our
775 informants explained to us that those "people" are predestined to live together with certain species of animal underground after
[841] their death. There they will remain alone in the company of those women who concealed their menstruation and were, as a
[126] result, swallowed up by the earth. A boy of Canaracuni made
[532] for us a drawing of Omao above the path of the sun and of the moon and of the earth. Under the earth he painted a man sitting on a rock and surrounded by animals: he was the guapo. 1/1

554 From the information we have in our notes we deduce the possibility that these are not isolated cases, but that the guapo may represent a social type who fills an institutional position with its own fixed duties and functions. A guapo of Erebato was not allowed to participate in the ceremony of gathering the bones of his father, because upon the death of his progenitor he had killed a child and they were afraid that grief might again cause

1/1 [see p. 71-An.]

/214 cont./

554 him to commit a similar excess. In their traditional duels no one dares to fight with the guapo, for they are afraid that in the heat of the encounter he may lose control of himself and kill
[621] his adversary. Apparently there is only one guapo in each local group, and, from what can be seen, he may have the social mission to eliminate the weak elements in the group, in spite
554 of his not realizing that that is his function. It was explained to us,
769 for example, that on occasion the neighboring group is invited to
628 the feast of the dead, when, the ashes reduced to fine powder,
[266] they ingest those of their dead companions. This invitation is extended to the enemy group in particular if it is known with certainty that among the dead whose ashes they are about to take there is one who died through the magical intervention of a member of the enemy band. During the ceremony the sablf shaman, before opening the gourd which contains the ashes, points out to the guapo of his group the probable murderer in the opposite band, who, in order to avoid complications, is always the weakest man in the group. The feast proceeds as though nothing had happened, but the enemies who lost the man during the feast invite their adversaries to celebrate the feast of their dead also.

554 Old people, for their part, do not seem to be very safe be-
[888] fore this element, /215/ and some Sanemá of the Ventuari ex-
[574] plained that the guapo must treat visitors in this way in order to prove his courage. It would be interesting to know in greater detail the function of the Sanemá guapo and to find out whether these are isolated cases or a traditional phenomenon.

842 The Sanemá believe that the child exists in the father,
162 who passes it to the mother so that it may grow and be born. In the Sanemá communities which we visited on our expedition
855 we were surprised at the small number of children to be found in the settlement. The parents showed much affection for their children, and when these latter have grown somewhat they participate, to the degree that their age and strength allow, in all the activities of the adults.

881 It seems that they are acquainted with rites indicatory of
000 the onset of puberty for a boy or girl. The first menstrual period

The first menstrual period

/215 cont./

584 881 indicates that a man may have sexual relations with the wife who was promised to him when she was still a child. Sometimes a girl will refuse to marry the man to whom she was promised as a wife, but she is afraid to conceal her first menstrual periods for mythological reasons.

881 773 In their oral literature the Sanemá tell of a very sad case which occurred in remote times because a girl concealed her first menstruation. Oineitĩb, a scrawny dwarf, found out about what had happened and caused heavy rains to fall for a period which demolished the rancheria where the girl lived. All the men died. The young girl went away to live with the neighboring group, where she was greeted with unequivocal signs of friendliness. On the very day of her arrival a man went to the river to fish, when suddenly he saw floating on the water the dead bodies of the people of the rancheria recently destroyed by the heavy rain. He immediately realized what had happened. He returned to the rancheria and killed the girl. The dwarf ate the girl and all the people who lived in the rancheria destroyed by the rain. This happens very rarely, however, which is why the dwarf is so thin.

881 [302] [262] We do not know the content of the puberty rites, but it seems that the hair is cut in the case of both sexes, and, for the boys as well as for the girls, food is limited to cassava and water, and that in small amounts. They do not eat meat. An informant 343 from the Erebato spoke to us of a special hut where the women 841 remain for the duration of their menstrual period. If we under- 881 stood him correctly, this hut is round and dome-shaped and made of palm leaves stuck into the ground. Inside the hut there is a circle made of little sticks placed side by side, within which there are two sticks stuck into the ground one meter apart. Between these sticks is fixed a bejuco. /216/ The woman, who must not lie down during menstruation, sits down and the bejuco serves as a back support. We did not see any house of this type.

584 The arrangements for a marriage are initiated with a private discussion between the two young lovers. The boy indicates to his fiancée that he wishes to take her as his wife and says to her:

/216 cont./

584 "péwa písayél." = I love you! If the girl agrees, she answers with the statement most feared and at the same time most desired by Sanemá suitors: "ipahâwana'a wahâbalone!" = speak to my father!

The anxiety which the young lovers feel as a result of this custom, which prescribes that, before marrying, they must speak to the future father-in-law, is surprising. We observed it in a palpable way in one of our informants. Sometimes it is necessary to wait until the girl takes the initiative and shows signs of love. In this case it is she who brings the matter up directly with her father. But the prevalent custom seems to be that it is the boy who must go to the house of his future father-in-law, who, forewarned, waits for him toward the end of the day. The future son-in-law comes without delay, but without showing any signs of haste or nervousness in order not to attract the attention of the people. He sits down in front of his fiancee's father, his gaze lost in the distance, and says in a very low voice: "authîwana sahbîp kobîtob' âble" = I need, I want your daughter. Everyone in the rancheria knows that a man will soon arrive to marry one of their prettiest girls, and all desire to know this man. Should the young man have been able to enter the rancheria incognito, all are aware of his arrival now, for the father-in-law gives a shout of surprise and repeats in a loud voice the boy's statement. The youth remains impassive, without moving, while all the people congregate to look at him, asking: what did you say? what did you say? All remain expectant to hear what the father-in-law may say. But the father-in-law is in no hurry. He says that he would lack three good conucos, that the girl requested has a younger sister who also wants to get married ... etc. All his suggestions are equivalent to actual conditions, which the young man considers carefully, but when the father-in-law finally says, "wahîspa kukéne" = take the woman, the young man runs off to the forest, now well informed about what he must do.

[593] [604] Should the girl not have a father, she would be represented by her elder brother or by her uncle.

/216 cont./

584 There are cases in which a brother or a friend of the suitor wishes to serve as intermediary and offers to speak to the father-in-law. The gesture is very well received and highly appreciated.

585 During the first two or three days the young husband remains
583 in the forest /217/ hunting; the woman hangs her hammock near that of her husband in the house of the family of orientation,
[476] that is, where she has always lived. This time having elapsed, the man tries to bring together some twenty friends to help him clear the land for the three conucos requested by his father-in-law. Usually he has no difficulty in finding this help. The father of the boy and his brothers do their best to feed the workers well, and, when the work is done, the young husband offers them as presents arrows, bows, etc. which they refuse to accept. Later, the man begins to clear some conucos for his own family.

584 Our informant from the upper Caura insisted that, once con-
627 sent has been obtained, delivery is definite and the girl cannot then accept any other young man. In order to give us an example, he told us what had happened to a man of his group.

A girl had accepted him as a husband, but, because of unforeseen circumstances, he had not had time to talk to the father-in-law. Then the girl surrendered to another young man and married him. The father-in-law knew nothing about the first offer. One day the people of the pueblo found the young couple in their hammock pierced by two arrows poisoned with curare. The murderer informed the father-in-law and the inhabitants of the rancheria of the motive which had caused him to perpetrate the crime. Neither the father-in-law nor the people intervened in the matter, for, according to them, the young lover was right in punishing the two who had deceived him in this way.

584 Sometimes parents marry off their children before they
595 reach maturity. Some men also take a second wife when she is
881 still underage, but they respect them and have no sexual contact with them until after the first menstrual periods have passed.

/217 cont./

606 The husband helps economically the family of orientation of his wives, supplies them with produce from the conuco, but dealings with his wife's parents are reduced the most indispensable ones. When he meets his mother-in-law on the path, he changes his direction immediately, does not greet her, and would not dare to speak to her for anything. Between father-in-law and son-in-law there exists a cold friendship from which all manifestations of cordiality are absent. The same taboo exists between parents-in-law and daughter-in-law.

836 The Sanemá of the Erebato assured us that an unmarried young man could have sexual relations with all the unattached girls of his group and that very often the girls are the ones who [584] take the initiative in this. When a boy is attractive, he joins up with one or two girls, who /218/ in all frankness and good faith ask him to stay with them for a few nights more, offer him food, and hope that he will resolve to ask one of them to marry him.

593 It seems that in general women do not abandon their hus-
937 bands and confidently expect the spouse to behave in the same manner and not have extramarital sexual relations.

593 Frequently angry fights arise in the family out of passional
586 motives, to the point where the man no longer tolerates it and leaves the rancheria forever and eventually marries another woman in a distant pueblo.

595 Usually, only older men have several wives; polyandry
587 is not permitted. Widows, as a general rule, marry a brother of
607 the deceased husband, who takes his nieces and nephews under
[836] his protection. This custom does not cause any great problems, since the brother of the deceased has already had sexual intercourse with his sisters-in-law before marrying them, for he has
587 always considered them as possible wives. Nor do the children
593 find it difficult to accept their new father, whom they have al-
[601] ways called "father" and he has called them "children." In
[184] this way the Sanemá (and also the Waica, Surará, and Pakidai) are a society which allows polygamy, the sororate, and the levirate.

/218 cont./

595 We have mentioned that an adult may marry a very young girl, but must not have sexual relations with her until after the first menstrual periods. We do not base our observation on the practice of polygyny among the Sanemá in isolated cases, but rather on the fact that several men have several adult wives at the [554] same time. It does not seem that polygyny is an exclusive privilege of status or rank, but rather is an accepted thing, since [584] all adults may marry two or more women. Since there seems to be some scarcity of marriageable girls, the custom of binding oneself to a little girl can be looked upon as a form of foresightedness [587] by the man, with a view to the future. Many polygynous marriages, however, probably stem from the custom of the levirate.

587 765 There are widows who marry very shortly after the death of their husbands; others, however, wait for many months. They live in the house of their brother-in-law or in that of their parents, and it seems that the future husband does not demand that they cease mourning since the person mourned and for whom they weep was not only their husband but also the brother of the new suitor.

If the brother (who is very often the youngest) does not want to or cannot /219/ marry all the widows of his deceased brother, he allows them to live with another man. These marriages take place only after some time, during which the brother of the deceased and the women live apart from the society in a sort of isolation.

587 There are no differential rules for secondary marriages, but the father of sisters has the right to prevent both of them from marrying the same man, particularly if the man, owing to his poor preparation or deficiency, cannot give assurance of the economic help which he expects from him. This explains why only older men with greater experience in life are able to marry several women with ease.

595 The wives of one man may live under the same roof or in several houses, and, in spite of there being no fixed rotation, the husband must devote the same amount of time, more or less, to each of his homes.

/219 cont./

588 Marriages which oppose the bilateral extension of the law of incest are criticized and are prohibited, and anyone who contravenes this law is automatically placed outside society.

589 793 Unmarried men are few, and, they say, only the priest practices celibacy.

165 The number of persons of advanced age is very small among the Sanemá. Among the Nabudub we saw only one old man.

753 In the majority of cases, sickness has a magical cause and the theurgists attempt to cure those who are within their field of action. We did not penetrate into this intimate sphere of Sanemá culture and the little that we heard is set forth in the section which deals with religious and magical aspects of these Indians.

764 159 We were not present at any funeral among the Sanemá, but our young informant of the upper Erebato told us in great detail about the death of his father.

159 753 825 763 He had gone out to the forest. There he had found an eagle. As eagles are men, they may only be killed if they are enemies of one's pueblo. The father asked the eagle whether he was a Waica or a Sanemá, and, when it answered that it was a Waica, the Sanemá man killed it with his arrow. Naturally he observed all the taboos that are obligatory for a hunter who kills an eagle. A few days later he became sick. He had a very high fever and remembered that when he picked up the eagle he got the impression that it was feverish, and, as birds of prey are often sent by a theurgist of neighboring enemies in order to kill the people, that explained everything. There was no reason to look for any other cause, the diagnosis was clear, the eagle had transmitted its sickness to the hunter. He became worse as the days went by and /220/ finally died; but he had first explained to the members of his family the cause of his sickness and the reason for

159 his certain death.

764 Immediately after the death, the whole family burst into tears and began to shout; meanwhile several men went in search of the material necessary for raising the corpse. For this there is needed a quantity of stakes and leaves with which a sort of cylindrical coffin is made, and, after the dead person is placed

/220 cont./

159 764 inside, it is tied with lianas. Then they take the corpse into the forest where it is deposited, at a distance of some kilometers, on the branches of a tree in order for the flesh to decompose there. Often the members of the family will not leave the corpse alone in the forest for fear that animals will come and [775] devour it. The dead are very much afraid of animals and shout when a jaguar approaches them.

[825] The feline respects only a dead sablí, because he will die [756] in turn if he approaches.

Our informant spent several nights next to his father's [784] corpse, always being very careful not to step on the damp ground beneath the dead man, because those who step there lose their feet.

152 764 The grief of the relatives is so intense that very often some of them can not endure the pain and go to the forest to die. Above all the women lament a great deal during the night and the men hold them back so that they will not run away to the forest. The informant remembered that the strongest man of his tribe behaved as though he were mad after the death of his father and wanted to kill everybody. The men did not allow him to go with them into the forest to gather up the bones of his father for fear that, given his behavior, he might commit some crime.

765 After one month, more or less, the men of the tribe go to the forest and gather up the bones of their companion; the flesh decomposes completely during this period. Some of the men let down the coffin and others wrap the remains of the deceased in some large leaves, making in this way a bundle of bones which they take back with them to the rancheria. There they place it in a hammock and leave it for about four days, while the relatives continue to weep in uninterrupted lamentation.

765 775 [756] Later the sablí carries the bones to a fire prepared in the plaza and places them on top of the pile of firewood. Our informant also said that as the sablí did this he pronounced a well-known formula which means: "you are getting along well," for, if he did not say this, the hĩkula would not be able to find its way. Afterwards he lights the fire, blows upon it at the same time as he raises his arms /221/ above his head, and in the smoke

/221 cont./

765 775 that rises the nonmaterial part of the man ascends, his hikula and his soul and possibly something else which we do not yet understand. On occasion the owner of the hĭkula can be heard as he comes whistling to carry the hĭkula of the dead man to the place where all the others are to be found.

765 [276] [756] The men take great quantities of yopo and dance around the fire which relentlessly consumes the bones. They sing and dance all night long, while the relatives cry out against their neighboring enemies. The ceremony comes to an end in the morning, at which time the sablĭ pulls out the bones in order to pulverize them in a gourd.

[266] The gourd, covered with a leaf and containing the ashes which will be consumed in a broth of bananas during the forthcoming feast of the dead, is kept inside his house by a relative.

121 771 Our knowledge of the religion and mythology of the Sanemá is insufficient, for in order to study the supernatural world of a tribe it is necessary to know the culture thoroughly, since the latter, in multiple activities, is a reflection of the former, and, furthermore, to enjoy the absolute confidence of the Indian so that he may expose without subterfuge everything that may be of [184] interest to the researcher. Nevertheless, taking as a point of departure the data which we were able to obtain and those which have been published by various authors of unquestionable reliability, we dare to take up the matter of the religious life of the Sanemá, because, despite the fact that there are many traits similar to those of the other subtribes of the Yanoama, in general there stand out certain specific elements which will give us a better understanding of the metaphysical world of the Yanoama.

793 756 791 Yanoama society seems to have three theurgists or religious practitioners, but each one belongs to and officiates in a different supernatural sphere.

793 776 The first of the three is the hɛwĭawán, or the priest, who is the intermediary between the human community and Omao. He belongs to the pueblo which he represents as much as he does to the court of Omao. He lives in both worlds and frequently changes residence.

/221 cont./

793 [776 621] Since the Sanemá people cannot exist in good conditions without the continued and intimate contact with the house of Omao, sáiyawan, the priest makes himself indispensable in the grouping of a band, whose very existence is perpetuated in large part by the quality of the priest.

The hɛwĩawán of the Sanemá devotes himself exclusively to filling his high office. For this reason he cannot work, or hunt, or fish, etc. like a common man, and he lives on the benefactions given to him by the community as compensation for the services which he renders to it.

/222/ In his frequent flights between the earth and heaven he commonly kills a vulture or sparrow hawk and that explains why he often returns with his mouth covered with blood, bringing some cashew birds and, on certain limited occasions, even a human leg, trophies which he obtained as he killed the enemy (23).

23. It is likely that all this represents the ideal habitus rather than the real one of the priest.

793 773 Before discussing the nature of the power of the hɛwĩawán, we shall first narrate the genesis of the first hɛwĩawán of the Sanemá, which will explain to us how it comes about that the hɛwĩawán is able to fly and why he always goes about raised some 30 centimeters from the ground when he is on the earth.

There was a man who one day went into the forest to hunt. There he was met by a Great Jaguar, omaukóhe, who is a gigantic jaguar, master of the other felines, and who goes about in an upright position like a man. The jaguar caught the man and ate all his flesh, leaving the skeleton picked clean but without breaking a single bone. The man remained alive and asked the Great Jaguar to give him other flesh. The Jaguar gave him other flesh, but told him that henceforth he would be hɛwĩ (bat). [825] And from that time on the man hɛwĩawán is also a bat. He is a very timid man; children love him very much, because he never gets angry and does not scold. When he is in the company of men, he spends his time singing songs, wásámo songs, which

/222 cont./

793 the men learn because of the frequency with which he sings them.
773 He sings during the day, but especially at night. Suddenly he
[776] interrupts his song and flies up into the sky, where he joins other hɛwĩawán in order to sup with Omao.

793 The hɛwĩawán must jealously keep a certain number of
784 taboos, and on the degree of care with which he keeps them depends, not only his power as a priest, but also the existence of
[262] all his people. Thus, for example, he must not eat crabs or other animals which in reality are men to them, just like eagles, etc.

[778] Should he do this, the "weight of the dead" kills his hikuladɛ, a disaster which, in turn, causes the death, not only
[726] of the priest, but also of a large part of his congregation. For the same reason, the hɛwĩawán never takes part in war or in any combat whatsoever, because, although he is invulnerable and no arrow or club can kill him, his hikuladɛ could not bear the "weight" of a man killed by his weapons. This is the reason why each Sanemá local group relies on a special chief for wartime.

793 The hɛwĩawán, who belongs to the court of Omao more than
[776] to the Sanemá community, does not marry a specific woman. He may have sexual relations with all the unmarried women
[836] of the group, but he is completely unconcerned about them and the children. He has no duties as either husband or father.

/223/ If a hɛwĩawán dies, any woman of the group may
[776] have a son predestined to be a hɛwĩawán. No one knows which
[781] of the boys born in the period immediately after the death of a priest may be the hɛwĩawán of the future, but one day the true hɛwĩawán will return from the forest where he has met the Great Jaguar, who changed him into a priest, replacing his human flesh with other flesh more worthy of his bones, the flesh of a bat-priest.

[771] He than informs the people of what has happened, and, as that election happens shortly after the death of a priest, the new hɛwĩawán tries to take the vacant place in time, assuring, in this manner, the continuation of uninterrupted contact which the Sanemá have had with Omao generation after generation.

/223 cont./

776 The Great Jaguar has certain relations with Omao, the
793 deified hero of the Sanemá, since his name, "Omao-kóhe," indicates such a relationship, and it is possible perhaps to speak of a vocation for the office of priest, since the Sanemá Supreme Being admits him, after his encounter with the Great Jaguar, into the court of Omao.

793 According to South American ethnology, it is surprising
171 to find a "specialist" in a nomadic preagricultural society, but, as we shall state below, this is the second time that we have found a similar case in Venezuela; the other one was that of the Warao wiʃiráto.

793 The Sanema priest is a member of the court of Omao, not
776 only because the Great Jaguar changed him into a bat, but also
778 because Omao gave him a hikuladɛ which is invisible, although it has a spherical shape like a ball, and the larger the hikuladɛ, the more powerful the priest.

The hikuladɛ of the priest, the informant explained, is like a globe which the hɛwĩawán keeps in his chest. We shall also see later that the other religious practitioner of the Sanema has a hikuladɛ too, but one which is essentially different. We
793 have the impression that the hikuladɛ of the priest contains "the
778 souls" of the ancestors who were destined by Omao to live there
775 and help the priest. Since the data obtained are, in our opinion,
793 insufficient, we do not want to hazard peremptory statements,
778 but it seems certain that the Sanemá priest also cures the sick,
755 particularly those who are suffering from fever. Our informant
[114] explained to us that the ancestors (hikula-dĩb), the people of the
[775] hikuladɛ of the priest, are the ones who cure the fever when the priest brings the hikuladɛ out of his chest and deposits it for a time on the body of the patient.

Sometimes the desired effect is not attained, and that indicates that the soul of the /224/ victim has already abandoned the
793 body and does not want to return. The hĩkula therefore constitute
778 a sort of supernatural "little pueblo" /pueblecito/ within the
629 Sanemá community in which the priest lives and do not wish to have any communication with the kĩkula-dib /sic/ of the neighboring pueblo. The priests from nearby pueblos do not visit each

/224 cont./

793 778 628 [776] other, for they would begin to fight each other until one of them lay inert on the ground, exhausted and overcome. But they do not kill each other. Only in the house of Omao may all the hɛ̃wĩawãn gather with their hĩkula-dĩb.

793 778 775 The hĩkula-dĩb of a priest act exclusively in his rancheria, in other words, in the rancheria of the priest who figures in the house of Omao as the representative of his particular terrestial community, and for this reason more than one priest is unnecessary. In the section of the illustrations[7] one can see the 532 hikuladɛ̃ of a priest, drawn by one of our informants. One sees 793 there five hĩkula-dĩb, or souls of ancestors of the group in which 778 the priest acts. The uppermost figure represents fever. In the 775 center one can see a quadrangular figure which is a house. One 126 of the beings who is inside it is the priest, but what can be seen on the left side is a coleopteran, a scarab. Under the house is seen the heart of the priest.

The informant, after having drawn the figure, insisted emphatically that we tear it up, and he suffered some anguish for having given it to us. After several days had passed, I took him the drawing in order to ask for more details and found him 532 calm and unworried. The reason for suffering this anguish is 793 based on the belief that a Sanemá must never speak of the insect 778 of the house of the hikuladɛ̃. As a matter of fact our informant 775 never mentioned its name. I identified the insect as a scarab 126 on the basis of the descriptions that he gave us and because it 825 was not the first time that I had heard the scarab or other coleopterans mentioned as a supernatural being in South American ethnology.

171 773 825 778 Such is the belief of the Lengua of the Gran Chaco, who affirm that the Great Scarab created the universe and peopled it with spirits and men. The Toba, also of the Chaco, call it payak, a name which means spirit; and it is interesting with regard to the hĩkuladɛ̃ of the Sanemá priest to note the Mataco custom of attributing a supernatural power to a maraca /gourd rattle/ with sacred beetles (Metraux, 1946d, pp. 350, 352, 353, 367). The similarity between the hikuladɛ̃ of the Sanemá and the "sacred maraca" of many South American tribes is very symptomatic.

[7] [see p. 70 - -Analyst]

/224 cont./

793 The function of the scarab in the curing process is as fol-
755 lows: If the hɛwĩawán wishes to cure a patient, he takes the
825 hĩkula from his chest and places it upon the patient. In order to effect the cure, the scarab opens an invisible hole in the chest of the patient, and the hikuladɛ of the priest enters through there.
[775] /225/ Once within the patient's chest, the hĩkula-dĩb come out of the hikuladɛ in order to combat and bring to the exterior the cause of the sickness. After a while the priest again takes possession of his hikuladɛ, and the treatment is fully successful. The informant did not want to mention the name of the caleopteran or even to talk about it, fearing that if he were to do so and if he were then to become sick, the priest would not be able to cure him, since the insect would not open a hole in the chest of the patient.

793 It is our impression that the priest only cures the ailments
755 that result from the presence, in the body of the sick person,
775 of the soul of a wandering deceased person who has approached the rancherias and whose very presence causes pain.

If we understand that the part of the Sanemá which goes to the house of Omao is the soul, we may say that the priest is concerned with the well-being of the same in the bodies of his companions, and that he represents the actualizing principle between the subject "the soul of the man" and the object "Omao," who enter into communication by means of the intervention of the priest. For the soul, which goes to live in the house [171] of Omao as hĩkula-dĩb, we noted down the name of hɛnpĩrtĩb, which essentially seems to correspond in its character to the "bole" of the Waica (Zerries, 1958b).

793 The hɛwĩawán may send a hĩkula-dĩb to a neighboring
775 pueblo in order to cause sickness among its inhabitants, but his
754 primary function is to guarantee the well-being of the souls of his community and to present them eventually to Omao at death.
793 It is interesting in this respect to note that the Surara and Pakidai,
754 subgroups of the Yanoama of Brazil, are of the opinion that
825 sicknesses are transmitted by a shaman of a neighboring pueblo
000 by means of sparrow hawks and bats. The Sanemá say that the

/225 cont./ The sanemá say that the
793 hɛwïawán kills vultures and sparrow hawks on his travels (Becher,
825 1960, p. 96). As we have already explained in another section of this chapter, the Sanemá believe that the eagle and other birds of prey are "men" who can be killed only if they belong to an enemy tribe.

793 The hikuladɛ offers the priest the possibility of flying to the
798 house of Omao. In order that I might understand him better and
[796] not doubt his veracity, the native making the drawing fixed a
[126] propeller to the mysterious sphere. One might say that the
[795] hɛwïawán is carrying the soul of a dead person to the house of Omao.

756 The second religious practitioner of the Sanemá is a shaman, who is called sablí. The supernatural world over which he has power is different from the world of the priest, and therefore his function is different from that of the former.

[533] In order to become a shaman, the candidate must submit to a very rigorous training under the guidance of an old sablí who knows how to sing the "Great Kɛɛ."

756 /226/ During the period of apprenticeship, which lasts
276 several weeks, the candidate takes yopo continually through a
262 tube or simply with the hand, eats very little and only the food
515 prescribed; he does not bathe and almost does not speak. Among
123 the Waica of the Upper Orinoco I saw a group of these candidates who gave me a depressing impression since they showed prolonged suffering as a result of the consumption of the drug. We were not able to speak with them, and we were not allowed to take blood samples from them as we did with the other members of the rancheria.

756 It seems that all the men are potentially sablíes, but
533 among them there are some who are very strong and others who
974 are weak, and only the strongest ones are able to sing the "kɛɛ" well. This song is rendered by the sablí at the end of his period of instruction, when the candidates are prepared and ready to receive the híkulas, or "specific vital principles" of the species of flora and fauna, with the exception of fish. As soon as they hear the call of their master, they obey and go toward his locality, where they find the sablí candidate waiting for them to enter his

/226 cont./

756 chest. They enter, without loss of time, through the extremi-
533 ties of the body and through the head. They arrive in the order
774 in which their names are sung by the master sablí, who in this way "builds a pueblo" of a microcosmos in the body of the man. The stronger the master, the greater will be the "pueblo," and the greater this "pueblo" is, the better chance the sablí will have to augment his inner world and his power during his life.

756 The hikuladi of the sablí is essentially different from that
774 of the priest, in the sense that it is inhabited by the vital princi-
[778] ple of vegetable and animal species and not by the souls of departed ancestors. The man also has a specific hísula, different from his soul and which, as is true of the vegetable and animal kingdoms, seems to be immortal and spiritual, essentially joined to animate matter until death. Each specimen of a species has a specific hísula; after death, the speciman goes to a luminous place in the forest. While the soul of a man may abandon the body during sleep, etc., without its being detrimental for the man himself, the hísula never leaves until the moment of death. Furthermore, the soul is typically human, while the hísula is found in man and also in plants and animals. Some informed us with insistence that women and small children do not have hísula.

773 Here is the story which explains the origin and the nature
774 of the hísula in the animate world.

[776] Chinanídmawan is a gigantic demon of dreadful shape, with long, sharp claws. He has skin which is impenetrable and as hard as rock.

/227/ One day Chinanídmawan came to attack the Sanemá. The latter posted themselves with their weapons to face his attack. Soon, however, the Sanemá realized that arrows and lances had no effect on the demon, who captured most of his enemies. Chinanídmawan quartered and devoured his victims, but kept the skins, which he nailed out on boards around and inside his house.

[171] (It is extremely interesting that this custom of keeping the skin
[727] of enemies has been preserved in Sanemá mythology, since it is reminiscent of some tribes of the Cauca, in Colombia, of the Mauta of Ecuador, of the Huauca of Peru, and of the Inca. It also recalls the cult of Xipe in Central America.)

/227 cont./

773 774 The Sanemá became discouraged in the face of the ferociousness of the monster and feared the day on which Chinanſdmawan would again mistreat and kill them.

773 774 756 In those days there lived among the Sanemá a great sablſ, very famous and extremely powerful, who began to think of how he could free them from this demon. The great sablſ went off to the forest, and there he found a liana which seemed very suitable for his purposes. He cut a piece of the bejuco and returned. During the night he went to the house of Chinanſdmawan in order to surprise him while he was asleep surrounded by his horrible trophies. In fact he did find him in a deep sleep; the sablſ then introduced a piece of the liana up his anus. The demon woke up startled. He realized that a powerful sablſ had found the means of killing him. In fact, shortly thereafter Chinanſdmawan died, and the Sanemá exposed his corpse to the sun so that the flesh might rot. But because the demon had such tough skin, the flesh dried up and the skin remained intact; they then tried to burn it, but this was impossible, so they flung it into the forest and fled from the place.

773 774 The skin of Chinanſdmawan, abandoned in the forest, gained access into the plants, animals, and men. That is why all male human beings, the animals, and the plants have within their bodies a hard and indestructible Chinanſdmawan which is called hſkula,

774 [764] The hſkula is that part of the male which remains on earth after his death. When the body of a person is burned, his hſkula, on seeing the black cloud which rises from the fire, joins all the other hſkulas and they remain there for a long time... listening and listening to what comes from the world where men live.

[826] The size of the hſkula of a man corresponds to the measure of his torso, and the larger the hſkula is, the stronger is the person.

[764] [276] [193] During the funeral rites, the men, under the influence of yopo, sing about their gigantic hſkula, and, in order to prove their gigantic strength, /228/ they invite each other to the wasamú, and they squeeze each other powerfully with their arms or with sticks. Among the men, only the priest, hɛwĭawan, has no hſkula, because he is already a citizen of heaven.

/228 cont./

756 778 825 [533] The Sanemá sablí has great power over animals and plants represented in his hikuladɛ, with which he communicates while he is asleep. If he should dream about a dangerous animal, a jaguar for instance, he makes him sit down in order to begin the song õkamõ against jaguars. This song keeps the jaguar from the rancheria, but, when it is relatively near, the hikuladɛ of the sablí goes out to kill the jaguar in the forest, where the hunters will find him dead on the following day. But if the men sent by the sablí do not find the body of the jaguar, everybody remains in the rancheria on the following day, for they fear that the Great Jaguar may be in the forest and will kill anybody found in his way.

756 533 754 [825] [774] The sablíes sing almost every night, and the bigger the animal who appears to them in their dreams, the more intense is the song. In his songs, the sablí can send any híkula from his chest to go and kill a man in a foreign rancheria, however far it is. Usually he does this at night, and on the following day the victim's companions find him dead in his hammock.

774 756 [754] [753] [761] I have the impression that the híkulas belonging to the various species are, of themselves, absolutely passive and that they behave in an active way only at the command and wish of the sablí. Most sicknesses, including death, are caused by a híkula introduced into the body of the man by the intervention of the sablí and by his magical power.

756 755 774 The priest sablí, influenced by the effects of yopo, shouts, sings, and dances around the patient. With this he attempts to scare off the harmful híkula which is striving to enter the body of the man. It is very often personified by a man who is symbolically fought by the híkula of the sablí and others chosen from his "pueblo of híkula" in his chest. The curative art of the sablí depends to a great degree on his diagnosis, according to which he chooses from his great híkula in his chest those which, by their skill, can combat the híkula or híkulas causing the sickness. It goes without saying that a young and inexperienced sablí makes mistakes in his diagnosis of identifying, from among all the possible thousands, the híkula which is causing the sickness sent by an enemy. It

/228 cont./

756 may also happen that a sablf with a small "pueblo" of hfkulas in
755 his chest does not have at his disposal a hfkula suitable for bringing
774 about the desired result. In this case, one turns to a more expert sablf, who will receive for his services presents of food, etc. A young sablf is always hopeful that the hfkula "pueblo" in his chest will grow. But the /229/ older the man becomes, the less opportunity he has of augmenting his power.

758 The potentiality of the hfkula of the sablf makes him in-
774 vulnerable, and should anyone shoot an arrow at him he breaks
[789] his hand and his weapons. For this reason the sablf is the best
[624] man to lead as the war chief, or at least he inspires and helps with his magical power and his singing along the way.

756 A sablf of great power does not die until all the hfkulas of
763 the plants, animals, and, some say, of the stars have come to
774 live in his chest, and, when they have done this, the power of
[754] his hfkula grows and brings about his death. Then the sablf informs his people, says farewell to all those whom he has protected during all the years of his adult life, and, as a last service, promises to kill the neighboring enemy group just as soon as his hfkula frees itself from his body. On dying, the red stone which he had, which had come down with a great noise from heaven, once again goes back up to the place from which it came (24).

24. I have not been able to gather any further details regarding this stone, nor have I seen it.

774 The hfkula of a man, animal, or plant, after death, does
775 not go to heaven, but rather congregates in a special place. Our informant told us that the hfkulas of male human beings later change after some time into butterfly jaguars /tigres mariposas/. In this form they continue the life that they had in the man; they recognize friends and enemies and the men of the group to which they belonged and also the enemy men against whom they fought. Sometimes a man will meet a butterfly jaguar in the forest; he realizes that he has met a hfkula of his group or one from a dead sablf. He does not kill it and allows the jaguar to go by quietly without even threatening it with his weapon.

/229 cont./

774 The world of the "specific" hĩkulas is found on the other side of the horizon and in contrast with the world of the souls. There the sablĩes live forever, together with the dead animals and plants.

562 773 825 [774] It is worthwhile to refer once again to the insistence of our Sanemá informant from the Upper Caura regarding the fact that women do not have specific hĩkula. He asserted to us, furthermore, that women have a different origin from men and that there still exists a purely feminine world, and that each Sanemá pueblo has its corresponding hanekasá.* The informant would not identify the animal of which he spoke, but we knew [773] that it was of a well-known species. From the mythology one can deduce that the first men were made from a dead tree by the cultural hero brothers, while the first woman was fished out of a very large river.

Omao wished to metamorphose into women the butterflies which danced /230/ like people on the shore of a river, because the hanekasá are a pueblo of females in which there are only three males to insure reproduction. This pueblo of amazons is an exact replica of the female population of the rancheria neighboring a pueblo, in the characteristics of which we found a concept of alter ego for the Sanemá women.

[774] It is possible that there exists some relationship between [763] the hĩkula and the male, for it is said that men die from the "weight" of the hĩkula of certain animals; but we are not certain on this point (cf. Zerries, 1958b; Becher, 1960, p. 92). We are [763] more certain about the relationship which exists between women and the hanekasá animal, since a woman (of the neighboring rancheria) dies for each hanekasá which is killed. Other religious concepts which are difficult to interpret for the time being may also enter here.

791 755 A third type of theurgist which seems to exist in Sanemá society is the magician, the kãilala. He does not sing like the sablĩ and has no influence over the specific hĩkulas or over souls. He is the curer of the organism, of the body of a man. He cures by uttering tremendous cries, gives massages on the ailing and painful limbs of his patients. Suddenly he will surprise all those

* [see additional data on the hanekasá on p 113 .. Analyst]

Y /230 cont./
791 present by taking out from under his tongue stones, small sticks,
[755] vermin, etc. "Arrows" come out in the form of a black liquid,
of tobacco, etc. He spits out and tramples on what he has been
Y able to extract. The káilala of the Sanemá also possesses power
[754] that is benevolent and malignant at the same time and can shoot
Y magic arrows at the enemy rancheria, thus causing sickness or
[171] death. If we compare this religious complex of the Sanemá
with that of the Warao, we find such a great similarity that
there cannot be the least doubt but that both have the same origin.

W Among the Warao the temple cult is strictly local and
793 cannot be carried out in a place where there is no priest; who
[771] may be a man or a woman, although for this office there is
[787] a special category in the society of the Warao. It is not hered-
[776] itary and can be obtained by the special calling of the Supreme
Being, Kanobo.

W The son of a priest is generally considered as more suitable --
[171] by birth -- to fill the office of his father, but although the son
may be competent to succeed his father in a political position,
he does not necessarily have the right to succeed him as priest,
as happens among the Taino, where the son inherits the office of
priest together with the chieftainship.

W The Warao temple cult is furthermore completely separate
793 from shamanism and magic; religious matters are the responsi-
755 bility of especially designated persons who act only within their
776 own domain. /231/ The fact that the priest may cure sickness
[771] must not lead the observer to false conclusions, since it is logical,
according to Warao mentality, that the priest controls -- through the
power of God -- the spirits of heaven, whose desire is to take
everyone to the side of God, to whom they owe obedience and
W whose orders are transmitted to them by the mediation of the
793 priest. These are spirits objectively good, but which become
755 subjectively bad when with their metaphysical capability they
776 enter the body of a man, physically limited, causing a pressure,
753 that is, a sickness. In Warao terminology the priest cures by
778 "alleviating this pressure," bringing about as a result typical
ailments, such as fevers of various kinds, which he cures by
frightening away the spirits with merely his presence, but in
particularly critical and difficult cases he may also use one of his
maraca /gourd rattle/.

/231 cont./

This latter instrument in the hands of the priest-doctor might cause one to err by identifying him with the shaman, although actually the maraca of a priest and that of a shaman are considered by the Warao as essentially different. The powers of the maraca of the priest are guaranteed by the kareko stones which are inside it, a second category of spirits which belong to the court of God. The stones in the maraca of the shaman represent other powers. So, although morphologically both instruments have the same origin, functionally they have become specialized, probably in different fashion, by our Indians. Warao shamanism is based on the conception of the existence of an immanent essence in all objects which can only be freed by the power of the shaman for the purpose of being directed toward someone's body. Each shaman has also the power to extract this type of essence from a person, that is, to cure him of his sickness. The shaman cures by smoking, emitting smoke and blowing, and, when he does so, he must rest his hand on the affected part, while he allows to pass through his mind numerous images of objects, until he fixes his attention on a special one which is the object which caused the sickness, as a result of which the spirit immediately jumps to his hand or to the maraca. The magician, finally, takes out from the body of a person or puts into it material objects, the causes of sickness.

Warao priests are specialized to a high degree. They must observe special taboos regarding food, which must be cooked only by their wives in a fire newly kindled for it and in a special pot. They eat apart from the others, live in their own house, and must not perform any strenous work. Ideally, they make their living from their office (Wilbert, 1957a, 1960a).

/232/ We publish below some mythological details on which we were able to take notes.

OMAO AND SOAO

In the beginning there was a pregnant woman. One day the Great Jaguar came and devoured the woman. When he came to the uterus he wanted to eat it also, but at that very moment a toad appeared and told him that one ought not to eat that thing. The Jaguar left the uterus in the forest and went away.

/232 cont./

539 The toad picked up the uterus and took it home. After some months there came out of it two male twins to whom it gave the names Omao and Soao. The two boys were brothers, but the toad was not their "mother," in spite of its having fed them and protected them from all dangers.

One day the Jaguar returned again and heard the two young men talking. Then he realized what had happened, and he tried to kill the two brothers. But they gave a tremendous jump and climbed a gigantic tree. They remained there for a long time, eating the fruit of the tree. The Jaguar kept waiting for them and coveting their delicious food. Therefore he planned to climb the tree also, but when he came close to them they jumped off into space. The Jaguar followed them, but his luck did not hold, and on falling he hit the ground so hard that he died.

The two brothers went off to the forest. They were alone. The solitude was overwhelming. They decided to create man. They tried to make the males out of very hard wood so that they would not die. They therefore began going through the forest in search of the strongest tree. They found many, but Omao was not satisfied and continued searching. His brother Soao became discouraged and completely lost his patience; he took out his ax, felled the closest tree, and began to make men. When Omao arrived on the scene and saw the tree which his brother had felled, he became extremely sad, for he foresaw that men would die young for lack of strength. He became furious with his brother, and grabbing him by the arm, he threw him to the ground on top of a nest of wasps who stung him so much that he fled in panic, running and shouting, through the forest.

Sometimes polished axes are found in the forest; they are those of Omao, with which he felled four very strong trees. But he did not make men out of them, but snakes, which do not die since by changing the skins they are continually rejuvenated.

Then Omao and Soao wished to create women, and, as Soao was an excellent fisherman, Omao made him a fishhook so that he might go to the river to fish. But Soao lost the hook and came back empty-handed. Omao made another stronger hook for him.

/232 cont./

539 This time Soao pulled out an enormous fish. Omao put it in /233/ a basket, saying that it was his wife and that Soao must not touch it. Soao did not touch her despite the fact that she was very beautiful.

One day Omao told his brother that he wished to make a wife for him and also for the other men, that he was going to the shore and that he must take good care of his sister-in-law, being very careful not to touch her.

Omao went off and after walking a great distance came to the bank of a large river. There he found a great number of beautiful butterflies. From them he decided to create a wife for his brother and women for the other men. The butterflies were very wary and fled every time that Omao approached them. Then Omao changed himself into a fly and put out some sweet bait in order to attract the prey. But all was lost because at the very moment of catching the most beautiful butterfly Omao heard a scream which he identified as one from his wife. In fact, Soao, tired of waiting for his brother and for his wife, lost patience, opened the basket which his sister-in-law was in, and attempted to cohabit with her. But she gave a tremendous scream and escaped. The butterflies became frightened and fled from the shore.

Omao, angered by this, left his brother alone on the earth and went to heaven.

THE SUN AND THE MOON

[221] The sun is a man and the moon is also a man. The two regard each other as enemies because of the occurrence which I shall relate.

One day the moon told a man to go and look for firewood. The man went off to look for it. When he brought it, he did not please the moon, who wanted a great deal more. Again it sent him into the forest. Then the man realized that what the moon wanted was to eat him. Then the man fled. He ran to the sun in search of asylum and protection. The sun hid him. When the moon arrived in search of him, the sun said that it had not seen the man. The moon, angered, insisted and even wanted

/233 cont./

539 to search the sun's house. Then the sun burned its surface and from that came the scars which show on its face.

The moon went to the other side of the world, and, while the sun sealed its friendship with man, the moon was his irreconcilable enemy. When the moon appears rose-colored, it 539 821 is because it, along with its family, is eating men. The sun also has a family, but does not eat human flesh. Sometimes the moon hides in its house in order to plan a new campaign. [532] During that time women are very much afraid and, in order to [751] protect themselves, paint a likeness of the sun on their cheeks; they also commonly paint it on large stones which they find on the path.

/234/

OINEITĨB

539 Beneath the earth there exists the world of the dwarfs, who [772] are called Oineitĩb. They live like men, but eat and speak very rapidly. They have no intestines or anus, and when they eat meat or other food, they cut it in pieces and swallow it raw, without chewing (25). They sometimes also eat women who conceal

[171] 25. See also the corresponding myth of the Yupa Indians of Venezuela (Wilbert, 1959d).

their menstruation. On one occasion the subterranean river grew so much that it acquired an enormous volume and gained so much strength that it blew out the earth beneath the ground of the rancheria in which there lived a woman who had tried to conceal her state. The houses collapsed and the inhabitants drowned, with the exception of the women, who were devoured by the dwarfs and their souls went to live forever with the guapo, who is also unable to go up to heaven and live with Omao.

Because the dwarfs have no intestines, they are always hungry and, for that reason, devour their food with much greediness. On occasion one of these dwarfs comes to earth to visit a man, but never a woman. The man cannot see his guest, but

/234 cont./

539 feels his presence because a devouring hunger attacks him. When the man realizes what is happening, he begins to eat greedily and immediately goes to see the sablí so that he will get rid of the importunate dwarf.

THE WOMAN WHO TURNS INTO A PECCARY

A man wished to go hunting for peccaries and asked his wife to go with him. The woman was having her menstrual period but said nothing to her husband. The two of them met a small band of peccaries in the forest. The man made his wife climb a tree while he prepared to kill the wild pigs. Hardly had the hunter left the place when a peccary appeared at the foot of the tree. It changed into a man and climbed the tree in order to carry the woman off. When the hunter returned, he began to search painstakingly for his wife, but he did not find her. He ran back to the rancheria and told his companions what had happened. The latter decided to follow the tracks of the woman. The sablí placed himself at the head of the retinue, which advanced in Indian file.

Soon the group met a man who called himself haʂmõ and who gave off flames from his belly. They asked him if he had seen a woman in the vicinity. The man answered that he had seen a woman whose upper part had been changed into a peccary when she had tried to pass under a fallen log on all fours, and that she was accompanied by many men and women.

The Sanemá continued the search, and the haʂmõ man accompanied them. /235/ Toward dusk the men hung their hammocks very close together because it was cold. One of them, still half asleep, attempted to revive the fire by blowing strongly, but he made a mistake and blew on the fire of the haʂmõ, who turned into a guinea hen and flew away.

On the following day, very early in the morning, the men continued to look for the abducted woman. After they had walked for quite a long time, they heard the sound of an ax; someone was cutting trees. It was pólawan, the jaguar who always follows the peccaries. He was cutting firewood in order to roast a peccary which he had just killed. He had seen the woman almost completely

/235 cont./

539 transformed into a peccary; only her feet were still human. All those who accompanied her belonged to a great herd of peccaries. The pőlawan offered to show them the way, and very early on the following day he helped them attack the enemy encampment. During the attack the man found his wife; he recognized her by her feet, which had still not lost their human shape. He approached her and, from the rear, grasped her upper lip with his right hand and her lower lip with his left hand, tugged violently, and ripped off the peccary skin, freeing her in this way from that repugnant disguise. The skin got up and ran away toward the forest. The Sanemá killed all the wild pigs, the men, the women, and the children. Pőlawan said good bye to them, and the woman returned joyfully with the men to the rancheria.

THE HANEKASA

773 The hanekasá are a pueblo made up, in its immense majority, of women. There lives among them only one man of verile age, which insures reproduction. Only female children are born, and, when the progenitor reaches an advanced age, a male child comes who replaces his father in this pueblo of amazons. The number of males may not exceed three: a child, a man in the prime of life, and an old man.

The hanekasá by preference feed on lapa /paca/.

For each Sanemá settlement there is a corresponding hanekasá one. When two of these groups meet on the road, they fight like men. The hanekasá also fight against men. If a man, while hunting, kills a hanekasá, a woman in the neighboring tribe will die.

HARAMI

539 One day a young Sanemá man was alone in the forest. He was looking for food. After walking a considerable distance without killing a single /236/ animal, he became very angry, complaining bitterly because the animals remained in their hiding-

/236 cont./
539 places (26).

[224
782
784]

26. Taking into account what has already been pointed out as a prayer directed to Omao in order that he allow to come out those animals which he would judge as surplus in the animal kingdom, the young man's behavior can be judged as an offense against God because he would not yield to his will.

The father of the young hunter was at home sitting in front of the fire. He was a sablí. Suddenly he saw a swarm of butterflies approaching to put out the fire. A great cloud of smoke arose. The sablí heard the prolonged and penetrating howls of the Great Fox who has various members of his family living in the river. When they come out of the waters, they do not only kill the hunter who made them leave their "house," but all of his family as well. The butterflies also live in the river and are the friends of the Great Fox, whom they help to kill bad and guilty hunters. After putting out the fire they attack the family of the bad hunter, and, if the latter happens to be at home, they suck out his blood from the corners of his eyes. The sablí knew all about this and the grave danger which his son and his whole family were in, but he also knew a means of defending them against the butterflies. He caught some of them and spat on them. The butterflies immediately ceased their attack on him and died. The Great Fox kept quiet because he knew that his victim was in the forest under the protection of a powerful shaman. In this way the young hunter was saved from the teeth of the Great Fox,[1] who devours his victims and swallows them without chewing.

KASMAI

Kasmái is a man who lives in the river. Every six months, when there is a new moon, he comes out of the water to live for three days among men. This pleases them, and they regale him with a dance celebration. Kasmái enjoys himself very much at these celebrations. He comes up out of the river with his body

/236 cont./

539 painted red with onoto. His children paint him in the river, which they call "their home." The men give him presents of succulent food, but Kasmãi does not eat much because he is full and has an abundance of food at home. He does not remain long on earth. After three days he invites his companions to bathe in the river and suddenly disappears at the mercy of the waters.

WAU

Wau lives in the river, but he is a cayman. He is not a common cayman, however, since he is the owner of the fish. He runs as fast as the wind and chases men who fish with barbasco or who throw back into the river the bones of fish that they have eaten. Wau always carries an enormous club, and the man whom he pursues can only save himself if he succeeds in quickly
600 climbing a tall, stout tree. /See the foreign text for the bibliography, pp. 247-263 in the original source, and the table of contents for the entire book, p. 265 in the original source./

conuco--cultivated areas
curiara--the native canoe
guayucos--loincloths
hamacas--hammocks
hɛ̨wĩawán--the priest
hɛ̨npĩrtĩb--a soul who goes to live in the house of Omao as hĩkula-dĩb
hĩkula--an immortal and spiritual vital principle in plants and animals, different than the soul
hĩkula-dĩb--ancestors
jefe--chief
káilala--the magician
morrocoy--turtle
póliawan--the jaguar; also used for the domestic dog
sablĩ--the shaman

INTRODUCCION

LAS tribus indígenas de las que se trata en el presente informe habitan la zona noroccidental del Escudo Guayanés, situada en la parte sur de la República de Venezuela. Como límites naturales de esa región, que llamamos "la región Orinoco-Ventuari", se pueden señalar los ríos: *Orinoco*, en el Norte y Oeste; *Ventuari*, en el Sur, y *Caura*, en el Este. Geográficamente la zona está comprendida entre 64°-68° W, y 4°-8° N, aproximadamente. La parte norte de la misma corresponde al Distrito Cedeño del Estado Bolívar, mientras que la parte sur pertenece, como Departamento Atures, al Territorio Federal Amazonas.

Hidrográficamente hablando, la región comprende cinco cuencas de ríos que la desaguan y que, al mismo tiempo, marcan las diferentes áreas de distribución indígena (1).

a) La *cuenca del Caura*, con los Mayongon, un subgrupo de los Makiritare, los Yecuana, y con unos grupos Sanemá;

b) La *cuenca del Cuchivero*, con los indios Panare y algunos grupos desconocidos en las cabeceras;

c) La *cuenca del Suapure*, que, con excepción de algunos núcleos Panare, no cuenta, hoy en día, con poblaciones indígenas;

d) La *cuenca del Sipapo*, con los indios Piaroa y Macú;

e) La *cuenca del Ventuari*, con los indios Yabarana en el río Manapiare, la subtribu Yecuana (Decuana) de los Makiritare, y los Nabudub, un subgrupo Sanemá (cf. mapa hidrográfico).

Todas estas cuencas, sin excepción, vierten sus caudalosas aguas en el Orinoco, que, como un arco gigantesco, recorre el norte del Escudo de Guayana, abrazando, de este modo, todas las tribus indígenas aquí estudiadas y marcando el ultra límite y fin de su mundo primitivo (cf. mapa étnico).

---

(1) No incluimos aquí los pequeños grupos indígenas recién llegados (Guahibo, Piapoco, Puinave, Curipaco). Ellos viven a lo largo de la periferia de la región, excepto los Guahibo, que, hace unos años, se adelantaron hasta el río Manapiare.

Mapa 1. Ruta de las expediciones

Es interesante señalar que la extensa red fluvial de la zona Orinoco-Ventuari no sirve, a la mayoría de las tribus, como medio de comunicación, ni como fuente extraordinaria de alimentación. Los Panare de la cuenca del Cuchivero no viajan por río y en el Cuchivero hemos encontrado solamente un bongo que era utilizado únicamente para cruzar el río. Por lo general, la curiara parece un elemento extraño a la cultura Panare, recientemente introducido por los criollos. Tampoco los Yabarana de la cuenca del Ventuari usaban la curiara y aprendieron recientemente de sus vecinos Makiritare el arte de hacerlas. Para los Sanemá el río representa, más bien, un obstáculo que un medio de comunicación, y utilizan balsas para cruzarlo. Hoy en día, solamente los grupos que viven en simbiosis con los Makiritare fabrican curiaras, pero no cabe la menor duda de que esta industria fue adoptada últimamente. Los Sanemá se dedican a la pesca menos que los Panare, Yabarana y Guahibo, ya que estos últimos pertenecen también a los indios orientados hacia la tierra, con sus caminos, más bien que hacia los ríos y la navegación. Los únicos navegantes auténticos de la zona Orinoco-Ventuari son los Piaroa y los Makiritare, y la fama de estos últimos excede a la de los primeros.

Culturalmente, los Makiritare pertenecen a un nivel neo-indio, así como sus primos, los Panare y los Yabarana, de la misma afiliación lingüística. Es interesante, sin embargo, hacer notar que hablar de indios Caribe no equivale *eo ipso* a hablar de indios navegantes. Existen neo-indios que desconocen la curiara y que desarrollaron la agricultura, no en una cultura meso-india (de pescadores y navegantes), sino básicamente encima de una cultura paleo-india (de cazadores). Culturas meso-indias, como la de los Warao, por ejemplo, y quizás la de los Piaroa, representan una especialización del paleo-americano que buscaba, en primer lugar, una nueva fuente de alimentación y no tanto un mejor modo de comunicación. El típico Caribe venezolano es, por lo menos hoy en día, un hombre amante de la tierra (Pemón, Cariña, Panare, Yabarana, Yupa), y los Makiritare, hombres de río, representan una excepción entre ellos.

De acuerdo con la importancia relativa que tiene el río entre las diferentes tribus, se encuentran núcleos de ellas a lo largo de las arterias acuáticas principales, como los de los Makiritare, o aparados de ellas, en los afluentes y cabeceras, como entre los Panare, Yabarana, Guahibo y Sanemá. Esa circunstancia es de gran trascendencia para el estudio de estos indios. Cuanto más retirados viven del río más difícil resulta el contacto y la convivencia con ellos. Así, los Panare son aún menos conocidos que los Makiritare y los Piaroa, y de los Sanemá y Yabarana traemos, en el presente informe, las primeras noticias relativamente amplias.

Mapa 2. Distribución de las tribus indígenas de la región Orinoco-Venezuela

Las tres semanas que pasamos entre los Panare fueron muy laboriosas, y el tiempo entre los Sanemá, finalmente, era muy duro.

A pesar de estas dificultades, que en comparación con las de un viaje al principio del siglo son insignificantes, la zona está abierta para cualquier tipo de comunicación. En avión se puede ir a Caicara, Puerto Ayacucho, San Juan de Manapiare y Cacuri (entre los saltos Tenqua y Oso). De este modo, para un estudio especial de los Panare, se va en pocas horas de vuelo desde Caracas hasta Caicara para seguir en jeep y llegar en el mismo día al primer bohío de los Panare. Para estudiar a los Piaroa, se va en avión hasta Puerto Ayacucho y se prosigue luego a pie o en curiara. A los Yabarana se les visita en la temporada seca yendo en un avión de línea a Puerto Ayacucho y desde allí hasta San Juan de Manapiare en un vuelo de avioneta durante 30 minutos. Se llega en el mismo día a las casas Yabarana y en unos días más a los "Monteros", el grupo más autóctono de esa tribu. Para arribar al territorio Makiritare y Sanemá del alto Ventuari, se va a Puerto Ayacucho en un avión de línea para seguir hasta Cacuri en un vuelo de avioneta durante 50 minutos más o menos. En ningún caso se necesita más de tres o cuatro días para llegar al sitio de estudios, y los gastos son relativamente bajos. En un remoto rincón de Venezuela viven los Waica y Samatari. Sin embargo, en un reciente viaje, salimos de Caracas a las siete de la mañana y estuvimos entre los Waica del Padamo a las cinco de la tarde del mismo día. Empleamos cinco horas de vuelo y tres en curiara rápida.

Para un viaje de reconocimiento y de prolongada duración como nosotros realizamos para el presente informe, se necesita ir más despacio en una curiara, quedándose entre las tribus, raudales y montañas. La única zona de difícil acceso es la de los "Monteros" y Chicano de la Sierra Guamapí.

La región Orinoco-Ventuari representa el macizo secundario occidental del Macizo de Guayana, con elevaciones superiores a los 2.000 m. La subida más difícil de la región resultó ser la zona al sur del Raudal Alto en el Cuchivero, hacia la Sierra Guamapí, y el paso del Salto Mono en el Alto Ventuari, donde el nivel sube a más de 1.500 m. de altura (cf. mapa físico). La travesía del Salto Mono, sobre todo la subida en la época de lluvia, resulta un trecho sumamente peligroso y se emplean, por lo menos, un día completo para la ida y seis horas para la vuelta. Los Makiritare suben en seis horas y bajan en cuatro horas con un bulto de 20 - 30 kg en la espalda. Bajamos con 20 Sanemá y 30 Makiritare en sólo cinco horas, pero tal maratón es en extremo agotador. Al contrario, atravesar el Mono en dos días representa una excursión sumamente bella por las características de esa montaña y lo gigantesco de su selva que, a veces, deja la vista libre

Mapa 1. Afiliación lingüística de las tribus indígenas de la región Orinoco-Ventuari

y se divisa un panorama encantador. Los Makiritare mantienen el ancho sendero (de más de 2 m) siempre abierto y en buen estado, y en el puerto de arriba construyeron una casa para reposar y pernoctar. Allí se encuentran unas curiaras, con las que se puede seguir por el río hacia las rancherías Makiritare y Sanemá, sitas en las cabeceras del mismo. Del puerto Mono arriba hasta las cabeceras no hay más obstáculos para la navegación, y el río permite todavía el fácil acceso a todas las poblaciones Makiritare del Alto Ventuari. Llamamos Alto Ventuari la parte de este río desde el Salto Tenqua hasta las fuentes. De allí, los Makiritare llevan al expedicionario, a través de la Sierra, al Erebato, afluente del río Caura.

La comunicación entre las tierras planas del norte y el Macizo es muy difícil subiendo el Paragua o el Caura. En ese trecho los indios mismos agotan sus energías y, frecuentemente, pierden la vida. Durante la época de lluvia no acostumbran viajar por estos peligrosos caminos (Vila, 1959).

Como es natural, las características físicas se reflejan en los diferentes tipos de vegetación con que cuenta la región Orinoco-Ventuari (cf. mapa de vegetación). En la zona baja, a lo largo de los ríos Orinoco, Ventuari, bajo Cuchivero y Caura se encuentran bosques de galería, chaparrales, estepas de gramíneas, al igual que en el alto Orinoco y en los llanos. En los trechos más altos hay bosques deciduos, en parte siempre verdes, mesófilos e higrófilos, mientras que en las zonas altas, por encima de los 1.000 m, se hallan los bosques higrófilos y mesófilos interrumpidos localmente por sabanas. El bosque entre 200-1.000 m de altura, por su parte, está cortado con frecuencia por estepas de gramíneas.

Por chaparrales se designan las sabanas llenas de árboles, como las del bajo Cuchivero y del *hinterland* y habitat de los Panare del Norte. Aquí, típicamente, se encuentran árboles achaparrados de 4-8 m de altura, con especies como *Curatella americana*, especies de *Byrsonima* y *Erythroxylum*, *Bowdichia virgilioides*, *Palicourea rigida* y *Haematoxylon Brasiletto*.

Las estepas de gramíneas, húmedas o secas, constituyen la vegetación típica de los llanos. Son zonas casi completamente desprovistas de árboles, interrumpidas por dunas o, en nuestra zona, por esteros, y a veces, con chaparrales u otros elementos leñosos en las zonas transitorias del Norte. Todavía permanecen casi inexploradas las sabanas y estepas de las sierras altas de Guayana.

Los bosques de galería, que indicamos en las regiones secas, los forman principalmente morichales. Los morichales del bajo Cuchivero son co-

Mapa 4. Mapa físico de la parte sur de Venezuela (según Vila, 1959)

4: Wilbert SQ18 Yanoama

nocidos en Venezuela por su mesura, a pesar de que, para el viajero, señalan casi siempre un obstáculo, sólo en épocas secas.

Las selvas higrófilas en perenne verdor (Tropical Rain Forest) están compuestas de árboles de 20-50 m de altura, entrelazados con lianas y epífitas. Los troncos pueden alcanzar más de dos metros de diámetro y poseen, de vez en cuando, raíces tabulares. Entre las especies características se cuentan: *Anacardium rhinocarpus, Terminalia amazonica, Philodendron bipinnatum, Sterculia apetala, Basiloxylon brasiliensis, Astronium graveolens, Brosimum spec., Pouteria spec., Guarea spec., Carapa guianensis, Mora excelsa, Bertholletia excelsa, Hevea Benthamiana y Ochroma lagopus.*

En la región venezolana de Guayana es difícil establecer una diferencia entre las zonas de selvas higrófilas y los bosques deciduos mesófilos. Los bosques deciduos mesófilos ocupan en Venezuela la parte más extensa de todas las zonas forestales. Debido al período de sequía, esta clase de bosque tiene un número más reducido de especies que las selvas higrófilas. Los árboles alcanzan una altura entre 20-40 m, y las lianas abundan menos que en los bosques higrófilos. Entre las especies importantes de los bosques deciduos de nuestra región se cuentan: *Cedrela mexicana* (Cedro), *Swietenia macrophylla* (Caoba), *Anacardium rhinocarpus* (Mijao), *Mouriopsis sepium* (Saquisaqui), *Spondias Mombin* (Jobo), *Samanea saman* (Samán) y *Tabebuia pentaphylla* (Apamate) (Hueck, 1960).

Como ya hemos indicado en el prefacio, el presente libro es el resultado de un informe de dos viajes y de un estudio bibliográfico de los datos existentes sobre la zona visitada (cf. mapa: Ruta de las expediciones). Aunque es verdad que no se ha escrito todavía un trabajo monográfico sobre ninguna de las tribus de la región Orinoco-Venturi, también es cierto que la gran cantidad de artículos que han sido publicados sobre los indios de esa zona es sorprendente. El material es, primeramente, descriptivo, pero como nos describen muchas veces aspectos de la vida indígena que hoy han desaparecido o cambiado, el material de conjunto de estos autores es de gran valor e interés.

En el presente informe utilizamos la mayoría de los datos existentes, y su recopilación, ordenación y selección, junto con nuestro aporte personal, constituye el estudio que aquí exponemos sobre los indios de esa parte de Venezuela.

Seguimos en nuestro propósito las huellas del gran etnólogo venezolano Lisandro Alvarado, quien, con la publicación de su libro "Datos Etnográficos de Venezuela", dio un paso firme hacia la gran tarea de recopilación

4: Wilbert SQ18 Yanoama

de todo el material objetivo, elaborado en el transcurso de muchos decenios, referente a las tribus indígenas de esa parte del mundo (2).

Nuestro informe carece de uniformidad en cuanto al carácter y volumen del material de las distintas tribus a que nos referimos, pero refleja este hecho precisamente nuestro actual conocimiento esporádico acerca de las tribus que, en la última fase de su vida autóctona, invitan, con urgencia, al etnólogo competente, para dejar el testimonio de un conglomerado humano de nuestro antiguo continente americano.

LOS SANEMA

[P. 177]

LA palabra Sanemá aparece aquí, como la designación de una subtribu de los Yanoama. Los Sanemá fueron llamados Guaharibo y a veces confundidos también con los Shirishana.

Los términos Guaharibo y Shirishana (escritos con abusiva libertad ortográfica) carecen de sentido adecuado aplicados a los Sanemá, y no debe, como hasta ahora ha sucedido, aplicárselos a esta tribu o a las bandas periféricas, quienes los aceptaron como designaciones empleadas por los Blancos (Guaharibo) y por los Makiritare (Shirishana).

El nombre Guaharibo, igual que Macú y Tapuya, es una designación vaga y colectiva que abarca muchas tribus primitivas y que, por consiguiente, tiene escaso valor clasificatorio y no resiste una crítica científica e imparcial.

El término Shirishana, por su parte, nos parece más que denominación genérica, un insulto, ya que significa "mono araguato" y que emplean los Caribe en tono despectivo cuando se refieren a los Sanemá, a quienes consideran como seres subhumanos nacidos del polvo de su sombra. También ese nombre se presta fácilmente a confusión con los Crichaná del río Ianaperi, y de filiación Caribe.

Por las razones arriba apuntadas, preferimos el término Sanemá, que significa "gente", al de Guaharibo, que equivale a "salvaje", o de Shirishana, "mono araguato". Esta preferencia tiene más visos de científica y mayor respeto humano. Parece que el término Yanoama lo introdujo en la literatura etnográfica Zerries (1956a, p. 187) y fue aceptado, con toda razón, por Schuster (1958, p. 115) y Becher (1960, p. 6) como nombre genérico de los Casupare, Sanemá, Waica, Sálumari, Surara y Pakidai.

En el presente tratado consideraremos a los Yanoama como una *tribu* no tanto en el sentido político-social, cuanto en el lingüístico-cultural, puesto que los Yanoama, en general, representan una cultura específica integrada

Mapa 7.—Distribución de los indios Yanoama (preliminar)

por varias subculturas propias de las diversas subtribus que habitan en un territorio coherente, que hablan lenguas estrechamente emparentadas, y poseen formas esencialmente similares en lo económico y sociológico.

Cada subtribu está compuesta por cierto número de grupos locales que forman una banda de familias extensivas y que aportan las características peculiares del grupo a que pertenecen, enriqueciendo así el patrimonio cultural de la subtribu. De esta forma conocemos como subtribus de los Yanoama a los Casapare, Sanemá, Waica y Samatari, mientras que los Pakidai y Surara parecen representar dos grupos locales de los Samatari o de una subtribu cuyo nombre ignoramos.

Como grupos locales de los Sanemá podemos mencionar a los: Nibadub del Ventuari, los Pubenatari del Caranakuni, los Taclaudub en el territorio del manantial del Caura, y otros que mencionaremos en la parte demográfica.

Por lo que se ha publicado hasta ahora acerca de las subtribus Yanoama podemos colegir que existen entre ellas diferencias culturales más o menos acentuadas, pero también es fácil demostrar que esas diferencias no representan sino variantes de un mismo patrón cultural; a pesar de que esas divergencias corresponderían básicamente a una separación que oscilaría entre los 600 como mínima y 3.500 años como máxima entre esas subtribus.

Para facilitar el estudio de la distribución de las subtribus Yanoama hemos elaborado el mapa conjunto que ilustra el presente trabajo. Los datos referentes a las poblaciones Surara y Pakidai se han tomado del estudio de Becher (1960), quien les localizó entre los ríos Demini y Aracá, en el Brasil. La localización de los Samatari del Brasil corresponde al mapa publicado por Seitz (1960), y la de los Samatari de Venezuela a uno levantado por la Malariología, ubicada entre los Waica, en el Alto Orinoco, frente a la boca del afluente Mavaca. De esta última fuente tomamos también los datos antropo-geográficos de los Waica y de los Sanemá del Padamo. El mapa referencia, se ha levantado según datos empíricos del personal de la Malariología que cuenta con la colaboración de los misioneros de esta zona, y, sobre todo, con la del señor James Barker, de la *New Tribes Mission*, quien ha intimado con los indios de esta región.

Tenemos conocimiento de la distribución de los Sanemá en el Ventuari, Erebato y Caura por el propio personal de nuestra expedición; mientras que los datos sobre los Casapare los tomamos del excelente trabajo cartográfico de Montoya (1958) quien visitó la zona durante varios meses.

El nombre Casapare lo emplean los Sanemá para designar a sus vecinos del oriente. Koch-Grünberg (1923) mencionó ya al grupo del Alto Ururicapará, afluente del Uneiuwini y al que ocupaba la margen derecha del río Ururicuera, frente a la serranía Marutani, en el río Mavaracó. Las líneas entrecortadas indican, aproximadamente, el territorio ocupado por cada subtribu Yanoama. La ubicación de los Makiritare del Cunucunuma proviene del mapa publicado por Civrieux (1959) y la de las demás poblaciones de esa tribu fue verificada por el personal de nuestra expedición.

Según ese mapa, el territorio actualmente habitado por los Yanoama está situado entre 0° 30' — 5° N y 62° — 65° 30' W. Si admitimos que la población total de los Yanoama alcanza la cifra de 20.000 individuos repartidos en una extensión de 150.000 km² reconocemos como índice de densidad de la población el de una persona por 7,5 km². Hay autores que, con sobrada generosidad, hacen subir la población de los Yanoama a 30.000 y hasta 50.000 habitantes, pero ese número nos parece exagerado.

Es interesante destacar que las cifras más altas de la población indígena corresponden a las tribus primitivas de cazadores y pescadores o aquellas que tenían una agricultura incipiente y rudimentaria, como: los Barí (Motilones, Mapoyo) 2.000; los Piaroa, 4.000 y los Warao, 8.000.

Son también las tribus que han tenido menos contacto con el blanco. Existe una relación interesante y aleccionadora entre el dato demográfico de una población indígena y el número de años que ha convivido con el blanco: mientras más elevado es el último, más bajo es el primero.

Los Barí sufrieron mucho de los Yupa, los Piaroa y Warao de los Caribe, pero esos sufrimientos fueron mínimos ante las vejámenes que experimentaron otras tribus por parte de los blancos. El Yanoama ha sido atacado durante centenares de años por los Caribe, quienes rodearon su territorio con un semicírculo por el Norte; con análoga tenacidad tuvieron que agenciar los Yanoama de los Arawak, quienes los rodearon con un semicírculo meridional. Pero con todo, el blanco no ha tenido mucho éxito todavía en aproximarse a esa población primitiva, y su influencia destructiva no ha afectado sus costumbres ancestrales. Los Caribe y Arawak han declinado gradualmente en vigor y en número; ahora presenciamos el triunfo de los Yanoama sobre sus vecinos poseedores de más refinada cultura pues no solamente defendieron su territorio, sino que lograron extenderse hacia el Norte y el Oeste.

El más fuerte y eficaz aliado de los Yanoama ha sido la Cordillera de Parima, junto con la densa selva tropical del Territorio Amazonas. En los

tiempos aciagos de persecución, siempre han encontrado en la acogedora selva un refugio seguro. Sin embargo, desde hace relativamente poco tiempo, las diferentes subtribus Yanoama se están dando cuenta de que el espacio allende los límites convencionales de su territorio tribal está escasamente poblado, casi desierto. El número de sus enemigos tradicionales ha disminuido considerablemente, y las invasiones a su territorio no han tenido prácticamente consecuencias. De esta manera han ganado casi 100 kms. al Norte de la Sierra de Pacarima, donde hoy viven los Casapare en el Alto Paragua; ,y el grupo norteño de los Sanemá en las cabeceras de los ríos Venezuari, Erebato y Caura.

El centro de distribución de los Casapare está situado al sur de la Sierra Pacarima en la cuenca del río Branco. Conocemos a esta subtribu Yanoama solamente por unos ligeros contactos esporádicos y, tanto la gente como el territorio, permanecen prácticamente ignorados. Por eso, consideramos el nombre de Casapare conque designamos a todos los Yanoama de la zona en estudio, como netamente preliminar, y no nos extrañaríamos tuviésemos que cambiarlo, en el futuro, por una denominación más propia y adecuada. Incluimos a los Casapare entre los Yanoama, basándonos en las informaciones de los Sanemá del Erebato, quienes nos aseguraron que hablan una lengua parecida a la suya.

Los escasos datos científicos de que disponemos y que se refieren a los Casapare provienen todos del grupo norteño, y su interpretación es relativamente difícil debido al hecho de que en el río Uraricuera se unen las zonas de distribución Waica y Sanemá con la de los Casapare; y los cronistas no lograron diferenciar con precisión y claridad los representantes de las diversas subtribus.

La diferenciación étnica que apareció muy temprano en las fuentes bibliográficas correspondientes, fue la de los Shirishana y Guaharibo (con sus múltiples variaciones ortográficas). Hoy, no cabe la menor duda de que se trata de indios Yanoama pero no creemos sea conveniente identificar a los Guaharibo y Shirishana como un solo grupo con dos denominaciones distintas. Opinamos por el contrario que cada nombre designa un grupo más o menos distinto, de los Yanoama, y que "Shirishana" se refiere a los Casapare, y "Guaharibo" a los Sanemá. Los Sanemá del Territorio Amazonas de Venezuela han sido conocidos, desde el principio con el nombre de Guaharibo. La confusión de ambos términos proviene, precisamente, de la zona norteña, en discusión, donde las dos subtribus viven en íntimo consorcio geográfico. Así, creemos que entre los Yanoama del Paragua hay Sanemá en el oeste o en las cabeceras del propio Paragua, mientras que los Casa-

pare ocupan el territorio hacia el este y están establecidos, principalmente, a lo largo y en las orillas del Paramichi.

Ese conocido lazo entre los representantes de las dos subtribus es reciente, como apuntaremos más adelante, y es casi seguro que hoy existe cierta fusión genética y cultural entre ambos grupos. Al sur de la Sierra Pacarima también venían algún trato pero de manera más esporádica, pues ocupaban dos zonas distintas: los Casapare (Shirishana) en el Uraricuera al Norte de la isla Maraca, y los Sanemá (Guaharibo) y los Waica el territorio más hacia el Suroeste.

De los Casapare del río Uraricuera poseemos los datos que nos suministró Koch-Grünberg (1923, pp. 284-319) y la comparación de su vocabulario "Shirishana" con el vocabulario "Shirishana" de Armellada y Matallana (1942, pp. 101-108), nos deja la impresión de que ambos son muy parecidos pero difieren mucho de la familia Sanemá (cf. croquis glotocronológico). A pesar de que hoy ocupan zonas geográficas adyacentes, preferimos hacer una clara distinción en la literatura entre los "Shirishana" (Casapare) y "Guaharibo" (Sanemá) considerándoles como dos subtribus diferentes de la tribu Yanoama. Según su separación lingüística, representan, en realidad, los dos polos extremos de distanciamiento máximo (18).

De su centro de distribución en el Brasil, los Casapare hostilizaron con continuas incursiones a sus vecinos los Pemón y los Makiritare, desde la época en que estos últimos llegaron a la vertiente norteña de la Serranía. Parece que los Taurepán (Pemón) nunca lograron fundar un pueblo más al oeste de la punta oriental de la isla Maraca en el Uraricuera y que los Makiritare mantuvieron sus puestos de avanzada, a costa de grandes bajas y sacrificios, hasta que, finalmente, tuvieron que abandonarlos ante la constante amenaza y el inminente peligro de perder sus vidas.

Los Makiritare empezaron a perder terreno hace ya, por lo menos, unos 120 años, cuando los Yanoama mataron a un número de indios Makiritare (Schomburgk, 1841, pp. 437-8, 444), y parece que actualmente Tarakuñiña en el alto Yaraviuri es el último reducto Makiritare al sur de la Serranía. Los Yanoama, empero, lograron, por su propia fuerza, contener el avance de los Caribe en la parte noreste de su territorio.

La matanza de indios a que hemos hecho referencia más arriba fue señalada por Schomburgk (1841), quien visitó esa tierra hacia el año 1839.

---

(18) Obsérvese que ésto no quiere decir que también consideramos la nomenclatura vieja, ésto que el nombre "Shirishana" de la literatura corresponde a la subtribu *Casapare* y el nombre "Guaharibo" a la subtribu Sanemá de esa tribu.

y sus datos constituyen el primer informe acerca de los Yanoama del Norte. Schomburgk había atravesado la Sierra Pacaraima cuando, en marcha hacia las fuentes del Orinoco, encontró a los Makiritare presas de enorme pánico. Los Yanoama, posiblemente un grupo de los Waica, habían matado a un número de Makiritare, quienes iban camino de las rancherías de los Yanoama para establecer con ellos relaciones comerciales. Poco tiempo después de aquella horrible matanza, los mismos Yanoama atacaron una ranchería Makiritare con el propósito de exterminar a todos sus habitantes. Este suceso marcó la fecha del retiro de todos los Makiritare meridionales de esa zona. Les acompañaron en su huída hasta los compañeros Caribe que estaban con Schomburgk, a quien abandonaron con su equipaje a corta distancia de las fuentes del Orinoco. Fácil es comprender el estado de ánimo rayano en la desesperación de Schomburgk al encontrarse tan cerca de su propósito sin poder lograrlo.

En el alto Uraricuera, en la región de la Sierra Maruani, Schomburgk encontró un conuco de los "Kirishanas" a quienes describe como indios nómadas cuya alimentación básica dependía, en primer lugar, de la caza, de la pesca y de la cosecha de frutas silvestres; algunos, sin embargo, cultivaban pequeñas plantaciones de yuca amarga y de pimientos (Schomburgk, 1841, p. 417). Setenta y dos años después de esta primera noticia, Koch-Grünberg, en diciembre del año 1911, estableció, de nuevo, breve comunicación con los Yanoama de esa zona, y sus informaciones constituyeron, hasta hace pocos años, el material más importante sobre los Yanoama en general. Koch-Grünberg conoció representantes de dos grupos distintos. El primer grupo (Casapare) al cual encontró en el salto Purumamé, vivía entonces en el alto Uraricaparú, aunque había llegado recientemente a esa región procedente del Uraricuera, más arriba de la isla Maraca. Era ése el lugar donde atraparon, por sorpresa, a todos los indios a quienes robaron y mataron.

En el otro extremo de la isla Maraca empieza el territorio de los Taurepan (Pemón) y resulta interesante notar que por el año 1911, los Casapare bajo el mando de un tal capitán Kurunaí habían establecido contactos pacíficos con sus vecinos Caribe, con el propósito de adquirir, mediante trueque, utensilios europeos que apreciaban en alto grado. De origen Caribe debe ser también la costumbre de cultivar pequeñas plantaciones y que fueron ya observadas por Schomburgk, Koch-Grünberg y Ghiorbrandt (1955, p. 345).

Koch-Grünberg (1928, pp. 302-308) logró publicar el primer vocabulario de una lengua Yanoama y, como el mismo autor advierte, se pueden distinguir unas palabras de procedencia caribe, en este idioma del río Urari-

taparí, pero casi todos ellos se refieren a utensilios y plantas cultivables de procedencia caribe o europea.

El otro grupo (¿Waica?) lo visitó Koch-Grünberg cuatro semanas después de su primer encuentro con gente Yanoama, con quienes vivió en una ranchería en el Mocomoco, enfrente de la Sierra Marutani. Este grupo tenía relaciones con los Makú del río Auarí, de quienes adoptaron algunos elementos culturales, como la agricultura. De este grupo no tenemos un vocabulario, pero según informaciones suministradas a Koch-Grünberg por sus compañeros indígenas, hablan el mismo idioma Yanoama con ligeras diferencias dialécticas.

La expansión de los Casapare hacia el norte, data de fecha reciente pues sus jurados enemigos, los habitantes del Paragua, como también los Pemón al noreste, cesaron en sus represalias y dejaron libre el avance de los nómadas Yanoama. Parece que en esa misma fecha, los Sanemá del suroeste y los Casapare empezaron a invadir la zona. Hoy día, los Yanoama dominan hasta el río Marí, afluente izquierdo del Paragua (5° 10'). Los Pemón al oriente del Paragua han dejado el espacio entre ese río y el Caroní. Sus núcleos se encuentran en la Gran Sabana, en la parte suroriental de Venezuela. Por influencia conjunta de la civilización y de la misión, han perdido sus características de Caribe expansionistas y su número resulta, actualmente, bastante reducido; cuentan con 1.800 individuos, y responden a una densidad de 1:16,5 km².

Los Mayongon y Arecuna, por el Norte, no significan una efectiva barrera a la expansión Yanoama. Sin embargo, aquí se exponen a chocar con la civilización ya avanzada de estas regiones y donde van a encontrar al indio, al negro y al blanco con culturas particulares irreductibles a la cultura paleo-indio del Yanoama.

Entre las tribus que fueron absorbidas por los Yanoama figuran los Kaliana, Auaké, etc., respecto a cuya identificación existe cierta confusión en la literatura.

Kaliana, es sin embargo el nombre que los Casapare dan a los Sapé. Estos fueron identificados como Kaliana por un compañero indígena de Koch-Grünberg (1923, pp. 12-13; cf. idem, 1922, p. 227), mientras que Armellada y Matallana (1942, p. 103) les identifican con el nombre "Shirianá" (Casapare) como Karinapuik. Los Sapé (Kariana, Kaliana) recibieron la visita de Monsoya el año 1956, quien les clasifica como afines a los "Shirishana" (1958, p. 168). "Es un grupo aislado", dice Monsoya, "que vive en el río Anauburí y alto Pao; en las zonas del alto Paragua y río Pauré-Muria".

"Se dedican a la agricultura, pero producen tan solo aquello que consumen o algo más para el intercambio con los Shirianna que son viajeros y les proporcionan sal y otros elementos de que carecen".

"Algunos de ellos han aprendido a construir curiaras en forma tan rudimentaria que hace sonreir a los indios Mofongón, los maestros en ese arte. Pero si fabrican "conchas", muy frágiles, pero que les permiten trasladarse a las zonas de pesca y caza, haciendo transportes ligeros".

"Realizan frecuentes matrimonios con los grupos Shirianna y hasta con los Arekuna. Parecen destinados a desaparecer como grupo étnico diferenciado o a ser totalmente absorbidos por los Shirianna, más numerosos y próximos que los Arekuna" (Monroya, ibid.).

Como se puede juzgar por esas indicaciones respecto al carácter de la cultura Sapé, se trata de una cultura poco desarrollada, y Monroya tiene razón al diferenciarles de los Caribe. Pero, juzgando por el vocabulario Sapé que acompaña el trabajo de Armellada-Matallana y otro de Koch-Grünberg (1928, pp. 308-317), no es posible identificar al grupo Sapé como "afín a los Shirianna".

Los Auaké, por otro lado, son idénticos a los Arutani, quienes fueron visitados por Armellada y Matallana durante su expedición al Paragua (1942, pp. 75, 86). Les encontraron viviendo en dos rancherías; una, cerca del salto de Maibia, en el río Paragua y frente del Momurio, afluente del mismo por la margen derecha, con una casa y 20 habitantes. La comparación del vocabulario Auaké de Koch-Grünberg (1928, pp. 308-313) con el vocabulario Arutani no deja lugar a duda de que los dos son de la misma lengua.

Ambos grupos, tanto los Sapé (Kaliana) como los Arutani (Auaké), parecen tener una cultura muy poco desarrollada, probablemente igual a la de los Yanoama. Monroya describe la cultura Sapé con rasgos típicamente marginales y Armellada y Matallana (1942, p. 75) dicen de los Arutani que "estos indios son los más pobres que hemos visto en todo el viaje; viven en un rancho enteramente miserable y los chinchorros que usan son de bejucos".

La comisión portuguesa de límites (1787) menciona a esta tribu como Acoquis, habitantes de las fuentes del Caranné, donde vivían en gran número bajo el mando de tres capitanes (Coudreau, 1887:2, p. 393). En el año 1838, Robert Schomburgk encontró algunos Orewaku en el medio Ururicuera, les describe como una tribu nómada, que vivía en las cabeceras del Ururicapará y en la cabecera del Paragua. En 1882 los Auaké (Arute-

al) fueron visitados por primera y última vez en su propio domicilio por una Comisión de Límites, que encontró un pequeño grupo en el alto Urucuparí. Tenían una casa grande y redonda, provista de una pared de palizada. Esta les sirvió de defensa contra los ataques de sus vecinos (Relatorio, 1884, p. 189; Grupe y Thode, 1890, p. 253). En 1911, Koch-Grünberg (1923, p. 12; cf. idem, 1922, p. 226), fue visitado por un pequeño grupo Auaké (Aruaní) en el alto Urumutuy, que enseñó al explorador que su tierra se encontraba en la cabecera del Paragua, donde tenían una casa comunal. Ya en estos días, los Auaké (Aruaní) habían dejado sus paraderos meridionales a los Casapare y migraron hacia el Norte. Pero un número creciido se mezcló con los Casapare y es muy probable que los Aruaní del alto Paragua representen los últimos vestigios de los Auaké.

Es interesante subrayar el hecho de que ambas tribus, los Sapé y los Aruaní, pertenecen a los grupos primitivos de Suramérica, y que sus idiomas constituyen lenguas independientes. Ellos han servido muy probablemente de parachoques entre los Caribe y los Yanoama, y mientras los primeros les empujaron del Paragua hacia el Sur, los últimos les absorbieron o desplazaron hacia el Norte. La misma función han tenido los Caribe en tiempos más recientes, cuando fueron destruidos entre las fronteras de la civilización blanca y de los Yanoama, y hoy permanecen tan sólo algunos reliquias de esas tribus.

Respecto a los idiomas de los Sapé (Kaliana) y Aruaní (Auaké) es interesante señalar que Loukotka (1935) encontró vestigios Chibcha en el Auaké y el Kaliana. Si consideramos que el Yanoama tiene relación con el Warao y que ambos tienen un nivel cultural relativamente bajo, es factible pensar en un suburano de tribus marginales con filiación lingüística Chibcha, a la cual pertenecen quizás las actuales tribus Warao, Sapé, Aruaní y Yanoama. Trataremos este tema tan interesante, en el capítulo que describe algunos aspectos lingüísticos de los Yanoama.

Las últimas noticias que tenemos de los Casapare fueron suministradas por los ya mencionados padres capuchinos Armellada y Masaliana (1942), por Ghezzbrandt (1955) y por Mosonyi (1958).

La expedición de los Padres Capuchinos se realizó por el año de 1940 con el fin de elaborar un informe misional completo sobre el río y su población indígena. Fueron en búsqueda de hombres y su conclusión de que el Paragua, aparte de ser un río peligroso y difícil de navegar, no tenía importantes agrupaciones indígenas es interesante. En su informe (1942, p. 87) mencionan un número total de 296 indios conocidos.

Este resultado contrasta con el obtenido por la expedición de Monoyo, y a pesar de que recorrió mucho más territorio que la de los padres Capuchinos, tenemos que admitir que Monoyo encontró poblaciones indígenas en el año de 1956, donde los Padres no vieron ninguna en el año de 1940. Esto tiene su valor en primer lugar, en cuanto se refiere a las poblaciones Yanoama (Camapare, Sanemá), y es significativo para la reconstrucción de la historia migratoria de los Yanoama. Armellada y Matallana (1942, p. 76) dicen que una ranchería cerca de la boca del Pumpirí, río que desemboca en el Paragua por la margen derecha, era "la única que los indios shirianas tienen del lado de Venezuela en la cuenca del Paragua". Veintiséis años más tarde Monoyo (1956) y sus compañeros descubrieron rancherías Yanoama establecidas desde el río Marí hasta las cabeceras del Paragua, éste indica que la expansión de los Camapare y Sanemá es de fecha muy reciente en esta zona del Paragua y que adquirió su actual volumen sólo en las últimas décadas. Las tribus marginales, como los Sapé y Arutani, han sido rechazadas hacia el Norte y están en proceso de ser absorbidas por los Yanoama en el Sur, y por los Caribe y los blancos en el Norte.

Refiriéndose a los Yanoama del Paragua Monoyo distingue los Guaharibo, Guaika y Shirianna. Según su excelente mapa, los Guaharibo y los Guaica viven entre el alto Caura y las cabeceras del propio Paragua y el río Okasiarí. Es posible que se trate de los Sanemá y Waica. Los Shirianna ocupan el río Paragua desde el río Marí hasta la cabecera del río Paramichí, y éstos parecen representar a los Camapare de nuestra nomenclatura. La mayor zona de incursión de estos últimos al territorio venezolano parece ser por el río Shatopae (3° 50') de donde parte el camino al río Ututiquera.

Según Monoyo (1958, pp. 173-174), los Guaharibo (Sanemá) casi desconocen la agricultura y atraviesan los ríos por sus puentes característicos que consisten simplemente en dos gruesas lianas paralelas y superpuestas; la superior sirve de pasamanos.

A los Guaika (Waica) los considera el mencionado autor como "los indígenas de vida más primitiva y salvaje de cuantos habitan en la gran región de la Guayana venezolana..." Tienen una agricultura incipiente, cultivan camburés y plátanos como base principal de su alimentación, que complementan con la fruta de la palmera Pijiguao. Practican el endocanibalismo, consumiendo los huesos de los muertos incinerados.

Sus chinchorros son anudados, sus casas triangulares y usan arco y flechas de diversas formas, según los usos. Guardan los huesos de muchos animales, viajan por tierra, rara vez por río y construyen puentes al estilo de los Guaharibo (Sanemá).

De los Shirianas (Casapare) dice Monroya (1958) que "los verdaderos Shirianas, viven en las márgenes de los ríos, construyendo poblados muy estables y dedicándose a una agricultura algo avanzada ya". Adquieren cuitetas de los Mayongon, pero también han aprendido a construir las suyas, aunque en forma rudimentaria. Usan arco y flechas para la caza, pero "sobre todo y por todo, son comerciantes y viajeros. Constantemente se internan en Brasil, a partir del Alto Paragua, utilizando la vía del río Shoropae, Urukuera y Parima, hasta Bouvista". Se distinguen de los demás indígenas de la cuenca del Paragua por ser altos y fuertes, sanos y bien nutridos.

La última noticia sobre los Yanoama del Noreste fue publicada por Gheerbrandt (1955, pp. 345-349), y en ese informe aparece también por primera vez el nombre de Kaserapai, que debe ser una variación ortográfica de la denominación Casapare que empleamos para designar toda una subtribu y no tan sólo un grupo local como lo hizo el mencionado autor.

Navegando por el Uraricuera, en el año 1950, Gheerbrandt encontró y oyó hablar de varios grupos Yanoama con nombres distintos. Muy cerca de la Sierra Marutaní encontró a los Guadema en la margen izquierda del mencionado río. Los Guadema temían mucho a los Kaserapai, quienes habían matado a la mayoría de los Guadema y que estaban en plena pelea con Waikas y Waixchas en el Uraricuera. Es posible que se aluda aquí a un choque entre grupos Sanemá, Waica y Casapare, pero los datos existentes no ofrecen ninguna certeza al respecto. Es interesante que Gheerbrandt (1955, p. 348) opine que los Makiritare habían dejado el Uraricuera hacía unos veinte años.

Los Guadema parecen ser distintos a los Casapare según se deduce del mencionado libro; probablemente se trate de un grupo local Sanemá o Waica.

El centro de distribución de los Sanemá es la cuenca del río Padamo, afluente del alto Orinoco. Su territorio está limitado al Sur por el territorio Waica, al Oeste por los Makiritare del Cunucunuma, al Norte, por los Makiritare del alto Ventuarí, Erebato y Caura, y al Este por el territorio poco conocido de los Casapare.

Si juzgamos por la actual situación de distribución de los Yanoama, es muy probable que los primeros Yanoama con quienes tuvieron contacto los blancos en sus viajes por el alto Orinoco, fueran los Sanemá que aparecen en las fuentes históricas como Guaharibo. Con frecuencia se encuentra a los Guaharibo mencionados junto con los Waica, pero es de interés el que desde las primeras noticias, los autores hicieran la distinción entre Waica y Guaharibo.

Caulin (1958, pp. 305-306), escribiendo en 1779, ubica los Guaribe en el Marauca y sus afluentes. Según él, son de color blanco como españoles, y son los mismos "uaribas" mencionados ya por la "Expedición de Solano". Humboldt habla también de Guaicas y de Guaharibos, representantes de ellos conoció en la Misión de Esmeralda. Spruce (1908:1, pp. 396-398), quien encontró en su viaje por el Casiquiare a un viejo Guaharibo, es el primero que nos dejó las más amplias y auténticas informaciones de los Yanoama del alto Orinoco. Según ese autor los Guaharibo se autodenominan Kudé-Kubui, pero resulta difícil hoy día el decidir si se trata de Guaharibo o de Waica. Lo mismo opinamos respecto a los Guaharibo de Chaffanjon (1889). Es posible que los Sanemá hayan ocupado zonas más hacia el Casiquiare y el Cunucunuma, pero los Arawak y Caribe de esta zona ocuparon estos lugares con anterioridad a la llegada del blanco, y los límites fueron establecidos por las tribus en ello interesadas.

Es relativamente reciente la expansión de los Sanemá hacia el Norte, o sea desde el Padamo hacia el alto Ventuari, Erebato y Caura, pero, a juzgar por los datos que nos suministra la glotocronología, la separación de los varios grupos de la subtribu corresponde ya a 600-1.700 años. Establecimos contacto con tres grupos norteños de los Sanemá: los Nabudub del alto Ventuari, los Taclaudub del alto Caura, y los Pubmatari del Canaracuni. Al parecer, ellos representan grupos Sanemá bastante bien establecidos, y la distancia interna de esa familia lingüística no deja, en cierto modo, de sorprendernos.

Los Sanemá del Padamo y del alto Orinoco son prácticamente desconocidos a la ciencia, y es de esperar que la diferencia cultural entre ellos y sus hermanos que viven al norte del 4° y en un contacto íntimo con los Makiritare, sea relativamente pronunciada.

La separación geográfica de los Sanemá en un grupo meridional y otro norteño es reciente y se debe a la circunstancia de que en el año de 1947 el capitán Cardona tenía que preparar en el Canaracuni un campo de aviación (comunicación personal), y como no había indios por esa zona, para ayudarle en su empresa, fue al Brasil y trajo los primeros Sanemá a esta región de Venezuela. Esta fecha marca el inicio de la infiltración en mayor escala del elemento Yanoama a la tierra Makiritare, sus vecinos por el Noroeste con quienes han vivido desde tiempos remotos en profunda enemistad. Mientras que los Makiritare del Cunucunuma todavía no toleran nutridos grupos Yanoama en su territorio, los del Ventuari, Erebato y Caura viven en estrecho contacto con grupos numerosos de la subtribu Sanemá. Por aquí penetró la cultura Makiritare del tipo selva tropical a esa tribu esencialmente

protagricultores y compuestos de cazadores y recolectores dotados de cultura muy rudimentaria. Los Sanemá recibieron un pésimo trato de los Makiritare, comparable con el que recibe un esclavo de parte de su amo, por lo cual hacia el año 1950 los Sanemá se sublevaron contra los Makiritare y les declararon una guerra sin cuartel. Fue entonces cuando las diversas subtribus Makiritare se reunieron para rechazar a los Sanemá, a quienes vencieron en varios encuentros merced a sus armas de fuego. Parece que, como consecuencia de este incidente, la convivencia entre los Makiritare y el grupo Norte de los Sanemá resultó más pacífica, y hoy es raro no encontrar una población Makiritare en esa zona del Ventuari, Erebato y Caura, sin que en sus inmediaciones no existan algunos grupos Sanemá.

La colisión de las dos culturas inició un proceso de aculturación progresiva y los cazadores y recolectores de vegetales silvestres adoptaron una cultura superior: serían, en adelante, agricultores. Por otra parte, las constituciones genéticas de las dos tribus experimentaron profundos cambios y la del grupo minoritario será absorbida quizás por los Sanemá en un lapso de tiempo relativamente corto.

Este proceso de aculturación y de absorción genética es interesante, pues uno está acostumbrado a pensar que los Caribe han sido siempre los invasores victoriosos y dominantes. Pero en este caso concreto, el proceso parece resolverse en dirección opuesta. El avance de los Sanemá, quienes adoptaron, entre otras cosas, el arte de la navegación, tiene por consecuencia el aislamiento de los dos grandes grupos Makiritare: los Yecuana (Decuana) del Ventuari y Caura, por una parte, y los Cunuhuna del Cunucunuma por otra. Antes, estos dos grupos se visitaban con suma frecuencia, sus miembros se relacionaban mutuamente y fuertes lazos familiares existían entre ambos. Hoy, los jóvenes Makiritare desconocen ya en parte los ríos y caminos de esas regiones tantas veces transitadas por sus padres, y viajan en pequeños grupos, embargados por densa angustia cada vez que tienen que cruzar la zona ocupada por los Sanemá. Lo observado en el viaje por el alto Ventuari, nos confirmó plenamente esa opinión, porque no cabe la menor duda de que el capitán Makiritare que, junto con nuestros cinco compañeros de viaje, había luchado hacía ocho años contra los Sanemá, se sentía molesto al alejarse de las rancherías Makiritare y su sobresalto subió de punto cuando un día encontramos una balsa Sanemá en la orilla del río. No pudieron disimular su nerviosismo cuando en la selva adentro topamos con un conuco y 7 casas recién desalojadas. Siempre los despreciaban y, a simple vista, parecían despreocupados, pero la persuasión de que ya no viven solos en la tierra de sus padres, y el tener noticias de que cuatro días antes de nuestra llegada

al conuco, un indio que se había refugiado trepando a un árbol fue alcanzado por una flecha Sanemá y cayó exánime al río, no dejaba de sorprender.

Un poderoso estímulo que alentaba siempre a los Makiritare en sus numerosos viajes era conseguir una mujer entre sus vecinos de la misma tribu. Hoy, a pesar del intenso desprecio que los Makiritare profesan a los Yanoama, el tomar una mujer de esa tribu no está considerado como cosa imposible ni degradante; son muchas las mujeres Yanoama que se han casado con Makiritare (cf. Grelier, 1955b, p. 10). Este intercambio matrimonial acarrea inevitablemente una asimilación de cultura entre ambas tribus, proceso en el cual el patrón cultural Makiritare va a dominar al de los Yanoama y los genes Yanoama se infiltran al *gene pool* Makiritare. No cabe la menor duda de que los Sanemá, quienes fueron traídos por corto tiempo, llegaron al alto Ventuari y Caura donde se establecieron para quedarse y que la fusión actual entre los Caribe y los Yanoama no debe achacarse tanto a la buena voluntad de los primeros cuanto a la fuerza vital de los últimos.

La subtribu Waica ocupa la parte central del actual territorio Yanoama, la del alto Orinoco y sus tributarios, más arriba de la boca del Ocamo, incluyendo también la margen sur del río (Barker, 1953, p. 434). Como ya hemos apuntado parecen vivir también en el área general del alto río Branco y sus afluentes occidentales, y Schuster (1958, p. 114) muy probablemente tiene razón cuando dice que la Sierra Parima no limita la zona Waica, sino que ésta llega hasta tierras brasileñas.

Ya hemos mencionado los primeros contactos que los blancos tuvieron con los Waica y después de un intento poco fructífero de Hamilton Rice a principios del presente siglo, el mundo Waica se quedó ayuno de ciencia hasta que la *New Tribes Mission* logró trabar relaciones pacíficas con los Waica a través del misionero James Paul Barker. Algunos datos etnográficos fueron también publicados sobre esa subtribu Yanoama por varios miembros de la Expedición Franco-Venezolana al Alto Orinoco (1951), (cf. Grelier, 1955b; Anduze, 1958). Finalmente los Waica fueron estudiados entre abril de 1954 y agosto de 1955, por los etnólogos alemanes Zerries y Schuster, quienes están preparando una monografía sobre esta subtribu Yanoama.

Los grupos más meridionales de los Yanoama son conocidos como Xamatari, Araraibo (Seitz, 1960), Surara y Pakidai (Becher, 1960). Este último presentó un estudio muy extenso basado en la experiencia que adquirió durante los nueve meses (Octubre 1955-Junio 1956) que permaneció con ellos.

Por carecer de datos comparativos hemos considerado a todos estos

grupos locales como integrantes de una subtribu Sanumani (grupo de tupir) que representan una entidad muy auténtica de los Yanoama. Advertimos, sin embargo, que esa clasificación está sujeta a cambios en el futuro, como también lo está el mapa de la distribución Yanoama que acabamos de discutir.

El *material lingüístico* que logró reunir el autor del presente trabajo durante su estancia entre los Sanumá corresponde a un vocabulario de los Nabuduh, quienes habitan en el alto Venezuela, y de los Sanumá del alto Casiquiare. El primer vocabulario comprende 270 palabras y 730 entradas, el segundo. (Wilbert, 1961b).

Para clasificar este material dentro de los diferentes idiomas Yanoama comparamos los dos vocabularios con otros pertenecientes a diversas lenguas Yanoama y así, establecimos, en cuanto nos fue posible, un vocabulario básico, calculando las diferencias mínimas existentes entre ellos, según el método glotocronológico.

Ya hemos indicado que los vocabularios Nabuduh y Sanumá fueron recopilados por el autor. El vocabulario de los Pubmatari (Sanumá del Casiquiare) proviene de Vinci (1956, pp. 351-357). Este vocabulario arroja un total de 278 palabras, de las cuales 73 corresponden al vocabulario básico. Según lo que dice el autor en las páginas 159 (1956) y 133 (1959), se trata según todas las probabilidades, de un vocabulario Pubmatari.

El vocabulario Casapare fue tomado de Koch-Grünberg (1928, pp. 302-308). En total cuenta con 303 entradas, 65 de las cuales corresponden al vocabulario básico. Existe otro vocabulario Casapare reunido por Armellada y Maruliana (1942, pp. 101-108), que comprende un total de 232 entradas, de las cuales 54 palabras corresponden al vocabulario básico. Por el itinerario de la expedición, sabemos que los últimos autores citados visitaron a los Shirianá del río Paramichí (afluente de las cabeceras del Paragua), zona que se considera, en el presente trabajo, como extensión del territorio Casapare del Brasil.

Koch-Grünberg obtuvo su vocabulario entre los Schirianá del Uraricapará (1923, p. 288) y la comparación de los dos vocabularios parece indicar una afinidad más estrecha entre ambos, que la que existe con cualquiera otra lengua Yanoama. El cálculo glotocronológico se basa en el material de Koch-Grünberg.

El vocabulario Waica proviene del Dr. Zerries, quien, gentilmente, nos facilitó uno básico de 96 palabras de los Waica del alto Orinoco.

Recientemente fue publicado otro vocabulario de la misma lengua por

Andrade (1958, pp. 258-267) que comprende 369 emisiones. El presente cálculo se basa en el material facilitado por Zerries.

El vocabulario "Samatari" lo llamamos así provisionalmente, pues se trata, con más precisión, del idioma Surara y Pakidai del río Demini en el Brasil. El material nos lo suministró el Dr. Becher en forma de un vocabulario básico que comprende 85 palabras. Entre el Surara y el Pakidai existen solamente leves diferencias dialécticas. Un vocabulario de 40 palabras del mismo idioma fue publicado en la monografía sobre esos indios por Becher (1960, pp. 136-137). Otro vocabulario de los Yanoama meridionales fue hecho público por Seitz (1960, p. 306) y comprende 40 entradas. Las pocas palabras que permiten hacer una comparación semántica con otras lenguas similares indican que el Arara-Xamatari de Seitz está más próximo al Surara, Pakidai, Waica y Kariné que al Sanemá y Casapare.

El vocabulario del Kariné, publicado por Salathé (1932, pp. 314-316) no nos fue posible conseguirlo. Dall'Igna Rodrigues (1960, pp. 134-138) lo coloca entre el Waica y el Casapare (Schiriana de Koch-Grünberg).

Según el resultado del cálculo léxico-estadístico (cf. p. 196), se puede decir que los idiomas comparados forman un conglomerado lingüístico cuyas divergencias internas datan de 6-35 siglos mínimos (sm). Por su distribución temporal constituyen dos grupos más o menos distintos (a) una familia Sanemá con: Nabudub, Sanemá y Pubenatari, con una divergencia interna de 6-17 sm. y (b) una familia Casapare con: Samatari, Waica y Casapare y con una divergencia interna de 8-21 sm. Las lenguas extremas son Nabudub (del Sanemá) y Casapare. La distancia del Waica a los tres idiomas Sanemá corresponde a 17 sm. que es igual a la distancia máxima interna de la familia Sanemá, y los Nabudub tienen idéntica dificultad en entender a un Pubenatari como a un Waica; deben, sin embargo, comprenderse aunque con alguna dificultad. El Waica tiene mayores vinculaciones con el Samatari, con quien se comunica oralmente sin mayores dificultades.

Otras clasificaciones de los idiomas Yanoama fueron hechas por Rivet (1924, p. 678), Loukotka (1944, pp. 8-9), Mason (1950, p. 254), Rivet-Loukotka (1952, p. 1140), McQuown (1955), Swadesh (1959) y Dall'Igna Rodrigues (1960, pp. 136-137).

Koch-Grünberg (1913, pp. 455-458) ya en 1913 estableció la independencia del idioma Yanoama (Shiriana) del Caribe, y añadió que el idioma representaba aparentemente una lengua aislada. Rivet (1924, p. 678) y W. Schmidt (1926, p. 211) compartieron la opinión de Koch-Grünberg acerca de la filiación e independencia de la familia "Shirishana".

La clasificación de la "Familia Shirishana" por Rivet-Loukotka (1952, p. 1140) comprende los siguientes idiomas:

Familia Shirishana

a) Shirishana (o Guahariho), que viven repartidos en pequeños grupos en el interior, a lo largo de los afluentes del Uraricuera y en la vertiente meridional de la Sierra de Parima;

b) Karime (o Shuairi), en el río Catemany en la misma región;

c) Waika que viven en el alto Ocamo y Mocajahy, afluentes derechos del alto Orinoco;

d) Pustérikin, tribu salvaje desconocida que habita en la Sierra Parima.

Como mencionamos arriba, somos partidarios de diferenciar entre Shirishana (Casapare) y Guahariho (Sanemá) lo cual lingüísticamente parece estar justificado por la distancia de 23-35 sm entre ellos. Rivet se basa, al parecer, en el material de Koch-Grünberg (1928), que también nosotros hemos utilizado en nuestra comparación. El idioma (d) Pustérikin que aparece también en la clasificación de Loukotka (1944, pp. 8-9) es un idioma completamente desconocido y no figura, por tanto, en la clasificación de Mason (1950, p. 254), quien presentó la siguiente agrupación Shirishaná:

SHIRISHANÁ

A.—Wahariho (Guahariho)
1. Shirianá
a) Waicá (Guaica, Uaica)
B.—Carimé (Karimé)

Según Mason, Shirianá y el menos importante Carimé son los idiomas principales de la familia. Esta observación se basa en el material de Koch-Grünberg (1928, Shiriana) que fue identificado en nuestra comparación como Casapare y, como la mayor separación del stock Yanoama corresponde a esa lengua, tenemos que admitir el valor de la opinión de Mason. El Carimé no figura en nuestra clasificación.

Por otra parte opina Mason, que el idioma Waica es, posiblemente, un dialecto del Shirianá (Casapare) pero, según el cálculo glottocronológico no parece estar en lo cierto. La distancia entre los dos idiomas es de 21 sm que es mucho más que una distancia dialéctica de 5-7 sm. Waica aparece en la gráfica como más cercano al Sanemá (17-18 sm). La opinión de mu-

chos investigadores de que Shiriană (Casapare) y Waica son descendientes de los Guaharibo (Sanemá) parece tener cierta justificación.

McQuown (1955) clasificó la familia "Chirianas" de la siguiente manera:

a) Guaharibas con Chirianas, Uaica y ? Guaharibo; b) Catrime; c) Pasaracas.

Una clasificación más reciente de la familia Yanoama fue hecha por Dall'Igna Rodrigues (1960, pp. 136-137). Por sus diferencias internas el mencionado autor agrupó los diferentes idiomas Yanoama en la forma siguiente: Surara y Pakidai (Sumatari), Waika, Karimé, Shiriană (Casapare), Waroma (Sanemá, Pohomoari) (19).

Dall'Igna Rodrigues llegó a ese resultado basándose en una comparación de 40 palabras de los idiomas mencionados y explica que los idiomas de su lista fueron ordenados según la distancia relativa de cada uno de ellos, con respecto al Surara y Pakidai. También subraya el carácter provisional de su resultado, algo distanciado de los presentados por Mason y McQuown.

Es interesante, sin embargo, observar que la clasificación de Dall'Igna Rodrigues coincide, en sus detalles, con la nuestra. Al añadir los datos léxico-estadísticos, la clasificación se leería del modo siguiente:

Surará-Pakidai (Sumatari) 8 sm > Waica; 21 sm > Shiriháná (Casapare); 21-25 sm > Waroma (Sanemá).

Dos lingüistas americanos, Greenberg y Swadesh, rompieron, recientemente, con la tradición que habían establecido Rivet, W. Schmidt, Loukotka, Mason y McQuown, según la cual el Yanoama no tenía afiliación próxima con otra familia lingüística suramericana.

Greenberg (1956) clasifica a los Shiriană como un grupo distinto en la sub-familia "Chibchan proper" de la familia "Macro Chibchan". A la misma categoría pertenecen también los Tunebo.

Swadesh (1959, p. 20) establece un Macro-Siriana, con una separación interna de 50 sm. incluyendo Chapacura (27 sm) y Siriana (21 sm). Según me manifestó personalmente el Dr. Swadesh, pensaba incluir también el Warao al Macro-Siriana, lo cual aumentaría la divergencia interna del grupo a 72 sm de un *micropáylum*. Tomé cierto interés en esa indicación de Swadesh y traté de comparar el Warao con el Yanoama; sobre todo con el vocabulario más amplio que colecciona entre los Sanemá.

Hice dos comparaciones: (a) la de los vocabularios básicos y (b) la de todos los pares posibles entre el vocabulario Sanemá y el diccionario

(19) Las cursivas entre paréntesis fueron añadidas por el presente autor.

Warao de Barral (1957). Los resultados de esas comparaciones se pueden expresar del modo siguiente: Más del 20% del total de los pares comparados parecen emparentados, porcentaje suficientemente alto para estimular un estudio lingüístico más detenido. El cálculo glottocronológico preliminar dio por resultado una separación entre los dos idiomas de 45 mm correspondiente a 26% de retenciones comunes.

Tengo la impresión de que ese resultado matemático tiende a disminuir y no a aumentar, a medida que se profundiza su estudio. También observamos ciertas relaciones del Yanoama con el Ye del Brasil. Pero éstas son de carácter distinto y más distantes que los casos considerados entre Warao y Sanemá.

Como ya mencionamos anteriormente, existen ciertos indicios de que los idiomas Tunebo, Warao, Yanoama, y Ye parecen tener una raíz común en el Chibcha y están lingüísticamente más estrechamente emparentados entre sí que con la mayoría de los idiomas suramericanos.

4: Wilbert SOTO Yanoama

[P 19]

A principios del año 1961 nos, con el Dr. Layrisse, la oportunidad de visitar a los Waica del alto Orinoco, donde fuimos con el propósito de tomar *muestras de la sangre de ese grupo*. Obtuvimos 140 muestras individuales, las cuales, con toda probabilidad, son representativas para los Yanoama en general. Vamos ahora a referirnos a un hallazgo genético interesante.

Los Waica mostraron una ausencia completa del gen Diego (Di^a). Como informamos anteriormente (Layrisse, Wilbert, 1960), el antígeno Diego es un marcador genético exclusivamente mongoloide, pero, a pesar de que ocurre solamente en poblaciones llamadas "mongoloides", no aparece en todas ellas. Hay mongoloides Diego-positivo y mongoloides Diego-negativo. También se han observado diferencias graduales de frecuencia entre una población mongoloide y la otra. Hasta ahora la escala de frecuencias oscila entre 0 y 50%.

Los Waica pertenecen a las poblaciones mongoloides Diego-negativo, y figuran en la misma categoría las tribus de Suramérica: los Tunebo, Bari (Motilones bravos) y Warao. Otros grupos con incidencia muy baja podrían ser incluidos en esta categoría también, ya que la baja frecuencia que muestran para el gen se puede explicar mejor por la mezcla de una población originalmente negativa con otra altamente positiva. Un representante del último grupo es la tribu de los Yaruro.

Durante los seis años de investigación del gen Diego llegamos a una observación que creemos de importancia y es: las diferentes grupos de frecuencias del antígeno Diego corresponden a distintas afinidades lingüísticas. El caso mejor estudiado es el de los Caribe. Examinamos más de diez tribus y subtribus y muestran todas un promedio de 28% del gen Di^a. En este caso la afinidad lingüística caribe es indicadora para una incidencia positiva del gen Di^a. Se entiende, naturalmente, que entre ambos datos no existe ninguna relación causal y que esta observación no debe interpretarse en el sentido de que tratamos de hacer responsable a un cromosoma para un determinado rasgo cultural. Ambos factores son esencialmente distintos, pero su aparición paralela es un hecho interesante.

Se ha observado una conexión lingüística entre los Tunebo, Bari, Warao y Yanoama; una relación que parece ser *más íntima* que la que existe generalmente entre todas las lenguas indígenas de América y, por eso, resulta interesante que este grupo de tribus ocupe un puesto común y al mismo tiempo extremo en la escala de la distribución del gen Di^a. No se trata, en

este caso, de una diferencia gradual como la de 12% Arawak y 20% Caribe. En este caso se trata de una diferencia principal entre "positividad" y "negatividad". Las tribus mencionadas se encuentran diametralmente opuestas a las tribus Piaroa, Jca y otras con 45% de frecuencia, y éste quiere decir que los Tunebo, Bari, Warao y Yanoama son genéticamente diversos de sus vecinos Arawak, Caribe y de los Chibcha de Colombia (Piaroa, Jca), pero idénticos entre sí (siempre hablando de un solo gen).

Otra observación, igualmente interesante, es que en términos generales el patrón cultural de las tribus marcadas con el Diego negativo es relativamente uniforme: son esencialmente recolectores y no productores en cuanto a la alimentación se refiere, pero también su estructura social y sus conceptos religiosos parecen tener muchos rasgos comunes que son, al mismo tiempo, muy distintos de los de otras tribus indígenas de Venezuela y de Suramérica. No podemos ahora explayarnos en más amplios detalles sobre este interesante punto. Para resumir, diremos que los Waica (Yanoama) son genéticamente parecidos a los Warao, Bari y Tunebo. Como todas estas tribus muestran rasgos culturales muy primitivos, opinamos que la ausencia del gen Di[a] es una característica de las poblaciones antiguas de Suramérica; ya que está generalmente aceptado que las llamadas tribus Marginales pertenecen a una invasión temprana de inmigración indígena. Llama la atención que todas las tribus hablan idiomas con rasgos Chibcha.

En la discusión anterior tuvimos que incluir las varias subtribus Yanoama para tratar de ubicar a los Sanemá dentro de un marco étnico-geográfico más amplio. Ahora nos concretaremos más especialmente en los Sanemá, debido al estudio que sobre el terreno hemos hecho de esa subtribu. Muchos de los datos acumulados podrían atribuirse a las demás subtribus también, pero no juzgamos conveniente hacer una generalización indiscriminada, máxime si tomamos en cuenta que las subtribus parecen ser portadoras de diferencias subculturas.

Los Sanemá viven en el alto Ventuari, el Erebato y el Caura. Se trata pues de los Sanemadub, Nabudub y Pabenaari y sus varios grupos locales, ya mencionados en la introducción. Podemos, en principio, dividir estos Sanemá en dos grupos: unos que viven en estrecha fusión con los Makiritare y los que, aunque habitan la tierra de los Makiritare, no han logrado establecer nexos permanentes con ellos. Por lo cual resulta difícil apuntar, de manera definitiva y absoluta, datos demográficos exactos, y los que aquí publicamos lo hacemos con ciertas reservas.

A. *Sanemá del alto Caure (Padamatari)*

Localidad	*Nº Habitantes*	*Observaciones*
1. Casiracuni	300	En la zona limítrofe existen varias hordas mixtas con nombres particulares, que aceptan el nombre "Sanemá" como nombre genérico de ellos. Cambian con frecuencia sus parajeros entre Brasil y Venezuela.
2. Wanaba	200	
3. Yanahami	300	
4. Cabecera Caure	100	
5. Hordas mixtas	500	
Total	1.400	individuos estimados

B. *Sanemá del alto Erebato (Sanemalab)*

1. Karima-edi	40	
2. Wanaba	62	
3. Udehababa	125	
4. Kayabiba	143	
Total	370	individuos censados 1960

C. *Sanemá del alto Ventuari (Nahalab)*

1. Wewetia	50	Los Nahalab de Ibababa cambian frecuentemente entre el Ventuari y el Erebato.
2. Wadekaba	80	
3. Mahanaba	50	
4. Ibababa	200	
Total	380	individuos estimados

Según esta estimación demográfica, se cuenta con 2.150 Sanemá aproximadamente, en la zona del alto Ventuari, Erebato y Caure. No obstante el número de Sanemá que vive en el Padamo.

Hemos visto cuatro tipos diferentes de *casas* entre los Sanemá: (a) tipo paraviense, (b) de forma triangular y sistema Makiritare, (c) rectangular y (d) oblongo. Los tipos (a) y (b) los hemos encontrado juntos en el mismo campamento en el Ventuari, en frente al Caño Mosquito.

En nuestra excursión por aquel sitio, vimos dos balsas Sanemá estacionadas a la orilla del Ventuari. Subimos luego a un barranco y seguimos un pequeño sendero que nos condujo a un conuco de los Sanemá. A uno de los extremos había un algarrobo gigantesco cargado de frutas. Por las cáscaras regadas en el piso nos dimos cuenta de que los Sanemá habían ingerido gran cantidad. Cerca del árbol que estaba les preparó su primera

4: Wilbert 5Q18 Yanoama

sumbra, encontramos un campamento Sanemá deshabitado. Estaba constituido por cinco chozas triangulares y dos del tipo puevientos. Ambas construcciones parecen ser típicas de los Yanoama, y se destacan por su tamaño, más bien pequeño. Para la construcción de una cabaña triangular se necesitan seis palos de 1,60 m de largo que sirven de postes o soportes. Con ellos se hacen tres pares, amarrando cada uno por su extremo superior con un bejuco y dejando unos 30 cm de modo a formar una horquera. Las partes inferiores de los palos se clavan en el suelo a una distancia de medio metro. Esas horqueras en forma típica con una separación de dos metros forman un triángulo regular. Después se colocan encima de las horquetas tres palos, que soportarán la techumbre, hecha de hojas de platanillo. Un rancho similar fue descrito por Koch-Grünberg (1923, tabla 43).

Los dos puevientos tenían dos postes clavados superficialmente en el suelo a una distancia de dos metros uno del otro. Consigue al poste había una estaca más pequeña, amarrada a aquél por un bejuco. El techo de ese puevientos estaba tapizado con ramas entrelazadas y cubiertas con hojas de platanillo,y sostenido con ligera inclinación contra dos postes. El techo sobresale de los postes unos 40 cm y toca la tierra por su parte inferior. En estas casas los Sanemá cuelgan sus chinchorros de bejuco o mujagua. En algunos ranchos encontramos vestigios de fuego.

Las casas del tipo Makiriware (rectangular y oblongo) son imitaciones, en miniatura, y tienen un solo cuarto. Los techos de hojas de palma son de dos aguas rectangulares y levantados encima de 4 ó 6 postes. Los extremos del techo son rectos o redondeados. Las paredes consisten en corteza de palo o palos yuxtapuestos. Tienen una dimensión media de 4 m de largo, por 2 m de ancho y aproximadamente 3 de alto. Cada casa está provista de una o dos puertas bastante estrechas. Dentro de la casa (del tipo Makiriware) reina el mayor desorden: del techo y de las paredes cuelgan cestas, sarumas, armas, bolsas de cuero, cabuyo, frutos de palmera, chinchorros de bejuco, mujagua y algodón. En tierra están fogones, leña, utensilios de cocina, guapas con huso y algodón, rallos de yuca, los perros y los niños, todo revuelto sin orden ni concierto. Se nota que no están acostumbrados a vivir bajo techo y la casa es un depósito más bien que una vivienda.

La *tecnología* de los Sanemá está muy poco desarrollada, y precisamente por eso se puede clasificar a los Sanemá (y a los Yanoama en general) como representantes de los pueblos más atrasados de América y del mundo entero. Parece que el ideal de estos indios semi-nómadas corresponde al: *omnia mea mecum porto* — ¡todo lo mío lo llevo conmigo! y, aparte de sus armas, algunos implementos y una cesta, es rara la vez que llevan algo más consigo en sus caminatas. Ni siquiera transportan sus chin-
